I. INTRODUCTION

The Colorado Department of Public Health and Environment (CDPHE), Air Pollution Control Division's (APCD) 2013 Ambient Air Monitoring Network Plan is an examination and evaluation of the APCD's network of air pollution monitoring stations. The Network Plan is an annual review of the Division's air monitoring network, as required by Title 40, Code of Federal Regulations, Part 58.10(a) [40 CFR 58.10(a)].¹ It is also a simple accounting of monitoring site changes expected for that year and the following year. It is due on or before July 1 each year.

Purpose of Network Plan

The purpose of the Network Plan is to provide an overview of the APCD's current air quality monitoring network and projected plans for the coming year. This plan shows the general reason for monitoring, the location of the monitor, and finally the type and frequency of measurements taken at each location. This is the sixth year that this review has been released to the general public for comment prior to its submittal to the U. S. Environmental Protection Agency (EPA) for approval. This change was initiated because of a change in Federal Regulations implemented in December 2006.

Overview of the Colorado Air Monitoring Network

In 2013, the Colorado Air Pollution Control Division currently operates monitors at 57 locations. Since last reported, six monitoring sites were removed: Breckenridge (PM₁₀), Swansea (PM_{2.5}), Lamar Power Plant (PM₁₀), DMAS (NCore), Carriage (ozone), and Rist Canyon (ozone). La Casa was added to the network as the new NCore site, and Lay Peak was established to monitor ozone. Carbondale was added as a PM₁₀ site. Existing sites were altered, including SO₂ added to the Highway 24 site, and meteorological monitoring added to the Weld County Tower site. Additions to the network for 2013 that are planned include near roadway NO₂, CO, meteorology, and particulate monitors. These changes are discussed in more detail later in this document.

Particulate monitors, including Particulate Matter 10 microns and smaller (PM₁₀) and Particulate Matter 2.5 microns and smaller (PM_{2.5}), and ozone monitors are the most abundant and widespread of monitoring types across the state, not considering meteorological monitoring. Currently, there are PM₁₀ monitors at 28 separate locations (the Lamar Power Plant site and Breckenridge site were removed, the Carbondale site was added), PM_{2.5} monitors at 17 separate locations (Swansea was decommissioned) and ozone monitors at 20 locations (down from 22 with the closure of Rist Canyon and Carriage, the closure of DMAS was balanced by the opening of La Casa). There are 18 meteorological sites in operation (down from 19 last period with the closure of Rist Canyon and Carriage and the addition of Weld County Tower). These sites monitor wind speed, wind direction, resultant speed, resultant direction, standard deviation of horizontal wind direction, and temperature. Three meteorological sites and the visibility site also monitor for relative humidity.

The APCD currently operates one TSP site at the Centennial Airport used for lead analysis, and submits PM₁₀ samples from La Casa for lead analysis. Only seven of the 28 PM₁₀ monitoring sites are continuous, while twelve of the 17 PM_{2.5} monitoring sites also have

¹ "Annual Monitoring Network Plan and Periodic Network Assessment," 40 Federal Regulations 58.10 (1 July 2011), p. 248.

continuous monitors. Only three continuous PM_{2.5} sites (Boulder Athens, NJH, and Rifle) are not collocated with PM_{2.5} FRM monitors. This difference reflects the age of the technology, as well as the availability and focus of EPA funding. Increasing the amount of automated versus manual monitoring will require modifications to the particulate network, in the current network these are primarily manually operated monitors.

32 of the 57 currently monitoring sites have been in operation for ten or more years, and 19 of these have been in operation for 20 or more years. Twelve monitoring sites have been in operation for more than 30 years. These sites are Alamosa ASC, Highland Reservoir, Pagosa Springs School, Boulder ó CU Athens, Denver ó CAMP, Denver ó NJH-E, Parachute Elementary School, Crested Butte, Arvada, Lamar Municipal, Steamboat Springs, and Greeley ó Hospital. Conversely, 26 of the 58 operating sites have begun operation since the start of the year 2000.

Four of the ozone (O₃) monitoring sites that are located on the western slope and have data included in this report are operated and maintained by a third party contractor, Air Resource Specialists (ARS). These are the Rifle, Palisade, Lay Peak, and Cortez monitoring sites. ARS keeps the sites in proper working order and performs calibrations, data retrievals, and data validation, while the APCD uploads data to the AQS database and conducts independent audits of the sites for Quality Assurance (QA) purposes.

APCD Monitoring History

The State of Colorado has been monitoring air quality statewide since the mid-1960s when high volume and tape particulate samplers, dustfall buckets, and sulfation candles were the best technology available for defining the magnitude and extent of the very visible air pollution problem. Monitoring for gaseous pollutants (carbon monoxide, sulfur dioxide, oxides of nitrogen and ozone) began in 1965 when the Federal Government established the CAMP station in downtown Denver at the intersection of 21st Street and Broadway. This was the area that was thought to represent the best probability for detecting maximum levels of most of the suspected pollutants. Instruments were primitive by comparison with those of today, and frequently were out of service.

Under provisions of the original Federal Clean Air Act of 1970, the Administrator of the U.S. Environmental Protection Agency (EPA) established National Ambient Air Quality Standards (NAAQS) designed to protect the public's health and welfare. Standards were set for total suspended particulate matter (TSP), carbon monoxide (CO), ozone (O₃), nitrogen dioxide (NO₂) and sulfur dioxide (SO₂). In 1972, the first State Implementation Plan (SIP) was submitted to the EPA. It included an air quality surveillance system in accordance with EPA regulations of August 1971. That plan proposed a monitoring network of 100 monitors (particulate and gaseous) statewide. The system established as a result of that plan and subsequent modifications consisted of 106 monitors.

The 1977 Clean Air Act Amendments required States to submit revised SIPs to the EPA by January 1, 1979. The portion of the Colorado SIP pertaining to air monitoring was submitted separately on December 14, 1979, after a comprehensive review, and upon approval by the Colorado Air Quality Control Commission. The 1979 EPA requirements as set forth in 40 CFR 58.20 have resulted in considerable modification to the network. These and subsequent modifications are made to ensure consistency and compliance with Federal monitoring requirements. Station location, probe siting, sampling methodology, quality assurance practices,

and data handling procedures are all maintained throughout any changes made to the network.

APCD Monitoring Operations

The APCD attempts to operate all of its monitors for a full calendar year, beginning operation of new monitors in January and terminating existing monitors in December. Circumstances both in and out of the Division's control make that desired schedule difficult to achieve. The APCD does not own either the land or the buildings where most of the monitors are located, and it is becoming increasingly difficult to get property owner's permissions for use due to risk management issues.

When modifications to the State and Local Air Monitoring System (SLAMS) network are required, the Division will provide EPA Region 8 with the appropriate modification forms prior to its implementation for their approval. All currently operating SLAMS monitors have been approved by EPA. With the exception of some vegetation issues (tall trees), sites meet the requirements set forth in 40 CFR 58, Appendices A, C, D, and E.

Network Modification Procedures

The APCD develops changes to its monitoring network in several ways. New monitoring locations have been added as a result of community concerns about air quality, such as the PM₁₀ monitors in Cripple Creek and Hygiene established in 1998. Other monitors have been established as a result of special studies, such as the O₃ monitoring in Aurora, Rifle, Cortez, Aspen Park, Rist Canyon, Palisade, and Lay Peak.

The most common reasons for monitors being removed from the network are that either the land or building is modified, such that the site no longer meets current EPA siting criteria, the property ownership changes, or the area surrounding the monitor is being modified in a way that necessitates a change in the monitoring location. The most current examples of this are the Auraria meteorological monitoring station and the relocation of the Denver Municipal Animal Shelter (DMAS) site. The Auraria station was removed due to the construction of a tall building in the immediate vicinity of the monitor that obstructed airflow around the monitoring site. The DMAS site was relocated due to a change in use of the property. Monitors are also removed from the network after review of the data shows that the levels have dropped to the point where it is no longer necessary to continue monitoring at that location.

Finally, all monitors are reviewed on a regular basis to determine if they are continuing to meet their monitoring objectives. If the population, land use, or vegetation around the monitor changed significantly since the monitor was established, a more suitable location for the monitor is sought. An example of this is the O₃ monitor previously located at the Arvada monitoring site. It was shut down on 1/1/2012, and relocated to the Denver ó CAMP location beginning 3/1/2012.

Table 1 lists the locations and monitoring parameters of each site currently in operation, by county, alphabetically. It lists the AQS identification numbers for each site, the site address and coordinates, the start dates, and the site elevations. It further breaks down the monitor type, orientation/scale, and the sampling frequency for each site. The parameter date is the date when valid data were first collected. Due to equipment problems this date can be significantly different than the site installation date, which is the "Started" date.

² The CAMP PM_{2.5} site is technically a micro-scale site, but the APCD demonstrated to EPA in 2001 that the CAMP site is representative of a much larger area of similar land use, meteorology, and emissions around downtown Denver, and has therefore been justified to meet the Neighborhood scale criteria for PM_{2.5} concentrations. The same is true for the Boulder Chamber of Commerce PM_{2.5} site, which is technically a middle scale site.

The following abbreviations were used in Table 1, with orientation (Orient) referring to the reason why the monitor was placed in that location, and scale referring to the size of the area that concentrations from the monitor represent.

Orientation

P.O. - Population oriented
Back - Background orientation
SPM - Special Projects Monitor
H.C. - Highest Concentration
POC - Parameter Occurrence Code

Scale (Area Represented)³

Micro - Micro-scale (several m ó 100 m)
Middle - Middle Scale (100 ó 500 m)
Neigh - Neighborhood Scale (0.5 ó 4 km)
Urban - Urban Scale (4 ó 50 km)
Region - Regional Scale (50 ó hundreds of km)

Also included in the above table are listings as "Other" which are meteorological monitors that do not include either orientation or scale. A "o" in the Start column indicates that the monitor has not yet been installed.

Description of Monitoring Areas in Colorado

The state has been divided into eight multi-county areas that are generally based on topography and have similar airshed characteristics. These areas are the Central Mountains, Denver Metro/North Front Range, Eastern High Plains, Pikes Peak, San Luis Valley, South Central, Southwestern, and Western Slope regions. Figure 1 shows the approximate boundaries of these areas.

Figure 1. Monitoring Regions in Colorado

³ "Appendix D to Part 58 of Network Design Criteria for Ambient Air Quality Monitoring," 40 Federal Register 58 (1 July 2011), pp. 290-292.

Central Mountains Region

The Central Mountains Region consists of 15 counties in the central area of the state. The Continental Divide passes through much of this region. Mountains and mountain valleys are the dominant landscape. Leadville, Steamboat Springs, Cañon City, Salida, Buena Vista and Aspen represent the larger communities. The population of this region is about 256,800, according to U.S. Census Bureau estimates. Skiing, tourism, ranching, mining, and correctional facilities are the primary industries. Black Canyon of the Gunnison National Park is located in this region. All of the area complies with federal air quality standards.

The primary monitoring concern is with particulate pollution from wood burning and road sanding. Currently, there are no gaseous and five particulate monitoring sites operated by the APCD in the Central Mountains region.

Denver Metro/North Front Range Region

The Denver-Metro/North Front Range Region includes Adams, Arapahoe, Boulder, Broomfield, Denver, Douglas, Jefferson, Larimer and Weld counties. It includes the largest population area of the state, with 2.8 million people living in the seven-county Denver-metro area and another half-million living in the northern Colorado area of Larimer and Weld counties. This area includes Rocky Mountain National Park and several wilderness areas.

Since 2002, the region complies with all National Ambient Air Quality Standards, except for ozone. The area has been exceeding the EPA's most recent ozone standards since the early 2000s, and in 2007 was formally designated as a "nonattainment" area. This designation was reaffirmed in 2012 when the EPA designated the region as a "marginal" nonattainment area for the more stringent ozone standard adopted by EPA in 2008.

In the past, the Denver-metropolitan area violated health-based air quality standards for carbon monoxide and fine particles. In response, the Regional Air Quality Council, the Colorado Air Quality Control Commission and the Air Pollution Control Division developed, adopted and implemented air quality improvement plans to reduce each of the pollutants.

For the rest of the Northern Front Range, Fort Collins, Longmont, and Greeley were nonattainment areas for carbon monoxide in the 1980s and early 1990s, but have met the federal standards since 1995. Air quality improvement plans have been implemented for each of these communities.

Currently, there are 25 gaseous pollutants monitored at 15 sites and 23 particulate monitoring sites in the Northern Front Range Region. There are five CO, 14 O₃, two NO₂, one NO_y, and three SO₂ monitoring sites. There are ten PM₁₀, 12 PM_{2.5}, and one TSP/Pb monitoring sites. There are two air toxics monitoring sites, one located at CAMP, and one at Platteville.

Eastern High Plains Region

The Eastern High Plains region encompasses the counties on the plains of eastern Colorado. The area is semiarid and often windy. The area's population is approximately 157,000 according to U.S. Census Bureau estimates. Its major urban centers have developed around farming, ranching and trade centers such as Sterling, Fort Morgan, Limon, La Junta, and Lamar. The agricultural base includes both irrigated and dry land farming. All of the area complies with federal air quality standards.

Historically, there have been a number of communities that were monitored for particulates and meteorology but not for any of the gaseous pollutants. In the northeast along the I-76 corridor, the communities of Sterling, Brush, and Fort Morgan have been monitored. Along the I-70 corridor only the community of Limon has been monitored for particulates. Along the US-50/Arkansas River corridor the Division has monitored for particulates in the communities of La Junta and Rocky Ford. These monitoring sites were all discontinued in the late 1970s and early 1990s after a review showed that the concentrations were well below the standard and trending downward.

For the Eastern High Plains Region there is currently one PM₁₀ monitoring site in Lamar and no gaseous pollutant monitoring sites in the area. A replacement site for the Elbert background site may be installed in Elbert County, which is in the Eastern High Plains Region or in Douglas County, which is in the Northern Front Range region.

Pikes Peak Region

The Pikes Peak Region includes El Paso and Teller counties. The area has a population of approximately 626,200 according to U.S. Census Bureau estimates. Eastern El Paso County is rural prairie, while the western part of the region is mountainous. All of the area complies with federal air quality standards.

The U.S. Government is the largest employer in the area, and major industries include Fort Carson and the U.S. Air Force Academy in Colorado Springs, both military installations. Aerospace and technology are also large employers in the area.

Currently, there are four gaseous pollutants monitored at three sites and one particulate monitoring site in the Pikes Peak Region. There is one CO, one SO₂, and two O₃ monitoring sites, and one PM₁₀ and one PM_{2.5} monitoring sites in the region.

San Luis Valley Region

Colorado's San Luis Valley Region is in the south central portion of Colorado and includes a broad alpine valley situated between the Sangre de Cristo Mountains on the northeast and the San Juan Mountains of the Continental Divide to the west. The valley is some 71 miles wide and 122 miles long, extending south into New Mexico. The average elevation is 7,500 feet. Principal towns include Alamosa, Monte Vista and Del Norte. The population is about 45,100 according to U.S. Census Bureau estimates. Agriculture and tourism are the primary industries. The valley is semiarid and croplands of potatoes, head lettuce, and barley are typically irrigated. The valley is home to Great Sand Dunes National Park.

The air quality planning region consists of Saguache, Rio Grande, Alamosa, Conejos and Costilla counties. All of the area complies with federal air quality standards.

Currently, there are no gaseous and two pollutant monitoring sites in the area. There is one PM₁₀ and one PM_{2.5} monitoring site.

South Central Region

The South Central Region is comprised of Pueblo, Huerfano, Las Animas and Custer counties. Its population is approximately 184,800 according to U.S. Census Bureau estimates. Urban centers include Pueblo, Trinidad and Walsenburg. The region has rolling semiarid plains to the east and is mountainous to the west. All of the area complies with federal air quality standards.

In the past the APCD has conducted particulate monitoring in both Walsenburg and Trinidad but that monitoring was discontinued in 1979 and 1985 respectively, due to low concentrations.

Currently, there are no gaseous pollutant monitoring sites and one particulate monitoring site in the South Central Region. There is one PM₁₀ and one PM_{2.5} monitoring site in the region.

Southwest Region

The Southwestern Region includes the Four Corners area counties of Montezuma, La Plata, Archuleta and San Juan. The population of this region is about 89,800, according to U.S. Census Bureau estimates. The landscape includes mountains, plateaus, high valleys and canyons. Durango and Cortez are the largest towns, while lands of the Southern Ute and Ute Mountain Ute tribes make up large parts of this region. The region is home to Mesa Verde National Park, tourism and agriculture are dominant industries. Though the oil and gas industry is growing in this area, all of the area complies with federal air quality standards.

Currently there is one gaseous and three particulate monitoring stations in the region. There is one O₃, two PM₁₀ monitors, and one PM_{2.5} monitor.

Western Slope Region

The Western Slope Region includes nine counties on the far western border of Colorado. A mix of mountains on the east, and mesas, plateaus, valleys and canyons to the west form the landscape of this region. Grand Junction is the largest urban area, and other cities include Telluride, Montrose, Delta, Rifle, Glenwood Springs, Meeker, Rangely, and Craig. The population of this region is about 309,700, according to U.S. Census Bureau estimates. Primary industries include ranching, agriculture, mining, energy development and tourism. Dinosaur and Colorado National Monuments are located in this region.

The Western Slope, along with the central mountains, are projected to be the fastest growing areas of Colorado through 2020 with greater than two percent annual population increases, according to the Colorado Department of Local Affairs. All of the area complies with federal air quality standards.

Currently, there are four gaseous pollutant monitoring sites and 9 particulate monitoring sites in the Western Slope region. There is one CO and three O₃ monitoring sites. There are seven PM₁₀ and two PM_{2.5} monitoring sites.

State-wide Population Statistics

Table 2 is a listing of the projected population statistics by county. The counties have been grouped into Planning and Management Regions (per Colorado Executive Orders of November 1972, 1973 and 1986, and October 1998), Metropolitan Statistical Areas (per the US Office of Management and Budget, June 30, 1993), and Sub-state Regions. The Sub-state Regional grouping typically varies from data user to data user. For the purposes of this assessment, the groupings used were as similar to the State's monitoring regions as possible.

Table 2. Population Statistics and Monitors by County and Metropolitan Statistical Area

REGIONS/COUNTIES	Actual Population	Projected Population		Avg. Annual % Change

II. Carbon Monoxide (CO)

In 2013 the APCD will operate seven CO monitors. Currently, the NAAQS for CO is a primary standard, with a concentration level not to exceed 9 parts per million (ppm) in an eight-hour time period, or 35 ppm in a one-hour period. There is no secondary standard for CO. CO levels have declined from a statewide maximum eight-hour value of 48.1 ppm in 1973 to a value of 2.7 ppm in 2012. The level of the standard has not been exceeded since 1999. The CO monitors currently operated by the APCD are associated both with State Maintenance Plan requirements and CFR requirements. However, the EPA has revised the minimum requirements for CO monitoring by requiring CO monitors to be sited near roads in certain urban areas. They are requiring one CO monitor to be collocated with the near-roadway NO₂ monitoring requirements. EPA is also specifying that monitors required in CBSAs of 2.5 million or more persons are to be operational by January 1, 2015, and that monitors required in CBSAs of one million or more persons are required to be operational by January 1, 2017. A monitor will be located at the near roadway NO₂ site to satisfy these requirements.

Denver Metro/Northern Front Range Region

The three major urban centers in the Northern Front Range Region include Fort Collins and Greeley in Laramie and Weld counties respectively, and the greater Denver Metro area. Motor vehicle activity is a major source of CO. However, there are several small industries and manufacturing processes that may contribute to CO levels. These industries include breweries, power plants, cement plants, mining, electronics and film manufacturing facilities, and rock quarries. Weld County is also an area of significant oil and gas development.

Table 3 lists the maximum eight-hour and one-hour concentrations recorded in 2012 for the Northern Front Range region while Table 4 lists the same values for monitoring stations in the Denver Metro area.

Table 3. Maximum CO Concentrations in Northern Front Range

Site ID	Site Name	Eight-Hour Max (ppm)	One-Hour Max (ppm)
08 069 1004	Fort Collins-Mason	1.8	2.7
08 123 0010	Greeley-West Annex	2.3	3.2

Table 4. Maximum CO Concentrations in Denver Area

Site ID	Site Name	Eight-Hour Max (ppm)	One-Hour Max (ppm)
08 001 3001	Welby	1.7	2.2
08 031 0002	CAMP	2.7	4.2
08 031 0025	Denver ó DMAS	1.5	2.08

The monitor in operation at the Denver ó DMAS site is a trace-level monitor, while the others are not. It was moved to La Casa in 2013. The network modification form can be seen in Appendix C.

Pikes Peak Region

The Pikes Peak Region is a very popular tourist area with rapid urban growth. In 2013 the CO analyzer was upgraded from a 48c to a 48iTLE analyzer. The TLE indicates the new analyzer is capable of trace-level CO detection, which increases the resolution of concentrations detected by an order of magnitude. The TLE is a more accurate analyzer. In 2012, the highest eight-hour CO concentration recorded at the Colorado Springs-Hwy 24 monitor was 2.0 ppm with a maximum one-hour concentration of 2.7 ppm.

The CO monitor in this area is:

08 041 0015 Colorado Springs ó Hwy. 24, 690 W. Highway 24

Western Slope Region

Population in the Western Slope region is not evenly distributed among the counties and ranges from 146,723 people in Mesa County to 2,064 in San Miguel County, according to the April 2010 census data. Grand Junction is the largest city on the western slope with a population of 58,566 (April 2010). This is due in large part to the transient oil/gas working population associated with the boom in drilling in this area.

In 2012, the highest eight-hour CO concentration recorded at the Grand Junction ó Pitkin monitor was 2.3 ppm with a one-hour maximum concentration of 3.2 ppm.

The CO monitor in this area is:

08 077 0018 Grand Junction - Pitkin, 645 ¼ Pitkin Ave.

Planned Changes in CO Monitoring

In 2013 the NCore site was moved from the current location of 678 S. Jason St., to 4587 Navajo St. in Denver. In addition, there are plans to install a new trace-level CO monitor in conjunction with the new Near Roadway NO₂ monitoring site.

III. Ozone (O₃)

On March 12, 2008, the U.S. Environmental Protection Agency released a new level of the NAAQS for O₃. The change in the level was from 0.08 ppm as an eight-hour average to 0.075 ppm as an eight-hour average. This made a significant change in the number of O₃ monitors that exceed the standard on an annual basis, though the standard is based on a three-year average.

The EPA is currently set to propose a new primary O₃ standard in 2013, to be final in 2014. The APCD operates seven sites out of 20 that have three-year design values (2010 ó 2012) in

excess of the current eight-hour O₃ NAAQS standard of 0.075 ppm, up from three sites last year.

EPA's monitoring requirements for O₃ include placing certain numbers of monitors in areas with high populations. For example, in Metropolitan Statistical Areas (MSAs) with a population greater than ten million people, EPA recommends the placement of at least four monitors in areas with design value concentrations that are greater than or equal to 85% of the O₃ standard. The largest MSA in Colorado is the Denver Primary Metropolitan Statistical Area (PMSA). This PMSA includes the counties of Adams, Arapahoe, Broomfield, Denver, Douglas, and Jefferson. There are seven different MSAs in Colorado. The table below lists EPA's O₃ monitoring requirements. Each MSA is discussed further in the following subsections.

Table 5. EPAs Minimum Ozone Monitoring Requirements

MSA population^{1,2}	Most recent 3-year design value concentrations \geq 85% of any O₃ NAAQS³	Most recent 3-year design value concentrations $<$ 85% of any O₃ NAAQS^{3,4}
>10 million	4	2
4-10 million	3	1
350,000-4 million	2	1
50,000-350,000 ⁵	1	0

¹Minimum monitoring requirements apply to the Metropolitan statistical area (MSA).

²Population based on latest available census figures.

³The ozone (O₃) National Ambient Air Quality Standards (NAAQS) levels and forms are defined in 40 CFR part 50.

⁴These minimum monitoring requirements apply in the absence of a design value.

⁵Metropolitan statistical areas (MSA) must contain an urbanized area of 50,000 or more population.

In addition to the above mentioned O₃ monitoring requirements, EPA rules also state that there must be at least one monitoring site per MSA that monitors for the highest concentrations.

Denver Metro/Northern Front Range

Motor vehicle activity is a major precursor source of O₃. However, there are several small industries and manufacturing processes that also contribute to those levels. These industries include a brewery, power plants, cement plants, mining, electronics and film manufacturing facilities, and rock quarries. Weld County is also an area of significant oil and gas development.

In the Northern Front Range, the first and fourth maximum eight-hour concentrations recorded in 2012 for each O₃ monitoring site in Larimer and Weld Counties are listed in the table below. Also listed are the three-year design values (2010-2012) for each site with enough data available to calculate them. There are two MSAs located in Larimer and Weld counties. These are the Fort Collins-Loveland MSA, and the Greeley PMSA. According to the 2010 Census data their populations are 299,630, and 252,825, respectively. Per EPA monitoring requirements, these MSAs fall in the 50,000 to 350,000 population range and each area requires at least one O₃

monitor. These requirements are satisfied by the monitors listed below. The monitor located at the Fort Collins ó West site is a highest concentration monitor for the Fort Collins-Loveland MSA. Design values that are bold and italicized exceed the NAAQS.

Table 6. Maximum O₃ Concentrations in Northern Front Range Region

Site ID	Site Name	1 st eight-hour Max (ppm)	4 th eight-hour Max (ppm)	Design Value (ppm)
08 069 0011	Fort Collins ó West	0.093	0.080	<i>0.078</i>
08 069 0012	Rist Canyon	0.077	0.071	0.071
08 069 1004	Fort Collins ó Mason	0.094	0.074	0.069
08 123 0009	Greeley ó Tower	0.090	0.080	<i>0.076</i>

In the Denver Metro area, only Adams, Arapahoe, Boulder, Denver, Douglas, and Jefferson counties have O₃ monitors. There are 11 monitors currently in operation in this area. In Table 7 Carriage lists summary statistics for Carriage, though the ozone monitor there has since been moved to CAMP.

The first and fourth maximum eight-hour concentrations recorded in 2012 for each O₃ monitoring site in the metropolitan Denver area are listed in the table below. Also listed are the three-year design values (2010-2012) for each site with enough data available to calculate them. The CAMP O₃ site was established in 2012, so there is insufficient data to report at this time.

There are two MSAs located in the Metropolitan Denver area. These are the Boulder-Longmont PMSA, and the Denver PMSA. According to the 2010 Census data their populations are 294,567, and 2,489,661, respectively. Per EPA monitoring requirements, the Boulder-Longmont PMSA falls in the 50,000 to 350,000 population range, and the Denver PMSA falls in the 350,000 to 4,000,000 range. The Boulder-Longmont PMSA therefore requires at least one monitor, which is satisfied by the monitor at South Boulder Creek. By EPA rules, the Denver PMSA requires at least two monitors. This requirement is satisfied by the remaining ten monitors that are placed throughout the Denver PMSA. The monitor at South Boulder Creek is a highest concentration monitor for the Boulder-Longmont PMSA. The monitors located at Chatfield, Rocky Flats ó North, and NREL are all highest concentration monitors for the Denver PMSA.

Table 7. Maximum O₃ Concentrations in the Denver Metro Area

Site ID	Site Name	1 st Eight-hour Max (ppm)	4 th Eight-hour Max (ppm)	2010-2012 Design Value (ppm)
08 001 3001	Welby	0.087	0.077	0.071
08 005 0002	Highland Reservoir	0.094	0.080	<i>0.077</i>
08 005 0006	Aurora ó East	0.085	0.074	0.073
08 013 0011	South Boulder Creek	0.094	0.076	0.074
08 031 0014	Carriage	0.092	0.077	0.073
08 031 0025	DMAS	0.090	0.073	0.069
08 035 0004	Chatfield State Park	0.098	0.086	<i>0.082</i>
08 059 0005	Welch	0.090	0.079	<i>0.076</i>
08 059 0006	Rocky Flats ó N	0.101	0.084	<i>0.080</i>

Site ID	Site Name	1 st Eight-hour Max (ppm)	4 th Eight-hour Max (ppm)	2010-2012 Design Value (ppm)
08 059 0011	NREL	0.095	0.081	<i>0.079</i>
08 059 0013	Aspen Park	0.090	0.077	0.074

Five of the twelve monitors are in excess of the 8-hour NAAQS standard for ozone. Their values are bolded and italicized to highlight them. Several other sites are within 0.005 ppm of reaching the standard limit. The Arvada site was removed from the ozone network on 12/31/2011. It was determined to be a redundant site in the CDPHE's 5-Year Network Assessment Plan. That monitor was placed at the CAMP site, located in downtown Denver, on February 2, 2012. The Network Assessment Plan also recommended that ozone monitoring be reinstated at CAMP for weight of evidence determinations and model validation. The CDPHE also closed the Denver ó Carriage site at the end of 2012. It was also determined to be a redundant monitor in the Plan.

Pikes Peak Region

The first and fourth maximum eight-hour concentrations recorded in 2012 for each O₃ monitoring site in the Pikes Peak Region are listed in the table below. Also listed are the three year design values (2010-2012) for each site with enough data available to calculate them.

There is one MSA located in the Pikes Peak Region, the Colorado Springs MSA. According to the 2010 Census data the population is 645,613. Per EPA monitoring requirements the Colorado Springs MSA falls in the 350,000 to 4,000,000 range and therefore requires at least two monitors. This is satisfied by the monitors at the Air Force Academy and Manitou Springs.

Table 8. Maximum O₃ Concentrations in Pikes Peak Region

Site ID	Site Name	1 st Eight-hour Max (ppm)	4 th Eight-hour Max (ppm)	2010-2012 Design Value (ppm)
08 041 0013	U.S. Air Force Academy	0.078	0.075	0.072
08 041 0016	Manitou Springs	0.079	0.075	0.074

Western Slope Region

The first and fourth maximum eight-hour concentrations recorded in 2012 for each O₃ monitoring site in the Western Slope Region are listed in the table below. Also listed are the three year design values (2010-2012) for each site with enough data available to calculate them. None of these sites recorded ozone concentrations that exceeded the 8-hour ozone standard. The Lay Peak site was established in August of 2011, so there is insufficient data to report at this time.

There is one MSA located on the Western Slope. It is the Grand Junction MSA, which includes all of Mesa County. Per EPA monitoring requirements, this MSA falls in the 50,000 to 350,000 population range, and requires one O₃ monitor. The monitor at the Palisade Water Treatment Plant satisfies this requirement, as well as the highest concentration monitor requirement.

Table 9. Maximum O₃ Concentrations in the Western Slope Region

Site ID	Site Name	1st Eight-hour Max (ppm)	4th Eight-hour Max (ppm)	2010-2012 Design Value (ppm)
08 045 0012	Rifle ó Health	0.078	0.068	0.066
08 077 0020	Palisade Water Treatment	0.075	0.071	0.068
08 083 0006	Cortez	0.072	0.070	0.068

Southwest Region

There is a single O₃ monitor in the Southwest Region in Cortez. The first and fourth eight-hour maximum concentration in 2012 were 0.072 and 0.070 ppm respectively, and the 2010-2012 design value is 0.068.

The O₃ monitor in Cortez is:

08 083 0006 ó Cortez 106 W. North Street

Planned Changes in O₃ Monitoring

Planned changes for the 2013-2014 plan year include the review of sites in the Front Range for possible enhancement, and the possible installation of a new site in the Pueblo area, pending reviews of industry monitoring data. The monitor from the Arvada site was removed and subsequently installed at the CAMP site. The Near-Roadway O₃ monitor will be installed.

IV. Nitrogen Dioxide/Reactive Oxides of Nitrogen (NO₂/NO_y)

The APCD has monitored NO₂ at eight locations in Colorado in the past. All but two of these locations, Welby and CAMP, are no longer operating. Only the CAMP monitor has ever approached the annual average standard of 53 ppb. It recorded a 52 ppb yearly average in 1975, 1976, 1979, and in 1983. In the past 20 years the levels have been declining and in the past three years the levels have been reduced to less than one-half of the standard. In January 2010, the EPA set a new primary NAAQS that is in addition to the annual average standard. The new one-hour standard is set at a level of 100 ppb, and is based on ó the 3-year average of the 98th percentile of the yearly distribution of the one-hour daily maximum concentrationsí ö⁴. The secondary standard is the same as the primary standard for this pollutant.

The APCD began monitoring for NO_y at the NCore DMAS site in January 2011, which was moved to the La Casa site in January 2013. NO_y monitoring is a requirement for an NCore station, but there are no standards for NO_y. The EPA has established requirements for an NO₂ monitoring network that will include monitors at locations where maximum NO₂ concentrations are expected to occur, including within 50 meters of major roadways, as well as monitors sited to measure the area-wide NO₂ concentrations that occur more broadly across communities. Per the requirements, at least one monitor must be located near a major road in any urban area with a population greater than or equal to 500,000 people. A second monitor is required near another major road in areas with either: (1) population greater than or equal to 2.5 million people, or (2) one or more road segments with an annual average daily traffic count greater than or equal to

⁴ óPrimary National Ambient Air Quality Standards for Nitrogen Dioxide; Final Rule,ö 75 Federal Register 26 (9 February 2010), pp. 6474 ó 6536.

250,000 vehicles. In addition to the near roadway monitoring, there must be one monitoring station in each CBSA with a population of 1 million or more persons to monitor a location of expected highest NO₂ concentrations representing the neighborhood or larger spatial scales. The CAMP and Welby sites satisfy this requirement.

Denver Metro/Northern Front Range Counties

In 2012, the annual NO₂ concentration at the Welby site was 18.90 ppb. For 2010 through 2012 the one-hour standard design value is 64 ppb, which is well below the 100 ppb NAAQS. The same value for the CAMP site is 89 ppb. The 2012 annual average at CAMP was 24.52 ppb, which is also well below the standard. There are currently no reportable NO₂ values available for the DMAS site. DMAS was moved to the La Casa site in January of 2013.

The NO₂/NO_y monitors in this area are:

08 001 3001 Welby, 3174 E. 78th Avenue
08 031 0002 CAMP, 2105 Broadway
08 031 0026 La Casa, 4587 Navajo Street

Planned Changes in NO₂/NO_y Monitoring

The only change planned is the addition of a near roadway monitoring site in 2013. Per 40 CFR Part 58, Revision to Ambient Nitrogen Dioxide Monitoring Requirements, Final Rule,

“On February 9, 2010, the EPA promulgated minimum monitoring requirements for the NO₂ monitoring network in support of the revised NO₂ NAAQS (75 FR 6474). The NO₂ NAAQS was revised to include a 1-hour standard with a 98th percentile form averaged over three years and a level of 100 ppb, reflecting the maximum allowable NO₂ concentration anywhere in an area, while retaining the annual standard of 53 ppb.

As part of the NAAQS rulemaking, the EPA promulgated revisions to requirements for minimum numbers of ambient NO₂ monitors that included new monitoring near major roads in larger urban areas. In addition, those monitoring revisions included requirements to characterize NO₂ concentrations representative of wider spatial scales in larger urban areas (area-wide monitors), and monitors intended to characterize NO₂ exposures of susceptible and vulnerable populations.

í The first tier of the ambient NO₂ monitoring network requires near-road monitoring. There must be one microscale near-road NO₂ monitoring station in each CBSA with a population of 500,000 or more persons to monitor a location of expected maximum hourly concentrations sited near a major road.”

Near-roadway stations are also to be designed with a CO monitor, and have the capacity to expand the monitoring suite.

V. Sulfur Dioxide (SO₂)

The Air Pollution Control Division has monitored SO₂ at eight locations in Colorado in the past. Currently, there are four monitoring locations in operation. A new one-hour primary standard was finalized in June 2011. To attain that standard, the three-year average of the 99th percentile of the daily maximum one-hour average at each monitor within an area must not exceed 75 ppb. The secondary NAAQS is a three-hour average not to exceed 500 ppb more than once per year. SO₂ had never approached the level of any of the standards until an SO₂ analyzer

was added at Highway 24 in Colorado Springs, which has exceeded the standard in 2013.

SO₂ monitoring requirements include the need for calculating a Population Weighted Emissions Index (PWEI). This figure is calculated for each MSA by multiplying the population of the MSA by the SO₂ emissions for that MSA and dividing by 1 million. This PWEI value is then used to determine areas in need of SO₂ monitoring. A sum of the most recent emissions data by county (2008) give a total for SO₂ emissions of 15,235 tons per year for the Denver PMSA. The calculated PWEI for this region is 37,930 million persons-tons per year. This indicates the need for one SO₂ monitor in the Denver MSA according to the EPAs monitoring rules for SO₂.

Using the same calculation for the Colorado Springs MSA, the calculated PWEI is 8,207 million persons-tons per year. Because of the increase in population in Colorado Springs, there is a need for one SO₂ monitor in this MSA. The monitors listed in the sections below meet these needs.

Metropolitan Denver Counties

The mean calculated by the one-hour standard design value for the DMAS site does not satisfy summary criteria. The concentration values are listed in ppb in accordance with the EPA's data reporting rules for this pollutant. It should be noted here that the values listed for the DMAS site are only shown for comparative purposes, and are not of sufficient validity for a comparison to the standard, as the data do not span the entirety of 2012. Also, in late 2012, DMAS was moved to La Casa, which is not included in the table below because of insufficient data collection to date.

Table 10. Maximum SO₂ Concentrations for the Denver Metro Region

Site ID	Site Name	Annual Avg. (ppb)	24-Hour Max (ppb)	One-Hour Max (ppb) ⁵
08 001 3001	Welby	0.88	5.0	40.0
08 031 0002	CAMP	2.01	10.3	43.3
08 031 0025	DMAS	1.53	7.5	31.8

Pikes Peak Region

In January of 2013 an SO₂ monitor was added to the Highway 24 monitoring station in Colorado Springs. While insufficient data has been submitted to the EPA to calculate NAAQS-comparable statistics, data collected at Highway 24 are already above the NAAQS. Discussion of the SO₂ data will be available in subsequent annual data reports.

Planned Changes in SO₂ Monitoring

In 2013, there are no planned changes to the SO₂ monitoring network.

VI. PM₁₀

In 2012, the APCD operated 33 PM₁₀ monitors at 30 different locations. 27 of these sites use high volume instruments, six sites use low volume instruments, six sites have continuous monitors collocated with FRM monitors, three of which have continuous dichot particulate monitors, which also monitor PM_{2.5} and PM₁₀. There are two sites with collocated high volume

⁵ The one-hour SO₂ design value is calculated by taking the three year average of the 99th percentile of the daily maximum one-hour averages.

samplers (CAMP and Crested Butte), and one site with a collocated low volume sampler (Grand Junction - Powell). The PM₁₀ NAAQS is a 24-hour average of 150 µg/m³ not to be exceeded more than an average of 1.0 times in a three year period. This average is also based on the monitoring frequency and the percent of valid data collected at a site.⁶

Denver Metro/Northern Front Range Counties

Motor vehicle activity is a source of particulate matter. Several industries and manufacturing processes also contribute to particulate levels. These industries include breweries, power plants, cement plants, mining, electronics, film manufacturing facilities, and rock quarries. There are also a variety of agricultural sources of PM₁₀ including feed lots, grazing, tilling, and other agricultural activities. This region is also an area of significant oil and gas development.

Neither the monitor at the Fort Collins ó CSU site nor the Greeley monitor had any PM₁₀ exceedances in 2012. The maximum concentrations recorded were 104 µg/m³ at Fort Collins ó CSU, and 102 µg/m³ at Greeley.

The PM₁₀ monitoring sites in this area are:

- 08 069 0009 Fort Collins-CSU, 251 Edison Drive
- 08 123 0006 Greeley-Hospital, 1516 Hospital Road

There were no PM₁₀ exceedances by any of the monitors in the Denver Metro area. The table below lists the maximum concentrations recorded at each of the sites in 2012. Site ID numbers that include an asterisk (*) indicate a low volume sampler, while no asterisk indicates high volume samplers.

Table 11. Maximum PM₁₀ Concentrations for the Denver Metro Area

Site ID	Site Name	Max. 24-Hour Concentration (µg/m ³)
08 001 0006*	Commerce City	113
08 001 3001	Welby	91
08 013 0003	Longmont-Municipal	55
08 013 0012	Boulder Chamber Bldg.	72
08 031 0002	CAMP	115
08 031 0017	Denver Visitor Center	87
08 031 0025*	DMAS	93

Eastern High Plains Region

The sources of PM₁₀ in the eastern plains are mainly agricultural with some mobile sources near cities and towns. Agricultural sources of PM₁₀ include feed lots, grazing, tilling, and other dry land agricultural activities. There is also a coal fired power plant in Lamar and a flour mill that contribute to PM₁₀ in Lamar.

There were three PM₁₀ exceedances at the Lamar Power Plant site, and two at the Lamar Municipal site in 2012. The highest concentration recorded at the Lamar Power Plant site was

⁶ Appendix K to Part 50 ó Interpretation of the National Ambient Air Quality Standards for Particulate Matter, 40 Federal Regulations 50 (1 July 2011), pp. 80-83.

220 $\mu\text{g}/\text{m}^3$, while that at the Lamar Municipal site was 242 $\mu\text{g}/\text{m}^3$. Both samplers are high volume samplers.

The PM₁₀ monitoring sites in this area are:

- 08 099 0001 Lamar Power Plant, 100 N. 2nd St.
- 08 099 0002 Lamar Municipal, 104 E. Parmenter Street

Pikes Peak Region

There were no exceedances of the PM₁₀ NAAQS in this region. The highest concentration recorded at the Colorado College site was 64 $\mu\text{g}/\text{m}^3$. This monitor is a low-volume sampler.

The PM₁₀ monitoring site in this area is:

- 08 041 0017 Colorado College, 130 West Cache la Poudre

San Luis Valley Region

There were nine exceedances in this region in 2012, four at Alamosa ó Adams State College, and five at Alamosa Municipal. The maximum concentration at Alamosa ó Adams State College was 389 $\mu\text{g}/\text{m}^3$ and the maximum concentration at Alamosa Municipal was 239 $\mu\text{g}/\text{m}^3$. Both monitors are high volume samplers. The high values seen at these sites are under consideration as exceptional events by the department, and are most likely due to strong wind gusts.

The PM₁₀ monitoring sites in this area are:

- 08 003 0001 Alamosa-Adams State College, 208 Edgemont Boulevard
- 08 003 0003 Alamosa-Municipal, 425 4th Street

South Central Region

There were no exceedances in this region in 2012. The maximum concentration found at Pueblo ó Fountain School was 62 $\mu\text{g}/\text{m}^3$.

The PM₁₀ monitoring site in this area is:

- 08 101 0015 Pueblo ó Fountain School, 925 North Glendale Avenue

Central Mountain Region

There was one PM₁₀ exceedance in the Central Mountain region at the Mount Crested Butte site. The table below lists the maximum concentrations recorded at each of the sites in 2012.

Table 12. Maximum PM₁₀ Concentrations for Mountain Counties

Site ID	Site Name	Max. 24-Hour Concentration ($\mu\text{g}/\text{m}^3$)
08 043 0003	Cañon City ó City Hall	61
08 051 0004	Crested Butte	50
08 051 0007	Mount Crested Butte	171
08 097 0006	Aspen ó Library	87
08 107 0003	Steamboat Springs	124
08 117 0002	Breckenridge	82

Southwestern Region

There were no exceedances of the PM₁₀ standard in 2012. The maximum concentration at Pagosa Springs was 147 µg/m³, and the maximum concentration at Durango ó River City Hall was 80 µg/m³.

The PM₁₀ monitoring sites in this area are:

08 007 0001 Pagosa Springs, 309 Lewis Street

08 067 0004 Durango ó River City Hall, 1235 Camino Del Rio

Western Slope Region

There was one PM₁₀ exceedance in the Western Slope region in 2012 at the Powell site. The table below lists the maximum concentrations recorded at the monitoring sites in this area. Site ID numbers that include a star (*) indicate a low volume sampler, while no star indicates high volume samplers. Sources of PM₁₀ in the Western region include motor vehicle activity, industries and manufacturing processes, which include lumber processing, mining, gravel pits, and rock quarries. There are also a variety of agricultural sources of PM₁₀ including feed lots, grazing, tilling, and other dry land agricultural activities.

Table 13. Maximum PM₁₀ Concentrations in Western Slope Counties

Site ID	Site Name	Max. 24-Hour Concentration (µg/m ³)
08 029 0004	Delta	65
08 045 0005	Parachute	65
08 045 0007	Rifle ó Henry Building	50
08 048 0018	Carbondale	40
08 077 0017*	Grand Junction ó Powell	176
08 077 0019	Clifton	74
08 113 0004	Telluride	80

Planned Changes in PM₁₀ Monitoring

The Carbondale site was added in September of 2012. The Breckenridge site was closed in December of 2012. The Lamar Power Plant station was closed in December of 2012.

VII. PM_{2.5}

PM_{2.5} concentration values are reported in four different groups of readings by the APCD. Data from instruments sampling according to the Federal Reference Method (FRM) are reported with the 88101 parameter code, data from continuous samplers that reasonably compare to the FRM are reported with the 88500 parameter code, data from continuous samplers that don't compare reasonably to the FRM are reported with the 88501 parameter code, and speciation data is reported with the 88502 parameter code. There are 17 FRM instruments at 15 sites, of the 15 sites eight are collocated with a continuous instrument and two are collocated with an FRM; one site (Rifle) has continuous PM_{2.5} but no FRM. Speciation samples are taken at three sites, all collocated with an FRM.

The primary PM_{2.5} NAAQS are 15.0 µg/m³ annually (averaged over a three year period) and 35 µg/m³ in a 24-hour period. The 24-hour standard was lowered on September 20, 2006.

Denver Metro/Northern Front Range Region

Motor vehicle activity is a source of particulate matter. There are also several small industries and manufacturing processes that may contribute to particulate levels. These industries include breweries, power plants, cement plants, mining, electronics and film manufacturing facilities and rock quarries. Weld County is also an area of significant oil and gas development.

The PM_{2.5} sites listed below with manual method FRM sites in the APCD network as of December 31, 2011, are suitable for comparisons to the annual PM_{2.5} NAAQS.

There were two PM_{2.5} exceedances in 2012 in the Larimer and Weld County area, one each at Greeley ó Hospital and Platteville. The table below lists the maximum PM_{2.5} concentrations recorded at each of the sites in Larimer and Weld Counties, as well as the weighted annual average values. The monitoring data listed below are all from FRM monitors. The annual average value for all three sites does not meet EPA statistical summary criteria because of insufficient data.

Table 14. Maximum PM_{2.5} Concentrations in Northern Front Range Counties

Site ID	Site Name	Max. 24-Hour Concentration (µg/m ³)	Annual Average Value (µg/m ³)
08 069 0009	Fort Collins ó CSU	30.5	7.31
08 123 0006	Greeley ó Hospital	44.3	7.90
08 123 0008	Platteville	48.0	7.82

There were two exceedances of the PM_{2.5} standard in the Denver Metro area in 2012, one each at the Longmont and CAMP sites. The table below lists the maximum PM_{2.5} concentrations recorded in 2012 for each site in the Denver Metro area. All the monitoring data listed in the table are from FRM monitors. The annual average value for all three sites does not meet EPA statistical summary criteria because of insufficient data.

Table 15. Maximum PM_{2.5} Concentrations in the Denver Metro Area

Site ID	Site Name	Max. 24-Hour Concentration (µg/m ³)	Annual Average Value (µg/m ³)
08 001 0006	Commerce City	33.7	8.59
08 005 0005	Arapahoe Community College	34.7	6.76
08 013 0003	Longmont ó Municipal	35.7	7.20
08 013 0012	Boulder Chamber of Commerce	28.5	6.17
08 031 0002	CAMP	32.3	7.95
08 031 0023	Swansea	33.5	7.85
08 031 0025	DMAS	35.2	8.18
08 031 0026	La Casa	33.9	6.94
08 035 0004	Chatfield Reservoir	32.7	6.05

The following sites are micro-scale sites and are EPA approved. Based on ongoing data collection and analysis CAMP can be shown to be analogous with sites ranging from Commerce City to DMAS and highly correlated with sites within the Platte Valley from Greeley and Platteville in the north to Chatfield in the south, and is approved as neighborhood scale.

08 031 0002-1 Denver CAMP, 2105 Broadway

08 031 0026-1 La Casa, 4587 Navajo Street
08 035 0004-1 Chatfield Reservoir, 11500 N. Roxborough Park Road

The Boulder Chamber of Commerce building site is considered a middle scale site, but it has been approved by the EPA as representative of a neighborhood scale site. The Division performed a land use and gridded emissions inventory analysis to demonstrate to EPA that the area surrounding the Boulder Chamber of Commerce building has many contiguous middle scale sites with similar emissions densities, meteorology and land uses.

Pikes Peak Region

There were no exceedances of the PM_{2.5} standard in 2012 in the Pikes Peak Region. The maximum 24-hour concentration at the Colorado College site was 18.9 µg/m³, and the annual average was 6.91 µg/m³, though the average does not satisfy EPA statistical summary criteria because of insufficient data.

The PM_{2.5} monitoring site in this area is:

08 041 0017 Colorado College, 130 West Cache la Poudre

South Central Region

There were no exceedances of the PM_{2.5} NAAQS standard in the South Central region in 2012. The maximum concentration at the Pueblo ó Fountain School was 25.7 µg/m³ and the annual average was 6.64 µg/m³ though the average does not satisfy summary criteria.

The PM_{2.5} monitoring site in this area is:

08 101 0015 Pueblo ó Fountain School, 925 North Glendale Avenue

Southwest Region

There were no exceedances of the PM_{2.5} standard in the Southwest region in 2012. The maximum 24-hour concentration at Cortez was 13.4 µg/m³, and the annual average was 5.65µg/m³.

The PM_{2.5} monitoring site in this area is:

08 083 0006 Cortez, 106 West North Street

Western Slope Region

There were no PM_{2.5} exceedances recorded in the Western Slope region. The maximum 24-hour concentration at Powell 28.3, and the annual average was 7.34, though the average did not satisfy summary criteria.

The PM_{2.5} monitoring site in this area is:

08 077 0017 Grand Junction ó Powell, 650 South Avenue

PM_{2.5}, TEOM, and BAM Continuous Monitors not intended for NAAQS Comparison

All Federal Reference Method (FRM) monitors in the Colorado PM_{2.5} network are compared to the NAAQS. The FRM monitors are all filter based 24-hour composite samples. The Division also employs a variety of continuous particulate monitors for forecasting and advising

the public of air quality alerts.

The APCD does not collect or report PM_{2.5} FEM data.

These monitors are used to gather near real-time data that are mainly used to inform and alert the public when concentrations are elevated and for short term forecasting of air pollution by the Division. The TEOM 1400ab with 8500 FDMS and the TEOM 1405-DF are federally equivalent monitors, however frequent monitor problems and Division concerns regarding equivalency designation have led the Division not to use these monitors for regulatory purposes. The following sites have continuous PM_{2.5} monitors that are not intended for comparison with the NAAQS:

08 001 0006-3 Commerce City, 7101 Birch Street
08 013 0003-3 Longmont-Municipal, 350 Kimbark Street
08 013 1001-3 Boulder CU/Athens, 2102 Athens St.
08 031 0002-3 CAMP, 2105 Broadway
08 031 0013-3 NJH-E, 14th Avenue and Albion Street
08 031 0026-3 La Casa, 4587 Navajo Street
08 035 0004-3 Chatfield Reservoir, 11500 N. Roxborough Park Road
08 041 0017-3 Colorado College, 130 W. Cache la Poudre
08 045 0007-3 Rifle ó Henry Building, 144 3rd Street
08 069 0009-3 Fort Collins-CSU, 251 Edison Drive
08 077 0017-3 Grand Junction-Powell, 650 South Avenue
08 123 0006-3 Greeley-Hospital, 1516 Hospital Road

Community Monitoring Zones

Community monitoring zones are an additional method of defining an area for comparison with the PM_{2.5} NAAQS where data from two or more monitoring sites are averaged together for comparison with the standard. Currently, the APCD does not have any areas where this technique is used.

The definition of community monitoring zone (CMZ) in 40 CFR Part 58.1 is as follows:
Community monitoring zone (CMZ) means an optional averaging area with established, well defined boundaries, such as county or census block, within a Monitoring Planning Area (MPA) that has relatively uniform concentrations of annual PM_{2.5} as defined by appendix N of part 50 of this chapter. Two or more community oriented SLAMS monitors within a CMZ that meet certain requirements as set forth in appendix N of part 50 of this chapter may be averaged for making comparisons to the annual PM_{2.5} NAAQS. The CMZ is an optional technique that averages the PM_{2.5} 24-hour concentrations from two or more monitors located in the same community.

If the PM_{2.5} monitoring network is changed by the creation/change of a CMZ or changing the location of a violating monitor, then the APCD will ask EPA Region VIII for approval via the current network modification process, and then notify the appropriate governments of affected communities. The APCD will also provide the proposed changes to the affected communities and concerned citizens on our web site. A public comment period will be open for thirty days prior to the APCD selecting a new site.

Planned Changes in PM_{2.5} Monitoring

A possible relocation of the Boulder CU/Athens TEOM site due to new construction near the site is being investigated. The Elbert background site was unexpectedly terminated due to a change in property ownership. The new owner does not want monitoring on his property. A replacement new PM_{2.5} background site is currently being established in Douglas County in Castlewood Canyon State Park.

VIII. TSP/Pb

In December 2006 Total Suspended Particulate (TSP) monitoring by the APCD was reduced from six monitoring sites to a single site at DMAS. In 2012 when DMAS was moved to La Casa, TSP sampling for lead was discontinued at the Division's NCORE site and PM₁₀ sampling for lead began. In the past three years the maximum quarterly lead concentration has generally been less than a tenth of the current standard. In addition, Colorado has not recorded an exceedance of the previous lead standard (1.5 µg/m³ averaged over a calendar quarter) since the first quarter of 1980. The new lead standard, which is 0.15 µg/m³ averaged over any three rolling consecutive three-month periods, has not been exceeded using data from 2010 - 2012. The new lead standard became effective on December 15, 2008.

With the revision of the standard in mind, the APCD reviewed its stationary sources database for all point sources that emit lead in Colorado. There were 32 lead sources identified in a database retrieval conducted in November, 2008. None of the sources emit greater than one ton(s) per year (TPY) of total lead, which includes elemental lead and all lead compounds. Thus, no new lead monitors are required at any point source facility in Colorado.

The U.S. EPA calculated emissions for lead at general aviation airports due to piston engine aircraft, which continue to use leaded aviation fuel. According to EPA, Centennial Airport had the second highest lead emissions of any airport in the country at 1.18 TPY using data from the 2005 National Emissions Inventory (NEI). Since this emissions estimate exceeded the threshold for lead, the Division has located a lead sampling site at the Centennial Airport. This monitoring site was installed in March 2011 and the first sample was collected on April 3, 2011. Subsequently, EPA has updated the lead emissions inventory for airports using 2008 NEI data. They found that Centennial Airport has dropped to the sixth highest lead emissions of any airport in the country at 1.08 TPY. The decrease in general aviation activity is likely due to the economic recession.

Also, the EPA has lowered the lead emissions threshold from 1.0 TPY to 0.5 TPY. Colorado still has no lead point sources greater than 0.5 TPY. However, the APCD may need to monitor lead at three additional airports, including Pueblo Memorial (0.55 TPY, ranked 47th), Greeley-Weld County (0.54 TPY, ranked 51st), and Rocky Mountain Metropolitan Airport in Jefferson County (0.51 TPY, ranked 59th). This new monitoring is on hold pending an airport lead study being conducted by EPA.

Denver Metro/Front Range Region

There are various industries and manufacturing processes located in the area, but only a very few emit significant amounts of lead into the air.

There were no exceedances of the lead NAAQS in 2012. The maximum TSP value recorded by the primary DMAS TSP monitor was 169 µg/m³. The maximum lead value recorded by the DMAS primary lead monitor was 0.014 µg/m³. The maximum TSP value recorded by the

Centennial TSP monitor was 69 $\mu\text{g}/\text{m}^3$. The maximum lead value recorded by the Centennial lead monitor was 0.078 $\mu\text{g}/\text{m}^3$.

The TSP/PM₁₀/Lead monitoring sites in this area include:

08 005 0007 Centennial Airport, near 7800 S. Peoria Street
08 031 0026 La Casa, 4587 Navajo Street

Planned Changes in TSP and Lead Monitoring

There are no planned changes to the network in 2013.

IX. METEOROLOGICAL MEASUREMENTS

Meteorological measurements taken by the APCD consist of Wind Speed, Wind Direction, Temperature, and Humidity. The wind speed and direction measurements are made as both scalar and vector averages. A final parameter that is recorded at the meteorological sites is the standard deviation of horizontal wind direction. This is a calculation, not a direct measurement, of the variation of wind direction over time.

The meteorological monitoring sites are:

08 001 0006 Commerce City, 7101 Birch Street
08 001 3001 Welby, 3174 E. 78th Avenue
08 005 0002 Highland Reservoir, 8100 S. University Boulevard
08 005 0006 Aurora-East, 36001 Quincy Avenue
08 031 0002 Denver-CAMP, 2105 Broadway
08 031 0026 La Casa, 4587 Navajo Street
08 035 0004 Chatfield State Park, 11500 N. Roxborough Park Road
08 045 0005 Parachute 6 Elem. School, 100 E. 2nd Street
08 045 0012 Rifle Health Dept., 195 W. 14th Street
08 059 0002 Arvada, 9101 W. 57th Avenue
08 059 0005 Welch, 12400 W. Hwy 285
08 059 0006 Rocky Flats-N, 16600 W. Hwy 128
08 059 0013 Aspen Park, 26137 Conifer Road
08 069 1004 Fort Collins-Mason, 708 S. Mason Street
08 077 0018 Grand Junction-Pitkin, 645 ¼ Pitkin Avenue
08 077 0020 Palisade Water Treatment, Hwy 141 and D Road
08 081 0002 Lay Peak, 17820 County Road 17
08 099 0003 Lamar Port of Entry, 7100 US Hwy 50
08 123 0009 Greeley 6 Weld County Tower, 3101 35th Avenue

Planned Changes in Meteorological Monitoring

Meteorological sensors will be installed at the near roadway site.

X. QUALITY ASSURANCE

Continuous Monitors

The APCD staff performs three types of gaseous analyzer performance checks: quality control checks, accuracy audits, and calibrations. These audits/calibrations challenge the analyzer with pollutant gases of known concentration within the range of the analyzer. The APCD Quality Assurance staff conducts accuracy audits on all of the instruments at least twice

per year. The APCD field staff conducts quality control checks nominally once every two weeks, and calibrations once every calendar quarter. The details and minimum standards for this program are set out in the Code of Federal Regulations (Part 58 Ambient Air Quality Surveillance). A complete description of the procedures and the results are available from the APCD.

Particulate Monitors

The audit checks performed on the particulate monitors consist of calibrated flow checks. The precision checks that are made on particulate monitors consist of collocated samplers that operate side-by-side and collect a sample from both samplers once every sixth day. EPA requires a minimum of 15% of the FRM network to be collocated. In 2012 Colorado maintained 14 FRM monitoring sites, two of which have collocated instruments (CAMP, Commerce City). The EPA also has a performance evaluation program (PEP), which checks the national network for bias by having a private contractor set up an independent FRM sampler next to the Division's PM_{2.5} sampler (between 1 to 4 m apart). Once each calendar quarter a collocated sample from 25 % of the network is sent to an independent laboratory (the EPA's Region X Lab) to compare results and check for bias. All of the samples are then compared to ensure that the data are within federal limits and meet pre-established data quality objectives.

Once each calendar quarter a collocated sample is sent to the EPA Region 9 lab as part of the lead performance evaluation program (Pb-PEP), which checks the national network for bias. The samples are then compared to ensure that the data are within federal limits and meet pre-established data quality objectives.

Meteorological Monitors

Annual calibrations and audit checks are performed on the meteorological equipment to determine proper alignment and operation of the sensors. The details and minimum standards for this program are set out in the Code of Federal Regulations (Part 58 Ambient Air Quality Surveillance). A complete description of the procedures and the results are available from the APCD.

XI. SUMMARY OF NETWORK CHANGES

In 2012, several network changes occurred, and in 2013 several more changes are planned. This section summarizes the completed and planned changes below.

Completed Changes

The following changes to CDPHE's monitoring network occurred during 2012.

- The NCore site was relocated from the DMAS location to the La Casa site. The site modification forms were available for public comment from 01/12/2012 to 02/13/2012, and are included in Appendix C.
- A SO₂ monitor was installed at the Highway 24 site in Colorado Springs and began collecting data on January 11, 2013, Appendix D.
- Meteorological equipment was added to the Weld County Tower site, Appendix D.
- The Carbondale site began collecting PM₁₀ data in September of 2012.
- The Carriage site was decommissioned at the end of 2012, Appendix D.

- The Swansea site was decommissioned at the end of 2012.
- The Breckenridge site was decommissioned at the end of 2012.
- The Lamar Power Plant site was decommissioned at the end of 2012, Appendix C.

Planned Changes

The following changes to CDPHE's monitoring network are planned for 2012-2013.

- A near-roadway NO₂ monitor, as well as a trace level CO monitor will be installed by June 1, 2013.
- A second near-roadway site is being considered to be in place by 2015.
- A new background PM_{2.5} site will be installed at Castlewood Canyon State Park by the end of 2013.
- The possible installation of a new ozone site in the Pueblo area will be investigated.
- A new location for South Boulder Creek will be investigated since vegetation in the area is changing siting criteria conditions.
- Waivers may be applied for siting criteria exceptions for Welby and CAMP.
- Rist Canyon will be decommissioned by June of 2013, Appendix F.
- Boulder CU/Athens TEOM site will be considered for removal.
- Lead sampling at Centennial Airport will be considered for removal.

Appendix A - Monitoring Site Descriptions

This appendix includes site information for all sites containing continuous gaseous monitors, meteorological monitors, or particulate monitors. The data is presented first in a tabular format, and is then followed by site descriptions. It is in the order of AQS ID number.

Table 16. Monitoring Site Locations and Instruments

<i>AQS #</i>	<i>Site Name</i>	<i>CO</i>	<i>O₃</i>	<i>NO</i>	<i>NO₂/NO_y</i>	<i>SO₂</i>	<i>PM₁₀</i>	<i>PM_{2.5}</i>	<i>TSP/Pb</i>	<i>Met</i>

Alsup Elementary School - Commerce City, 7101 Birch Street (08 001 0006):

The Alsup Elementary School - Commerce City site is in a predominantly residential area with a large commercial and industrial district. It is located north of the Denver Central Business District (CBD) near the Platte River Valley, downstream from the Denver urban air mass. There are two schools in addition to the Alsup Elementary School in the immediate vicinity, a middle school to the north, and a high school to the southeast. There is a large industrial area to the south and east, and gravel pits about a kilometer to the west and northwest.

PM₁₀ monitoring began in January 2001 and continues today. PM_{2.5} monitoring began in January 2001 and continues today. There are a collocated set of monitors, along with a continuous monitor, a trends speciation monitor, and a PM_{2.5} carbon monitor all in operation.

Meteorological monitoring began in June of 2003.

Welby, 3174 E. 78th Avenue (08 001 3001):

Located 8 miles north-northeast of the Denver Central Business District (CBD) on the bank of the South Platte River, this site is ideally located to measure nighttime drainage of the air mass from the Denver metropolitan area and the thermally driven, daytime upriver flows. The monitoring shows that high CO levels are associated with winds from the south-southwest. While this is the direction of five of the six major sources in the area, it is also the direction of the primary drainage winds along the South Platte River. This monitor is in the SLAMS network, and is population oriented for a neighborhood scale.

CO monitoring began in 1973 and continued through the spring of 1980. Monitoring was stopped from the spring of 1980 until October 1986 when it began again as a special study. Welby has not recorded an exceedance of either the one-hour or eight-hour CO standard since January 1988. In the last few

years, its primary value has been as an indicator of changes in the air quality index (AQI).

O₃ monitoring began at Welby in July of 1973. The Welby monitor has not recorded an exceedance of the old one-hour O₃ standard since 1998. However, the trend in the 3-year average of the 4th maximum eight-hour average has been increasing since 2002.

The Welby NO₂ monitor began operation in July 1976. The site's location provides an indication of possible exceedance events before they hit the Denver-Metro area. The site serves as a good drainage location, but it may be a target for deletion or relocation farther down the South Platte River Valley from Denver.

The Welby SO₂ monitor began operation in July of 1973.

PM₁₀ monitoring began at Welby in June and July of 1990. The continuous monitor began operation in June, while the high volume monitor began operation in July.

Meteorological monitoring began in January of 1975.

Alamosa – Adams State College, 208 Edgemont Boulevard (08 003 0001):

The Alamosa 6 Adams State College site is located on the science building of Adams State College in a principally residential area. The only significant traffic is on US 160 through the center of town. The site is adjacent to this highway but far enough away to reduce direct impacts on the PM₁₀ levels. Meteorological data are not available from the area. The city has a population of 8,780 (2010 Census data). This is an increase of 10.3% from the 2000 census. The major particulate source is wind-blown dust. This site began operation in 1973 as a TSP monitor and was changed to a PM₁₀ monitor in June 1990. This is a population oriented neighborhood scale SLAMS monitor that is on a daily sampling schedule.

Alamosa - Municipal, 425 4th Street (08 003 0003):

The Alamosa 425 4th Street was started in May 2002. The site was established closer to the center of the city to be more representative of the population exposure in the area. This is a population oriented neighborhood scale SLAMS monitor that is on a daily sample schedule.

Highland Reservoir, 8100 S. University Boulevard (08 005 0002):

The Highlands site began operation in June of 1978. It was intended to be a background location. However, with urban growth and the construction of C-470, it has become a long-term trend site that monitors changes in the air quality of the area. It is currently believed to be near the southern edge of the high urban O₃ concentrations although it may not be in the area of maximum concentrations. This is a population oriented neighborhood scale SLAMS monitor.

Meteorological monitoring began in July of 1978.

In September of 2010 the site and meteorological tower were relocated to the east by approximately 30 meters to allow for the construction of an emergency generator system. This emergency generator system is located approximately 20 meters northwest of the new site location.

Arapahoe Community College (ACC), 6190 S. Santa Fe Drive (08 005 0005):

The ACC site is located in south suburban metropolitan Denver. It is located on the south side of the Arapahoe Community College in a distant parking lot. The site is near the bottom of the Platte River Valley along Santa Fe Drive (Hwy. 85) in the city of Littleton. It is also near the city of Englewood. There is a large residential area located to the east across the railroad and Light Rail tracks. The PM_{2.5} monitor is located on a mobile shelter in the rarely used South parking lot. Located at 6190 S. Santa Fe

Drive, this small trailer is close to the Platte River and the monitor has excellent 360⁰ exposure. Based on the topography and meteorology of the area ACC is in an area where PM_{2.5} emissions may collect. This location may capture high concentrations during periods of upslope flow and temperature inversion in the valley. However, since it is further south in a more sparsely populated area, the concentrations are usually not as high as other Denver locations.

Winds are predominately out of the south-southwest and south, with secondary winds out of the north and north-northeast (upslope). Observed distances and traffic estimates easily fall into the neighborhood scale in accordance with federal guidelines found in the 40 CFR, Part 58, Appendix D. The site meets all other neighborhood scale criteria, making the monitor a population oriented neighborhood scale SLAMS monitor on a 1 in 3 day sample schedule.

Aurora – East, 36001 Quincy Ave (08 005 0006):

The Aurora East site began operation in June 2009. It is intended to act as a regional site and an aid in the determination of the easternmost extent of the high urban O₃ concentrations. It is located along the eastern edge of the former Lowry bombing range, on a flat, grassy plains area. This site is currently outside of the rapid urban growth area taking place around Aurora Reservoir. This was a special projects monitor (SPM) for a regional scale, and became a SLAMS in 2013.

Centennial Airport, 7800 S. Peoria Street (08 005 0007):

The Centennial Airport site was established in April of 2011 in response to the improved lead standards from the EPA. The lead concentrations found in this monitor are well below the improved standards.

Pagosa Springs School, 309 Lewis Street (08 007 0001):

The Pagosa Springs School site was located on the roof of the Town Hall from April 24, 2000 through May 2001. When the Town Hall building was planned to be demolished, the PM₁₀ monitor was relocated to the Pagosa Springs Middle School and the first sample was collected on June 7, 2001.

The Pagosa Springs School site is located next to Highway 160 near the center of town. Pagosa Springs is a small town spread over a large area. The San Juan River runs through the south side of town. The town sits in a small bowl like setting with hills all around. A small commercial strip area along Highway 160 and single-family homes surrounds this location. It is representative of residential neighborhood exposure. Pagosa Springs was a PM₁₀ nonattainment area and a SIP was implemented for this area. PM₁₀ concentrations were exceeded a few times in the late 1990s.

Winds for this area predominantly blow from the north, with secondary winds from the north-northwest and the south. The predominant wind directions closely follow the valley topography in this rugged terrain. McCabe Creek, which is very near the meteorological station that was on the Town Hall building, runs north-south through this area. However, the highest wind gusts come from the west and southwest during regional dust storms. This is a population oriented neighborhood scale SLAMS monitor on a daily sampling schedule.

Longmont – Municipal Bldg., 350 Kimbark Street (08 013 0003):

The town of Longmont is a growing, medium sized Front Range community. Longmont is located between the Denver/Boulder Metro-area and Fort Collins. Longmont is both suburban and rural in nature. The town of Longmont is located approximately 30 miles north of Denver along the St. Vrain Creek and is about six miles east of the foothills. Longmont is partly a bedroom community for the Denver-Boulder area. The elevation is 4978 feet. The Front Range peaks rise to an elevation of 14,000 feet just to the west of Longmont. In general, the area experiences low relative humidity, light precipitation and abundant sunshine.

The station began operations in 1985 with the installation of PM₁₀ followed by PM_{2.5} monitors in 1999. Longmont's predominant wind direction is from the north through the west due to winds draining from the St. Vrain Creek Canyon. The PM₁₀ site is near the center of the city near both commercial and residential areas. This location provides the best available monitoring for population exposure to particulate matter. The distance and traffic estimate for the controlling street easily falls into the neighborhood scale in accordance with federal guidelines found in 40 CFR, Part 58, and Appendix D. This is a population oriented neighborhood scale SLAMS monitor on a 1 in 6 day sample schedule.

South Boulder Creek, 1405½ S. Foothills Parkway (08 013 0011):

The city of Boulder is located about 30 miles to the northwest of Denver. The Boulder Foothills, South Boulder Creek site was established as a special-purpose O₃ monitor as a part of the "summer 1993 Denver O₃ Study." During that summer a one-hour level of 0.128 ppm was recorded on July 2, 1993. In 1994, the monitor was converted from an SPM to a seasonal SLAMS monitor. In 1995 it was converted to a year-round O₃ monitoring site when the instruments were moved into a new shelter.

This is a highest concentration oriented urban scale SLAMS monitor.

Boulder Chamber of Commerce, 2440 Pearl Street (08 013 0012):

The city of Boulder is located on the eastern edge of the Rocky Mountain foothills. Most of the city sits on rolling plains. The Boulder PM_{2.5} site is approximately 7,000 feet east of the base of the Front Range foothills and about 50 feet south of a small branch of Boulder Creek, the major creek that runs through Boulder.

PM₁₀ monitoring began at this site in December of 1994, while the PM_{2.5} monitoring did not begin until January of 1999.

The predominant wind direction at the Division's closest meteorological site (Rocky Flats "North") is from the west with secondary maximum frequencies from the west-northwest and west-southwest. The distance and traffic estimate for Pearl Street and Folsom Street falls into the middle scale, but the site has been justified to represent a neighborhood scale site in accordance with federal guidelines found in 40 CFR, Part 58 and Appendix D. This is a population oriented neighborhood scale SLAMS monitoring site on a 1 in 6 day sample schedule.

Boulder – CU - Athens, 2102 Athens Street (08 013 1001):

The Boulder - CU site is located at the edge of a low usage parking lot to the immediate north of the site and south of the University of Colorado football practice fields. This location provides a good neighborhood representation for particulates. The site began operation in November 2004, and may be removed in 2013 due to construction of a new covered air-filled dome covering the practice fields that obstructs air flow. The dome is erected each fall, and remains inflated until early spring. It is removed during the summer months.

Delta, 560 Dodge Street (08 029 0004):

Delta is a small agricultural community midway between Grand Junction and Montrose. The topography in and around Delta is relatively flat as it sits in the broad Uncompaghre River Valley surrounded by high mesas and mountains. Delta sits in a large bowl shaped basin that can effectively trap air pollution, especially during persistent temperature inversions.

The Delta County Health Department site was chosen because it is a one story building near the downtown area. The site began operation in August 1993, and is representative of the large basin with the potential for high PM₁₀ due to agricultural burning, automobile traffic, and the former Louisiana

Pacific wafer board plant. This is a population oriented neighborhood scale SLAMS monitor on a 1 in 3 day sample schedule.

CAMP, 2105 Broadway (08 031 0002):

The City and County of Denver is located approximately 30 miles east of the foothills of the Rocky Mountains. Denver sits in a basin, and the terrain of the city is characterized as gently rolling hills, with the Platte River running from southwest to northeast, just west of the downtown area. The CAMP site is located in downtown Denver.

CO monitoring began in February 1965 as a part of the Federal Continuous Air Monitoring Program. It was established as a maximum concentration (micro-scale), population-oriented monitor. The CAMP site measures the exposure of the people who work or reside in the central business district (CBD). Its location in a high traffic street canyon causes this site to record most of the high pollution episodes in the metro area. The street canyon effect at CAMP results in variable wind directions for high CO levels and as a result wind direction is less relevant to high concentrations than wind speed. Wind speeds less than 1 mph, especially up-valley, combined with temperature inversions trap the pollution in the area.

Sampling for all parameters at the site was discontinued from June of 1999 to July of 2000 for the construction of a new building.

The NO₂ monitor began operation in January 1973 at this location.

The SO₂ monitor began operation in January 1967.

O₃ monitoring began originally in 1972 and has been intermittently monitored through January 2008.

The O₃ monitor began operation in February 2012.

The PM₁₀ monitoring began in 1986 with the installation of collocated monitors, and was furthered by the addition of a continuous monitor in 1988.

The PM_{2.5} monitoring began in 1999 with a continuous and an FEM monitor, and was furthered by the addition of a collocated FEM monitor in 2001.

Meteorological monitoring began at this site in January of 1965.

NJH-E, 14th Avenue & Albion Street (08 031 0013):

This site is located three miles east of the Denver CBD, close to a very busy intersection (Colorado Boulevard and Colfax Avenue). The current site began operations in 1982. Two previous sites were located just west of the current location. The first operated for only a few months before it was moved to a new site in the corner of the laboratory building at the corner of Colorado Boulevard and Colfax Avenue. Data from this continuous TEOM monitor is not compared with the NAAQS. It is used for short term forecasting and public notifications. The monitor here is a population oriented middle scale special project monitor.

DESCI:

A visibility site was installed in Denver in late 1990 using a long-path transmissometer. Visibility in the downtown area is monitored using a receiver located near Cheesman Park at 1901 E. 13th Avenue, and a transmitter located on the roof of the Federal Building at 1929 Stout Street (Figure 15). Renovations at the Federal Building forced the transmissometer to temporarily move to 1255 19th Street in 2010, and quality control measurements showed no meaningful difference between old and new locations. This instrument directly measures light extinction, which is proportional to the ability of atmospheric particles and gases to attenuate image-forming light as it travels from an object to an observer. The

station also monitors relative humidity in order to resolve low visibility because of fog or rain.

Denver Visitor Center, 225 W. Colfax Avenue (08 031 0017):

The Denver Visitor Center site is located near the corner of Colfax Avenue and Tremont Street. It began operation on December 28, 1992. In 1993, this site along with the Denver CAMP and Gates monitors recorded the first exceedances of the 24-hour PM₁₀ standard in the Denver metropolitan area since 1987. The Visitor Center recorded a PM₁₀ level of 161 µg/m³ on January 14, 1993. Since then, high values have been observed but have been below the NAAQS of 150 µg/m³. In the past ten years, the 24-hour maximum levels have trended downward. This is a population oriented middle scale SLAMS monitor operating on a daily sample schedule.

La Casa, 4587 Navajo Street (08 031 0026):

The La Casa site was established in January of 2013 as a replacement for the Denver Municipal Animal Shelter (DMAS) site when a land use change forced the relocation of the site. The La Casa location has been established as the NCore site for the Denver Metropolitan area. In late 2012 the DMAS site was decommissioned and moved to La Casa in northwest Denver and includes a trace gas/precursor-level CO analyzer, and a NOy analyzer, in addition to the trace level SO₂, O₃, meteorology, and particulate monitors. La Casa has been certified in 2013 as an NCore compliant site by the EPA. The site represents a population oriented neighborhood scale monitoring area.

The trace level SO₂, CO, and NOy analyzers began operation in January 2013.

The meteorological monitoring began at La Casa in January 2013.

PM₁₀ monitoring began at La Casa in January 2013. Currently, there is a pair of collocated high volume samplers, and a Lo-Vol PM₁₀ on the shelter roof. These concurrent PM₁₀ measurements will be compared prior to removing the Hi-Vol PM₁₀ monitors. The Lo-vol PM₁₀ concentrations are more useful as they can be used with the PM_{2.5} measurements to calculate PM_{10-2.5} or coarse PM.

PM_{2.5} monitoring began at La Casa in January 2013 with an FRM monitor, a continuous TEOM/FDMS FEM instrument, a supplemental PM_{2.5} speciation monitor, and a carbon speciation monitor.

PM₁₀/lead (Pb-TSP) monitoring began in January 2013. Lead sampling at La Casa is accomplished via PM₁₀ filter sample collection and sampling for TSP, as practiced at DMAS, was discontinued.

Chatfield State Park, 11500 N. Roxborough Park Road (08 035 0004):

The Chatfield State Park location was established as the result of the 1993 Summer O₃ Study. The original permanent site was located at the campground office. This site was later relocated on the south side of Chatfield State Park at the park offices. This location was selected over the Corps of Engineers Visitor Center across the reservoir because it was more removed from the influence of traffic along C-470. Located in the South Platte River drainage, this location is well suited for monitoring southwesterly O₃ formation in the Denver metro area.

PM_{2.5} monitoring began at this site in 2004 with the installation of a continuous monitor, and was furthered by the addition of an FEM monitor in 2005.

Meteorological monitoring began in April of 2004.

Colorado Springs, USAFA Road 640 (08 041 0013):

The United States Air Force Academy site was installed as a replacement maximum concentration O₃ monitor for the Chestnut Street (08 041 0012) site. Modeling in the Colorado Springs area indicates that high O₃ concentrations should generally be found along either the Monument Creek drainage to the

north of the Colorado Springs central business district (CBD), or to a lesser extent along the Fountain Creek drainage to the west of the CBD. The decision was made to locate this site near the Monument Creek drainage, approximately 9 miles north of the CBD. This location is near the south entrance of the Academy but away from any roads. This is a population oriented urban scale SLAMS monitor.

Colorado Springs Hwy-24, 690 W. Highway 24 (08 041 0015):

The Highway 24 site is located just to the west of I-25 and just to the east of the intersection of U.S. Highway 24 and 8th Street, approximately 0.8 miles to the west of the Colorado Springs CBD. Commencing operation in November 1998, this site is a replacement for the Tejon Street (08 041 0004) CO monitor. The site is located in the Fountain Creek drainage and is in one of the busiest traffic areas of Colorado Springs. Additionally, traffic is prone to back-up along Highway 24 due to a traffic light at 8th Street. Thus, this site is well suited for the SLAMS network to monitor maximum concentrations of CO in the area both from automotive sources and also from nearby industry, which includes a power plant. It also provides a micro-scale setting for the Colorado Springs area, which has not been possible in the past.

In January of 2013 an SO₂ monitor was added to Highway 24 to meet monitoring criteria for an increased population found during the 2010 census.

Manitou Springs, 101 Banks Place (08 041 0016):

Manitou Springs is located 4 miles west of Colorado Springs. It was established because of concern that the high concentration urban O₃ area was traveling farther up the Fountain Creek drainage and the current monitoring network was not adequate. The Manitou Springs monitor began operations in April 2004. It is located in the foothills above Colorado Springs in the back of the city maintenance facility. It has not recorded any levels greater than the current standard. This is a population oriented neighborhood scale SLAMS monitor.

Colorado College, 130 W. Cache la Poudre Street (08 041 0017):

The Colorado College monitoring site was established in January, 2007 after the revised particulate regulations required that Colorado Springs needed a continuous PM_{2.5} monitor. The Division elected to collocate the new PM_{2.5} monitor with the corresponding filter based monitors from the RBD site at the Colorado College location, which included a FRM PM_{2.5} monitor and added a low volume FEM PM₁₀ monitor in November, 2007. The continuous monitor began operation in April of 2008.

The nearest representative meteorological site is located at the Colorado Springs Airport. Wind flows at the Colorado College site are affected by its proximity to Fountain Creek, so light drainage winds will follow the creek in a north/south direction. The three monitoring sites here are population oriented neighborhood scale monitors, two on the SLAMS network (PM₁₀ and PM_{2.5}) and one that is a special projects monitor (PM_{2.5} continuous).

Cañon City - City Hall, 128 Main Street (08 043 0003):

Cañon City is located 39 miles west of Pueblo. Particulate monitoring began on January 2, 1969 with the operation of a TSP monitor located on the roof of the courthouse building at 7th Avenue and Macon Street. The Macon Street site was relocated to the City Hall in October of 2004.

The Cañon City PM₁₀ site began operation in December 1987. On May 6, 1988, the Macon Street monitor recorded a PM₁₀ concentration of 172 µg/m³. This is the only exceedance of either the 24-hour or annual NAAQS since PM₁₀ monitoring was established at Cañon City. This is a population oriented neighborhood scale SLAMS monitor on a 1 in 6 day sample schedule.

Parachute – Elementary School, 100 E. 2nd Street (08 045 0005):

The Parachute site began operation in May 2000 with the installation of a PM₁₀ monitor at the high school. This is a population oriented neighborhood scale SLAMS monitor on a 1 in 3 day sample schedule.

Rifle - Henry Building, 144 3rd Street (08 045 0007):

The first Rifle site began monitoring for particulates in June 1985 and ended operation in May 1986. The next site began operation in December 1987 and continued until 2001. The levels at that site, with the exception of the March 31, 1999 high wind event, were always less than one half of both the annual and the 24-hour standards. The current location on the Henry Building began operation in May of 2005 with the installation of a PM₁₀ monitor as a part of the Garfield County study. There are now two population oriented neighborhood scale special project PM₁₀ monitoring sites: one on a 1 in 3 day sample schedule, and one that is continuous. There is also a continuous monitor measuring PM_{2.5} and PM₁₀, and meteorological monitors.

Rifle – Health Dept., 195 14th Ave (08 045 0012):

The Rifle Health site is located at the Garfield County Health Department building. The site is 1 kilometer to the north of the downtown area and next to the Garfield County fairgrounds. The site is uphill from the downtown area. A small residential area is to the north and a commercial area to the east. This site was established to measure O₃ in Rifle, which is the largest population center in the oil and gas impacted area of the Grand Valley. Monitoring commenced in June 2008. This is a SLAMS with a neighborhood scale.

Carbondale, 1493 County Road 106 (08 045 0018):

Carbondale is in the fairly narrow Roaring Fork valley between Aspen and Glenwood Springs. The Carbondale site is located just south of the confluence of the Crystal and Roaring Fork rivers and was established to monitor PM₁₀ in January of 2013. This is a population oriented neighborhood scale special project monitoring site.

Crested Butte, 603 6th Street (08 051 0004):

The Crested Butte PM₁₀ site began operation in June 1985. Crested Butte is a high mountain ski town. The monitor is at the east end of town near the highway and in the central business district. Any wood burning from the residential area to the west directly affects this location. The physical setting of the town, near the end of a steep mountain valley, makes wood burning, street sanding, and wintertime inversions a major concern. The town is attempting to regulate the number of wood burning appliances, since this is a major source of wintertime PM₁₀.

There are two population oriented neighborhood scale monitors here, one in the SLAMS network (1 in 3 day sample schedule) and one that is a continuous monitor.

Mt. Crested Butte Realty, 19 Emmons Road (08 051 0007):

Mount Crested Butte is located at an elevation of 8,940 feet (2,725 m) at the base of the Crested Butte Mountain Resort ski area. Mount Crested Butte is a unique location for high particulate matter concentrations because it is located on the side of a mountain (Crested Butte 12,162 ft. or 3,707 m), not in a bowl, valley, or other topographic feature that would normally trap air pollutants. There is not a representative meteorological station in or near Mt. Crested Butte.

The location for the Mt. Crested Butte site was selected because it had an existing PM₁₀ site that had several high PM₁₀ concentrations including five exceedances of the 24-hour standard in 1997 and one in

1998. Mt. Crested Butte also exceeded the PM₁₀ annual average standard in 2011. A CMB source apportionment from 10 PM₁₀ filters identified crustal material as the mostly likely source (91%) of PM₁₀. Carbon, which is most likely from residential wood smoke, made up 8% of the statistically composite sample and secondary species made up the remaining one percent. The Mt. Crested Butte site was also selected because it is an area representative of the residential impact of PM₁₀. This is a population oriented neighborhood scale SLAMS monitor on a daily sample schedule.

Arvada, 9101 57th Avenue (08 059 0002):

The city of Arvada is located 15 miles west-northwest of the Denver central business district (CBD). The Arvada site began operation before 1973. It is located to the northwest of the Denver CBD near the western end of the diurnal midday wind flow of the high concentration urban O₃ area. As a result, when conditions are proper for daylong O₃ production, this site has received some of the highest levels in the city. In the early and mid 1990s, these wind patterns caused Arvada to have the most exceedances in the metro area. In the 5-Year Network Assessment Plan the Arvada site was deemed to be redundant. The last valid O₃ sample was taken 12/31/2011, and the instrument was removed shortly after that.

Meteorological monitoring began in 1975 and continues today.

Welch, 12400 W. Highway 285 (08 059 0005):

The Division conducted a short-term O₃ study on the grounds of Chatfield High School from June 14, 1989 until September 28, 1989. The Chatfield High School location was chosen because it sits on a ridge southwest of the Denver CBD. Wind pattern studies showed a potential for elevated O₃ levels in the area on mid to late afternoon summer days. There were no exceedances of the NAAQS recorded at the Chatfield High School site, but the levels were frequently higher than those recorded at the other monitoring sites south of the metro area.

One finding of the study was the need for a new, permanent site further north of the Chatfield High School location. As with most Denver locations, the predominant wind pattern is north/south. The southern flow occurs during the upslope, daytime warming period. The northern flow occurs during late afternoon and nighttime when drainage is caused by cooling and settling. The major drainages of Bear Creek and Turkey Creek were selected as target downwind transport corridors. These are the first major topographical features north of the Chatfield High School site. A point midway between the valley floor (Englewood site) and the foothill's hogback ridge was modeled to be the best estimate of the maximum downwind daytime transport area. These criteria were used to evaluate available locations. The Welch site best met these conditions. This site is located off State Highway 285 between Kipling Street and C-470. This is a population oriented urban scale SLAMS monitor.

Rocky Flats - N, 16600 W. Highway 128 (08 059 0006):

The Rocky Flats - N site is located north-northeast of the plant on the south side of Colorado Highway 128, approximately 1¼ miles to the west of Indiana Street. The site began operation in June 1992 with the installation of an O₃ monitor and meteorological monitors as a part of the first phase of the APCD's monitoring effort around the Rocky Flats Environmental Technology Site.

O₃ monitoring began as a part of the Summer 1993 Ozone Study. The monitor recorded some of the highest O₃ levels of any of the sites during that study. Therefore, it was included as a regular part of the APCD O₃ monitoring network. The Rocky Flats ó N monitor frequently exceeds the current standard. This is a highest concentration oriented urban scale SLAMS monitor.

NREL Solar Radiation Research Laboratory, 2054 Quaker Street (08 059 0011):

The National Renewable Energy Laboratory (NREL) site is located on the south rim of South Table

Mountain, near Golden, and was part of the Summer 1993 Ozone Study. Based on the elevated concentrations found at this location, it was made a permanent monitoring site in 1994. This site typically records some of the higher eight-hour O₃ concentrations in the Denver area. It frequently exceeds the current standard. This is a highest concentration oriented urban scale SLAMS monitor.

Aspen Park, 26137 Conifer Road (08 059 0013):

The Aspen Park site began operation in May 2009. It is intended to verify/refute model predictions of above normal O₃ levels. In addition, passive O₃ monitors used in the area in a 2007 study indicated the possibility of higher O₃ levels. The monitor is located in an urban setting at a Park and Ride facility off of Highway 285, at an elevation of just over 8,100 feet. Because the site is nearly 3,000 feet higher than the average metro area elevation, it should see O₃ levels that are larger than those seen in the metro area, as O₃ concentrations increase with increasing elevation. Whether or not the increased concentrations will be a health concern will be determined with the data gathered from this monitor. This is a SLAMS neighborhood scale monitor.

Durango - River City Hall, 1235 Camino del Rio (08 067 0004):

Durango is the second largest city on the western slope. The town is situated in the Animas River Valley in southwestern Colorado. Its elevation is approximately 6,500 feet (1,981 meters) above mean sea level. The Animas valley through Durango is steep and narrow. Even though little meteorological information is available for the area, the microclimate of Colorado mountain communities is characterized by cold air subsidence, or drainage flows during the evening and early morning hours and up valley flows during afternoon and early evening hours when solar heating is highest. Temperature inversions that trap air pollutants near the surface are common during night and early morning hours. This is a population oriented neighborhood scale SLAMS monitor that samples continuously.

Fort Collins – CSU – Edison, 251 Edison Street (08 069 0009):

Fort Collins does not have the population to require a particulate monitor under Federal regulations. However, it is one of the largest cities along the Front Range. There are two population oriented neighborhood scale SLAMS monitors, a PM₁₀ and a PM_{2.5}, that sample on a 1 in 3 day sample schedule. There is also continuous monitor measuring PM₁₀ and PM_{2.5}.

Fort Collins - West, 3416 W. La Porte Avenue (08 069 0011):

The Fort Collins-West monitor began operation in May of 2006. The location was established based on modeling and to satisfy permit conditions for a major source in the Fort Collins area. The levels recorded for the first season of operation showed consistently higher concentrations than the 708 S. Mason Street monitor. This is a highest concentration oriented urban scale SLAMS monitor.

Rist Canyon, 11838 Rist Canyon Road, (08 069 0012):

The Rist Canyon site began operation in May 2009. The monitor is located within the Rist Canyon Volunteer Fire Department Station Number 1, in the foothills west of Fort Collins. The monitor is at an elevation of 6,750 feet, which is roughly 1,600 feet above the Fort Collins ó West monitor. Model predictions have indicated possible elevated O₃ levels in this area. The site is intended to verify/refute the model prediction. This is an urban scale special purpose monitor that has achieved its monitoring objectives and will be decommissioned in 2013. Concentrations at this site closely follow Fort Collins ó West, so it is viewed as redundant. There are also some logistical problems with this monitoring location; an unusually long sample inlet line was required, and some trees are too close to fully meet EPA siting criteria.

Fort Collins- Mason, 708 S. Mason Street (08 069 1004):

The 708 S. Mason Street site began operation in December 1980 and is located one block west of College Avenue in the Central Business District. The one-hour CO standard of 35 ppm as a one-hour average has only been exceeded on December 1, 1983, at 4:00 P.M. and again at 5:00 P.M. The values reported were 43.9 ppm and 43.2 ppm respectively. The eight-hour standard of 9 ppm was exceeded one or more times a year from 1980 through 1989. The last exceedances were in 1991 on January 31 and December 6 when values of 9.8 ppm and 10.0 ppm respectively were recorded.

Fort Collins does not have the population to require a CO monitor under Federal regulation. However, it is one of the largest cities along the Front Range and was declared in nonattainment for CO in the mid-1970s after exceeding the eight-hour standard in both 1974 and 1975. The current level of monitoring is in part a function of the resulting CO State Maintenance Plan (SMP) for the area. It is a population oriented neighborhood scale SLAMS monitor.

O₃ monitoring began in 1980, and continues today.

In March 2012 the meteorological tower was relocated from a freestanding tower on the west side of the shelter to a shelter mounted tower on the south side of the shelter due to the Mason Street Redevelopment Project.

Grand Junction - Powell, 650 South Avenue (08 077 0017):

Grand Junction is the largest city on the western slope in the broad valley of the Colorado River. The monitors are on county owned buildings in the south side of the city. The site is on the southern end of the central business district and close to the industrial area along the train tracks. It is about a half a mile north of the river and about a quarter mile east of the railroad yard. This site monitors for 24-hour and hourly PM₁₀ as well as for 24-hour and hourly PM_{2.5}.

Grand Junction - Pitkin, 645¼ Pitkin Avenue (08 077 0018):

The Grand Junction-Pitkin CO monitor began operation in January 2004. This monitor replaced the site at the Stocker Stadium. The Stocker Stadium location had become less than ideal with the growth of the trees surrounding the park and the Division felt that a location nearer to the CBD would provide a better representation of CO concentration values for the city. The CO concentrations at the Stocker Stadium site had been declining from an eight-hour maximum in 1991 of 7.8 ppm to 3.3 ppm in 2003. It is a population oriented, micro-scale SLAMS monitor.

Meteorological monitors were installed in 2004, and include wind speed, wind direction, temperature and relative humidity sensors.

Clifton, Hwy 141 & D Road (08 077 0019):

The Clifton PM₁₀ monitor is located in the town of Clifton which is a southeastern suburb of Grand Junction. The monitor is in a low usage parking lot operated by the sanitation district. It is one half mile north of the Colorado River. The site was established at the request of the Mesa County Health Department to address concerns of oil and gas related industries in the area.

The population oriented neighborhood scale SLAMS monitor began operations in October 2007, and operates on an every third day schedule.

Palisade Water Treatment, Rapid Creek Rd (08 077 0020):

The Palisade site is located at the Palisade Water Treatment Plant. The site is 4 km to the east-northeast of downtown Palisade, just into the De Beque Canyon area. The site is remote from any significant population and was established to measure maximum concentrations of O₃ that may result from

summertime up-flow conditions into a topographical trap. Monitoring commenced in May 2008. This is an urban scale special purpose monitor.

Lay Peak, (08 081 0002):

The Lay Peak site was established in support of the 3-State Pilot Study program. It began operations in August of 2011. The site monitors for O₃ and meteorological parameters, including relative humidity. The purpose for this site and other Three State Study sites is for the development of monitoring data sets in geographic areas that have no monitoring data to support modeling efforts in NEPA assessments and in determinations of NAAQS compliance. The Lay Peak site is located approximately 18 miles west of the town of Craig and 2 miles south of Highway 40 on County Road 17. The site sits on the north flank of Lay Peak and is approximately 200 ft above the valley floor. The surrounding terrain is high desert, dominated by sagebrush, pinion pines, and riparian vegetation. The site is in open terrain with a 360-degree exposure. There are no significant sources nearby, however, the oil and gas development potential is high for lands to the north and east of the site, and development of these resources is expected to increase in the future. It is a regional site.

Cortez, 106 W. North St (08 083 0006):

The Cortez site is located in downtown Cortez at the Montezuma County Health Department building. Cortez is the largest population center in Montezuma County in the southwest corner of Colorado. Currently, there are O₃ and PM_{2.5} monitors in operation at this site.

The O₃ site was established to address community concerns of possible high O₃ from oil and gas and power plant emissions in the area. Many of these sources are in New Mexico. Monitoring commenced in May 2008. This is an urban scale SLAMS monitor.

Aspen - Library, 120 Mill Street (08 097 0006):

Aspen is at the upper end of a steep mountain valley. Aspen does not have an interstate running through it. Aspen was classified as nonattainment for PM₁₀, but it is now under an attainment/maintenance plan. The valley is more restricted at the lower end, and thus forms a tighter trap for pollutants. The transient population due to winter skiing and summer mountain activities greatly increases the population and traffic during these seasons. There is also a large down valley population that commutes to work each day from as far away as the Glenwood Springs area, which is 41 miles to the northeast.

The population oriented neighborhood scale SLAMS monitor is operating on a 1 in 3 sample schedule.

Lamar - Municipal Building, 104 Parmenter Street (08 099 0002):

The Lamar Municipal site was established in January of 1996 as a more population oriented location than the Power Plant. The Power Plant site was located on the northern edge of town (until it was decommissioned in 2012) while the Municipal site is near the center of the town. Both sites have recorded exceedances of the 24-hour standard of 150 µg/m³, and both sites regularly record values above 100µg/m³ as a 24-hour average. This is a population oriented neighborhood scale SLAMS monitor on a daily sample schedule.

Lamar Port of Entry, 7100 US Highway 50, (08 099 0003):

The particulate monitors in Lamar have recorded some of the highest readings in the state. These readings are primarily associated with east winds in excess of 20 mph. The Division first established a meteorological monitor in Lamar at the Municipal Building but this location was too protected and the meteorological monitor was moved to the Port of Entry location in March of 2005.

Pueblo – Fountain School, 925 N. Glendale Ave (08 101 0015):

Pueblo is the third largest city in the state, not counting communities that are part of Metropolitan Denver. Pueblo is principally characterized by rolling plains and moderate slopes with elevations ranging from 4,474 ft to 4,814 ft (1,364 to 1,467 m). The Rocky Mountain Front Range is about 25 miles (40 km) west and the sight of Pikes Peak is easily visible on a clear day.

Meteorologically, Pueblo can be described as having mild weather with an average of about 300 days of sunshine per year. Generally, wind blows up valley from the southeast during the day and down valley from the west at night. Pueblo experiences average wind speed ranges from 7 miles per hour in the fall and early winter to 11 miles per hour in the spring.

This site was formerly located on the roof of the Public Works Building at 211 E. D St., in a relatively flat area found two blocks northeast of the Arkansas River. At the end of June in 2011 the Public Works site was shut down and moved to the Magnet School site as the construction of a new multi-story building caused a major change in the flow dynamics of the site. The new site began operations in 2011. The distance and traffic estimate for the surrounding streets falls into the middle scale in accordance with federal guidelines found in 40 CFR, Part 58, and Appendix D.

Steamboat Springs, 136 6th Street (08 107 0003):

Like other ski towns, Steamboat Springs has problems with wintertime inversions, high traffic density, wood smoke, and street sand. These problems are exacerbated by temperature inversions that trap the pollution in the valleys.

The first site began operation in Steamboat Springs in June 1985 at 929 Lincoln Avenue. It was moved to the current location in October 1986. The 136 6th Street location not only provides a good indication of population exposure, since it is more centrally located, but it has better accessibility than the previous location. This is a population oriented neighborhood scale SLAMS monitor on a daily sample schedule.

Telluride, 333 W. Colorado Avenue (08 117 0002):

Telluride is a high mountain ski town in a narrow box end valley. The San Miguel River runs through the south end of town and the town is only about ½ mile wide from north to south. The topography of this mountain valley regime creates temperature inversions that can last for several days during the winter. Temperature inversions can trap air pollution close to the ground. Telluride sits in a valley that trends mainly east to west, which can trap air pollutants more effectively since the prevailing winds in this latitude are the westerly and the San Miguel River Valley is closed off on the east end. This is a population oriented neighborhood scale SLAMS monitor on a 1 in 3 day sample schedule.

Greeley - Hospital, 1516 Hospital Road (08 123 0006):

The Greeley PM₁₀ monitor is on the roof of a hospital office building at 1516 Hospital Road. Greeley Central High School is located immediately to the east of the monitoring site. Overall, this is in an area of mixed residential and commercial development that makes it a good population exposure, neighborhood scale monitor. The distance and traffic estimate for the most controlling street easily falls into the neighborhood scale in accordance with federal guidelines found in 40 CFR, Part 58. This is a population oriented neighborhood scale SLAMS monitor on a 1 in 3 day sample schedule.

Winds in this area are primarily out of the northwest, with dominant wind speeds less than 5 mph. Secondary winds are from the north, north-northwest and east-southeast, with the most frequent wind speeds also being less than 5 mph. The most recent available wind data for this station is for the period December 1986 to November 1987. Predominant residential growth patterns are to the west and north with large industrial growth expected to the west. There are two feedlots located about 11 miles east of

the town. There was a closer feedlot on the east edge of town, but it was shut down in early 1999, after the town of Greeley purchased the land in 1997.

Platteville, 1004 Main Street (08 123 0008):

Platteville is located immediately west of Highway 85 along the Platte River valley bottom approximately five miles east of I -25, at an elevation of 4,825 feet. The area is characterized by relatively flat terrain and is located about one mile east of the South Platte. The National Oceanic and Atmospheric Administration operated the Prototype Regional Observational Forecasting System Mesonet network of meteorological monitors from the early 1990s through the mid 1990s in the northern Colorado Front Range area. Based on this data, the area around Platteville is one of the last places in the wintertime that the cold pool of air that is formed by temperature inversions will burn off. This is due to solar heating. The upslope/down slope Platte River Valley drainage and wind flows between Denver and Greeley make Platteville a good place to monitor PM_{2.5}. These characteristics also make it an ideal location for chemical speciation sampling, which began at the end of 2001.

The Platteville site is located at 1004 Main Street at the South Valley Middle School, located on the south side of town on Main Street. The school is a one-story building and it has a roof hatch from a locked interior room providing easy access to its large flat roof. There is a 2-story gym attached to the building approximately 28 meters to the Northwest of the monitor. The location of the Platteville monitor falls into the regional transport scale in accordance with federal guidelines found in 40 CFR, Part 58, and Appendix D. There are three monitors here. Two are population oriented regional scale monitors, one of which is on the SLAMS network and the other is for supplemental speciation. The SLAMS monitor is operating on a 1 in 3 day sample schedule, while the speciation monitor is operating on a 1 in 6 day schedule. The remaining monitor is a population oriented neighborhood scale supplemental speciation monitor on a 1 in 6 day sample schedule.

Greeley - Weld County Tower, 3101 35th Avenue (08 123 0009):

The Weld County Tower O₃ monitor began operation in June 2002. The site was established after the 811 15th Street building was sold and was scheduled for conversion to other uses. The Weld County Tower site has generally recorded levels greater than the old site. This is a population oriented neighborhood scale SLAMS monitor.

Meteorological monitoring began in February of 2012.

Greeley West Annex Bldg, 905 10th Avenue (08 123 0010):

Greeley does not have the population to require a CO monitor under Federal regulation. However, it is one of the larger cities along the Front Range and was declared in nonattainment for CO in the late-1970s after exceeding the eight-hour standard in 1976 and 1977. The first Greeley monitor operated from December 1976 to December 1980. It was located at 15th Street and 16th Avenue and exceeded the eight-hour standard numerous times from 1976 through 1980. The monitor is a population oriented neighborhood scale SLAMS monitor.

The 811 15th Street location began operation in November 1981 and was discontinued in 2002. The current monitor is located in the Weld County West Annex building, and began operations in December 2003. This location is in the Greeley CBD. The levels recorded at this site are comparable but slightly lower than those at the former 811 15th Street site, about a quarter of the eight-hour standard.

Appendix B- La Casa NCore Approval

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

RESEARCH TRIANGLE PARK, NC 27711

MAR 07 2013

OFFICE OF
AIR QUALITY PLANNING
AND STANDARDS

Mr. Gordon Pierce
Program Manager
Air Pollution Control Division
Colorado Department of Public Health and Environment
4300 Cherry Creek Drive, South
Denver, Colorado 80246-1530

Dear Mr. Pierce:

This letter transmits our approval of Colorado's request to move the NCore station from the Denver Animal Shelter location, AQS # 08-031-0025, to a new location known as LaCasa Quigg-Newton, AQS # 08-031-0026, as required by the Ambient Air Monitoring Regulations. According to these rules (see 40 CFR 58.11(c)), NCore network design and changes must be approved by the Environmental Protection Agency's (EPA) Administrator. This authority has been delegated to the Director of the Air Quality Assessment Division in EPA's Office of Air Quality Planning and Standards.

In considering approving the move of the NCore monitoring station, we worked with EPA Region 8 on a review of your request, including the rationale of why the first NCore site could no longer be supported, and assessed the location and characteristics of the area at the new location to be monitored. This included a site visit to the new location on October 24, 2011. After careful consideration of your request to move the site, we are pleased to approve the new location for this station as part of the NCore network.

We understand the NCore station at the new location is fully operational. Thank you for your program's efforts in working through the issues of having to move the NCore station and establish the new site. For any technical questions, you may contact Tim Hanley at hanley.tim@epa.gov and 919-541-4417.

Sincerely,

A handwritten signature in cursive script that reads "Richard A. Wayland".

Re: Various Network Modification Requests

Dear Gordon:

Thank you for submitting the Network Modification Request Forms (NMRFs) described below. The table below summarizes the proposed changes that have been requested, including the date of the individual request, the common name of the air monitoring station, the Air Quality System (AQS) identification number, the affected parameters and the type of change proposed.

Date	Common Name	AQS Identification Number	Parameters	Type of Change
12/30/2011	Lamar Power Plant	08-099-0001	PM ₁₀	close
1/11/2012	LaCasa Quigg-Newton	08-031-nnnn	NCore*	open
1/12/2012	Denver Municipal Animal Shelter	08-031-0025	NCore*	close
5/30/2012	Longmont – Main Street	08-013-0009	CO	close

*Standard suite of NCore parameters, including CO, NO-NO_y, O₃, SO₂ (trace), PM₁₀, PM_{2.5} mass (criteria pollutant monitoring), PM_{2.5} (speciated) and lead.

Lamar Power Plant, 08-099-0001. The only criteria pollutant being monitored at this station, and thus the only parameter to be affected by its closure, is PM₁₀. Under a cover letter dated November 21, 2011, the Air Pollution Control Division (APCD) submitted a NMRF describing the proposed closure. Following a public comment period that ran from November 28 to December 29, 2011, during which no comments were received, the APCD submitted a letter dated December 30, 2011 to Region 8. In that

letter, the APCD pointed out that the proposal to close this station had been addressed in the Colorado Annual Monitoring Network Plan, 2011 – 2012. The network plan stated that, “The Lamar Power Plant monitor will be considered for removal in 2011 because it is no longer located in ambient air.” Monitoring of PM₁₀ would continue at the Lamar Municipal Building station (08-099-0002). Neither the Power Plant station nor the Municipal station is producing precision data with collocated PM₁₀ samplers; accordingly, the proposed change will not cause the loss of a collocated site.

Denver Municipal Animal Shelter, 08-031-0025. The Animal Shelter station has served as Colorado’s NCore station since 2005. Due to significant changes in planned land use on adjacent property, the APCD finds that this station “will no longer be suitable for ambient air quality monitoring,” according to the NMRF dated November 12, 2011. After examining various locations in Denver as alternative sites for the NCore station, the APCD has selected the La Casa – Quigg Newton Family Health Center at 4545 Navajo Street for this purpose. Representatives of the APCD, EPA’s Office of Air Quality Planning and Standards and Region 8 evaluated the La Casa site on October 24, 2011.

Longmont – Main Street, 08-013-0009. Although the APCD has monitored other criteria pollutants in Boulder County, the Main Street station in Longmont strictly has monitored carbon monoxide (CO). Monitoring began there in November 1989. Due to an alley construction project, the APCD recently found it necessary to close the station. The CO analyzer stopped reporting data to AQS effective December 31, 2011, and the APCD proposes not to resume monitoring at the same location. The NMRF cites steadily declining CO concentrations in the Longmont maintenance area. The APCD has been in communication with Region 8 regarding the ability to surrogate CO data from the Denver CAMP station (08-031-0002) for data from Longmont in order to support the Longmont Maintenance Plan.

Thank you for submitting the site description packages discussed above. Region 8 concurs with the network changes described. In the case of your NCore station, however, Region 8 does not have approval authority for the network modification. While we concur with moving the NCore operation from the Denver Municipal Animal Shelter to the La Casa site, we intend to email this letter and electronic copies of the two NCore-related NMRFs, to the Office of Air Quality Planning and Standards for review and approval.

If you have any questions or comments, contact me at (303) 312-6431 or Richard Payton of my staff at (303) 312-6439.

Sincerely,

Deirdre Rothery, Chief
Air Permitting, Monitoring, & Modeling Unit

Colorado Department
of Public Health
and Environment

Date:

Richard Payton
8P-AR
US Environmental Protection Agency Region VIII
1595 Wynkoop Street
Denver, CO 80202-1129

Dear Mr. Payton,

As required, the Colorado Department of Public Health and Environment (CDPHE) Air Pollution Control Division (APCD) is submitting four network site modification request forms for the proposed decommissioning of the Carriage site (ozone and meteorology), the commissioning of sulfur dioxide monitoring at the Colorado Springs Highway 24 site, the commissioning of ozone and meteorology monitors at the Lay Peak site, and the commissioning of Weld County Tower meteorology monitors. Sites common name, AQS ID and proposed actions are as follows:

➤ Carriage (Denver) AQS ID: 08-031-0014

Removal - Ozone SLAMS Monitor

Removal - Meteorological Special Purpose Monitors

➤ Highway 24 (Colorado Springs) AQS ID: 08-041-0015

- Addition - Sulfur Dioxide SLAMS Monitor

•

➤ Lay Peak (Moffat County) AQS ID: 08-081-0002

- Addition - Ozone Special Purpose Monitor

Addition - Meteorological Special Purpose Monitors

•

➤ Weld County Tower (Greeley) AQS ID: 08-123-0009

Addition - Meteorological Special Purpose Monitors

This letter and the enclosed network modification forms were made available for a 30 day public comment period from 11/27/12 to 12/27/12. The Air Pollution Control Division received one set of public comments from the Sierra Club. These comments and APCD's response to these comments are contained in Attachment 5 and Attachment 6 of this letter, respectively.

Carriage - AQS ID: 08-031-0014

The proposed last sample to be collected from the Carriage ozone monitor and meteorological sensors is planned for December 31, 2012 at 23:00 hr, with the shelter, monitor and sensors to be removed early January 2013 as weather and time permits. The decommission of the Carriage site was initially identified in Colorado's 2010 5-Year Network Assessment and slated for removal in Colorado's 2012 Annual Network Plan. The APCD plans to shut down the Carriage ozone monitor for the following reasons:

- The site no longer meets siting criteria for both ozone and meteorology. The dripline of tree located to the ENE of the ozone sample probe inlet is within 10 meters of the probe. Additionally, a different tree located to the ENE and a tree located SE of the sample probe inlet are obstacles. These trees are also obstacles to the wind speed and direction measures. All of the above listed trees are located on private land and are outside the control of the APCD. Exact measurements to the above mentioned trees can be provided upon request.
-
- The Carriage site has become increasingly redundant with the new ozone analyzer at CAMP and the proposed La Casa NCore ozone analyzer (to be installed in the fall of 2012). If the Carriage site is decommissioned on December 31, 2012, one year of concurrent sampling will have occurred with CAMP ozone analyzer and 3 months of concurrent sampling will have occurred with the La Casa ozone analyzer. The closure of this monitor is in accordance with EPA's effort to disinvest in redundant sites so that resources can be reallocated to further enhance multi-pollutant sites where applicable and/or further expand the existing network as needed.

Highway 24 - AQS ID: 08-041-0015

As per the 2010 revision of the Primary Sulfur Dioxide National Ambient Air Quality Standard, Core Based Statistical Areas (CBSA) with Population Weighted Emission Index (PWEI) values in excess of 5,000 requires the operation of at least one sulfur dioxide monitor. To comply with the 2010 rule, the Colorado Springs area requires the inclusion of a sulfur dioxide monitor. The existing Highway 24 site is the proposed location for this site because of its proximity to the Drake Power Plant. While this location is not ideal, it is considered acceptable for the near term. Ultimately, the future reconstruction of the Cimarron exit will require the relocation of the Highway 24 site to a more appropriate location. The APCD plans to have the sulfur dioxide monitor operational by January 1, 2013.

Lay Peak – AQS ID: 08-081-0002

As a courtesy to the Environmental Protection Agency, the APCD is including a network modification form for the commissioning of ozone and meteorological parameters at the Lay Peak site. This site was originally installed in support of the state and federal agencies' Three-State Study Pilot Project. This site was purchased, installed and is operated by a contractor. The site began operation in August 2011 and is planned to continue operations for at least three years.

Weld County Tower - AQS ID: 08-123-0009

As a courtesy to the Environmental Protection Agency, the APCD is including a network modification form for the commissioning of meteorological parameters at the Weld County Tower site. Meteorological monitoring began on February 25, 2012 and will continue indefinitely into the future. Meteorological parameters were added at the Weld County Tower site to assist in modeling efforts in the Weld County area.

Enclosed are the associated Ambient Air Monitoring Network Modification Request Forms. If you have any questions or need further information, you can reach me at (303) 692-3232.

Sincerely,

Gregory Harshfield
Continuous Monitoring and Data Systems Support Supervisor

Carriage - Ambient Air Monitoring Network Modification Form

EPA REGION 8 AMBIENT AIR MONITORING NETWORK MODIFICATION REQUEST FORM

(VERSION 2, 4/1/04)

DATE: 11/20/2012	CITY: Denver	STATE: CO
------------------	--------------	-----------

AQS SITE ID: 08-031-0014	SITE NAME: Carriage
--------------------------	---------------------

PROPOSED MODIFICATION/REASON WHY:

Proposed closure of ozone site and met tower. Site, established in 1983, is no longer a maximum ozone location. The site no longer meets siting criteria due to tree growth on private property surrounding the site. This ozone monitoring site will be somewhat redundant with the ozone measurements at the new NCORE site.

AIR QUALITY PARAMETER (PM10, SO2, CO, NO2, ETC.)	MONITOR TYPE (NAMS, SLAMS, SPM, TRIBAL, etc.)	CHECK ONE OR MORE OF THE APPLICABLE CATEGORIES BELOW:				LIST SAMPLER EQUIPMENT

Colorado Department
of Public Health
and Environment

Date: February 20, 2013

Richard Payton
8P-AR
US Environmental Protection Agency Region VIII
1595 Wynkoop Street
Denver, CO 80202-1129

Dear Mr. Payton,

As required, the Colorado Department of Public Health and Environment's (CDPHE) Air Pollution Control Division (APCD) is submitting a network site modification request form for the proposed decommissioning of the Rist Canyon site (ozone and meteorology). Site common name, AQS ID and proposed actions are as follows:

➤ Rist Canyon AQS ID: 08-069-0012

Removal - Ozone SPM Monitor

Removal - Meteorological Special Purpose Monitors

This letter, the enclosed Comparison of Top Ranked Daily 8-Hour Average Maximum Values (Attachment 1), the enclosed network modification form (Attachment 2), and site assessment form (Attachment 3) was made available for a 30 day public comment period from 1/16/2013 to 2/16/2013. The Air Pollution Control Division did not receive any comments related to this network modification request.

Rist Canyon - AQS ID: 08-069-0012

The proposed last sample to be collected from the Rist Canyon ozone monitor and meteorological sensors is to be based upon EPA's concurrence of this network modification request. The Rist Canyon site was established in 2009 in support of an EPA recommendation to verify a modeling hot spot in the foothills to the west of Fort Collins. This hot spot was originally presented in the 2010 Ozone Projections for the 2010 Base Case and 2010 Sensitivity Tests and 2010 Ozone Source Apportionment

Modeling for the Denver 8-hour Ozone State Implementation Plan document. The APCD proposes to shut down the Rist Canyon ozone monitor and meteorological sensors for the following reasons:

- The monitored concentrations observed at the Rist Canyon site do not appear to validate the modeled hot spot. Attachment 1 shows a comparison of the top ranked daily 8-hour average maximum values for sites located in the Fort Collins area. The APCD believes the 3.5 year data set is sufficient to adequately demonstrate attainment of the site's objectives. The Rist Canyon site has a calculated design value 7 ppb lower than the Fort Collins West site and 2 ppb higher than the Fort Collins CSU site. A comparison of values shows the Rist Canyon site to be redundant with the Fort Collins sites. The closure of this monitor is in accordance with EPA's effort to disinvest in redundant sites so that resources can be reallocated to further expand the existing network as needed.
-
- Even though the site has been in operation in excess of three years, the analyzer is still currently classified as a Special Purpose Monitor. Continued monitoring at the Rist Canyon site would require a conversion of the site's monitoring type designation, from a Special Purpose Monitoring Station (SPM) to a State and Local Air Monitoring Station (SLAMS). This conversion would imply a longer term commitment to continue monitoring at this location. The APCD believes long term monitoring at this site is not in the best interest of the air monitoring network. The monitoring resources spent on the Rist Canyon site are better spent expanding the air monitoring network elsewhere.
- The site marginally fails to meet siting criteria for ozone and meteorology. A tree located 15 meters west of the ozone probe is 18 meters above the probe; thus making it by definition an obstacle. A tree located to the southwest of the meteorological tower is also by definition an obstacle to the meteorological measurements. The location of the analyzer within the Rist Canyon Fire Station requires the use of long sample lines. The long sample line results in sample retention times in excess of 20 sec. The conversion to thick walled sample lines (smaller internal diameter) has decreased sample retention times; however, sample retention times remain marginal.

Enclosed is the associated Ambient Air Monitoring Network Modification Request Form and a copy of the Rist Canyon Site Assessment Form. If you have any questions or need further information, you can reach me at (303) 692-3232.

Sincerely,

Gregory Harshfield
Continuous Monitoring and Data Systems Support Supervisor

Attachment 2

Rist Canyon - Ambient Air Monitoring Network Modification Form

EPA REGION 8 AMBIENT AIR MONITORING NETWORK MODIFICATION REQUEST FORM

(VERSION 2, 4/1/04)

DATE: 1/9/2013	CITY: Larimer County - Foothills area west of Fort Collins	STATE: CO
----------------	------------------------------------------------------------	-----------

AQS SITE ID: 08-069-0012	SITE NAME: Rist Canyon
--------------------------	------------------------

PROPOSED MODIFICATION/REASON WHY: Site results are very similar to the Fort Collins - West location. Meteorological tower does not meet siting criteria due to nearby trees. According to EPA siting criteria, one nearby tree, to the west, is an obstruction to the ozone probe. Siting of the ozone monitor within the fire station requires an unusually long inlet line that has not always met the requirement that sample residence time be less than 30 seconds.

AIR QUALITY PARAMETER (PM10, SO2, CO, NO2, ETC.)	MONITOR TYPE (NAMS, SLAMS, SPM, TRIBAL, etc.)	CHECK ONE OR MORE OF THE APPLICABLE CATEGORIES BELOW:				LIST SAMPLER EQUIPMENT
		MAX CONC	SOURCE IMPACT	POPULATION EXPOSURE	BACKGROUND	
Ozone	SPM	x		x		API 400 E
Meteorological Tower	SPM					Met One Wind speed, wind direction, temp.

PROPOSED SAMPLING START / REMOVAL DATE OR DATE STARTED / REMOVED: Proposed removal March 1, 2013

ESTIMATED MEASUREMENTS FOR AIR QUALITY PARAMETERS: Ozone and Meteorology

LOCATION (LAT./LONG. OR UTM' S): Latitude 40.64191 Longitude -105.27525 WGS 84

SITE ELEVATION (M. MSL): 2057 Meters PROBE HEIGHT (M. AGL): 3.6 Meters

DISTANCE TO TREE DRIPLINE (M)	DIRECTION TO TREE	DISTANCE TO OBSTACLE (M)	DIRECTION TO OBSTACLE	OBSTACLE HEIGHT ABOVE PROBE (M)	OBSTACLE COMMENTS
Tree 1052 - 15 Meters	NW	15 Meters	NW	14.4 Meters	Tree 1052 to NW is on a hill, which
					Makes it more of an obstruction.

UNRESTRICTED AIR FLOW: >270 DEG. >180 DEG. <CRITERIA __ 270 _____ DEG.

DISTANCE TO FLUES/INCINERATORS (M): None

DISTANCE TO INTERSECTIONS (M): No intersections nearby DISTANCE FROM SUPPORTING STRUCTURES (M):
VERT. __ 1.2 __ HORIZ. __ 2.1 ____ Probe comes out of building side

DISTANCE TO EDGE OF NEAREST ROADWAY	NAME OF ROADWAY	DIRECTION	DAILY TRAFFIC ESTIMATES	YEAR OF TRAFFIC ESTIMATES	TYPE OF ROADWAY	COMMENTS
		NORTH				
17 Meters	Rist Canyon Road	EAST			Local Highway	
		SOUTH				
		WEST				

DISTANCE TO NEAREST POINT SOURCES (MILES)	DIRECTION TO POINT SOURCES	DISTANCE TO NEAREST AREA SOURCES (MILES)	DIRECTION TO AREA SOURCES	COMMENTS
No nearby point sources.				
Forested foothills area.				

CERTIFICATION: I certify the network modification proposed above meets all 40 CFR 58, Appendix E siting criteria, except as noted with submittal.

Printed Name: _____ Signature: _____

FOR EPA USE ONLY: Received Date: _____ Follow-up Actions: _____ Approval Status
 Given: _____ Email Response Date: _____ Letter Response Date: _____

FOR METEOROLOGICAL PARAMETERS ONLY:

MONITORING PURPOSE/OBJECTIVES: Monitor wind speed, temperature, and wind direction at ozone site.

PROPOSED MONITORING SCHEDULE/DURATION: Proposed shut down on March 1, 2013.

PROPOSED START / REMOVAL DATE Proposed shut down on March 1, 2013.
 OR DATE STARTED / REMOVED:

DATA ACQUISITION SYSTEM: Air Vision

PRIMARY Air Vision	PARAMETERS:	APPLICABLE √ those that apply	SENSOR HT (M)
BACKUP	WIND SPEED/DIRECTION	X	10 Meters
EQUIPMENT MANUFACTURER/MODEL: Met One 010/020 Wind Speed Also temperature probe	SOLAR RADIATION		
	RELATIVE HUMIDITY		
WILL THE DATA BE USED FOR MODELING? <u>YES</u> NO	PRESSURE		
IS SITE REQUIRED FOR SIP? YES <u>NO</u>	SIGMA THETA	X	10 Meters
UNRESTRICTED AIRFLOW? YES <u>NO</u> Obstructions to NW and SE	PRECIPITATION		
DISTANCE TO TREE DRIPLINE (M): A number of trees are obstructions - see attachment.	TEMPERATURE	X	6 Meters
NEARBY TERRAIN: SMOOTH ROLLING <u>ROUGH</u>	OTHER (DESCRIBE)		

TOPOGRAPHIC FEATURES (E.G HILLS, MOUNTAINS, VALLEYS, RIDGES, BODIES OF WATER): In valley in foothills area of the Rocky Mountains, to the west of the city of Fort Collins, CO.

COMMENTS:
