Why Do I need a Permit?

There are many important reasons to obtain building permits and to have inspections performed for your construction project.

Protects property values
Your home is typically your largest investment. If your construction project does not comply with the building codes, your investment could lose value. If others in your neighborhood make unsafe or substandard changes to their homes, it could lower the resale values for the entire community.

Saves Money
Homeowners insurance policies may not pay for damages caused by work done without permits and inspections.

Makes Selling Property Easier
Listing associations require owners to disclose any home improvements or repairs and whether permits were obtained. Many financial institutions will not finance a purchase without proof of a final inspection. If you decide to sell a home or building that has had modifications without a permit, you may be required to tear down the addition, leave it unoccupied or do costly repairs.

Improves safety
Your permit allows the building department to inspect for potential hazards and unsafe construction. By ensuring your project meets the minimum building code standards of safety, the building department can reduce the risk of fire, structural collapse and other issues that might result in costly repairs, injuries and even death. Inspections complement the contractor’s experience and act as a system of checks and balances that can result in a safer project.

It’s the Law
Permits are required by Ordinance. Work without a permit may be subject to removal or other costly remedies.

Tips on hiring contractors

♦ Hire only licensed contractors.
♦ Get at least 3 bids.
♦ Get 3 references, and ask to see a project.
♦ Get it in writing, but before you sign the contract, make sure you completely understand.
♦ Do not make final payment until you have received a Certificate of Occupancy (CO) and until you are satisfied.
♦ Have the contractor apply for the required permits.
What is a Site Plan?
A site plan is a detailed drawing of your property, also known as a survey of your land. These are usually drawn by a land surveyor. The site plan will show the dimensions of your project and its relationship to existing setbacks, easements, utilities, other structures on the property, and distance to your property lines. If your project will require moving any utilities (gas, water, sewer/septic, electric, etc.), show where those utilities will be relocated.

What is REQUIRED for a Permit?
- Provide copies of the SITE PLAN

Notes:
1. Structures shall not be permitted to be built over setback lines, easements, or property lines. Check with your local zoning department for any location or size restrictions.
2. A survey from a registered land surveyor will be required if your project is located in a protected area.
3. An as-built survey is required if the structure is proposed within 12 inches of a required minimum setback.
4. If your property is on a slope, you may be required to install silt fence to keep the dirt on your property.
5. If you are on a septic tank, you will be required to have approval from the county health department prior to issuance of a permit.
6. If you do not know the location of your utilities, contact the Utility Notification Center. Remember to ask them about the cost of this service.

---

Inspection Information

What will the building inspector look at?

A typical accessory structure project will require the following inspections:
1. Footings. Footing inspections shall be made after trenches are excavated, forms erected, and PRIOR to placing of concrete.
2. Slab. Inspection shall be made PRIOR to placing concrete.
3. Frame/Rough Inspection. (Utility inspections if installed) This inspection is made after the roof, all framing, bracing and fasteners are in place.
4. Final. Inspection made AFTER the structure is completed.

The permit technician will let you know your projects’ required inspections when the permit is issued.

The purpose of this guide is to assist you in the permitting process. This handout is intended to cover information for a basic plan submittal and typical project under the building codes. It is not intended to cover all circumstances. Depending on the scope and complexity of your project, additional information may be required. Discuss your project with city staff to determine if it is subject to additional requirements.

How do I schedule a required Inspection?
Please call the inspection line listed on your permit card and leave all information requested in the message.
Construction details and specifications help the building department find problems before they occur in the field.

This example shows the types of detail our office will be looking for in your plan submittal.

In addition to construction details such as these, you will need to submit details on:
1. Foundation detail
2. Floor Plan

**REMEMBER:**
Permits are only issued after plan review. The time required to conduct this review will depend on the completeness of the information we receive in the plans.

**Foundation Details are required.** Detail A and B located below are typical.

---

**Foundation Detail A**
- 1/2" anchor bolts minimum. R403.1.6
- 3 1/2" minimum
- Rebar if required
- 2'-6" minimum 1 story wood frame. R403.1

**Foundation Detail B**
- 1/2" x 10" steel anchor bolts 6'-0" O.C. max., 7" min. penetration max. " from corner and 12" from each end of plate (min. 2 bolts per plate).
- Bottom plate shall be min. 6" above grade, or be treated wood or decay resistant wood
- Fiberboard expansion joint
- Check with your building official for local minimum
- #4 rebar min. continuous top of stem wall & at footing with 18" laps
Floor Plan

The floor plan is used to determine the complexity of the work and to validate the site plan. Floor plans must show any dimensions of the structure and openings.

Locate and detail bracing

Floor slope

Window

Mark Dimensions

Indicate rafter or truss direction.

Note: If roof trusses or rafters bear on header, special header design may be required.

Space is (check one):

- Heated
- Not Heated

Show door and window header sizes and location and size of landing in front of door

(____) __ x ____ header [example: (2) 2 x 10]

Garage door opening

Opening width: ________

Braced Wall Panel Detail

1,000 lb. strap opposite sheathing

Fasten top plate to header with two rows of 16D sinker nails at 3" O.C. typ.

Fasten sheathing to header with 8D common or galvanized box nails in 3" grid pattern as shown and 5" O.C. in all framing (studs, blocking, and sill) typ.

Min. width = 16" for one story structures
Min. width = 24" for use in the first two story structures

Min. 2x4 framing

3/8" min thickness wood structural panel sheathing

Min. 4,200 lb. tie-down device (embedded into concrete and nailed into framing)

See Section R602.10.6.2

Typical portal frame construction

For a panel splice (if needed), panel edges shall be blocked, and occur within 24" of mid-height. One row of typ. sheathing-to-framing nailing is required. If 2x4 blocking is used, the 2x4's must be nailed together with 3 16D sinkers

Min. 1,000 lb. tie down device

Extent of header

Single portal frame (one braced wall panel)

Double portal frame (two braced wall panels)
