

Shrub Photos, 1.5 - 3.0 tons/acre

The following photos of shrub fuel loads are excerpted from the Pacific Northwest Research Station's website, <http://depts.washington.edu/nwfire/dps/>. The site numbers match. The pictures are provided here to save time retrieving them. They are divided into several files to keep file size manageable.

Suggestions for evaluating shrub load:

- Consider both plant size and density. The data table for each photo includes percent of area covered.
- Looking down at plants can give a more accurate view of the area they cover than looking out several yards away.
- Within a photo, differentiate between grass/forbs and shrub so that the load of shrubs only has your attention.
- Focus on the portion of the site where sampling occurred, which is behind the 6' tall sign.
- For OAK there is a [separate photo series excerpt](#).
