1939

PRICE ONE DOLLAR

SURVEY

of

Colorado State Tax System

by

JENS P. JENSEN, Ph.D.

Made under the auspices of the

DENVER CHAMBER OF COMMERCE

with the assistance of a voluntary council composed of representatives of chambers of commerce and other commercial organizations over the state acting in an advisory capacity at the invitation of the Taxation Committee of the Denver Chamber of Commerce.

(Copyright 1930)
Denver Chamber of Commerce

PREFACE

On May 9, 1930, the Board of Directors of the Denver Chamber of Commerce authorized the Survey of the Colorado State Tax System. The work was placed in charge of the Taxation Committee composed of Messrs. F. Tillman Brownne, Chairman; A. K. Barnes, Frank N. Bancroft, Walter Beans, Fred B. Conine, Orville Dines, and George Spalding.

The Committee secured the services of Dr. Jens P. Jensen, of the University of Kansas. He is a national tax authority and the author of standard text books on public finance. He acted as a special advisor to the Committee on Taxation of the American Bankers Association in its "Survey of Bank Taxation in the United States". As this Survey of the Colorado State Tax System goes to press, Dr. Jensen is in Chicago making a survey of Cook County taxes under the auspices of the University of Chicago.

The necessity for a Survey of the Colorado State Tax System has been recognized a long time. It is the privilege of the Denver Chamber of Commerce to meet this need.

The Denver Chamber of Commerce, as an organization representative of every class of economic endeavor, has no pet remedies for present taxation ills. It has endeavored to ascertain the facts impartially. This is for the purpose of having available the largest possible amount of data for the guidance of such agencies as may propose remedial legislation and for the guidance of the Chamber in determining its attitude toward any such legislation.

H. S. SANDS
President
DENVER CHAMBER
OF COMMERCE

LETTER OF TRANSMITTAL

Denver, Colorado
September 12, 1930

To the Board of Directors,
Denver Chamber of Commerce
Gentlemen:

I herewith submit to you my report covering the survey of the Colorado tax system which was begun on May 1st of this year. The report is necessarily brief because of the short period of time available.

I appreciate the support of the Committee. Mr. Donald D. Keim, in charge of the Tax Department of the Chamber of Commerce collected much of the information, thereby making it possible for me to devote my time chiefly to analysis of the data and preparation of the report. Miss Marion C. Smith, statistician of the Tax Department has taken charge of much of the tabulation and organization of the data. Both acted under my direction. My thanks are due to Mr. H. S. Sands and Mr. George E. Collisson, president and manager respectively, of the Denver Chamber of Commerce for making available to me the necessary facilities for the work, and for counselling with me in the investigation. I appreciate the courtesy and co-operation of numerous individuals, business organizations and associations in giving information and advice freely. The same is true of numerous public officials, notably the Colorado Tax Commission. And not least is my appreciation of the efforts of the representatives of diverse organizations of the entire state, who have met with me in council for discussion and advice.* (See Page 6).

The report is obviously incomplete. The line of exclusion had to be drawn somewhere. Matters belonging in the periphery of the field of taxation have been given scant treatment or omitted entirely. The very important subject of special assessment has not been touched at all because the necessary field work could not be done. The same is true of the perhaps equally important subject of highway finance. The subject of governmental fees and other supplementary revenues had to be omitted. Problems of administrative efficiency in every unit of the government had to be left practically untouched. These matters, and others not specified, leave an open field of work for the permanent Tax Department of the Denver Chamber of Commerce, and for other investigations.

In the main I have attacked the most pertinent problems in the general field of state and local taxation. In matters that are at all controversial I have presented the arguments for all sides. Many suggestions that did not to me seem practical in the Colorado situation have been omitted, the report being already rather lengthy without them. Here also the line had to be drawn somewhere. In all cases I have tried not only to state the facts but also to interpret them where such interpretation was possible and was deemed helpful.

It is proper to acknowledge the special assistance given by Mr. G. S. Klemmedson of the Colorado Agriculture College in making available a great deal of data of his studies on public debts and taxation, and by Dr. Don C. Sowers of the Extension Division of the University of Colorado in investigating certain parts of the field covered. Dr. Sowers prepared tentative drafts of parts of Sections IV, VII, VIII, IX, X, and XI of the report. While these sections are among the briefer ones, Dr. Sowers' work was valuable in making possible the inclusion of material that must otherwise have been excluded.

Yours very truly,

JENS P. JENSEN.

*This refers to the "Advisory Council on Taxation" which met in Denver on two separate occasions upon invitation of the Taxation Committee of the Chamber of Commerce. The following organizations were invited to participate by appointing a representative to the Council:

Aguilar Boosters Club	Aguilar, Colorado
Chamber of Commerce	Alamosa, Colorado
Lions Club	Akron, Colorado
Chamber of Commerce	Antonito, Colorado
Chamber of Commerce	Arvada, Colorado
Chamber of Commerce	Aspen, Colorado
Chamber of Commerce	Boulder, Colorado
Colorado Press Association	Brighton, Colorado
Chamber of Commerce	Brighton, Colorado
Brush Civic Club	Brush, Colorado
Chamber of Commerce	Buena Vista, Colorado
Chamber of Commerce	Burlington, Colorado
Chamber of Commerce	Canon City, Colorado
Lions Club	Castle Rock, Colorado
Chamber of Commerce	Center, Colorado
Gilpin County Mining Association	Central City, Colorado
Chamber of Commerce	Cheyenne Wells, Colorado
Chamber of Commerce	Colorado Springs, Colorado
Colorado Stock Growers and Feeders Association	Colorado Springs, Colorado

SECTION I

PUBLIC EXPENDITURES

Complaints about taxation, in Colorado as elsewhere, assume two principal forms. In the first place, it is asserted that taxes are too high, which is another way of saying that the government spends too much, either for all or for particular services. In the second place, it is stated that the taxes are not equitably distributed among the taxpayers, some paying too much and others not enough. It is also often asserted that the government is inefficient and extravagant. The latter state of affairs, if true, will of course increase taxes, or decrease the services the government can render, or both. It is not the primary purpose, in the present survey, to study governmental efficiency, and it will be touched upon only incidentally, in so far as it affects either the level of the public expenditures or the apportionment of the tax burden, or both. And the bulk of the effort is devoted to the apportionment of the tax burden, rather than to the expenditures. The level and purposes of public expenditures will be treated first and briefly.

The decision to give a minor place to the public expenditures and their apportionment is not based upon a conviction that the matter is unimportant. On the contrary it is fundamental, since it is the decision on the part of the citizens or their representatives to spend money for highways, schools, or other public services that give rise to the necessity for taxes. The minor emphasis upon public expenditures of the state and its subdivisions is dictated by the following considerations:

In the first place, the amount which a state, a county, a town or city, or a school district ought to spend for public services can not be determined readily in statistical terms, as percentages of income or of wealth. The return for public expenditures consists of services that either help the citizens in their business or yield satisfaction and enjoyment directly. To the extent that the public services help business they indirectly yield satisfaction by enabling the citizens to earn more, and hence, to spend more. Therefore, the question is whether the enjoyment and satisfaction yielded by the public services are equal, as they should be, at least to the sacrifice involved in paying taxes. But how much is this satisfaction from the public services worth, and how much would the enjoyment that could be obtained with the money paid in taxes, be worth if the money were retained by the taxpayer and spent privately? No outsider can possibly know. In the last analysis the taxpayers themselves must decide.

In the second place, it is not possible to tell from the official records what are the governmental costs to Colorado taxpayers

of all the governmental services of the state. For this unfortunate circumstance there are many reasons, only one of which is given at this point. Official statistics do not show governmental costs. That is not the purpose they were designed to serve. The reports of public officers, such as state auditor, state treasurer, and county treasurers, who handle public money, are primarily designed to show the balance on hand at the beginning, the receipts, and disbursements during, and the balance at the close of the fiscal period, usually a year. They are designed to insure responsibility on the part of the respective officials, not to present statistically the governmental costs. Doubtless a competent statistician could analyze and reorganize the official data so as to present a practically accurate statement of the costs of government for all purposes, and for particular purposes. But in the present study time for doing so has not been available. Yet cost data should be prepared and published. Suggestions for the solution of the problem of securing and publishing governmental cost data are offered in a later section of this report.

I. State Expenditures

In his study, "General Trends in State Government Expenditures in Colorado", Dr. Don C. Sowers, of the University of Colorado, presents data showing the amounts of expenditures of the state government for about two decades. To this study students should go for data on state expenditures. Only one extract from the study is given here, in the form of the following table, adapted for the purpose:

TABLE 1
Colorado State Expenditures, Operating and Total, Unadjusted and Adjusted on the Basis of the 1913 Price Level, for Specified Years

Kind of Expenditures	Year		
	1909-1910	1919-1920	1927-1928
Amounts:			
Operating expenditures:			
Unadjusted	$4,649,295	$9,865,345	$16,255,030
Adjusted, 1913 price level	4,685,000	4,567,000	11,059,000
Total expenditures:			
Unadjusted	6,426,344	20,505,117	33,640,621
Adjusted, 1913 price level	6,480,000	9,493,000	22,900,000
Per capita:			
Operating expenditures:			
Unadjusted	5.81	10.50	15.49
Adjusted, 1913 price level	5.86	4.86	10.30
Total expenditures:			
Unadjusted	8.05	21.82	31.30
Adjusted, 1913 price level	8.13	10.10	21.35

Source: Stated in text.

Note: Basis of adjusting to 1913 price level is the wholesale commodity index of the U. S. Bureau of Labor Statistics.

The table draws attention to two conditions. First, and most noticeable, is the increase that has occurred, from $6,426,344, in the total expenditures for 1909-1910, to $33,640,621 in 1927-1928, or 423.5%. Of course, some increase in the population has taken place. Hence the per capita increase is somewhat less, namely from $8.05 to $31.30, or 285.0%, and is a fairer index, even disregarding the difference in purchasing power between the 1910 dollars and the 1928 dollars. But a still better index of the burden is the per capita increase, adjusted to the 1913 price level, as done in the table. That increase, from $8.13 to $21.35, or 162.8%, is much lower but still formidable. Some allowance probably should be made on account of the fact that the per capita wealth, adjusted to the 1913 price level is greater than it was in 1910. Yet that factor would probably not reduce the burden far below an increase of 150%. The question that matters, then, is whether the services of the state government in 1928 were worth 150% more than they were in 1910. That the services were demanded and that they have expanded may be seen from the analysis made by Dr. Sowers in the publication from which preceding table has been taken. There has been no real increase, perhaps a relative decrease, in the cost of general government since 1910. The increases have occurred in specific services such as education and highways. But the reader should consult Dr. Sowers' analysis itself.

The second condition, to which the table draws attention, is the fact that the operating expenditures are due, to a greater extent, to the non-operating costs than to the operating costs. Thus the per capita operating expenditures, adjusted to the 1913 price level, rose from $5.86 to $10.30, or 75.8%, as compared with the corresponding increase of total expenditures of 162.8%. The non-operating expenditures were due for the most part to outlays for such construction works as public buildings and highways, which to a large extent are permanent. This finding is equivalent to saying that the cost of the current services rendered is less than the figures would show.

A comparison with the per capita governmental cost payments for expenses and interest, but excluding outlays such as for construction of buildings and highways, of all the 48 states, and of those of adjacent states, as shown in Table 2 following, supports the conclusion that there is nothing strikingly wrong with the state expenditures of Colorado, unless indeed the expenditures are excessive in all the states. Reference to the table will show that, (1) the per capita governmental cost payments are higher for Colorado than the average for all the states, (2) they are higher for Colorado than for Kansas and

Nebraska, but (3) they are lower for Colorado than for the adjacent Rocky Mountain states, in which the general conditions determining governmental costs are presumably similar to those in Colorado. Whatever those conditions may be, they operate to raise the costs per capita for these states above the average for all the states; but, as stated, the Colorado costs are considerably lower than the average for the states in this group.

TABLE 2

Per Capita

Governmental Cost Payments for Expenses and Interest of the 48 States, Colorado and Adjacent States, for Specified Years

Year	Per Capita Governmental Costs								
	48 States	Colorado	Kansas	Nebraska	Wyoming	Utah	New Mex.	Texas	Arizona
1915	$4.06	$4.32	$3.06	$3.38	$6.01	$6.16	$3.22	$3.76	$7.89
1919	5.42	6.11	4.00	4.42	9.34	9.31	5.80	5.45	13.08
1923	8.73	10.34	6.36	6.12	17.46	14.66	9.05	7.75	13.69
1924	9.60	10.90	22.59*	6.06	17.43	14.88	10.84	7.97	14.01
1925	9.87	11.05	7.77	6.24	23.53	16.19	10.62	10.92	13.19
1926	9.72	10.20	7.78	7.04	18.73	15.49	10.83	10.02	12.90
1927	10.30	11.00	8.72	7.92	23.12	16.33	13.06	10.59	13.32

*Due to payments of nearly $30,000,000 for Soldiers Bonus.

For the local divisions of Colorado, the counties, cities, and school districts, no such data can be had because the basic information is not available, at least not fully enough to yield comparable results. The state authorities publish their expenditures annually or biennially, and analysis and comparison are thus made possible, though only with much adjustment and labor. The county expenditures and those of the larger cities are, of course, made matters of record, and doubtless in most cases these accounts are available; but the accounts are not uniform and comparable, and no reports are made to any central state agency. Hence the data, where they exist at all, cannot be consolidated and compared except at prohibitive labor and cost.

There is only one source conveniently available from existing records showing current local expenditures, and that source is not accurate for the purpose of showing actual costs. In fact it does not show costs at all, and does not pretend to do so. The Colorado tax commission publishes in its annual reports the amounts which each local political division anticipates will be raised by means of the general property tax. To be sure the amount thus anticipated is not the amount actually raised and likewise is not the amount that any local unit actually spent. For not all of the taxes anticipated or levied are ever collected in any county. On the other hand these local units have other minor sources of revenue such as state and federal aid, fines, fees, etc. But the amount anticipated annually from the property tax will reflect fairly well the increase in the taxes levied on property from year to year, and for local purposes there are relatively few sources of revenue. Moreover, it is the tax revenue that involves sacrifice and burden. In a sense therefore the anticipated tax revenue is a better index of the burden than the governmental costs would be. Since the state shares to a small extent in the property tax, Table 3 following is presented to show the total anticipated revenue for all purposes; and Table 4 following is presented to show the share of the total property tax that goes to the state.

Table 3 shows the anticipated revenue from the general property tax for all purposes—state, county, city, town, and school districts. Because of the wide variation in the purchasing power of the dollar during the years covered in the table, not only are the figures given for the actually anticipated revenues, but these figures have been adjusted for each year on the basis of the 1913 price level, by means of the U. S. Bureau of Labor Statistics wholesale index number, as was done in Table 1 above, showing state governmental costs. Presumably the higher price level of the later years indicates a greater ease in parting with each dollar of taxes. Thus while the anticipated taxes increased from $18,032,588 in 1913 to $49,665,458 in 1929, showing an increase of $31,632,870, or more than 175%, the sacrifice from the higher taxes did presumably not increase by 175%. If the figures adjusted to the 1913 price level reflect the increase, then the sacrifice was shown by an increase from $18,032,588 to $35,937,379, by $17,904,791, or about 99%.

TABLE 3

Anticipated Tax Revenue from the General Property Tax, for all Purposes, Unadjusted and Adjusted to the 1913 Price Level, for Specified Years

Year	Price Index	Anticipated Revenue	
		Unadjusted	Adjusted to 1913 Price Level
1913	100	$18,032,588	$18,032,588
1914	97.6	18,420,601	18,873,566
1915	99.6	20,536,105	20,618,579
1916	122.5	20,430,508	16,677,966
1917	168.3	24,657,787	14,651,091
1918	188.1	26,173,856	13,914,862
1919	198.6	33,292,320	16,763,504
1920	221.2	39,424,852	17,823,170
1921	139.8	42,260,392	30,229,178
1922	138.5	41,956,321	30,293,373
1923	144.1	42,241,487	29,314,009
1924	140.5	42,992,308	30,599,507
1925	148.2	45,190,471	30,492,895
1926	143.2	46,241,539	32,291,578
1927	136.6	47,975,566	35,121,205
1928	140.0	48,230,730	34,450,521
1929	138.2	49,665,458	35,937,379

Source: Reports of Colorado Tax Commission.

Table 4 shows the anticipated property tax revenues for state purposes, likewise unadjusted and adjusted according to the index number of prices. It also shows the percentage which the state property taxes formed of the total property taxes. It is noticeable that the percentage of the state levy was 9.44 in 1913, rose to 16.56 in 1922, and decreased to 11.74 in 1929. In all years, therefore, the state required only a relatively small part of the total tax revenue from property taxes. The reason for the decline in the state share of the property tax is that other sources of revenue have become available, such as the

gasoline tax and motor vehicle license fees. It is evident that the state government is not heavily dependent upon property taxes. At this point it is suggested, and more fully discussed later, that it would be possible, and perhaps useful to make it completely independent of that tax.

TABLE 4

Anticipated Revenue from the General Property Tax for State Purposes, Unadjusted and Adjusted to the 1913 Price Level, and Percentage State Revenue is of Total Revenue, for Specified Years

Year	Anticipated Revenue		Percentage of Total Anticipated Tax Revenue*
	Unadjusted	Adjusted to 1913 Price Level	
1913	$1,701,571	$1,701,571	9.44
1914	1,823,878	1,868,727	9.90
1915	2,607,576	2,618,048	12.70
1916	2,508,807	2,048,006	12.28
1917	4,081,539	2,425,157	16.55
1918	3,947,047	2,098,377	15.08
1919	5,200,701	2,618,682	15.62

*Total anticipated property tax revenue on which these percentages are computed, is not repeated. See Table 3. So also for Tables 6-8.

II. Local Expenditures

It is unfortunate that data showing governmental costs do not exist for counties and other local units, particularly since they spend by far the largest part of the tax dollar. Each year,

except during the regular census years, the Bureau of the Census attempts to secure data showing governmental costs of all cities having 30,000 inhabitants or over. But Colorado has only three such cities, namely Denver, Pueblo, and Colorado Springs. For these cities the per capita governmental cost data are given in Table 5 following. It will be seen that Denver very closely approximates the average per capita cost for all cities, while Pueblo runs considerably below, and Colorado Springs considerably above. Doubtless local conditions explain the differences.

TABLE 5

Per Capita Governmental Cost Payments for Expenses and Interest in All Cities over 30,000, and in Denver, Pueblo and Colorado Springs, for Specified Years

Year	All Cities Over 30,000	Denver	Pueblo	Colo. Springs
1916	$24.20	$20.09	$16.01	$18.58
1919	28.19	24.25	22.01	23.59
1922	41.42	40.79	38.77	37.27

It would be possible to accumulate cost data for counties, cities, and towns, and school districts at relatively little cost, if some state agency, such as the tax commission, or such effective budget bureau as should in any event be created, were charged with the task of receiving the reports of audited accounts of all the local units, prescribing the proper forms for the reports so as to enable comparative cost statistics to be prepared for all the local units. Of course the county treasurers are now charged with making, and do make biennial statements to the state auditor. But no provision is made for organizing and publishing these data in such statistical form that the general public can understand them.

In the absence of cost data, reliance must again be had upon the anticipated property tax collections. Table 6 presents these data for the counties unadjusted and adjusted, and expressed as percentages of the total tax revenue anticipated.

The share of the counties is higher than that of the state, partly because the counties have relatively few other sources of revenue than the property tax. They do now of course share in the motor vehicle license fees and the gasoline taxes. It is also noticeable that the counties, more conspicuously than the state, require a diminishing share of the total anticipated revenue, the percentage declining from 38.40 in 1913 to 20.78 in 1929. Aside from road building and maintenance, the functions of the county have not increased so markedly as other political units; and the cost of roads is partly met from other sources than county property taxes.

*See note Table 4.

Table 7 shows the corresponding data for city and town purposes, unadjusted and adjusted and expressed as percentages of the total property tax revenue. Like the county and the state, the cities and towns require a smaller share of the property tax dollar today than they did in 1913, notwithstanding that they have few and unimportant other revenue sources. Instead of taking 24.21 cents of each property tax dollar, as in 1913, they take only 18.78 cents in 1929. This is not difficult to understand when it is remembered that the cost of schools are separately reported in Table 8.

TABLE 7

*See note Table 4.

Table 8 following concludes the series of tables showing the anticipated property tax revenue, by giving the amounts for the school districts, including both the county levies made uniformly within each county and the levies made in each of the separate school districts. The share of the property tax dollar taken for school purposes increased from 27.95 cents in 1913 to 48.70 cents in 1929, the absolute increase being from $5,040,946 to $24,186,283. While all other divisions required a declining share of the property tax dollar, the schools alone required a much larger share. One reason for this condition is in part that the public schools depend almost entirely upon property taxes as their sources of revenue.

III. Expenditures for Schools

It appears from the foregoing analysis that the two public services which are responsible for the bulk of the governmental costs are education and highways. If savings are to be made,

TABLE 9

Expenditures for Education, State and Local, Unadjusted and Adjusted to 1913 Price Level, for Specified Years

Year	State Disbursements	Local Disbursements	Total Disbursements

Sources: Stated in text.

most of them must be made in connection with these two services. To indicate the total costs of these functions, the state costs and the local costs are brought together in Tables 9 and 13. The first of these indicates the growth of public expenditures for education, elementary, secondary and higher. The data are derived as follows: The anticipated property tax revenue for schools, as shown in Table 8, are taken as the

local expenditures. Probably the actual expenditures for elementary and secondary schools were higher than the figures given. For, although not all of the anticipated tax revenue was collected, the schools had other sources, such as the state general educational fund. The state disbursements are taken from Dr. Sowers' study mentioned above. The disbursements for each biennium are simply halved and each half used as the expenditures for one year of the biennium. The 1928 figures, for the first time, show a halt in the increase of per capita school costs, and then only in the adjusted costs is there an actual decrease.

In Table 10 following are seen the principal factors responsible for the increase in school costs. Briefly, they are as follows: More children, as indicated by the increase in the enrollment; costlier facilities, as indicated by the rising value of the school property per enrolled pupil; and more expensive instruction, as indicated by the higher average teacher's salary. The enrollment increased from 172,196 in 1913 to 256,134 in 1929, or 48.7%. This factor of increasing cost is not, of course, adjustable. The children are here and educational opportunities must be provided. The unadjusted investment value of school property per pupil, increased from $79.08 in 1917 to $236.81 in 1929, and the adjusted value from $46.99 to $171.35. Clearly the schools are better than they were. Are they better than the people can afford? The average unadjusted monthly salary rose from $78.32 in 1917 to $145.41 in 1929, and the adjusted salary from $46.53 to $105.21. Are these salaries too high—higher than necessary to provide the educational opportunities the people of Colorado desire to provide for their children? It is not a part of this study to present a brief for present school costs. But it is proper to call attention to the fact that both the investment values and the salaries in 1917 and for a few years thereafter were undoubtedly too low; the property values, because the war prevented the construction of necessary buildings; and the salaries, because of the common tendency of public salaries to lag behind the more sensitive prices of commodities. The result is that the rate of increase in both is made to appear greater than it really is. Such are the general explanations of the increase in costs of elementary and secondary education. And the explanations of the increase in the costs of higher education are similar, except that the increased enrollment is there to a much greater extent responsible for the increased costs. Dr. Sowers reports that the total student attendance at state educational institutions, reduced to a nine-month basis, increased from 3,521 in 1913-14 to 9,890 in 1929.

Source: Reports of State Superintendent of Public Instruction.

It is possible, indeed it is probable, that the costs of education could be materially reduced through more business-like administration. But to the present investigator time and resources are not available to make possible an intensive and extensive survey of educational administration efficiency. Such a survey should be made and would undoubtedly disclose many opportunities for economy without harm to the service.

It is interesting to note that the school expenditures for Denver, the school district for which the most complete cost

data are available, have increased less rapidly than for the rest of the state, as shown in Tables 11 and 12 following. The cost per pupil per year rose from $50.56 in 1913-1914 to $138.77 in 1928-1929. It is also interesting to note that the bonds issued during the years following the war, evidently for the purpose of "catching up" with the building program, delayed during the war, has produced a school debt whose interest payments will necessitate high taxes for years to come. Doubtless other school districts borrowed similarly, which for them also means high taxes for years to come. A decrease is shown for the last year.

Note:

Not included in above expenditures are figures for amount spent of money raised by bonds, nor does above table include amount expended for lunch room accommodation, the same includes only amount spent from current revenue.

Unless therefore a radical change takes place in the public attitude toward the public schools, it is evident that high taxes for schools will continue. There is all the more reason for making an extensive and intensive study of school financing and school administration for the purpose of securing for school purposes the full value of the school dollar.

IV. Expenditures for Highways

Second in rank of public expenditures for public purposes is the cost of highways. It is not necessary to explain at length

TABLE 13

Disbursements by State Highway Department and by Counties for Highway Purposes for Specified Years

Year	Highway Department	Counties	Total
1910	$40,353	--------	--------
1911	36,767	--------	--------
1912	--------	--------	--------
1913	461,165(a)	--------	--------
1914	301,274	$1,646,096	$1,947,370
1915	212,597	--------	--------
1916	623,133(b)	1,683,518	2,306,651
1917	720,993	2,276,876	2,997,869
1918	1,174,974(c)	--------	--------
1919	1,555,559(d)	3,653,637	5,209,196
1920	3,896,945	4,380,701	8,277,646
1921	4,053,853	5,134,965	9,188,818
1922	6,735,882	7,682,484	14,418,366
1923	5,453,446	6,795,745	12,248,191
1924	5,664,567	6,905,969	12,570,536
1925	4,567,089	5,427,449	9,995,538
1926	4,799,052	5,732,624	10,531,676
1927	4,164,805	6,522,967	10,687,772
1928	5,916,002	5,981,109	11,897,111

Sources: See text. Also see text for warning as to probable inaccuracy of data.

(a) From "internal improvement fund", where $490,000 had accumulated.
(b) Mill levy started in 1916 and also motor vehicle fees.
(c) Federal aid became available.
(d) Gasoline tax adopted.

why these costs have increased. The automobile made costly roads necessary. State supervision first, and state participation second, became necessary and new sources of revenue were tapped for highway purposes. Table 13 (page 30) shows the approximate expenditures for highways, though the data are incomplete and somewhat overlapping. The state highway department began with very modest expenditures in 1910. In 1913 an accumulated surplus from the "internal improvement fund" was made available . In 1916 the proceeds of a mill levy was authorized, but continued for a few years only. In 1918 federal aid became available, and in 1919 the gasoline tax was adopted. The data of expenditures for the highway department reflect fairly accurately the state costs for highways.

The county figures are probably not accurate, and the figures in the second and third columns should not be used for other purposes. For the particular purpose of showing, in a general way, the rapid increase in highway costs they are fairly adequate, since whatever error they contain may be presumed to persist. The figures for the years 1914, 1916, 1917, 1919, and 1920 are taken from the reports of the tax commission showing anticipated property tax revenue for county roads; and the figures for the remaining years, except 1928, from the reports of the state auditor showing county disbursements for highways. The figure for 1928 is taken from the Colorado Yearbook, based on data supplied by U. S. Bureau of Public Roads. Giving the figures such credence as they deserve for the present purpose, they may be fairly said to show that during the period covered the annual highway costs increased from considerably less than $2,000,000 to nearly $12,000,000, or by over 500%.

V. Other Expenditures

It is not possible, nor is it necessary for the present purpose, to elaborate in further detail upon the expenditures for other purposes. The services of education and highways not only have increased faster than the rest, in general, but they also account for nearly three-fourths of the total state and local expenditures. One more public function, that of charity, may be mentioned, since the data, though incomplete and not up-to-date, are available. Dr. Sowers found that the item of charities and corrections in the state expenditures rose from $1,319,824 or $1.56 per capita for the biennium of 1913-1914 ($659,912 or $.78 per capita for each year of the biennium) to $4,375,203 or $4.07 per capita for the biennium of 1927-1928 ($2,187,601.50 or $2.035 per capita for each year of the biennium).

The county expenditures for charity are shown in Table 14 following, which is derived from the reports of the Department of Charities and Corrections, now substantially abolished. The reports were admittedly incomplete and should be accepted with reservation, as they are probably useless for any purpose other than the present, namely to show the trend in the expenditures for charity and the variations in the costs among the counties, as is shown in Tables 15 and 16 following. The variations in per capita costs of the four services covered in the table, namely 1) relief at home, 2) county farm and hospital, 3) other hospital care and care of the blind, and 4) mothers compensation, suggest that many of the counties are too small units to carry on these services.

TABLE 14

County Expenditures for Charity for Specified Years, Total and per Capita

Year	Total Cost	Number Aided	Cost Per Case	Cost Per Capita
1917	$333,877	6,045	$55.23	$.42
1918	388,287	6,537	59.39	.49
1923	1,150,514	1,405	81.92	1.17
1924	1,254,312	18,731	66.96	1.26

SECTION II

REQUIREMENTS OF A STATE TAX SYSTEM

Human experience has yielded certain more or less definite conclusions as to the characteristics of a good tax system. So long as they are expressed in general terms there is very little disagreement about their validity. In this brief section it is merely attempted to list these accepted earmarks of a good tax system separately. It is understood that these requirements can not all be fully realized, since they involve conflicts with each other. For this reason the best tax system is necessarily a compromise. Some concessions must be made in some of the requirements, since otherwise, other requirements will be violated to the detriment of the entire system. The best combination of taxes is that which involves a net minimum of concessions to these conflicting requirements.

The first and greatest requirement of a state tax system is that the aggregate tax each taxpayer pays or bears must bear some reasonable relation to his net income. Whatever the basis for the imposition of the tax may be, whether property, income, business, production or sales, only one source exists out of which it may normally be paid, namely the taxpayers' income. It is, of course, possible for a time to require taxpayers who have no income, to pay taxes out of their capital, but that condition can not long continue, and it should not normally exist. What the precise relation between the aggregate taxes and the taxpayer's income should be, is in dispute. It is agreed, however, that the taxes should not be regressive—that is, the tax should not take a larger percentage of the poor man's income than it takes of the rich man's income, such as a uniform poll tax would do. Some argue that taxes should be proportioned to the taxpayer's income, such as the general property tax would be if all income were derived from property (which it is not), if all property were taxed once and once only (which is not the case), and if all property yielded income in proportion to its value (which it does not do). They argue that ability to pay taxes is proportional to the taxpayer's income. But the better opinion favors the view that taxes should be progressive —that is, they should take a higher percentage of the rich man's income than of the poor man's income. The precise degree of steepness of the progression, the rate at which the tax rate should increase as the income grows larger, is in dispute. That question depends upon diverse factors which need not be discussed here.

The second requirement of a tax system is really a corollary of the first, namely, that the tax sources should be so ap-

portioned among the political tax-levying units as to be proportional to the revenue required to defray the cost of the reasonably necessary public services. For example, if in a local school district there is a large number of children, but not sufficient property to yield the required revenue at a reasonable tax rate, some tax adjustment is desirable.

In the third place, the tax system must fit our dual form of government. Minor changes can be made and should, when necessary, be made in the federal statutes to reduce serious evils in the state tax system. Even the federal constitution may have to be changed if the state tax evils are serious and general enough. But, in the main, the federal laws must be regarded as permanent and the state tax system must adjust itself accordingly. Likewise, in framing or modifying a state tax system it is necessary to bear in mind that the forty-seven other state laws and constitutions are largely beyond the reach of the tax-adjusting authorities of Colorado.

In the fourth place, the tax system should be economical. The taxes should be collectible at a minimum cost to the public treasury; they should not involve the taxpayer in excessive labor and expense of computation and payment; they should not unnecessarily discourage business or cause it to migrate; nor should they lead to uneconomical business organization or practices in order to avoid the tax. The canon of economy in taxation (a different thing from the canon of economy in public expenditures and public administration) is very important and is sometimes overstressed and sometimes overlooked. A state, or a county, or a city, or any other political tax-levying unit, may be somewhat arbitrarily bounded in an economic sense; but it is necessarily an economic unit because both the raising of revenue and the spending of public funds inevitably affect every form of economic activity. Many forms of business are extremely, and all forms somewhat sensitive to the operations of the public treasury, whether revenue-raising or revenue-spending. Any one tax, as well as the entire tax system, and the particular form it may assume, should be judged in the light of its economic effects upon mobile business activities.

In the fifth place, the taxes should not be arbitrary in amount, as to time, or as to form of payment. The amount of taxes due should be known as early as possible. It should be based on definite external indices, and as little as possible left to the discretion of the tax officials.

In the sixth place, the taxes should be capable of administration. They should not run counter to the habits of business and living. They should not antagonize unnecessarily the prevailing sense of justice. For this reason a tax to which a people are accustomed is, other things equal, superior to one with which they are unfamiliar.

Finally, a tax system should not be framed or modified in ignorance or disregard of the economic effects of the imposition of taxes. Some taxes can not be shifted while other taxes usually are shifted. In framing or modifying tax laws so as to realize the desired relationship between taxes and income, it is the income after taxes (after the taxes have reached their final resting place) that is significant. For example, it is well known that certain unshiftable taxes are capitalized so that, for example, to present owners of the taxed property or present recipients of the taxed income, the tax is no burden. To increase unanticipatedly such taxes will seriously affect these taxpayers by way of reducing the capital value of their property or the annual value of their income. Conversely, to decrease unanticipatedly such taxes is equivalent to extending to the affected property owners or income recipients an undeserved bonus in the form of increased capital value of their property or annual value of their income. On the other hand, taxes that are readily shifted and whose burden is widely diffused may be raised or reduced with no such serious effects.

It is understood that no one tax need fulfill all, or perhaps any of these requirements, provided that the tax system as a whole does meet them, in substance. A regressive property tax, that fails to reach income from non-property sources, may be compensated as to its faults, by a progressive income tax. And these two, failing to exact any direct contribution from persons who have neither taxable income nor taxable property, may be supplemented by certain sales or consumption taxes, which latter, taken alone, would be objectionably regressive. And any one of these may be modified so as to conform to the requirement that the taxes must not unnecessarily depress the economic activities of the state. It is the experience of the various states that the best system consists of a moderate number of taxes, such as on tangible property, incomes, inheritances, business, and possibly sales or consumption rather than a single tax, on the one hand, or a great number of taxes on the other.

There are in use in American commonwealths today, a moderate number of taxes, each yielding in each state a varying percentage of the total revenue required. These combinations have been adopted because, at the time, they were believed to be capable of yielding the required revenue with the least attendant harm to business of all kinds and to the general welfare. But the economic conditions that determine which combination of taxes will result in a minimum of sacrifice vary from

time to time. Surveys and studies are now being made or have been made in practically every state, in some states several in recent years, to determine whether changed conditions necessitate a change in the tax system. It is the unanimous conclusion resulting from all of these investigations that changes are required. There is a remarkable unanimity in the reports of all these investigations in recommending certain taxes, namely, taxes on property, income, inheritance, business and sometimes certain sales taxes. There is not the same unanimity in the recommendations as to the form these taxes shall assume, or as to the percentage of the total revenue each of these taxes shall yield in each state. These variations are easily explained since the economic conditions that determine which form and emphasis of each tax are best in each state vary widely. The tax system of each state should fit the conditions, as a suit of clothes should fit the man, and as an accounting system should be adapted to the particular business using it.

In the following pages it is attempted to examine every tax now in use or possible for use in the state, in the light of the economic conditions of Colorado. It is the purpose to find, as far as possible within the limits of time and funds, the best combination of taxes for Colorado, and the best form and fiscal importance of each part of the system.

It is understood that it is not the purpose in evaluating these various taxes to advocate that they, taken together, should yield either more or less revenue than they now do. Only the voters can decide directly or individually, what the level of public expenditures shall be. But a burden of a given weight may be more easily borne if distributed among the various carriers in proportion to their strength. The analysis of the several taxes is made for the purpose of making the aggregate tax burden easier to bear, not for the purpose of proving that that burden should be either heavier or lighter.

SECTION III

THE GENERAL PROPERTY TAX

Having examined briefly the system of public expenditures, it is proper to examine in greater detail the revenue system which, in Colorado as in all other states, consists of two principal parts, each of which may be extensively subdivided. The first part is called taxes, and consists of such items as the general property tax, the inheritance tax, sales taxes, corporation taxes and business taxes. The other part consists of such forms of revenue, as special assessments, fees collected by the various departments of the government for specific services, fines, gifts, escheated property and earnings of the various public service organizations, as well as other sources, such as interest on investments. Taxes in Colorado, as elsewhere, are the most important part of the revenue, but the sources other than taxation are important because if they are properly fixed they can be made to furnish some part of the revenue necessary to meet the governmental cost. In so far as this can be done it is possible to reduce the amount that must be raised from taxes.

In Colorado, as in all the other states, the general property tax is fiscally by far the most important form of taxation. It assumes that all property is alike. All taxable property of persons or corporations is to be listed and appraised. Within each taxing district there is assessed an amount of taxable property which is subject to taxation within that district. Each district ascertains the amount of money it must raise for the current fiscal year in order to meet its governmental cost. The amount necessary as shown in the budget, or in what passes for a budget, is spread over the taxable property of each district. Hence, in Colorado as elsewhere, there are several tax rates or tax levies, each of which is uniform on all property within the district. The state, the counties, cities and towns, and the school districts each levy taxes on the property situated within their boundaries. Moreover, each of these levies taxes for several purposes. The aggregate rate at which any one parcel of property is taxed is therefore the sum of all the rates of all the districts in which it is situated.

I. Historical Development

The general property tax in the United States has had a long and varied history. The reason for briefly reciting this history is that many people believe that the general property tax has always been in use and must always continue substantially as it is. It has been in use in Colorado since the organization of the state. Hence many taxpayers have never known

any other form of taxation and believe erroneously that none other could exist. Other countries have at earlier times used something like the general tax. They have lumped together all of the taxable property for the purpose of ascertaining what portion of the tax each taxpayer should bear. However, at the present time no other country than the United States uses the general property tax. In other countries that have used the tax it has disintegrated into its constituent elements, of taxes on land, taxes on improvements, taxes on tangible personal property, and possibly taxes on intangible personal property. The same disintegrating process is now at work in the United States.

Property taxation is largely indigenous in the United States. The immigrants who have most definitely formulated the tax system in the various states were those coming from England. Those who in early colonial days came from other countries were fewer in number and less influential in formulating the tax system. At the time of Queen Elizabeth Parliament passed the act which is at the present time the basis for property taxation in England. That law provided that taxes should be levied on property. It did not say that all property should be lumped together into one sum and the taxes based on that sum. The English counties and cities to a large extent used their own judgment as to what should form the basis for taxation. However, court decisions and supplementary Parliamentary acts later limited that basis to the rental value of real property.

The early American settlers, especially in the New England colonies, were therefore familiar with the system of property taxation in England. They did not, however, copy that system outright. A system that was suitable for a well settled country such as England, probably would not have been suitable for the colonies that were widely scattered and sparsely populated. The colonists endeavored to formulate a tax system suited to the conditions under which they lived. Their developing tax system did not resemble the contemporary tax system of England. An early revenue act of the colony of Massachusetts did formulate the basis of the tax that was to be levied for colonial purposes. The basis of that tax consisted of three parts: First, there was the poll; second, there was the estate of the taxpayer; in addition there was a so-called "faculty" element which meant that persons having special ability to pay taxes by reason of having incomes from particular sources, such as attorneys, and others, should be "rated" thereon. The special ability which these latter persons had was given a value. The value of the poll, and the value of the property, and the value

of the special faculty, were then added together and on that sum was imposed, or was spread, the total taxes that had to be levied for colonial purposes. The local taxes for town purposes were levied at first almost according to the wishes of the people in the towns. However, soon the colonial government began to regulate the tax bases for the local town levies, which came then to have the same base as the colonial tax.

This early colonial composite tax has long since disintegrated into its parts. We have in many states still the poll tax. It is not an important source of revenue, and need not be considered here. The faculty tax also disappeared, or became a primitive income tax. There are still state income taxes that can boast a continuous existence and can be traced back to the colonial faculty tax. But for many years these income taxes were deemed futile and neglected, though not repealed. The property of the taxpayer was therefore left as the sole tax base.

It must not be supposed that these early taxes on property resembled very closely the current general property tax of Colorado and other states. They did in fact differ from the present tax in important respects. In the first place, only such property was taxed as was specifically mentioned in the successive revenue acts of the various colonies or states. These particular specified types of property were not always taxed at a uniform rate, and they were often "set" in the list at specific statutory valuations. The colonies had therefore, a series of specific property taxes, or, if being worthy of being called a tax system, a classified property tax. However, as both real property and personal property became more varied, it became difficult to specify in the law exactly the classes of property that should be taxed and the valuation at which a unit of each class should be appraised. Hence, it was found necessary to include in the revenue acts an omnibus clause which provided that all other property should be lumped together. This omnibus class of property gradually absorbed all other forms of property. Before the Revolution the revenue acts began to specify that all property should be taxed uniformly. Later one state constitution after another was amended so as to provide that all property should be appraised uniformly and be taxed at a uniform rate within each taxing district. At the time of the Civil War nearly all the state constitutions then in existence contained this uniformity rule, except in a few states which never placed any constitutional restrictions on taxation whatsoever. Beginning with 1873, however, there appeared a reversion, away from the policy of uniform taxation of all property. In that year Pennsylvania amended her constitution, so as to provide that property might be classified and taxed uni-

formly as to class. At the present time more than half of the state constitutions have been amended so as to permit classification of property for taxation.

Colorado became a state in 1876. At that time the practice of having the uniformity rule in the constitution was at its zenith. The Colorado state constitution therefore contains the same rule. In Article X, Section 3, we read: "All taxes shall be uniform upon the same class of subjects within the territorial limits of the authority levying the tax, and shall be levied and collected under general law, which shall prescribe such regulations as shall secure a just valuation for taxation of all property, real and personal." Such is the now notorious uniformity rule in the state constitution. We may therefore say that the general property tax is the constitutionally required tax in the state of Colorado. One other section of the constitution deserves quotation. In Article X, Section 2, we read: "The general assembly shall provide by law for an annual tax, sufficient with other resources to defray the estimated expenses of the state government for each fiscal year." This tax is the general property tax which is provided for each year by the legislature. It is in form a deficiency tax. It is expected to provide that part of the necessary revenue which is not provided for from other sources. In practice other sources have been unimportant even for state purposes. The deficiency tax, therefore, produces nearly all or at least the most important part of the total revenue. For local purposes, that is, for the revenue of the counties, the cities, the towns, and the school districts, the general property is even more important. It may be said therefore, that the general property tax is practically the tax system of the state of Colorado.

It is customary on the part of many students of the general property tax to say that it is an antiquated form of taxation, and that it is destined soon to disappear. Such statements are misleading if they are understood to mean that all property taxes will disappear, and that public revenue will be derived from other sources, such as income taxes, inheritance taxes, or possibly sales taxes. There is no tendency whatsoever for property taxation to become less popular or less used among the local divisions of any state. There is a distinct tendency, however, for the state government to rely less and less upon the general property tax. This tendency may be seen in Table 17 following. The average percentage of the total state revenue which was derived from the general property tax declined from 50.4% in 1918 to 21.1% in 1927.

TABLE 17

Distribution of States According to the Percentage of Their Total Revenue Derived From the General Property Tax for Specified Years

Percentage Groups	1918	1927
Less than 10	--	7*
10 to 19.99	--	11
20 to 29.99	4	14
30 to 39.99	8	11
40 to 49.99	8	4
50 to 59.99	14	1
60 to 69.99	10	--
70 to 79.99	4	--

Source: Financial Statistics of States, 1918 and 1927.

*In 1927 two states, Pennsylvania and North Carolina reported no revenue from the general property tax.

It can be said of the general property tax for local use, that it has produced the required revenue, and does so at the present time. As far as can be seen in the visible future some form of property taxation is destined to produce the bulk of the revenue for the local divisions. There does not, in fact, seem to be any other tax which the local division can administer than some form of property taxation. If other forms of taxation are to yield the revenue, it will be necessary for the state to administer these taxes and to retain the revenue or distribute it to the local units.

II. Tax Exemptions

The constitutional requirement that all property be taxed uniformly does not preclude numerous exemptions. Many state constitutions specifically exempt federal property, but such exemption is entirely gratuitous since no state could tax federal property anyway. The Colorado constitution also exempts all state and municipal property in Article X, Section 4. Section 5, granting other exemptions, reads as follows: "Lots with buildings thereon, if said buildings are used solely and exclusively for religious worship, for schools or for strictly charitable purposes and cemeteries not used or held for private or corporate profit shall be exempt from taxation unless otherwise provided for by general law." In the same Article, Section 6, it is stated

that all laws exempting from taxation, property other than that provided in Section 5, shall be void. The general assembly, however, by law of 1872, has provided that all ditches used for purposes of irrigation and where the water is not sold for the purpose of deriving a revenue therefrom are exempt from all taxation. Also the legislature by law of 1911 provided that the increase in value of private land, caused by the planting of timber thereon, other than fruit trees and hedges, shall not for a period of thirty years, after date of planting, be taken into account in assessing the land. At the end of thirty years, however, and in the event of the maturity of the timber before the thirty years, the value of the timber shall be accounted for in taxation. Again in the law of 1915, the assembly has authorized the Colorado tax commission to rebate the taxes levied against all real and personal property of any county fair association used for the purpose of a county fair. Apparently the restriction in Section 6 has not been violated in these later exemptions. The constitution also grants an exemption of personal property to every person being the head of a family to the value of $200. By law of 1907, the legislature exempted parsonages to the extent of $3,000 from taxation. This law, also, apparently has not been contested.

The amount of tax-exempt property in Colorado is large. Just how large, no one can tell. By law of 1913, the assessors are required to make a tax schedule of all properties, personal and real, exempt by law, which is to be entered in the same detail as required for the assessable and taxable property. Apparently the assessor pays no attention whatsoever to this law and no appraisal is made of exempt property. The state board of immigration, however, in the Colorado Year Book for 1928-1929, has presented a table in which it endeavors to show how much property in the state is exempt from taxation. The figures given, at best, can be only estimates, and they are probably relatively over-estimated in view of the fact that taxable property is ordinarily returned at less than its full value. The table, somewhat rearranged, is given here as Table 18 following, not so much for the purpose of showing the actual amount of each kind of exempt property, as for the purpose of presenting the various kinds of property that are exempt. As will be seen, the majority of the items or at least the largest items are federal property which the state has no power to tax. The only way in which the difficulties, if any, arising from this exemption could be remedied, would be through such influence as they might have upon the federal government in disposing of this property, or in granting federal aid for, say, highway purposes. It will be seen that the other items, though large in the aggregate, are not in any one case, except that of the state property,

very large but quite varied. It is probably not true that the tax rates could be reduced to any appreciable extent through making some of the items of property now exempt taxable, but the magnitude of the amounts of exempt property calls attention to the danger in extending tax exemptions further. If the tax base is continually nibbled away, the rates will be increased.

TABLE 18

Property Exempt from Taxation in Colorado 1928

Class of Property	Estimated Value
Federal property:	
Unappropriated federal lands	$11,575,681
Federal coal lands	732,246,800
Federal reclamation projects	11,000,000
National forests	70,000,000
Federal shale land	47,612,950
Federal shale reserves	3,878,000
Federal oil reserves	2,189,000
Federal buildings	27,400,000
National parks and monuments	1,590,000
Federal power, water, and reservoir reserves	25,000,000
Total federal land	932,492,431
State and local public property:	
State property	217,297,610
Municipal property	59,950,000
County property	8,932,000
Public schools	58,043,117
Total state and local public property	344,222,727
Private property:	
Colleges and universities (private)	4,755,646
Churches and rectories	26,646,456
Hospitals	12,000,000
Cemeteries	2,000,000
Fraternal organizations	10,000,000
Miscellaneous charity organizations	3,000,000
Irrigation works	90,000,000
County fair associations	1,000,000
Federal land filed upon but not patented	3,120,000
Miscellaneous	5,000,000
Total private property exempt	157,522,102
Total exempt property	1,434,237,260
Taxable property (assessed valuation)	1,577,560,380
Percentage exempt of all property	47.6%

That there is danger in excessive exemptions from taxation was clearly realized by makers of the state constitution. They inserted a provision that all laws, granting exemptions other than those specifically mentioned are void. Before exemption is granted there ought to be good reason for doing so. What, then, is a good reason for exempting property from taxation? There ought to be some distinct public service rendered, some service that the state would otherwise have to render, either solely or to a greater extent than it now does. Exemption is proper if taxing any exempt properties hampers the organizations rendering these public services in performing their functions. Whether or not in any given case there is a public service will depend of course, upon the appraisal which people have made of the services of the exempt institutions. There are wide differences of opinion as to whether, for example, religious property, or property used for religious purposes should be exempt. The same differences of opinion prevail as to whether co-operative organizations or even certain charitable and fraternal organizations should be exempt. It does not appear that the permissive exemptions granted in the constitution are excessive. Any danger from the increasing exemptions seems to emanate rather from the state courts. There are two schools of legal thought respecting tax exemption, one favoring a liberal, the other a strict construction. The liberal construction appears to prevail in Colorado though rarely observed elsewhere. It seems that if the court can possibly find an excuse for permitting exemptions it will do so. In states where strict construction is the rule, an exempt institution whose property was not directly used for an exempt purpose would not be exempt, as to such property merely because the income from it was devoted to an exempt purpose.

III. The Problem of the Uniformity Rule

The provision in the state constitution which requires all property not exempt to be taxed at the same rate within each taxing district is equivalent to an assumption that all property is alike, or that it may be treated as if it were alike for taxation purposes. This is perhaps the most fundamental fallacy in the theory of the general property tax. It is a convenient prevailing practice to divide all property into three classes, namely, real property, tangible personal property, and intangible personal property. Each of these three classes differs fundamentally from the two others, and within each class there are numerous items which differ from others within the class. In treating these items uniformly the taxing authorities encounter certain almost insoluble problems.

In case of most intangible property we have a representation of tangible property which has already been taxed in full, presumably. Most of the difficulty in the taxation of intangibles springs from the fact that the concept of property is not clear. There is in most states thrown into the general mass of all taxable property such unlike things as a parcel of real estate and the mortgage that is owed on it, the corporate property and the stocks and bonds representing that property to the share holders, bank deposits representing property, such as merchandise or manufacturers goods in stock, which has already been taxed without deduction of the debt. Such widely different things can not be assimilated into a mass that can be subjected to uniform taxation.

There are two possible consistent ways in which to use the term property for purposes of taxation. Each of these, if followed consistently, will reach all property once and only once. If in the tax law they are confused, some property may be reached more than once, or perhaps not at all.

One way is to think of property as the tangible goods, such as land, fixtures, machinery, livestock. Every tangible thing worth anything is owned by somebody, though it may not be in the possession of the owner. If the tax is based on the tangible property solely, all property will (or can be) taxed once and once only. By this method any indebtedness against tangible property is ignored and the owner will be taxed on the full value of his holdings of tangibles though his equity therein may be negligible.

Another way is to think of the interest or equity in these tangible things. From the assets of each taxpayer are deducted his liabilities. His taxable valuation would then be his net worth, as the bookkeeper finds it. Since debts allowed against assets to one taxpayer would be assets to the creditor, all property would (or should) be reached once and only once; and the aggregate assessed valuation by this method should be the same as by the former method, except that it would not be assessed in the same amounts to the same persons by the two methods. And since the creditor and the debtor might live in different taxing districts the assessed valuation in the different tax districts would not be identical by the two methods.

Colorado, like all other states, has not followed either method consistently. The lack of consistency did not produce serious results in the early days of the state when nearly all property was tangible and the tax rates were low. But these conditions no longer obtain. The particular confusion in Colorado may best be shown for each of the three classes of property separately.

First, in connection with real property the first method is followed consistently in Colorado, while in most of the other states it is not. The revenue act of 1902, defining taxable property, includes all real estate (not exempt as provided) but provides that "where any property within this state is mortgaged, conveyed or pledged for the security of a loan or debt then owing, the said property and the notes, mortgage, deed of trust, trust deed, contract or other conveyance, shall be assessed as a unit, and as one and the same, and as of one value and as the value of said property so mortgaged, pledged or otherwise conveyed only, and any such notes, mortgages, deeds of trust, trust deeds, contract or conveyance, shall not be otherwise returned or assessed." Thus, in very labored language, the legislature provided that real property should be assessed and taxed without deduction for debt, and that the debt thus secured should be exempt.

In the case of Washington County v. Murray, 71 Colo. 522, this provision was attacked as unconstitutional on the ground that it exempted mortgages in violation of the constitution. But the court held that to tax both the tangible property and the mortgages, would be double taxation and that not to tax the mortgages did not constitute an exemption. In upholding this statute the court held contrary to the rulings of the courts in other states in cases involving similar issues; but in so doing it did well. It is unjustifiable double taxation to tax real property without deduction for debt and to tax also the debt thereon.

This part of the revenue act of 1902 which in effect exempts domestic real estate mortgages is good and should not be changed. In support of this conclusion it may be indicated what the alternative methods are and would lead to. If the mortgages were required to be taxed, in addition to the taxes on the unencumbered value of the tangible property, at the local ad valorem rate, it is as certain as anything human can be, that such a tax could not be enforced with such administrative procedure as the people will tolerate. For, the tax on the mortgage, being in addition to the tax on the full equity in the property, must be a tax on personalty. As such it could be taxed only to Colorado residents. With the tax rates mounting to 3, 4, or 5 per cent Colorado residents could not afford to hold the mortgages and pay the tax. Such Colorado residents as held the mortgages would evade the tax by not listing them. In any case, there would be practically no revenue from such a tax. Such is the experience of all states that have tried to tax mortgages as personal property.

Another alternative would be to declare, by whatever statutory provisions necessary, the mortgage on real property to be an interest in real property and thus taxable at the situs of the real property rather than at the domicile of the holder. Then the mortgagee and the mortgagor would each be taxed on his equity in the property. Such a tax could be administered. But it would merely split up the assessment between the mortgagee and the mortgagor. It would necessitate two assessments instead of one. States that have tried this method have found that the mortgagor would always contract to pay the tax on the mortgage as well as the tax on his own equity. And if by law the mortgagor should be forbidden to pay the tax on the mortgage, he would have to pay at least the equivalent in the form of higher rate of interest on the mortgage debt.

The disadvantage of the present arrangement is of course that the owner of mortgaged property may be paying taxes on a valuation in excess of his net worth. But there appears to be no practical remedy for that condition. And if the property tax is properly conceived there is no serious objection to that condition. The mortgaged property is situated in the district, just as is the unencumbered property. Both are presumably equally effective factors in the business activities of the district. The public revenue furnished by each should be equal, regardless of who pays the tax. Both require the same governmental services. The taxes on fixed property can usually not be shifted and constitute a fixed charge on the property, and as will be explained later, they reduce the value of it proportionately. They are in effect necessary apportioned operating costs, since their payment is a condition of continued possession and use. Taxes on real property in Colorado, are, as they ought to be, taxes in rem. It is a mistake to argue that such taxes should bear any necessary relation to the personal circumstances of the owner.

Another alternative is to adopt the classified property tax for mortgages, giving them in form or in effect a low tax rate. But that method brings difficulties in its train, especially in connection with the taxation of banks. It is, in any event, a compromise and unsatisfactory. It will be discussed later in this report in connection with bank taxation.

In taxing mortgaged personal tangible property the result is nearly the same, the revenue act of 1902 exempting mortgages extends to chattel mortgages; in fact the term in ordinary language is "secured debts" for all mortgages. Personal property mortgaged is therefore not treated differently for taxation than unencumbered personal property. No deduction is

allowed, properly enough, for debts against tangible personal property. Whether all forms of tangible personal property should be taxed is doubtful, but that question will be raised later.

Thus, one very important class of intangible property is exempt. And the same is properly true of another perhaps equally important class, namely shares of stock, except bank stock, in corporations, both foreign and domestic, which are by administrative interpretation held to have no value apart from the property of the corporations represented by the shares, which has presumably been fully taxed. Here again, Colorado differs from most of the other states, most of which usually require foreign and sometimes domestic shares to be taxed as property to their holders, and again Colorado is right in its position. Such shares, except the shares of banks, to be discussed specifically later, are not required to be listed. What is left subject to taxation of intangible property, after the two important categories of secured debts and corporate shares have been excluded, includes money and bank stock, bank deposits, credits, book accounts, notes, bonds, special privileges and franchises and miscellaneous.

From the sum of his taxable intangible assets the taxpayer may deduct his debts, provided that deductible debts do not include insurance premiums due, debts due on subscriptions for stock, liabilities as surety for another, debts incurred for purchase of exempt securities, or fictitious debts. The object of the restrictions is evidently to permit only bona fide debts to be deducted and such only as are representative of taxable property presumably taxed. As a further safeguard against abuse of the privilege of deduction the taxpayer is, or may be, required to furnish a list of debts for which he claims deduction. If we accept as proper the taxation of any representative intangibles, there can be little objection to the tax on intangibles of Colorado, except that the two most important categories are exempt.

But, both as a matter of principle and of administrative practicability, it is very doubtful whether intangible property, certainly such parts as are merely evidence of interest or equity in tangible property, should be taxed as property. That question can best be settled finally when we examine the administration of the taxes on the various forms of intangible property. For the moment it is necessary to confine ourselves to a discussion of principle.

Owing to the fact that certain intangibles are taxable and that the deduction of debts is permitted only against these taxable credits, it is inevitable that many will pay taxes upon intangible property in excess of their net worth. Such will be the case with those whose assets are largely tangible, for their intangible liabilities may exceed their intangible credits. They may not have sufficient debts to cancel their credits. At first blush it may seem improper to hold that to tax such a taxpayer on the excess of his assets over his liabilities is objectionable while it is not objectionable to tax the holder of tangibles in excess of his equities. Yet, that position is the only logical one to take if the property tax is a tax against the things as such rather than against the person as such. Such is the position taken by the Colorado Statutes, by Colorado courts, and by Colorado tax administrators with reference to secured debts and shares of corporate stock. Why do they not follow the same course consistently with reference to other intangibles? The answer is no doubt in part that the issue has never been squarely presented.

There is really very little difference between secured debts and corporate stocks, on the one hand, and the rest of what is called intangible property on the other. If one class is deserving of tax exemption they all, or substantially all, are so deserving. For they all, and not merely the two first classes, are merely representations of equities in tangible property already taxed without deduction of debts. That such is the nature of substantially all intangibles is not as easy to show as it is to show that secured debts and corporate stocks are such representations. It will be shown, as convincingly as may be, later in this report, when the fiasco of the administration of these irrational property taxes on intangibles is surveyed. For the moment it is enough if the doubting reader is willing to grant that, in case these intangibles are substantially all shown to be merely such representations of equities in otherwise fully taxed tangibles, then they should not be taxed as property if discriminatory double taxation is to be avoided.

We should be fully aware that the argument for complete exemption of all intangibles places us in a position at present unpopular. Driven to the ultimate conclusion we would seem to be defending the proposition that the home owner, the farmer, the merchant and manufacturer, in short the owner of any tangible property, should be taxed thereon without deduction for his debts, and that the wealthy owner of intangibles should not even be taxed on the excess of his credits over his debits. But that is really not the position that has to be defended. The contention is that tangible property should be taxed as such for three reasons: First, tangible property alone produces an income, (which is different from saying that only tangible prop-

erty yields an income). One can grow wheat or alfalfa on a farm but not on a mortgage. He can produce rubber goods in a factory but not on the corporate shares of the corporation operating the factory. Second, as shown above, the tangible property, being one of the factors of a community should contribute to the public treasury equally, regardless of whether it is free from debt or encumbered. And, Third, to tax tangibles without deduction for debts is, as the experience of all states shows, the only practical way of taxing property. Intangibles, on the other hand should not be taxed as property for three equally good reasons: First, they do not produce, though they may and usually do yield an income. Second, as accepted in Colorado for secured debts and corporate stock, the tangible property they represent has presumably been fully taxed. And, Third, as will be presently shown, all administrative attempts to tax such intangibles as property at the prevailing ad valorem tax rates are either as futile as the rain-making of charlatans, or, in the few cases where they are effective, are productive of such monstrous inequalities that they ought to be abandoned.

But to contend that intangibles should not be taxed as property is not equivalent to contending that the rich owner of securities and other credits should not be taxed. He cannot, and should not be taxed with respect to his intangibles as property. There are, however, other and more effective ways to reach him. And such other ways will be suggested in a later section of this report. And it is well to bear in mind that not all intangibles are held by rich persons, and that the present notorious property taxes on intangibles, while they inevitably permit the rich usually to escape, do often apprehend many poor and of moderate means, and inflict upon them such burdens that the state ought not to tolerate them.

IV. The Effectiveness of the Assessment

The assessment of the general property tax, as indeed of any tax on property measured by the value of the property, is the pivotal part of the taxation procedure. If the assessment procedure is faulty, no corrective device can assure a proper apportionment of the tax burden, even as contemplated in the law.

The test of the effectiveness of the assessment is double. First, it includes a complete listing of all the taxable property. Second, it includes a full valuation of the property listed. In some classes of property such as land and buildings, it is next to impossible to escape listing, but the valuation is difficult. Therefore land and buildings escape from taxation, if at all, chiefly through undervaluation. On the other hand, certain

other kinds of property, such as money and credits, are difficult to find, but are ordinarily easily appraised. When money and credits escape taxation, as they almost invariably do, it is usually due to the failure on the part of the assessor to list them for taxation. In analyzing the escape from taxation it will be convenient to consider separately the three classes of property, namely real estate, tangible personal property, and intangibles.

A. Real Property Assessments

Both for the purpose of appraising real estate for taxation, and for the purpose of testing the appraisal, the market value of property is the best criterion. The law, in fact, requires that all property shall be assessed at its "full cash value". In most of the counties of the state the assessors do not always accept the market value as the basis for the appraisal. They do, as a matter of fact, often attempt not to vary the real estate values from one year to another. This, of course, is in violation of the law. In Denver, and to a certain extent in other large cities of the state, the assessor secures records of bona fide sales in different parts of the city and on those records he bases his valuations of the land and, to a large extent, of the buildings thereon. Away from the large cities, ordinarily no systematic records of the sales are kept by the assessors, and the appraisal is made more or less as a matter of guess work, except in so far as the value is deliberately kept the same from one assessment year to another. The result is that there are great inequalities not only among the individual properties within each tax district, but in the average ratio of assessed to true value between counties.

1. The Assessment Ratio

Colorado is like all the other states in that the average assessed value of taxable real property is considerably below the legally required "full cash value". The reason is obvious: Pressure of every kind is brought to bear upon the assessor to reduce the assessed valuation; and there is no corresponding upward pressure. The result is that the assessors yield to the one-sided pressure and the average assessed value tends year after year to fall farther and farther below the "full cash value". There is one strong business reason why the assessor yields to the downward pressure. If the average assessed value, expressed as a percentage of the "full cash value", in one county exceeds the corresponding average assessment ratio for the entire state, the property of that county will bear a disproportionately large percentage of the state property tax. Hence the assessors feel to some extent moved to engage in a

competitive undervaluation for the purpose of saving money to the property owners in the county. Among the various owners of the taxable property of each county there is the same competitive undervaluation. For if any one taxpayer's property can be assessed below the average assessment ratio for the county, he will pay less than his proportionate share. And the local property taxes are much higher than the state property tax.

For these reasons every assessor is constrained to seek for his county an average assessment ratio, not at 100% of the "full cash value", but one that is at least not higher than the average assessment ratio for the state. The very real practical necessity for each assessor to "keep his valuation in line" makes it impossible for any one zealous assessor to comply with the law.

It is estimated by the respective taxing authorities, and reported by the Bureau of the Census in "Financial Statistics of States", that the average assessment ratios for the various states range from 15% to 100% of the full value. These estimates of the assessment ratio are based chiefly upon statements made by the respective tax commissions. But these state commissions, since they are charged with enforcing a 100% assessment of all taxable property, are obviously not in a good position to confess to having permitted anything less. Thus the Colorado estimate of the assessment ratio is 100%. Yet all the evidence goes to show that, while many individual items of property are obviously assessed at 100% and even far above, the average assessment ratio for Colorado is far below the "full cash value".

Now the continued pressure for undervaluation, though in direct violation of the law, would not be a serious matter, except for two reasons. First, the undervaluation is uneven in the several counties, and for individual items of property within each county. That such is the case will be shown in the following paragraphs. In the second place, as soon as the assessor departs from the legal "full cash value" as his criterion, he is at sea, not knowing what assessment ratio to use as his criterion. For while everybody admits that the average assessment ratio for the state is less than 100% of "full cash value", no one knows how far below it is. The failure, therefore, to enforce a 100% assessment ratio introduces an additional element of guess work into the already difficult process of assessing property.

True it is that a 50% assessment ratio might serve nearly as well if it were legal. Some states have in fact legally required the assessed value to be some percentage of the full value, less than 100%; and a few of them still do so. Until 1913 Colorado did in fact require the assessed value to be one-third of the full cash value. In requiring a 100% assessment ratio in 1913 Colorado did well. For there is no merit in using a lower percentage; and in doing so there is some demerit in that it unnecessarily complicates the assessment procedure.

The essential desideratum in the assessment ratio is that, whether it is at 100% of "full cash value" or some lower percentage, it should be uniform for all property. This fact is usually recognized by the courts, both federal and state. Thus in the case of A. T. & S. F. Ry. Co. v. Sullivan, 173 F. 456, 461, it was held that "a systematic, intentional, under or over assessment of one or more classes of property in violation of law, the inevitable effect of which is an unjust discrimination in taxation against the property of complainant and property similarly situated, will sustain a suit for the unjust part of the taxes thus levied." Similar decisions have been rendered in federal courts elsewhere, and the state courts must respect these federal decisions. They serve well as an interpretation of the law. But the problem of determining what is "the unjust part of taxes thus levied" still remains. Relief from relatively excessive assessments cannot be a judicial, but must be an administrative procedure. And adherence to the legal "full cash value" will facilitate such relief or, better still, will eliminate the necessity for such relief.

2. Inequalities in the Assessment

In a number of states very careful and elaborate analyses of assessments have been made by public agencies. The assessments have been checked by means of extensive lists of sales records of bona fide sales, where the fair consideration of the transfer is stated. Unfortunately in Colorado no public authority has done so, except the assessor in a few counties, as already stated, and no appropriation has been made whereby such public authority might obtain a list of bona fide sales records for use as a guide in making the assessment and for the purpose of checking the assessment when once made. Such limited investigations as have been made show wide variations in the ratio of the assessed value to the sales value, and therefore demonstrate unjustifiable inequalities in the local taxes of different properties in the same district, as well as in the tax for state purposes among different counties. And these discrepancies in the assessment ratio occur also when the assessed value is compared with the owner's own estimated value.

Thus in a study made by Whitney Coombs, L. A. Morehouse, and Burton D. Seeley, of which the results are published in Bulletin 346 of the Colorado Agricultural Experiment Station, September 1928, entitled "Some Colorado Tax Problems" are shown very wide discrepancies in the assessment ratio, among individual units of property. On page 41 of this study it is shown that in 1920, for example, in northern Colorado, of 262 cases, the lowest ratio of the assessed value to the owner's valuation was 18%, whereas the highest ratio was 129.3%, the average ratio being 52%. On the same page, for the year 1925, it is shown that in four districts in Colorado, of 420 records, the assessed value amounted in one case to 531.6% of the owner's valuation, whereas in the case having the lowest ratio, it amounted to 14.6%, the average being 61% for all the districts.

The assessment ratios cited in the foregoing paragraph deal with agricultural real estate. The case is similar with respect to urban property. On page 33 of the same study it is shown that in 1920, of 198 cases, the assessed valuation varied from 13.3% of the owner's valuation to 232.9%, the average being 65.2%. In 1926, of 205 cases, it is shown that the assessment ratio varied from 16.9% to 232.9%, the average being 63.6%.

In the aforementioned study the comparisons were made between the owner's estimates of valuation and the assessed valuations because sales records did not exist for the purpose of that study. Local and limited studies have been made comparing the assessed value to the sales value, and the results are not very different from those indicated above. The discrepancies they show are between individual items of property and no comprehensive attempt has been made to determine whether any wide discrepancies exist as between counties. In an elaborate study now being undertaken by a group of public utility corporations, it is attempted to obtain assessment ratios for real property, both urban and rural, in the entire state. This study is not yet complete, but such examination of the preliminary figures as can be made, warrants the conclusion that the average assessment ratio to the sales value of bona fide sales is about 60%. The lowest average for any county on both urban and agricultural property is about 30%. The highest ratio of assessed to sales value, expressed as the average for any county, is about 130%. The Combs-Morehouse-Seeley study shows, and the above mentioned study now in progress indicates very clearly that there are wide discrepancies in the ratio of assessed to "full cash value" not only among individual properties, but also among the average assessment ratios in the different counties.

For the purpose of showing that the condition in Colorado is not greatly different from the condition that prevails or has prevailed in other states, tables are presented herewith, showing the discrepancies in the assessment ratios in other states. Thus for Kansas a study made by Professor Englund of the

study made in Kansas is that it covers individual properties. The group of corporations making the aforementioned study in Colorado are not greatly interested in individual variations. They are interested in variations between counties and in the average valuation for the state as a whole, for the purpose of showing that other property is being relatively under-assessed whereas their own property, is being relatively over-assessed.

Table 19 (Page 57) presents the variations in the assessment ratios of 1,140 items of farm real estate and 1,954 items of city real estate in Kansas for the years 1921 and 1922. It is shown that 39 parcels of farm real estate and 127 parcels of city real estate were assessed at less than 35% of the sales value, and that 37 parcels of farm real estate and 155 parcels of city real estate were assessed at 115% or more of the sales value.

Table 20 (Page 58) presents the assessment ratios of farm real estate in fifteen Kansas counties during the period from 1913 to 1922. The purpose is to show that there is a strong tendency for the smaller or less valuable parcels to be relatively over-assessed, while the larger or more valuable parcels are relatively under-assessed. Thus for all the groups it was found that the average ratio of the assessed value to the sales value was 65.6%. But the average ratio for the group of the smallest or least valuable parcels was 85.7%, while the corresponding ratio for the group of the largest or most valuable parcels was only 58.7%. This tendency doubtless operates in Colorado as well. But before it can be corrected the necessary data will have to be accumulated somehow. In Kansas this tendency to regressive assessment is shown in all the counties. Doubtless it is even more striking in Colorado than it was in Kansas.

In Table 21 following are shown similar regressive discrepancies in the assessment ratios of city real estate in sixteen Kansas counties for the years 1913-1922. The only respect in which the city real estate assessments differ from those on farm real estate, as shown in Table 20 above, is that the average ratio is higher, being 73.3%, while that of farm real estate was only 65.6%. It is probable that these regressive discrepancies are also found in Colorado city real estate assessments. Whether or not city real estate tends to be assessed at a higher percentage of the "full cash value", as Tables 20 and 21 (supra) show to be true for Kansas, cannot be proved until the necessary data have been accumulated. But the experience of the other states suggests that it is the prevailing practice to assess urban real estate relatively higher than farm real estate.

An investigation made under the auspices of the 1928 special tax commission of North Carolina, in its report on page

In a very careful and elaborate study, entitled "The Tax System of Iowa", made by Professor Brindley and Miss Zorbaugh, published in 1929 as Extension Bulletin No. 150 of the Iowa State College of Agriculture, similar discrepancies in the assessment ratios are shown, both for agricultural and urban property. Of 2,150 transfers of farm real estate, it was shown that 28 were assessed at 25% or less of the true value, whereas 3 were assessed at over 100% thereof. Of 1,305 urban properties, 5 were assessed at less than 10% of true value and 54 at over 100%. It would be possible, were it necessary, to present similar records of other states showing similar discrepancies. The data for Iowa are shown in Tables 23 and 24, respectively.

B. Tangible Personal Property

In case of tangible personal property the inequalities in the assessment are chiefly due to a failure to list the property. Great amounts of certain classes of personal property are not listed by the taxpayer, nor are they found by the assessor. A few examples of escape will suffice. The examples must be incomplete because in the nature of things there is no inventory of the property that escapes listing.

1. Personal Effects and Household Goods

Consider the items of watches and clocks. Table 25 following shows the number and assessed valuation of these items of personal property from 1919 to 1929 inclusive. The number of persons per watch or clock was 30.9 in 1919 and 60.2 in 1928. If we assume five persons to the family, the figures would indicate that only one family in 6 in 1919, and only one in 12 in 1928, possessed a watch or a clock. Comparisons may be made for other items of personal effects with similar results. The taxation of such forms of property is so much a farce that it would be better not to tax such items at all.

TABLE 25

Number Assessed and Valuation for Specified Years of Clocks and Watches, Total and Per Capita

Year	Number	Valuation	Persons for Each Watch or Clock
1919	29,470	$483,681	30.9
1920	26,615	478,515	35.3

The case is no different with household goods and similar forms of personal property. And it would do but small harm if all such property were exempt. The Colorado experience as well as that of other states indicates that the assessment of household goods is annoying to the taxpayer. The assessment

is inadequate because it is not possible to induce all the assessors to take it seriously. The assessed valuations of household goods, expressed as totals, as percentage of total valuation, and per capita, are shown in Table 26 following. To exempt household goods from taxation would do but little harm since it is probably widely distributed, and in roughly the same proportion to the taxes people would pay under an adequate tax system. Moreover such property has a use-value only and yields no money income with which taxes can be paid. Furthermore if household goods and personal effects were exempt the troublesome constitutional family exemption of $200 could be abolished. It should be abolished in any case.

Department of Agriculture. Nevertheless livestock is probably better assessed than almost any other tangible personal property. Hog raising is a seasonal industry, and on April 1, there is probably a minimum of swine on farms.

That the undervaluation prevails also for other kinds of livestock is suggested by Table 28 (Page 66). Moreover, if the estimates of the Division of Crop and Livestock Estimates are correct, the percentage of undervaluation is on the increase.

That escape from taxation occurs in case of other livestock is indicated by Table 29 following. The Bureau of the Census reports only stock on farms. Hence the figures for all cattle and for sheep are not exactly comparable.

TABLE 29

Assessment of All Livestock for 1925 and 1928

*Includes range cattle and cattle fed in transit.

**Includes sheep fed in transit.

That the assessors were not equally successful in finding all the swine in all the counties may be seen from Table 30 following, showing the variations in the percentages which the assessed swine were in each county of the number estimated to be in each county by the Department of Agriculture. The variations in the percentages may be more readily seen from the frequency distribution shown in Table 31 following.

Over 100	--	1

*In most of these counties no swine were assessed.

3. Motor Vehicles

Motor vehicles constitute an important type of personal property. In general, in Colorado as in other states, the assessors probably try more carefully to assess such property than any other personal property. Table 32 following shows the total number of automobiles registered and the number assessed each year for the period 1919 to 1929, inclusive. The ratio of the number assessed to the number registered ranged from 72.5% in 1919 to 77.7% in 1927, with a decline to 76.3% in 1929. The table also shows the very interesting fact that the average assessed value declined from $421.83 to $231.75 during the period.

TABLE 32

Number of Automobiles and Trucks Assessed and Registered, Total and Average Assessed Valuation, and Ratio of Assessed to Registered, for Specified Years

Year	Number Assessed	Assessed Valuation	Average Assessed Value	Registration of Automobiles and Trucks	Ratio of Listed to Registered Automobiles and Trucks
1919	75,995	$32,056,805	$421.83	104,865	72.5%
1920	95,579	46,210,870	488.08	127,549	74.9%
1921	110,098	50,842,323	461.70	145,784	75.5%
1922	121,367	43,667,262	359.79	162,328	74.8%
1923	141,092	40,956,676	290.28	189,020	74.6%
1924	163,194	43,328,095	264.90	213,333	76.5%
1925	178,985	47,239,978	265.39	240,179	74.5%
1926	195,884	45,978,402	235.86	253,299	77.3%
1927	208,803	48,040,996	234.61	268,492	77.7%
1928	218,829	47,496,745	217.87	283,994	77.0%
1929	230,991	53,531,256	231.75	302,461	76.3%

Source: Reports of Colorado Tax Commission and Colorado Year Book.

There are wide variations in the ratios of the assessed to registered vehicles among the counties, as shown in Table 33 following. The highest ratio was found in Pitkin county, namely 91.2%; and the lowest in Archuleta county, namely 58.1%. This is a ten-year record and it is not very creditable. It should be remembered that the figures are 10-year averages. As is always the case in averages, the variations within each county tend to disappear. Hence the actual variations, year by year, are doubtless considerably larger than shown in the tables.

Source: Table 33.

The preceding samples of inadequate assessment of tangible personal property should suffice. More could readily be adduced, covering other forms, but it is not necessary. The conclusion is amply warranted that the assessment is very poor. Remedies will be suggested in a following subsection.

C. Intangible Property in General

In the assessment of intangible property evasion of the tax law is practiced most elaborately. And in connection with the

assessments of intangibles the wildest imaginable statements are made of escape from taxation. It is contended that hundreds of millions of dollars escape the tax roll. No one knows how much escapes, but very little gets on the tax roll. Table 35 following shows the assessed valuation of money and credits, including bank deposits, but not bank stock, for the years 1913, 1921, 1925, 1928, and 1929. The amounts assessed are ridiculously small, whether considered as totals, as percentages of the total assessments, or as per capita assessments. Thus for 1928 the total assessment of money and credits was $16,589,782, or 1.05% of the total assessment, or $16.20 per capita. The assessed valuation of money and credits is shown by counties for 1928 and 1929 in Table 36 following; and the distributions of the counties according to the percentages the assessed valuation of money and credits were of the total assessed valuation, and according to the average per capita assessments of money and credits, are shown in Tables 37 and 38, respectively, following.

TABLE 35

Total Assessed Valuation and Assessed Valuation of Money and Credits for Specified Years

Year	Assessed Valuation		Percentage Money and Credits Are of Total Valuation	Money and Credits Per Capita
	Total	Money and Credits

Small as are the per capita amounts of intangible property assessed, they are in some cases far in excess of the amounts that are actually taxed. A comparison of the assessed amounts of money and credits in Denver for the years 1928 and 1929 may be used as the starting point for this analysis. For 1928 the total assessed value of money and credits, bank deposits and other money and credits not being separately reported,

was $12,788,120. For 1929 this same figure jumped to $47,260,490. These two sets of figures are not comparable. The 1928 figure is the net, while the 1929 figure is the gross amount of the assessed value of money and credits. The difference is the deduction of debts from credits, which is made from the sum of bank deposits and other money and credits in 1928 and not made at all in 1929. The net assessment of money and credits for Denver in 1929 was in fact nearly $2,000,000 less than in 1928. The reason seems to be that the assessor reports the preliminary roll with or without deduction of debts to the tax commission. Subsequent assessments and rebates of taxes may or may not be reported at all. And it is not possible to say from the figures as published for the other counties how far they represent net and how far they represent gross assessments of intangibles. It is obvious that the first step to be taken is to require standardized reports. This matter will be more fully presented later in this report. For the present it is possible to conclude that the intangibles actually taxed are doubtless smaller, in some cases much smaller, than those shown in these tables.

Untrustworthy as these figures are, they seem to warrant the following conclusions: First, the evasion, whatever there may be of it, is very unevenly practiced, as shown by the wide variation in the per capita assessments; Second, there is doubtless much of it in most of the counties, as shown by the per capita figures; and, Third, it is due in many counties to the disposition on the part of the assessor to ignore money and credits, as is shown by the astonishing fact that in several counties no bank deposits are assessed at all, and in some no money and credits are assessed at all.

It is customary for critics of the taxation system to state that enormous amounts of intangibles escape, that these amounts *could* be reached for taxation with adequate "teeth" in the tax law, that they *should* be so reached for purposes of equity and fairness, and that if they were so reached great relief *would* result to the owners of property which does not now escape, by way of a material reduction in the tax rate.

Undoubtedly the escaping amount of intangibles is large. But there is good reason for believing that it is not nearly as large as is alleged. It is customary to reckon the total amount of intangibles and to assume that it is all taxable and should all be taxed. But, in the first place, there are large amounts of intangibles which for various reasons are not and ought not to be taxed as property. Thus, as explained above, secured debts and capital stock of corporations are not taxable as property and should not be. Again the bonds of the federal governments, and those of the state, county, city and town, and school district governments are of course not taxable, and the same is true of any intangible assets which these political units may hold, whether in the form of bank deposits or otherwise. Intangibles of railroads and other corporations assessed by the Colorado tax commission do not appear as intangibles, but are lumped into a unit valuation. The moneys and credits of banks, building and loan associations and other financial organizations are not listed as such. Moreover, the fact that bank deposits are taxable to the depositors make the deposits, as published by the banks, indicate more than the depositors should in any case report, because of the checks in the process of clearing. And, finally from his credits the taxpayer may deduct his debts, or at least most of them. When it is remembered to what extent the average family purchases all sorts of things on credit, it will be clear that these deductions must be large. Business enterprises moreover, employ much borrowed money which is deductible from the gross credits. How important this deduction is in reducing the net assessed valuation of money and credits may be seen from the 1929 Denver assessment. The gross assessed valuation of money and credits was in the neighborhood of $50,000,000, depending upon the stage of progress of the assessment. The deductible, or at any rate, the deducted debts amounted to about $38,000,000, leaving about $12,000,000. And, as will be recalled from Table 36, the Denver assessment of intangibles accounts for more than three-fourths of the state total.

How much of intangible property remains taxable after all the aforementioned items have been eliminated is problematical. The amount that escapes illegally may be as much as listed or it may be ten times as much. But in either case would it fall far short of the enormous amounts that are often alleged to escape. It is barking up the wrong tree to argue that the aggregate property valuation could be materially augmented by enacting laws having "teeth" in them, adequate to apprehend all taxable intangibles. One other consideration supports that conclusion: If the owner of taxable intangibles could not rely upon the convenient but illegal method of non-listing to enable him to *evade* the confiscatory ad valorem tax on his intangibles, he could readily find perfectly legal means of *avoiding* it. If the assessor were adequately supported by law and by public opinion, and if he were sufficiently informed and courageous to succeed in reaching all taxable intangibles, there cannot be the slightest doubt but that the taxpayer would convert his intangibles into tax exempt securities or otherwise make them tax exempt. It is extremely improbable that, from the fiscal point of view alone, the assessed valuation could be ap-

preciably increased by any law or any administration procedure that would subject intangibles to a property tax at the local ad valorem rate. Intangibles, apprehended in one year by special diligence of any assessor, steal away silently, as the Arab with his tent at night. No investor can afford to hold securities yielding 6% or 5%, or savings deposits yielding 3.5%, and pay on the full nominal value thereof an ad valorem tax at the rate of 3.5 mills. Such a property tax is the equivalent of an income tax of 58.33%, 70% and 100%, respectively. With this rate of net return, after taxes, should be compared the net return, after taxes, from real property, as shown in Subsection VI of this report. One should not debase his own intelligence or insult the intelligence of any important investor by assuming that he would pay such taxes so long as they can be *evaded* or *avoided*. There is, as shown by the experience of Colorado, as well as that of all other states, no way in which intangibles can be reached by a property tax at such rates as apply to tangible property. There are good reasons of equity why they should not be so reached, as shown above in the present section of the report. To the proposition, stated above, that the intangibles in general should not, as a matter of principle, be taxed as property, we must now add the proposition that, as a matter of practice, they cannot be taxed, except to the extent of a small but undetermined percentage of the whole.

Another circumstance makes the taxation of intangible property a peculiar hardship for the owner, in comparison with the hardship that is imposed upon tangible property. Taxes on real and on some tangible property cannot be avoided, but intangible property usually gets away from the assessor. It is therefore expected that taxes on tangible property will have to be paid. The owner, when he buys real property, will expect to pay the tax, and will capitalize it. He will pay so much less for the property, that after the tax is paid, the property he purchased will tend to yield him the prevailing competitive return. Taxes are, or ought to be, considered in arriving at the purchase price of a parcel of property. In a sense, any purchaser of real property, after the tax is imposed, may be said to buy himself free of the tax, by reason of paying less for it, than he would have paid if the property had been tax-free, or capable of evading the tax.

In the case of intangible property, it is not expected that the tax will have to be paid. It is seldom necessary that the owner declare it for taxation if his conscience does not require him to do so. There are in general only three classes of persons who declare their intangible property for taxation at the regular ad valorem rate. There are those few, a very small

minority, who are so honest that they will do whatever the law requires. The second class are those, who, for the time being, are ignorant of the effect of the tax, or those who are accidently caught with the goods. The third class are those who for the time being are legally incompetent, such as widows, minors, and others who for the time being have estates in the process of probation, where it is publicly recorded. It may, therefore, be said that intangible property is declared for taxation by those who are excessively honest, by those who are temporarily or permanently ignorant, and by those who are unfortunate enough to have their property publicly recorded. It may be said that the taxation of intangibles is in proportion to the inability to escape, rather than in proportion to the ability to pay. Since it is not expected to pay the tax on intangible property, there is practically no capitalization of the tax. The intangibles will therefore be bought at nearly such a figure as would be paid if they were tax-free. The result is that when the tax is actually applied, the amount by which it reduces the net income is very high. If all taxable securities were taxed there would be a much larger spread between the price of taxables and the price of exempts.

It is, of course, possible to argue that taxes on intangibles can be collected. It is possible to imagine a law which would declare any debt invalid on which the tax had not been paid, and would impose other similar legal disabilities upon non-payment. But it is inconceivable that the American people would tolerate methods of tax administration of that sort. When it is said, that taxes on intangible property at the regular ad valorem rates cannot be collected, it is meant that they cannot be collected in view of the temper of the American people. It follows that if such taxes were collected, the interest rate of borrowed money would be increased by the amount of the tax. It is inconceivable that the people of Colorado would tolerate a condition in which to a mortgage interest of say 7%, there would be added the tax of 3½ or 4%, making the effective interest rate 10% or 11%.

D. Bank Stock

There is only one type of intangibles that can be shown to be adequately assessed, namely the shares of stock of commercial banks, state and national. Table 39 following, shows the assessment of bank stock for selected years and the ratio thereof to the total assessed valuation, for the state as a whole for the years 1913, 1920, 1925, 1928, and 1929. The percentages which these assessed valuations of bank stock were of the total valuations, for the respective years were, 2.21%, 1.82%,

1.62%, 1.50%, and 1.57%, respectively. It is sometimes incorrectly stated that the percentages which the banks paid of the total property taxes in the state are indicated by the foregoing percentages. But they paid more than that. For the banks are located in towns and cities, and therefore paid the tax levies made by these municipal corporations, which are not levied upon property located outside of the corporate limits. Besides the tax on the shares, the banks pay taxes on any real estate they own at the local rate.

TABLE 39

Total Assessed Valuation, Assessed Value of Shares of Bank Stock and Percentage the Latter Was of the Former, for Specified Years

Year	Total Assessment	Bank Stock Assessment	Ratio
1913	$1,306,647,430	$28,924,765	2.21
1920	1,590,267,667	28,916,377	1.82

1929	1,586,919,769	25,029,280	1.57

Source: Reports of Colorado Tax Commission. Data for 1929 taken from the records prior to publication.

Tables 40 and 41 following are designed to test whether the banks are adequately and equally assessed on their shares. A brief statement of the peculiar method of taxing banks is perhaps necessary. The national banks are federal corporations and as such are not taxable except and in so far as Congress permits the state to tax them. Since the state banks are competing institutions they are almost necessarily taxed on the same basis. Such permission is granted in Section 5219 of the U. S. R. S. The real estate of the bank is taxed as is other real estate. The bank shares may be taxed on their value as is other property, but only at a rate not greater than that applicable to other moneyed capital. In obtaining the taxable value of the shares it is customary to take from reports, which the banks are required to furnish, the sum of the capital, surplus, and undivided profit, less the assessed value of the real estate taxed to the bank. Technically the shares are assessed to the stockholders, but since the bank is required to furnish the list of the shareholders and their holdings, and is also required to pay the tax for the shareholders, the effect is the same as if the shares were taxable to the bank and exempt to the shareholders. It thus comes about that the shares of bank stock are the only shares of corporate stocks that are taxable in Colorado.

In Table 40 preceding, the capital, surplus, and undivided profits of national banks were obtained from the report of the Comptroller of the Currency. Similar data for the state banks were obtained from the reports of the state bank commissioner. From the sum of these items was deducted in each case the book value of the real estate, furniture and fixtures. The remainder was taken to indicate roughly the "amount assessable". The figures in italics indicate that the book value of the real estate, furniture and fixtures exceeded the book value of the capital, surplus, and undivided profit, leaving a negative value for the "assessable amount". The amounts actually assessed were obtained from the report of the Colorado tax commission. And the ratios of the assessed to the assessable amounts are shown in the last column of the table. It is not asserted that the ratio should be 100% in all cases. For example, the furniture of the banks, which is not taxable, could not in all cases be segregated from the real estate and fixtures, which are taxed. But the banks do not require, and do not have a great deal of furniture. Also the book value of the real estate may not be the same as the assessed value. There are probably other sources of discrepancy. Yet the table furnishes a rough test for comparative purposes.

Table 41 following shows the frequency distribution of the counties on the same basis. The average assessment ratio was

94.5% and the highest ratio was 260.1%. Four counties had no banks and hence no assessment. In Moffat County the real estate and furniture and fixtures exceeded the sum of the capital stock, surplus and undivided profits.

Note: Four counties have no banks, and hence no assessment.

The banks contend that the present system of property taxation results in placing an unfair tax burden on them. There are several factors in the present system, which combine to bring it about that there probably is some foundation for their discontent. In the first place it is contended that the shares are assessed at 100% of their value while property in general is assessed at some lower ratio. Insofar as the data in Table 40, based on book values, are trustworthy it is apparent that bank shares are assessed at a higher percentage of the true value than property in general. Also, since the banks must furnish a statement of the number of shares and the book value, it is obvious that the banks cannot participate in the prevailing practice of evading the tax law by not listing the taxable property. In other words, the tax law can be enforced against them, but can only be enforced more or less imperfectly against property in general.

In the second place, the taxed real property owned by the banks is deducted from the value of the shares at its assessed and not at its book value. Since the assessed value is presumably less than the book value it comes to pass that the banks must pay taxes on the full value (or as nearly at 100% as the shares are appraised) not only on the excess of the value of their shares over the value of their taxed real estate, but on the real estate as well. In other words they do not benefit from

the prevailing underassessment of real property. The effect is the same as if all their property were personal and were taxed at 100% (or such assessment ratio as is effective for the shares of stock).

In the third place, no deduction in the assessed value of the shares is made by reason of such tax exempts as federal, state and local bonds, and such secured debts as the banks may hold. Since these tax exempts, by reason of being exempt to others than banks, are necessarily purchased at a high price and consequently yield a low rate of return, the banks are disadvantaged. This disadvantage is conspicuously shown in comparison with building and loan associations to whom such tax exempts, especially secured debts, are not listable as parts of their gross assets, with the result that these latter organizations pay practically no taxes at all. In a later subsection of this report the comparison of commercial banks and building and loan associations will be further developed.

V. Remedies for Defective Assessment

From the foregoing analysis, it is plain that the assessment for the taxation of property is very faulty in spots, moderately successful in other spots, but in general rather poor. In view of the fact that the assessment is the pivotal part of the general property tax, it is proper to seek relief. The remedial measures must be sought in the assessment, in the personnel of the assessing officials, and in the base of the tax itself.

A. The Assessment Practices

It has not been possible to survey exhaustively and intensively the practices of the county assessors. But the evidence shows that in many counties the assessor adopts his own rules and practices, in many cases contrary to law. The inequalities in the assessments of individual items within each county, and the discrepancies among counties are due only in part to chance variations, but are in part deliberately intended. The assessors do not always attempt to assess at a 100% valuation as the law requires. It is well known that a certain stable percentage of the full value, in line with the average ratio for the state, is sought instead. But once the 100% rule is departed from, there necessarily arises guess work as to what is the average assessment ratio in the state. The assessors often state that they try to discover what the average ratio is for the state, and to be guided in their work by that ratio. Sometimes, for election purposes, they boast that they have kept the average ratio for the home county down below the state average, and thus saved for the taxpayers a part of the state tax.

Another prevailing practice leads even more surely to inequalities. It is common for the assessors to keep the valuation of individual parcels fairly steady from year to year, so as not to necessitate changes in the tax rates. The result is that the valuation of individual properties is kept relatively uniform, regardless of changes in individual values, or in the correctness of the original assessment. Such a procedure is bound to produce inequalities in the assessment, since the changes in value of individual properties are not uniform.

Considerable confusion exists in the preparation of the tax schedules, the blanks on which the taxpayers are to enter their taxable property, and it cannot be doubted that the results are detrimental to the assessment. The statutes of 1902, M.A.S. 6237, make it the duty of the state auditor to prepare the tax schedule blanks and other forms, to forward these forms to the county commissioners to be printed as required. The statute of 1911, M.A.S. 6306, creating the Colorado tax commission, assigns the duty of preparing all necessary forms, but provides nothing as to when or how they shall be printed. From a comparison of the tax schedules in use it would appear that no central authority has standardized the general schedule. Although the tax commission has exerted its influence toward making the schedules uniform, they are yet very diversified as to size, form, arrangement, items listed and affidavits or oaths required. It would appear that the general schedule blanks are designed to serve for all classes of taxpayers, whether individuals, or corporations, banks or merchants, etc., with or without supplementary schedules. Not one of the blanks examined provides for the appraisal of exempt property. Many of them do not provide space for gross credits and for deductions, so that the operation of the process of determining the net taxable credits can be seen on the schedule. The list of items of taxable property is not uniform, nor is the list uniformly arranged.

Obviously several beneficent changes could be made. The general schedule should be uniform and designed to take care of the large run of ordinary persons. Special schedules should be prepared to meet the conditions of particular classes of taxpayers, such as banks, building and loan associations, merchants, manufacturers, filling stations, etc., and possibly for use in the assessment of special classes of property such as intangibles. Each blank should be uniform throughout the state. The tax commission should prepare these forms and require their use. Otherwise the commission is seriously hampered in enforcing the law, and in preparing its reports, whose accuracy and speedy publication are important to the legislature, the assessing officials, and the general public as well. Moreover,

the printing should be contracted for in one lot by the tax commission, and the required quantities distributed to the counties as needed. It is more economical to prepare, print, and maintain one reserve stock of such uniform blanks for 63 counties than to do so for 63 counties separately.

That there are other causes of the inequalities in the assessments is certain. There is ignorance and carelessness, and perhaps favoritism for political and other reasons. But there is in nearly all counties, except Denver, and possibly a few other counties, an absence of reliance upon anything but "rule of thumb". In assessing real property, a reference to sales records as recommended by the tax commission, would obviate many inequalities. A file of these sales records kept from year to year, and properly interpreted should give a fairly accurate record of the importance of the factors of value, such as fertility, location, obsolescence, fall in prices of products. But there is no evidence that any such systematic record is generally kept. The absence of a systematic record of pertinent data not only makes the original assessment inaccurate, but it also makes the county and state equalization ineffective.

B. Personnel of Tax Administration

It is probably true that the keeping and using of such records of sales values is a task with which the majority of county assessors are unfamiliar. But the tax commission is in a position to develop and use such data, or at least would be, if sufficient funds and clerical assistance were provided. The Colorado tax commission is on paper endowed with a great deal of authority, but is very scantily supplied with funds for competent help, a fact which doubtless explains in part why the commission has not itself made extensive and systematic use of sales records for the purpose of equalizing between counties. And it probably also explains why the tax commission has made such sparing use of its power to reassess property when the local assessor failed on the job. For it cannot have escaped the attention of the tax commission that there existed wide discrepancies in the average value among the counties, and it is the specific duty of the tax commission to so supervise and direct the assessment that it shall be on a uniform and 100% basis. But such power cannot be effectively used nor can such duty be effectively performed in the absence of the necessary data. And such necessary data cannot be secured, analyzed and used in the absence of funds to meet the cost involved. Moreover, such data can attain their full measure of usefulness only when secured, analyzed, and kept over a state-wide area, and for a period of years.

Sometimes, it is argued that the ineffectiveness of the assessment flows from the method of selecting the assessor, from the tenure of his office, from the assessment area, and from the lack of any requirements or qualifications. The county is the unit of assessment, and it should certainly not be smaller. Certain other states, such as Minnesota, Michigan, and Iowa unfortunately have township assessors, and have failed repeatedly to change to the county unit. These states have had to remedy the flaws inherent in the local assessor by shearing him of his authority and by giving to the county auditor supervising functions over the assessment. Some of the Colorado counties are already too small, both in population and wealth to function economically as political units. And the demand for consolidating several counties into one, such as occurs in other states as well, is quite legitimate in Colorado.

The assessor is elected for a period of two years and may be re-elected. In other states it has been attempted to make the assessor appointive, subject to civil service rules, and with suitable qualifications for office. Kentucky made such a change recently, but information is not available to show the results of the change. The larger cities in many states have the assessor's office appointive, and it is established that the assessment of real property in general is much more effective where an appointive assessor is found. One reason why an appointive office is sought is the allegation that the election method causes too frequent changes in the office. But in Colorado, it cannot be said that the assessor changes office too often. Table 42 following shows that, during the past decade, there have been relatively few changes. In 14 counties, the same assessor served during the entire decade, and in 30 counties, there was only one change. It is not probable that the continuity in office would be longer if the office were appointive. But certain political abuses in office are less probable under a system of appointive officers whose tenure of office is reasonably secure, whose responsibility can be enforced. Moreover, it is by no

TABLE 42

Distribution of Colorado Counties According to the Number of Changes in the Office of County Assessor During Period 1921-1930

Number of Changes	Number of Counties

Total	63

means certain that some of the continuity in office prevailing under the elective method is desirable. Public opinion is rapidly changing in the direction of favoring centralized control of the assessment machinery. It would be well if, as soon as the public opinion of the state will sustain such a change, the county assessors be made appointive by the tax commission.

On one particular matter, it is not difficult to recommend, namely, that the state board of equalization should be abolished. This ex-officio board was provided for in the original constitution, and consists of the governor, state auditor, state treasurer, secretary of state, and attorney general. It is not difficult to understand how the constitution came to contain such a provision. Prior to 1891, there was no administrative tax commission in any state to which the much needed equalization among counties could be delegated, as is the case now in nearly all of the states. State equalization had been a neglected function, and the states had been experimenting in trying to find for this function a proper agency. To make sure that equalization would be performed, a constitutional ex-officio board was created. At the time, such a provision was as modern and suitable as any it had been developed. But during the past 40 years, the administrative tax commission has been developed in nearly all the states, and in 1911 a statutory tax commission was established in Colorado. To it was assigned all the statutory functions that had previously from time to time been assigned to the board of equalization. Even the function of equalization, which belonged to the board under the constitution, by statute so curtailed, and what of it could constitutionally be transferred was assigned to the tax commission. The board is useless because a better agency for equalization has been developed in the tax commission. Missouri is the only other state having both a constitutional ex-officio board of equalization and a statutory tax commission; and the experience of Missouri strengthens the conclusion that the Colorado board should be abolished.

The board is harmful as well, in several respects. One reason is that its useless procedure consumes time, and that time, it will be seen, is valuable. The procedure in levying and collecting the general property tax in the state is as follows: As soon as possible after January 1, the assessor leaves assessment blanks with the property owners. Why it is necessary to allow three months for the taxpayer to look over his blanks is not clear, but between April 1, and May 20, every taxpayer must deliver his completed tax schedule to the assessor. On or before the first Tuesday in August, the assessor must mail statement of changes in the assessment to persons in whose assessment the valuation has been changed, and must also publish notice of time when he will sit to hear objections to his assessment. On September 1, the assessor must have concluded his hearings on the assessment, and have his assessment completed, and must deliver it to the county commissioners, sending a copy of it to the Colorado tax commission. During September, the county board of equalization holds two series of meetings for the purpose of equalizing within the county. October 1 is the last day for the tax commission to determine any necessary equalization among counties; and on or before that day must deliver to the state board of equalization the abstracts of assessments; with recommendations of necessary changes. The tax commission cannot itself make the changes because under the constitution the equalization is assigned to the state board of equalization. The commission can merely recommend. During the two weeks between the first and the third Monday in October, the state board of equalization must complete the equalization and certify changes to the counties. On the first Monday in November, the county commissioners must levy the tax or fix the rate. January 1 is the last day for the county assessor to deliver the tax list to the county treasurer. On the last day of February, the first half of the taxes are due, and penalties start unless the whole tax is paid before the end of April. And on or before July 31, the last of the tax must be paid unless it becomes subject to penalty. On August 1, all unpaid taxes are delinquent. Thus from January 1 to August 1 of the following year, the normal process of levying and collecting the tax goes on. Nineteen months are or may be consumed, and that is unnecessarily long.

Nearly a month could be saved if the tax commission instead of recommending changes could make them, and certify the changes to the counties on October 1. There are good reasons why the saving of a month would be valuable. The fiscal year begins on July 1, but the first half of the taxes to meet the expenditures of the fiscal year are not due and will presumably not be paid until the last day of February, and the last half (unless the entire tax has been paid on or before April 30), is not due until July 31, one whole month after the fiscal year for which they are supposedly available. The tax year and the fiscal year should coincide as nearly as possible, for the sake of correlating revenues and expenditures, simplifying the public accounting, and enforcing responsibility. But the saving of time is valuable in other ways. For example, the longer the time that elapses between the dates of which the tax becomes a lien and the date of collection, the greater is the chance that the taxpayer or the property or both will have disappeared and the taxes become uncollectible.

Moreover, the state board of equalization is inefficient, and ill adapted to the function of equalization. Such a statement does not reflect upon the personal attributes of the members. The board is ex-officio, and it is not to be presumed that the members, elected for other purposes, have any fitness for the work of equalization, which involves considerable technical skill and knowledge. The change in personnel must be frequent, so that little skill and experience can be accumulated from one year to another. The board sits for less than two weeks, and unless it has a permanent staff to accumulate and organize information, it can have little or no basis of fact for its work. Having little or at least an inadequate factual basis for its rulings, it becomes the easy victim, even if it is not so inclined, to aggressive groups, making extravagant claims of excessive or inadequate assessments, on the property of themselves or others, respectively. It can hardly avoid getting the assessment, which ought to be an impartial ascertaining of rather elusive and intractable facts, involved in controversial politics.

The board is wasteful and inconvenient to the other assessment agencies, and to at least some of the taxpayers. The tax commission, if it takes seriously the double task of 1) recommending changes, as among counties, in the assessment of property assessed by the county assessors, and 2) of assessing of property that is centrally assessed, must or should have at its command, the same data that are necessary for the state board of equalization, if the latter is to equalize in fact. The railroad companies and other enterprises whose property is assessed by the tax commission must twice appear to protect their rights. They must file protest with the tax commission against the original assessment if they deem it necessary to do so. They must then repeat the process before the state board of equalization, if necessary. And the latter process must be made before a political board that is minus the basic facts, and that must do its work in two weeks, a period that is wholly inadequate for proper notice, for the preparation of evidence, and for adequate hearings. It would certainly not be strange if, under such circumstances, these taxpayers themselves should enter controversial politics.

If all the necessary functions of the state board of equalization were assigned to the tax commission, and if the latter body were given adequate funds to accumulate and organize necessary information, it would be reasonable in time to expect greater equality in the assessment, as among counties, and also as among the items of property within each county. Having the necessary basic facts, and definite responsibility, it is reasonable to expect that the commission would muster the courage to exercise other latent powers it possesses, even to the extent of disciplining inefficient assessors, and to order reassessments when necessary. The present double-headed arrangement tends to break down the respect for and the efficiency of the tax commission.

C. Shortening the Assessment Period

The excessive length of the assessment period has certain other undesirable effects. It impedes real estate transfers by causing differences between buyer and seller as to who shall pay the tax. It requires business enterprises to carry reserves for taxes against a given fiscal period for an unnecessarily long time. Adding these inconveniences to others that probably exist, we arrive at good reasons why the period should be shortened. It is believed the following suggested procedure, after the initial inconveniences had been endured, would mean an improvement.

Let the taxpayers return their schedules within the first week in March, the assessment to be as of the first day of March.

Let the assessor make his assessments, send notices of arbitrary assessments and changes in returns filed, and complete his preliminary tax roll, forwarding a copy thereof to the state tax commission before May 1.

Let the assessor and the county board of equalization jointly sit to equalize, to hear complaints and equalize among individual persons and parcels of property during May.

During June let the assessor readjust his roll as authorized by the board of equalization in sessions during May, and on or before July 1, forward to tax commission the assessment abstract.

Let the tax commission equalize during July, and return to counties on or before August 1.

Let the board of county commissioners levy the taxes at once, having already on hand the estimates of revenue required from all the units in the county.

Let the county treasurer extend taxes on the roll not later than September 1, and send the tax bills to the taxpayers.

Then, on or before October 1, the first half of taxes should be due and delinquent if not paid. And on March 1, the last half should be due and delinquent if not paid.

D. Changing the Tax Base

The tax system, at least in so far as it consists of the general property tax, could be improved appreciably by certain

changes in the tax base. It does not appear that in the taxation of real property any change should be made, except that an appraisal of exempt real property should be included in the assessment process. Real property, in contemplation of law, is properly taxed once, and only once in Colorado. It is taxed where located, which is proper. Such improvements as may appear in the taxation of real property must result from improved assessment procedure. The exemption of real property for reasons of being owned by charitable, educational, or similar organizations should be restricted. There is no reason why one type of real property should be taxed at a higher rate or included at a different valuation than any other unless Colorado should wish to join the single-tax movement, and partly exempt improvements, as is done in Pittsburgh, Pennsylvania. Real property is fairly homogeneous and all should be taxed alike.

It is not possible, consistently, to recommend that all tangible personal property should be taxed, or that it should be taxed alike, or that it should be taxed like real property. It is convenient to subdivide the miscellaneous mass of personal property into two parts. Personal property, such as automobiles, livestock, implements and machinery, stocks of merchandise, manufacturers stores and stocks, and furniture in offices, hotels, and other places, constitutes one class. Personal property of this class is employed in active business. Presumably there is an income derived from its use. From and with this income the taxes can be paid. Not that in every case there actually is an income, but one is normally expected. Property of that sort should be taxed at the same rate as real property. For the taxation of such personal property there is the further administrative argument that it can be reduced to a fairly small number of items, that can be found and appraised. It is possible that the list should include some forms of productive property that are not now included. For example, huge advertising signs scattered widely through the state, are probably valuable, but it is doubtful if in very many cases they are listed for taxation. Being part of the productive capital of the community they should bear the same burden as other productive tangible personal property employed in business.

There is another class of personal property consisting of a great number of different items, not one of which is of great importance. It consists of household goods, musical instruments, silver plates, works of art, books and libraries, personal effects, such as watches and clocks, jewelry, and a great number of others equally unimportant. In the aggregate, if these items could be fully listed for taxation, their value would be

considerable. In practice the amount listed is negligible. Property of this kind is not employed in any business, and seldom yields a money income with which taxes can be paid. The assessment is annoying to both the assessor and the owner. It would simplify the assessment if such property were exempt, so that the $200 constitutional exemption might be eliminated.

There are three possible ways to deal with the taxation of intangible personal property. One is to apply the uniform ad valorem rate to taxable intangible property. The other is to exempt it entirely, with or without the compensating burden of an income tax. A third is, by way of compromise, to tax the intangible property at a rate intermediate between nothing and the rate that is applied upon personal and real property.

The first method, taxing intangible personal property at the uniform ad valorem rate is the one in use in Colorado at the present, except for secured debts and corporate stock. That method is out of the question. At least that is true for all but a small part of the mass of intangible property.

The second way to deal with intangibles is to accord them a low tax rate or, what amounts to the same thing, to assess them at a lower percentage of the true value than tangible property, as is done in some states where classification of property for taxation is permitted. Probably the state constitution of Colorado does not permit property to be classified for the imposition of different rates on the different classes of property, or for the valuation at different percentages of the true value of the different classes. It is argued that the constitution ought to be so amended as to permit classification. There is no objection to such an amendment. In any event the constitution should be liberalized so as to eliminate the uniformity rule therein. But it is highly improbable that the classified property tax according a lower rate, say five mills on the dollar, to intangible property would be successful in Colorado. There are several reasons for this conclusion: In the first place, as a matter of principle, the classified property tax is a compromise. Intangible property either is representative of other property that has been taxed, or it is not. If it is representative property, then it should not be taxed. If it is not representative property but is property in its own right, employed in business and producing an income, it should be taxed at the regular rate. There can be no rational justification of the classified property tax in principle.

In the second place, the classified property tax on intangibles has not proved itself capable of producing revenue in satisfactory amounts. Professor Simeon E. Leland, of the University of Chicago, has recently published a book entitled, "The

Classified Property Tax", in which he shows the growth of this tax. One finds traces of it from very early days, but the present development began in Connecticut and in Pennsylvania some decades ago. Its popularity was not great until it was adopted in 1911, and extended in 1913, in Minnesota. In 1907 in that state domestic real estate mortgages were exempted from the regular general property tax, provided there had been paid on them a recording tax of 2.5 mills on the dollar. Two years later money and credits were made taxable annually at the rate of 3 mills on the dollar. Probably due to the existence of an energetic and well supported tax commission, that has repeatedly reassessed intangibles, where the original assessments were not satisfactory, the success of that law has been relatively conspicuous. Not that the revenue derived has been large, but the revenue from the tax on intangibles at the low rate was somewhat greater than the revenue realized from the former much higher ad valorem rates on intangible property. The reason was that many were induced to list their intangibles, when the rate was only 2.5 mills, who did not list it when subject to the regular ad valorem rate. The moderate success of the classified property tax in Minnesota has been widely heralded. One legislature after another has classified property for taxation, hoping that the success of Minnesota could be duplicated. In no one single instance has this success been duplicated, although there are creditable revenue yields in other states. It should be remembered that the classified property tax, by apportioning the tax in small amounts over a great many (as compared to the number of those who are assessed on the general property tax) has become not so much an instrument of revenue as an instrument of relief to a few honest, ignorant, or legally incompetent persons, whose property was previously assessed at the excessive rates of the general tax. In many states the revenue yielded was, not as in Minnesota greater than that which was realized under the old regular ad valorem tax, but considerably less. Thus Kansas in 1924 amended the state constitution so as to permit classification, and imposed in 1925 a tax at the rate of 2.5 mills on money and credits, and a recording tax of 2.5 mills on domestic real estate mortgages. Two years later, the rate on money and credits was increased to 5 mills. Even at this higher rate the revenue realized from the tax on intangibles was only two-thirds of the revenue realized prior to the adoption of the classified property tax from the general property tax on intangible property. It is improbable that Colorado could do much better from a fiscal point of view than Kansas did.

In the third place, and most important, it is not the mediocre fiscal success, however, of the classified property tax which

bars it from Colorado, even though the constitution should for other reasons be amended to permit such classification. The reason is that the application of such low rates to intangible property brings the tax system into an irreconcilable conflict with the taxation of banks. This conflict and suggestions for the solution will be treated under a later section on bank taxation. It will suffice to say here that the national banks are federal corporations. They cannot be taxed by the state except with the permission of Congress and to the extent that Congress permits. Congress has permitted any state to tax the shares of national banks, but at a rate not exceeding the rate applicable to competing moneyed capital in the state. By recent court decisions many items, classified in Colorado as intangible property, constitute moneyed capital in competition with the national banks. If, therefore, a rate of 5 mills be accorded to unsecured notes, money, bank deposits, and other taxable intangibles, it is almost certain that the national banks will demand and be awarded a tax rate not higher than 5 mills. It is highly improbable that at the present time, the people of Colorado would tolerate a tax rate on shares of national bank stock at the rate of 5 mills. Moreover, since the state commercial banks are banks of the same kind as the national banks, and are in competition with them, Colorado would not want to, and under the federal law (the Fourteenth Amendment of the Federal Constitution) could not impose on the state banks a tax at a higher rate than that imposed on national banks. Until the question of bank taxation is settled, it would be inadvisable to recommend a low-rate tax on intangible.

The third method of dealing with intangibles is to exempt them from property taxation and to devise some other way in which the owners of intangibles can be reached. If, in so far as the intangibles are merely representations of equities in tangible property that has been taxed without deduction for debt, they should not be taxed as property, it remains to discover to what extent the intangibles are merely representations or are property in their own right, and to suggest appropriate modes of treatment for taxation in the state.

First, secured debts and corporate stock are regarded clearly as mere representations, and, since they are not taxed, require no further discussion, with important reservations to be noted below. But most of the taxable intangibles are also mere representations. Bank deposits are chiefly such, as may be easily demonstrated in case of savings deposits. The equities of the depositors are offset by the mortgages on real property, and these securities in turn represent the bank's equity in the mortgaged property. The facts are not far different in case of

checking deposits. In the aggregate such deposits are much more than offset by the depositor's loans which in turn diminish the equities of the borrowers in their tangible merchandise or manufacturer's stock, which are usually taxed without deduction for debts. It would be a long and tedious process to show that book accounts and other claims are merely representations, indefinite and involved to be sure, of equities in tangible property somewhere, all of which, not specifically exempt, are taxed to someone without deduction for debts. It should seem fairly clear, though, that with one important group of exceptions referred to above and to be noted below, the gigantic and complicated network of accounts and claims, can represent only widely diffused equities in tangible property owned by and taxed to somebody somewhere. For, with the exception noted, there is nothing productive and worth owning except tangible goods.

For the purpose of presenting the deposits according to their character the following analysis is offered: Table 43 following shows the total deposits of all Colorado commercial banks, exclusive of postal savings deposits and United States deposits. In any case the amounts assessed could not possibly exceed the almost $280,000,000 which is the sum of the total deposits reported. But that latter sum is of course anywhere from 20 to 100 times the amounts assessed.

A request was made of all the banks in the state for a statement showing their deposits, as to what extent they were

TABLE 43

Time and Demand Deposits of Colorado State and National Banks, 1929

Kind of Bank	Time Deposits	Demand Deposits	Total
State Banks	$26,343,531	$37,484,908	$63,828,439
National Banks	89,344,000	126,624,000	215,968,000
Total	$115,687,531	$164,108,908	$279,796,439

Source: 1) State Banks, state bank commissioners records, 1929. 2) National banks, report of the comptroller of the currency, 1929.

Note: Time deposits include savings accounts, trust funds, and time certificates. Demand deposits include: dividends unpaid, individual deposits, demand certificates, certified checks, and cashiers checks. Postal savings deposits and United States deposits are not included.

deposits of individual persons, of the state, cities, counties, and other public corporations, of railroads and other public utilities, and of all others. Not all the banks responded but 49 freely did so. And these 49, being mostly Denver banks, account for considerably more than one half of the total deposits. Table 44 presents the figures for these 49 banks classified as requested. The table puts clearly before the reader the amounts involved in the contention that substantially if not all of the deposits are mere representations of equities in tangible property fully taxed, or tax free. The public funds of course are exempt. The deposits of railroads and other corporations are included in the valuations made by the Colorado tax commission of the tangible property. There remains $90,190,403 deposits of individual persons and $42,628,203 deposits of others, doubtless mostly of local business firms. How much is accounted for by deductible debts against credits, no one can tell. But in any event, these deposits, as shown in the preceding analysis, are chiefly if not entirely representative of equities in tangible property, directly or indirectly.

TABLE 44

Deposits of 49 Banks as of December 31, 1929, Classified According to Kind of Deposits and Character of Depositors

Kind of Deposit	Total	Amounts of Deposits by			
		Individual Persons	Public Corporations	Business Firms	
				Railroads and Public Utilities	Others
1. Savings accounts	$53,103,146	$50,412,987	$1,127,972	$75,239	$1,486,948
2. Trust Funds	2,300,148	1,002,718	0	205,346	1,092,089
3. Dividends unpaid	331,893	271,634	0	0	60,259
4. Individual deposits	87,961,759	34,369,351	7,915,937	6,626,853	39,049,618
5. Demand Certificates	595,483	390,773	186,016	0	18,694
6. Time Certificates	4,026,482	2,799,904	828,863	9,591	388,124
7. Certified Checks	198,503	94,228	12,701	334	91,240
8. Cashier's Checks	1,305,809	848,808	10,866	4,899	441,236
Total	$149,823,223	$90,190,403	$10,082,355	$6,922,262	$42,628,203
Percentage	100.00	60 20	6.73	4.62	28 45

The one most important form of non-representative intangibles is found in the excess value of business enterprises over the value of their tangible property. In case of a prosperous enterprise employing relatively little tangible property in proportion to the volume of its business this excess will be large, while in case of an enterprise that is not prosperous and employs relatively much property it may be negigible or negative. To the extent that the market value of the shares of a corporation represents this excess there is in shares of corporate stock an element of non-representative property; and upon this value there is no tax in Colorado except in two classes of corporations. The commercial banks, being taxed, as explained above, on the value of their shares, are taxed on their corporate excess. And in case of corporations such as railroads whose property is assessed by the Colorado tax commission, this intangible value is included in the unit valuation arrived at by the commission's appraisal methods, and is distributed for local taxation. In the case of other corporations, and in case of individual enterprises and partnerships there is no tax on this excess in Colorado. A few states, among them, Kansas, Illinois, and Massachusetts, attempt to reach this excess in part by means of a socalled corporate excess tax. Elsewhere there is no reason to try to tax it since the corporate shares are taxable as personal property. But the corporate excess tax laws are not very successful. It would seem to be better to reach such value on another basis. Since the value of such excess grows directly out of the earnings of the enterprise, and must be based thereon, it is simpler to reach such excess through an income tax. There are perhaps other minor forms of non-representative property, which should be reached for taxation in some way, but it seems that as property they cannot well be reached. Income taxation is superior for that purpose.

One class of property, namely metallic money is in a peculiar position. It is of course, tangible, having an intrinsic value. But, with respect to its uses, it is interchangeable with paper money, checking deposits, and possibly other media of exchange, which are clearly mere representations. Moreover, the amount of metallic money carried by the ordinary taxpayer is negligible. It would be as futile to tax it as it is futile to try to tax intangibles. It is therefore advisable not to try to tax any form of money and credits as property.

VI. Scope of the Property Tax

In the preceding paragraphs, it is shown that certain changes should be made in the general property tax for the purpose of making it more equitable in its results, and more capable of successful administration. It remains to discuss the question of how great should be the reliance upon this tax, and to what extent other sources of revenue should be used for state and local purposes.

A. General Experience of Other States

For this purpose, it is helpful to consider the trend of the property taxes in other states. Table 45 following shows that in the 48 states, while the per capita receipts from the general property tax increased absolutely during the period 1915-1927, there was a decline in the percentage which the receipts from the general property tax was of the total receipts. Thus during that period, the per capita receipts for the 48 states rose from $1.89 to $3.16; but the percentage of the total receipts which was derived from general property taxes declined from 40.6% to 21.1%. The table also shows that Colorado makes absolutely and relatively greater use of receipts from the general property tax than, on the average, do the other states, although for Colorado there appears to be the same tendency to rely less upon the general property tax for state purposes with the passing of time.

TABLE 45

Per Capita Receipts from the General Property Tax and Percentage These Receipts Were of all Receipts for the 48 States for Specified Years

Year	Receipts From General Property Tax			
	All 48 States		Colorado	
	Per Capita	Percentage of Total Receipts	Per Capita	Percentage of Total Receipts
1915	$1.89	40.6	$2.17	53.9
1917	1.80	34.9	3.50	62.6
1919	2.26	35.1	4.36	62.9
1922	3.22	30.0	6.75	47.4
1924	3.16	25.7	6.19	38.7
1926	3.24	22.7	5.35	37.0
1927	3.16	21.1	5.23	34.3

Of the relative decline in the general property tax for state purposes there are ready explanations. In general, it has

been deemed good public policy to relieve property of a part of the tax burden, and to derive increasingly greater amounts from other sources. These sources, yielding increasing revenue, are state income taxes, taxes from motor vehicle license fees and on motor fuels and federal aid for highways and other minor purposes. The most important respect in which Colorado has failed to tap these other sources is in not making use of income taxes.

In the cities, counties and other local political units not only have the absolute receipts from the general property tax increased much faster than they have for state purposes, being besides much greater per capita than the taxes for state purposes, but the percentage which is derived from the general property tax has shown a moderate increase. Unfortunately statistical data are not readily available to show how rapidly the reliance upon the general property tax has increased for all Colorado local units. Data are available to show the increased reliance upon general property taxes for city purposes in 146 selected cities of those having population of 30,000 or over. Table 46 following shows that while the per capita receipts from the general property tax in these 146 cities increased between 1915 and 1927 from $18.73 to $46.09, the percentage of all revenue receipts derived from the general property tax increased from 62.4% to 66.1% during that period. The figures for Denver, Colorado Springs, and Pueblo, the three largest Colorado cities, having over 30,000 population, are somewhat irregular, but in the main they show similarly heavy reliance upon the general property tax.

TABLE 46

Per Capita Receipts from the General Property Tax and Percentage These Receipts Were of All Receipts for 146 Cities, and for Denver, Colorado Springs, and Pueblo, for Specific Years

Year	Receipts From the General Property Tax							
	146 Cities		Denver		Colo. Springs		Pueblo	
	Per Capita	Percentage of Total Receipts	Per Capita	Percentage of Total Receipts	Per Capita	Percentage of Total Receipts	Per Capita	Percentage of Total Receipts
1915	$18.73	62.4	$16.07	62.0	$15.08	56.7	$11.59	56.0
1917	20.57	64.3	19.59	70.9	13.37	56.3	10.73	57.0
1919	23.29	66.0	21.22	66.3	16.64	60.5	15.49	58.1
1922	35.85	66.9	32.32	62.1	33.54	67.8	27.06	63.4
1924	38.59	66.1	32.98	60.5	40.64	68.0	25.90	53.3

1927	46.09	66.1	40.02	65.2	45.12	50.2	29.12	53.4

Source: Financial Statistics of Cities.

It is to be remembered that the receipts from the general property tax are expressed as percentages of all revenue receipts. The aggregate revenue receipts include receipts from other sources than taxes, such as gifts, fees, earnings of public service departments and subsidies from the federal and state governments. If the receipts from the general property tax were expressed as percentages of the receipts from taxes alone the degree of completeness with which the cities rely upon the general property tax would be shown more strikingly.

The counties and school districts are even more completely dependent upon the general property tax than the larger cities. We are therefore warranted in saying that all the local political units have required a rapidly increasing tax revenue from general property, while the state governments can and do increasingly rely upon other sources. Furthermore, Colorado relies for state purposes more heavily upon the general property tax, and less heavily upon other taxes than do the states in general. If the other states are right in seeking increasing revenues from other sources than property taxes, and if the significant conditions are not peculiarly different in Colorado from what they are elsewhere, Colorado should seek other sources of revenue for the purpose of relieving property from heavy and increasing taxes. That this tentative conclusion is correct will be shown in the following paragraphs.

B. Property Taxes the Principal Local Revenue Source

Yet it is not well to arouse vain hopes for relief from property taxes in the minds of property owners beyond what can possibly be given. The extent to which property can, practically speaking, be relieved from taxes is strictly limited. But to demonstrate this fact, it is necessary to consider separately, the state government and the local governments. It is quite possible to relieve property from taxes for state purposes; but it is not practical to give corresponding relief from property taxes for local purposes.

The Colorado state government may readily, after making proper adjustments in case of the specific property mill levies now authorized for the support of educational institutions and other state services, dispense with property taxes and rely instead upon tax revenue from other sources, such as taxes on income and sales. Such an arrangement, in which the state

government draws no revenue from taxes on general property, while the local governments are dependent upon revenue from property taxes is called segregation of sources. Segregation of sources does not necessarily involve the absence of state taxes on some forms of property. There are some who believe that, as a matter of principle, segregation is advantageous. It is argued, for example, that if the state levies no general property taxes, the incentive on the part of the assessors to keep their valuations low so as to avoid a part of the state property taxes will disappear. But the experience of states where segregation has been tried or contemplated, tends to show that segregation is not important as a matter of principle.

But for the local governments, there is no such escape from property taxes. Taxes on property are the only taxes that can be adequately administered by a governmental unit smaller than the state. Even the state government suffers by comparison with the federal government with respect to the efficiency of administration of other than property taxes. Experience has shown that income taxes, inheritance taxes, and sales taxes, cannot be administered except with intolerable ineffectiveness by any governmental unit smaller than the state. Even property taxes cannot be tolerably administered by the counties without state supervision in general, and without state assessment and consequent apportionment for local taxation of such property as railroads and similar inter-county properties. The ineffectiveness of local administration is inherent in the smallness of the local unit, and not primarily due to personal inefficiency.

It is conceivable, of course, if we were to assume that the state could raise any amount from sources other than property taxes, that the counties, cities, towns, and school districts could reduce their property tax levies either by transferring their functions to the state, or by having the state arrange to distribute a part of its revenue raised from these other sources. Some transfer of services has taken place, notably in connection with the construction and maintenance of highways, which are now financed and constructed directly by the state to an increasing degree. And it is increasingly common for the state to distribute revenue in the form of local aid, either in the form of apportionments for schools or roads out of the general or some special fund or by assigning a part or all from certain taxes, notably the income tax, for local use. If then, the state could raise revenue indefinitely from sources other than property taxes, these amounts could be used as suggested, to finance these local public services that now are so expensive and involve such heavy levies upon property.

But as a matter of fact, the state government cannot in practice command sources, other than property taxes, to yield indefinite amounts. The amounts so obtainable are on the contrary, in a state like Colorado, rather sharply restricted. Fixed property cannot get away if the taxes are heavy. Personal property, especially intangibles, and business are mobile and can get away, not only from the assessor, but physically from the state, if the taxes are excessive. And they are excessive, in this sense if, because of the taxes, business finds it expedient and profitable to move elsewhere. And if business and property move away, because of excessive taxes, they will not contribute any tax revenue, and their removal may indirectly deprive local industry of a market for its products, and involve other detriments more burdensome to the owners of real property than the taxes of which real property was temporarily relieved.

It is not, of course, argued that a heavy income tax, or a heavy sales tax, or heavy business taxes will instantly, or even ultimately drive out all business or even all intangible property from the state. Nor is it argued that complete freedom from taxation of business and mobile property will cause an instant and phenomenal concentration of business, and of mobile property in the state. It is merely asserted that while income taxes, sales taxes, and possibly some forms of business taxes can be, and should be made to contribute a modicum of revenue for state purposes, the amount practically realizable from these sources in Colorado is limited. If these sources are pressed too far for tax contributions, it will be to the detriment of the fixed property of the state. What is the expedient limit for taking revenue from each of these sources will be discussed when each of the possible and practicable sources is discussed in later sections of this report.

C. A Reasonable Property Tax Contribution

How much then, of the total tax revenue for all purposes should be collected from property taxes? It will be easier to answer that question if one bears in mind the economic interactions of the general property tax and property values. Real property constitutes 75% or more of the total valuation, and hence bears the bulk of the tax burden anyway. It only will be considered.

Real estate consists of land and fixtures. The land cannot be moved at all, and the improvements only with difficulty, though excessive taxes might retard replacements and delay new construction. Hence, the land and the improvements, inevitably get on the tax list. The tax must be paid, if not by the

present owner, then by the person who takes it on a tax title. If then the tax cannot be escaped, how does the payment of it affect the value of the property?

It will not be seriously contested that real property has value, a market value, or a capital value, because it yields a recurrent income, either directly in the form of a rental income, or a business income from its use, or indirectly in the form of a satisfaction from its use as in the case of a dwelling house occupied by its owner. Nor will it be seriously contested that the capital value will vary with and depend upon the anticipated future money or service income. The capital value tends to be the mathematical equivalent of the sum of all the future incomes, discounted to the present, at some accepted competitive rate. What a purchaser of a piece of real property is really interested in is the series of anticipated annual incomes to which he and his assigns and heirs become entitled by reason of ownership. Ownership of real property that yields no such income and justifies no hope for such future income is an empty shell. And the greater these recurrent future incomes, the greater is the capital value. If, for example, 5% is the acceptable rate of discount and if a property yields an annual income of $1,000, then the capital value of that property should be $20,000, since $1,000 is interest at the rate of 5% per annum on $20,000. Of course, the appraisal of a parcel of property is not as simple as that. The future incomes are uncertain and variable, and must be estimated, because the prices of, as well as the products of, the property and the other factors such as labor, used jointly with the property in question, are uncertain. Finally, the taxes themselves affect the value. The greater the tax, the less net income is left over after taxes, and hence the capital value, and the assessed value, should be reduced accordingly.

It has been asserted that the property taxes are too high, and in evidence is offered the statement that they have depressed the values of real estate. It should be clear from the foregoing that all unshiftable taxes—all taxes, practically speaking, on real property, depress the value below what it would have been had there been no taxes or had taxes been lower. Taxes on real property, since they are not shiftable, are one of the factors, which, with other factors such as the price of wheat, the price of butterfat, the cost of farm machinery, the freight rates, the wages of farm labor, determine the net income from the use of a farm, and therefore determine its capital value. Similar factors determine the value of urban property, and in all cases these factors include property taxes.

It is also asserted that the tax rate is so high that it eats up all the income from the property, thus destroying the capital value. For example, it is said that if the tax rate is 50 mills, or 5%, then the tax will eat up all the income from a property that yields 5% on the assessed valuation. That, as the case is stated, is true enough, but there is something radically wrong with the valuation. If the tax takes all the income, then there is no clear income left after taxes, and the land is not worth anything. And if the land is not worth anything, and is properly assessed on that basis, then, on a zero valuation, there is no tax. Obviously, there is something wrong in the assessment.

It is a simple matter to develop a formula by means of which can be demonstrated the interaction of real property taxes and real property values:

Let A be the amount of net income before taxes (assumed constant year after year).

Let C be the capital value of the net income after taxes.

Let R be the tax rate.

Let I be the discount rate (the rate by which C is determined).

Then $$C = \frac{A - RC}{I},$$

$$CI = A - RC,$$

$$CI = RC - A,$$

$$C(I - R) = A,$$

$$C = \frac{A}{I - R}.$$

Using the formula above, anyone can for himself demonstrate the interaction of the capital value, and the tax rate. As will be shown in the following examples, no tax rate, however high, so long as it is expressed as a percentage of the capital value, can completely confiscate the capital value, provided the assessed value (the capital value) is correctly arrived at. If then the tax does, nevertheless, take all the income (as is amply demonstrated that it does when the owner deliberately lets the taxes become delinquent, and the property be sold for taxes), the assessed value is grossly excessive.

Let A = $100.
Let I = .05.
Then find C at various values for R.

If R = 0, $C = \frac{100}{.05} = \$2{,}000.00.$

If R = .001, $C = \frac{100}{.051} = 1{,}960.80.$

If R = .005, $C = \frac{100}{.055} = 1{,}818.18.$

If R = .01, $C = \frac{100}{.06} = 1{,}666.67.$

If R = .02, $C = \frac{100}{.07} = 1{,}428.57.$

If R = .05, $C = \frac{100}{.10} = 1{,}000.00.$

If R = .10, $C = \frac{100}{.15} = 666.67.$

If R = .50, $C = \frac{100}{.55} = 181.82.$

If R = 1.00, $C = \frac{100}{1.05} = 95.24.$

If R = 10.00, $C = \frac{100}{10.05} = 9.95.$

If R = 10,000.00, $C = \frac{100}{1{,}000.05} = \$.0099 = \$.01.$

It follows from the foregoing demonstration that the property tax is a device by which the state, simply by means of adjusting the rate, can literally appropriate for itself as much or as little as is expedient of the property owner's equity in his real property. It also follows that by lowering the rate the state can give back as much of the value it has taken through rapidly rising taxes, as it pleases, provided that the necessary revenue to "run the government" can be obtained elsewhere, without hurting business, thereby depressing income, and in turn depressing the capital value.

There is ample evidence to show that some factor or factors have depressed the Colorado real estate values. Here again, we are hampered by the absence of data showing sales prices. For agricultural land it would appear that the value is now below the pre-war value. Table 47 following shows the United States Department of Agriculture Index for values of farm real estate (with improvements) for the United States, for Colorado, and for adjoining states, taking the average value for 1912, 1913, 1914, as 100. It will be seen that not only is the index throughout lower for Colorado than for the United States as a whole, and lower than for any of the states given, but Colorado is the only one of these states in which the index shows that farm land values are below those prior to the world war.

TABLE 47

Index Number of Estimated Value Per Acre of Farm Real Estate for the United States, for Colorado, and Nearby States, 1920-1929 (1912, 1913, 1914 taken as 100)

Source: Indirectly from United States Department of Agriculture Circular No. 101, "The Farm Real Estate Situation, 1928-1929". The information is based upon reports made by cooperating farmers and real estate dealers throughout the country. Circular 101 was not at hand. The table is adapted from Kansas Circular 156, January 1, 1930, Agricultural Experiment Station, Manhattan, Kansas.

The declining value of farm property is partly reflected in the annual assessments. The Colorado tax commission in its 1928 annual report took occasion to note the declining value of irrigated land and of dry farming land, and the increasing value of urban real property, as shown in Table 48 following. The commission urged that no further decline in the value should take place, and recommended an increase for 1928, which the state board of equalization did not see fit to authorize.

*Decrease. **Increase.

That the heavy tax rates have had something to do with the depressed capital value of farm land is suggested by the data supplied in Table 49 following, in which are shown the percentages which the general property taxes were of the rents of a number of rented farms in a number of specified states during the years 1919 to 1927. The data were obtained from studies made by the agricultural experiment stations of the respective states or by the United States Department of Agriculture, usually cooperating with each other. The rented farms were taken because in their case the troublesome question of separating the owner's wages from the return upon his investments in the farms does not arise, as it does in case of owner-operated farms. Although in a few cases the data go back of 1919 these figures are not given here, because they are not as reliable as the later figures.

It does not appear that the farm property taxes in Colorado absorb much more or less of the net rent before taxes than is the case in other states. But the figure of 37.8% for 1923 is much higher than the figure of 22.7% for 1919, and the later figures of 33.2% and 32.6% for 1925 and 1926, respectively, are not declining very rapidly. The most striking fact revealed by the original data, namely the tremendous variation in these percentages, is lost in the average figures to a large extent. But they may be seen upon analysis. Compare the low percentages of North Dakota of 14.8% in 1919 and 15.7% in 1924 with the high percentages of the intervening years. Inasmuch as the taxes are fairly constant from year to year the variable factor must be the net rent before taxes. When the crops fail or the income from the land for other reasons decreases, the taxes continue.

*Cash-rented farms. **Share-rented farms.

When the Colorado figures are broken up into their component parts these variations in percentages of the net rent before taxes that is absorbed by property taxes, and the factors responsible therefore, are conspicuously seen in Table 50 following, prepared from the same sources as Table 49. It is seen that the net rent before taxes per acre of 52 farms in Otero County reporting in 1919 was $12.63; but that the corresponding figure for the 30 farms reporting in 1924 was only $.75, and that consequently the property taxes absorbed only 17.3% of the net rent in 1919, but absorbed 62.7% in 1924. The comparison is suggestive in that it shows how inconvenient the general property tax may be in poor years when the income is reduced or converted into a deficit.

The following quotation from the Technical Bulletin No. 172, p. 15, from which the data in Tables 47, 48, and 49 are

drawn, demonstrates the unsuitability of the exclusive use of a tax based upon the capital value of the real property: "When the reports are considered individually, it is found that there is a great difference among farms in the percentage relationship of taxes to net rent. In 1926, one-fifth of the farms reported paid less than 20% of their rent in taxes. About one-fourth of the farms paid from 20 to 40 per cent, and 15 per cent fell into the 40 to 60 per cent group. Thus three-fifths of all the farms paid less than 60 per cent of their net rent in taxes. Contrasted with these, however, are 89 farms, or 30 per cent of the total number reported, which failed to yield in 1926 enough to enable their owners to pay taxes after the other necessary deductions from gross rent had been made."

It does not appear that taxes on farm real property absorb a larger percentage of the rent than property taxes absorb of the rent of urban property. Such at least is the conclusion drawn from the percentages presented in Table 51 following, showing the relation of taxes on farm and urban real property to the rents thereon. Taking all the states represented, the percentage of net rent before taxes that is absorbed by the property taxes does not differ much in the two kinds of real property. In Colorado the percentage absorbed by taxes of net rent on farm property appears to be somewhat greater than is the case with urban property.

It may be argued, and correctly so, that not all of the decrease in the valuation of agricultural property is due to taxes. Unfavorable seasons, low prices, high freight rates, and other factors reducing net income unquestionably have affected the valuation. But it is undeniable that the valuation is lower (or ought to be lower) than it would have been for the heavy and

TABLE 51

Percentages General Property Were of Net Rent, Before Taxes, of Farm and Urban Property in Years Specified, in Specified States

increasing real property taxes. That the property taxes have been heavy and increasing is shown by Table 52 following, in which is shown the total anticipated general property taxes for all purposes by years during the period from 1913 to 1929 inclusive, and also the index number of these taxes with 1913 taken as 100. While the tax index thus shown increased from 100 in 1913 to 275 in 1929, the index of capital value of farm real estate in Colorado declined during the same period from 141 to 82, as shown in Table 47 above. It appears to be well established, not only that property taxes are taking an increasingly larger and larger percentage of the capital value of farm real estate, and therefore of the annual income from farm real estate, but that this trend has gone so far as to encroach heavily upon the equities in farm real estate. Better prices and possibly lower costs may increase net income from farm real estate in years to come, and if so, they will minimize this trend, but they will hardly reverse it, especially if the public expenditures are to continue at the present or higher levels. It would seem that we are warranted in the conclusion that revenue from other sources should be found in order to reduce the burden directly placed upon real property.

TABLE 52

Anticipated Revenue from the General Property Tax in Colorado for All Purposes and Index Thereof, Taking 1913 as 100, for Period 1913-1929

Year	Amount	Index
1913	$18,032,588	100
1914	18,420,401	102
1915	20,536,105	114
1916	20,430,508	113
1917	24,657,787	136
1918	26,173,856	145

1928	48,230,730	267
1929	49,665,458	275

As for the property tax burden upon urban real property, the data are unfortunately not available so as to show the same relationship between real estate values. But it is certain that the relationship exists. The fact that in Table 48 above, the assessed value of town and city lots increased slightly, 2.94%, and that the improvements thereon increased considerably, 43.07%, probably is a result of the general tendency toward urbanization, and does not indicate that the value of urban real estate is not reduced by the heavy and increasing property taxes. The fact that the increase in the value of lots was negligible, while it was considerable in case of the improvements tends to prove that proposition. This conclusion is corroborated by Tables 53 and 54 following, showing the percentages of selling value taken by property taxes of farm real estate and of city real estate of Kansas for the years 1910 to 1923. It happens that these data are available for Kansas and not for Colorado. The reasoning is therefore from analogy. But conditions in Colorado do not appear to be any better than they are in Kansas. And the Kansas data are useful in showing authoritatively a condition in Kansas that may, from other evidence, be safely assumed to exist in Colorado, namely that taxes have increased much faster than the income from both farm and urban real estate.

TABLE 53

Taxes on Farm Real Estate of Kansas, in Percentage of Selling Value, 1910 to 1923

Year	State Average	Corn Belt	General Farming Region	Blue Stem Region	East Half of Wheat Belt	West Half of Wheat Belt	Grazing Region

Source: Same as Table 53.

It is shown that, for Kansas as a whole, property taxes took in 1910 .53% of the selling value of farm real estate, and that in 1923, the percentage had risen to 1.01%. With minor variations, the trend is the same for all the different sections of the state. The data for later years are not published, but it is known that farm values have further declined since 1923 (the index, as shown in Table 47 above, being 127 for 1923, and 113 for 1929) and it is generally known that property taxes in Kansas have further increased since 1923. Hence, the percentage of the farm real estate capital value taken in taxes is today higher than 1.01%, though we cannot tell how much.

It is also shown that, for the state as a whole, the percentage of the market value of urban real estate rose from 1.07% in 1910 to 2.29% in 1923. Here also this trend is found in all sections of the state, with minor variations. Here also the facts are well known that there has been little or no increase

in urban real estate values, and that the taxes have increased considerably. And it is interesting to note that the percentage of the selling value of urban real estate taken in property taxes is consistently more than twice as high as the percentage taken in taxes of the farm real estate selling values. A suggested explanation of this phenomenon is given in a later paragraph of this report. But if the conditions in Colorado, are similar to those in Kansas (and the index in Table 47 indicates that they are worse), then it is true that of the selling value of urban as well as of farm real estate, the taxes are taking increasing percentages, so high as to warrant relief in the form of revenue from other sources.

Are the people of Colorado willing to sanction as a public policy the taking, in the form of taxes, of such increasing percentages of the income from property that the capital value of the taxed property will be considerably impaired? There is a school of philosophers, those who believe that all taxes should be borne by the income from the bare land, who would favor such a policy. They would cheerfully levy taxes on land only, so heavy that they would result in taking substantially all income from land and thereby reduce the capital value of land to the vanishing point. Of course, they would compensate by doing away with all other taxes. They base their program on the proposition that all value of land is created by society, and not by the landlords, and therefore ought to be appropriated for public purposes. The objection that present owners of land have been permitted and encouraged by society to own land in which they have perhaps their sole investments, which would vanish if the tax took all of the income, is brushed aside lightly. It must be admitted that, except for the last mentioned objection, such a single-tax policy has much in its favor, and would probably have been satisfactory, if it had been adopted and continued from the beginnings of the state. But it is believed that the people of Colorado would not favor the single tax on bare-land values. And that is what we are drifting toward when the taxes take increasingly larger and larger percentages of real property selling values. If the equities of the owners of real property, especially of land are to be respected, other sources of revenue than the general property tax must be had, and must be used as far as possible without themselves becoming harmful to business and thus indirectly inflicting equal or greater injury to taxpaying owners of real property.

VII. General Property Not a Suitable Base for Total Taxes

Aside from the foregoing reasons for finding other sources of revenue to supplement the general property tax, there are

other good reasons why general property is not a suitable base on which to apportion the total tax burden. These reasons may be briefly stated.

A. Relation of Taxes to Income

In the first place, not all income or all activities, capable of sustaining a tax can be reached by taxes on property. Income arises not only from property but also from labor, professional services, and business activities involving little property. There are limits to the possible revenue from these non-property sources of income. But some can be taken and the taking of it will cause less sacrifice to the payers and less harm to business in general than the benefit of the relief accruing to the property owners and the general benefit to society that will flow from a resulting decrease in property taxes. It is a familiar fact that the percentage of the total national income that is derived from sources dissociated from property has been increasing rapidly, and is now very large. These incomes should help to support the government. For a large part of the governmental services are for the personal benefit of the citizens, and not primarily related to their property. Such is the case mainly with the very costly school services.

Not only are there the foregoing labor incomes that now for state and local purposes are tax-free, but the income from intangible property can bear some tax, though it cannot, practically speaking, be reached through a property tax.

In the second place, even if it were desirable to collect all the taxes from the owners of property, it would still be desirable to collect a part of the tax on the basis of the income from the property rather than collecting all of it on the basis of the capital value of the property. As much of the tax from property as possible should be collected where and when there is an income out of which and with which the tax may be paid. It is a familiar fact that the income from tangible property will vary, in some cases narrowly, but in other cases widely, from year to year; and in some years income may be negative, as is clearly shown in preceding tables. It is equally well known that these variations in the annual incomes from property are expected and not strongly reflected in the capital value. The result is that the property tax, based on capital value must be paid whether there is any current income or not. If a part of the total taxes on property were raised on income, the payments of taxes would, for any particular taxpayer, vary more nearly in accordance with income realized than is now the case. Assuming a given amount of revenue to be raised, the individual taxpayers would then pay more in prosperous years and less in lean years.

It is obviously not possible or at least not practical to raise all or even the major portion of the taxes to be derived out of property income, on the basis of income. For the counties, cities and towns and school districts are, and must for years to come be, dependent upon the taxes on property. There are two reasons why they must raise their share on the basis of capital value. In the first place, the property tax is the only tax they can administer, practically speaking. In the second place, these governmental units require a reasonably stable revenue from year to year. And the lean years would often afflict not only individual taxpayers with low incomes or deficits, but would affect the general body of taxpayers in the district, with the result that an income tax at reasonable rates would not yield adequate revenue. To give the local governmental units their stable annual revenue, the property owners must take up the slack. For these districts cannot even up the revenue in fat and lean years by means of borrowing, as can the national government, and as could the state government if it were authorized and equipped to do so. But a part of the taxes on property could be levied on the income basis, or possibly on some other basis than capital value, with resulting benefit and convenience to the taxpayer. It is, for example, true, as will be shown below, that much property is sold for delinquent taxes, and is permanently lost or has to be expensively redeemed, because in lean years the property owner simply does not have and cannot raise the money. In cases where a series of poor years afflict all or most of the taxpayers in a county there are veritable epidemics of such sales.

In the third place, it is another familiar fact that not all business enterprises require the same interest factor in capitalizing their earnings on employed property in arriving at a capital value of their property. It is generally admitted that farm property yields a lower rate of return than does other property in general. Thus farm property yielding a given income will be given a higher capital value than other general property yielding the same income, because a lower interest factor is used, in the capitalization. Reference to Tables 48 and 49 above, showing that the property taxes in Kansas took less than one half as large a percentage of capital value of farm real property as they took of urban real property suggests that, since the tax rate, though lower on farm property, is greater than one half of urban rates, the farm property is capitalized at a lower rate. For it is found by other studies, as shown in Table 51, that, on an income basis, farm property usually pays as much as does urban property.

It is inherent in the taxation of property on a capital basis that the taxes cannot be in proportion to the income from the property by reason of the different rate factors of capitalization employed. In general, those industries in which the owners are willing, for reasons of competition, to accept a lower return on their employed property must bear a heavier tax, measured by the income therefrom, since the rate on all capital value within a tax district is necessarily uniform. These inequalities can be partly remedied by collecting a part of the taxes on some basis other than capital value of property.

B. Unequal Territorial Distribution of Taxable General Property

But whether or not Colorado is to continue to rely exclusively upon taxes on general property, there is evidence to show that some more effective equalization of the tax burden is required—and that not merely such equalization of the burden as would flow from a better equalization of the assessment. For taxable property is not distributed among the various taxing districts so that the reasonable public services required can be financed by the levy of tax at a reasonably uniform rate in all the districts. And the smaller the district is the greater will be the discrepancies between the cost of legitimate governmental services of a taxing district and the taxable property from taxes on which these services can be financed. The discrepancies are best seen in the school districts, partly because they are the smallest tax-levying units and partly because they perform the most costly public service of any in the state. Table 55 following shows the frequency distribution of the school districts in Colorado counties according to the rate of the school levy (county and district) for the years 1928 and 1922. It will be seen that the average school tax rate for each county varied in 1928 from 4.91 mills in Mineral county to 21.36 mills in Rio Grande county, while the average for the state was 11.73 mills. In 1922 the lowest average county rate was 4.00 mills in Gunnison county and the highest was 15.46 in El Paso county, and the average rate for the state was 9.37 mills.

It is interesting that the average for the state increased from 9.37 to 11.73 mills. But it is much more significant that the spread is wider in 1928 than in 1922. Thus in 1928 there were 53 districts levying 25 mills or more while in 1922 there were only 14; in 1928, 9 districts levying 30 mills or more while in 1922, only 2; and in 1928, 2 districts levying 35 mills or more while in 1922 there were none. The data in the table bear out the theoretical conclusion that, with an increase in the

tax rate the spread will increase. For as the tax rate increases, the tax will appropriate more of the net income, hence reduce the valuation, which in turn will necessitate a higher tax rate, which in turn will further reduce the valuation, and so on. Should the expenditures for schools therefore increase, we may expect still higher tax rates, and wider variations in the tax rates, other things remaining as they are.

Is this discrepancy, between legitimate costs of public services and the basic assessed valuation, a problem requiring solution or is it merely a phenomenon, more or less interesting? There are two different lines of thought on this subject. On

the one hand it is accepted as basic that the tax on property in any school district must suffice to finance the school, be the rate what it may. If the property will not yield enough income to sustain these legitimate governmental costs, then the property in the district is not worth having and ought either to be abandoned or devoted to some other purpose not requiring residence of citizens requiring governmental services. According to this line of thought, to give state aid to such districts is to contribute toward maintaining a parasitical population.

According to the other line of thought it is the duty of the state to provide for all the children in the state a minimum of educational facilities. People are already in such districts, and they will in any event continue there, though perhaps in smaller numbers. Moreover, there is a feeling that high tax rates are, per se, unreasonable, and in order to keep the tax rates low, such high-rate districts will provide inadequate school facilities. If then, it is argued, the district cannot finance minimum school facilities from "reasonable" rates, the state must contribute to make up the deficiency. The deficiencies in each district can be eliminated in various ways. One way is to enlarge the district, say by spreading the school costs of all the school districts uniformly over all the property of the county. Even that, as the table shows would require, as shown in Table 55, county school rates varying from nearly 5 mills to 21.36 mills. Another way is to let the state establish an equalization fund from which can be distributed to counties or districts such aid as will equalize the burden for the high rate districts. The revenue for the state equalization fund may come from new taxes or from state property taxes.

It must be admitted that the former line of thought is the more logical, but the latter appeals to the popular sympathy and will probably prevail. Whether or not any relief is to be granted, a problem exists, which will in part be solved if a part of the total tax revenue can be raised on other bases than the capital value of the property.

VIII. Delinquent Property Taxes

The following analysis of the problem of delinquent property taxes was undertaken for the following reasons: First, the public treasuries lose revenue, though because of the heavy interest collected that sum is probably not very large. Second, the counties are involved in the handling of the delinquent property. Third, the penalties are unnecessarily severe on the delinquent taxpayers. And, fourth, the amount of delinquency is believed to be unnecessarily large and capable of being remedied through improved assessment.

A questionnaire was sent, through the courtesy of the Colorado tax commission, to the treasurer of every county in the state requesting data showing the extent of the delinquency, the procedure in dealing with delinquent property, and remedies suggested. At the time when the analysis had to be completed only 28 of the 63 county treasurers had returned the questionnaires. But these 28 questionnaires were carefully prepared and it is believed that the data, which are the basis for the following tables, present a fairly accurate picture of the tax delinquency problem of the state.

A. Extent of Delinquency

Table 57 following shows the distribution of the counties according to the percentages of the 1928 taxes, due in 1929, that had been collected up to the time of returning the questionnaires, the latter date being over one year after the due date for the last half of 1929 taxes. In one county at that date only 69.6% of the 1928 taxes had been collected; in two counties only 70%, while at the other extreme two counties reported 99% or over collected. Most of the counties do not fall far behind the required amounts. The medium percentage was 96.37.

In 24 counties, 4 of the 28 reporting being in part incomplete, the total taxes charged against the counties for 1928 was $17,724,590.76. Of this sum, $951,420.09, or 5.37% was delinquent and advertised as such for sale in 1929. But before being sold, taxes and interest to the extent of $456,855.99, or 48.0% was paid, leaving taxes to be disposed of to the amount of $583,323.00, principal and interest. These delinquent taxes were disposed of as follows. Firms or persons

organized to handle tax certificates purchased $137,800.06, or 25.6%. Other private persons or firms, not organized primarily for that purpose, purchased $114,898.90, or 21.3%; and the counties took the remainder of $538,323.00, or 53.1%.

In Table 58 following is shown the distribution of 26 counties reporting on this point according, 1) to the percentage of the taxes charged that was delinquent and advertised for sale, and 2) to the percentage of the taxes charged that was advertised but not sold, because the taxes were paid prior to the sale, but after advertising. The median percentage of property delinquent and advertised was 5.65, which is not far different from the arithmetic mean percentage of 5.3 given in the preceding paragraph. The conclusion is that, in the counties considered, about 5.5% of taxed property becomes delinquent and is advertised for sale. The median percentage of taxes charged which was delinquent and advertised for sale but paid before being sold was 2.85, about one-half of property delinquent. Table 59 following presents the distribution of the counties according to the percentage which the delinquent property on which taxes were paid prior to sale, was of the entire amount of delinquent property. The median percentage was 47.1. The median was only slightly lower than the arithmetic mean of 48.0%, as shown in the preceding paragraph. Table 59 is thus merely another way of showing that a little less than one-half of the delinquent taxes is paid before the threatened sale actually occurs. Since interest accrues at the

rate of 10% on the delinquent taxes until sale, at 18% for the first six months after sale on the taxes and costs, and at 12% for 30 months thereafter, it will seem that the delinquent taxpayer pays heavily for his carelessness or inability to raise the money, whichever the explanation of the delinquency may be.

Total	26

Median percentage, 47.1.

B. Disposition of Tax Certificates

Some very interesting conclusions follow from an examination of the three ways of disposing of delinquent property, and the percentages of the total delinquent property each takes in each county. Table 60 following shows the distribution of the counties according to the percentage of the total tax certificates taken by persons or firms organized partly or exclusively to buy, handle, and hold these certificates. In 14 of the 28 counties these tax certificate financiers did not take any certificates, while in 6 counties they took 50% or more of the certificates, in terms of their value. Evidently these financiers select carefully the counties in which they operate. And the selective principle they employ is simple: They do not buy tax certificates that are not likely or sure to be redeemed; they do not want to have the property left on their hands; they buy and hold the certificates for the sake of earning the interest thereon. This interest is at the rate of 18% for the first 6 months and 12% thereafter.

TABLE 60

Distribution of 28 Counties According to Percentage of Delinquent Tax Certificates Was Purchased by Persons or Firms Partly or Exclusively Organized to Handle Tax Certificates

Percentage Purchased by Such Firms or Persons	Number of Counties
None	14
0.1 to 9.9	1
10 to 49.9	7
50 to 89.9	5
90 to 100	1
Total	28

In addition to the more or less professional tax certificate financiers, there are miscellaneous local buyers of tax certificates. The distribution of the 28 counties according to the percentages of the tax certificates taken by these miscellaneous buyers is shown in Table 61 following. In only 2 counties of the 28 did they take no certificates. They also, like the more professional financiers, prefer to operate only with the certificates that will be redeemed. They too operate to collect the heavy interest. But they appear to be less rigid in their selection. For only in 2 counties did they refrain from taking any certificates at all, while the professional financiers refrained in

14 counties. And while they took tax certificates in the aggregate, in the 24 counties reporting, to the amount of $114,898.90, or 21.3% of the total tax sales, the median percentage was only 12.12% as shown in Table 61. The tendency not to buy certificates in counties where the probabilities of redemption are poor, pulls down the median below the arithmetic mean.

TABLE 61

Distribution of 28 Counties According to Percentage of Tax Certificates Taken by Persons and Firms Not Organized for That Purpose

Percentage Purchased by Such Firms	Number of Counties
None	2
0.1%-9.9%	9
10-49.9	12
50-89.9	5
90 and over	0
Total	28

The median percentage of tax certificates taken by miscellaneous buyers is 12.12.

After the professional tax certificate financiers and the miscellaneous buyers have taken their choice of tax certificates, the counties have to take the rest. In the 24 counties reporting on this point, $285,624.04, or 53.1% of the total sales, had to be taken by the counties themselves. The distribution of the counties according to the percentage they had to take of the total sales is shown in Table 62 following. It will be seen that in no county was it possible to sell all the tax certificates to professional or miscellaneous private buyers, that in 6 counties over 90% had to be taken by the counties and that the median percentage was 47.6%. The explanation is obvious: In every one of the 28 counties there was some property taxed at such high valuation that the private buyers could not be induced to pay the taxes in order to collect the high interest thereon, where the prospects were they might have to take the property. And in some counties nearly all of the delinquent property offered for sale for taxes was so assessed, as shown by the fact that the county had to take nearly all the delinquent property.

That the counties are compelled to take the leavings after the professional and miscellaneous buyers is of course well known. It is demonstrated clearly in Table 63 that only where the percentages of taxes collected are very low, and where

consequently the property is not likely to be redeemed, do the counties have to take large percentages of the delinquent property.

C. Redemption and Tax Deeds

Three years after sale a tax deed may be issued to delinquent real property. The owner has five years thereafter in which to redeem. In effect, he enjoys the privilege of redemption for eight years after sale. The cost at which redemption may take place is indicated by the successive rates of interest applicable: Until sale, the rate on the delinquent sum is 10%; for 6 months after sale it is 18% on the taxes and costs; for 30 months thereafter it is 12%; and during the last 5 years the rate is 8%. Table 64 following indicates that there is considerable variation in the extent to which property is thus redeemed. In 2 counties less than 10% of the sales is redeemed and in 7 over 90%, the median percentage being 50.

TABLE 64

Distribution of 25 Counties According to the Percentage of Property Sold for Taxes That is Redeemed by the Owner

To such property as is not redeemed title is taken on tax deeds by any one who has paid the taxes, costs, and accrued interest due. Or if the property has gone to the county, the commissioners will later sell it for such sums as may be had, on the theory that little is better than nothing. But there is evidence that in many counties much land taken by the county can not even be given away. Table 65 following shows the activity during 1929 in the way of issuing tax deeds from the county treasurer's office. These deeds range all the way from 1 in a county to 126, and average 31 per county.

TABLE 65

Total tax deeds issued, 812, or an average of 31 deeds per county.

D. Causes of Delinquency

An inquiry in the questionnaire dealt with the causes of the delinquency. Obviously the county treasurers cannot have intimate knowledge in all cases of the reasons for the non-payment of taxes. Yet only a few of them sought refuge in the statement that they did not know. They were asked to say what percentage of the delinquency was due to, 1) carelessness on the part of the taxpayer, 2) inability to raise the money, and 3) taxes so high as to make it inadvisable to hold the property. The results of the replies are shown in Tables 66, 67, and 68 following. In relatively few cases is the carelessness of the taxpayer blamed for the non-payment; but it is of course impossible to tell what the treasurer meant by carelessness, which may mean anything from merely forgetting to pay the tax on the date due to being shiftless or thriftless in general with the result that there is no money for the payment of the tax. Yet the fact that nearly half of the delinquent taxes were paid after advertising, but before sale, suggests that carelessness is a large factor involved. The most important explanation lies in inability, only temporary perhaps, to raise the money. But the most significant explanation is that high taxes made the holding of the property unprofitable.

The questionnaire also carried a request for more general or fundamental explanations of the epidemics of tax delinquency in some counties. For the present purpose it is convenient to divide the suggested causes into two classes. First those factors which reduce the income and may, if they seem permanent, influence the owner to let the property go for taxes, but will in any case cause difficulty in raising the money.

Roughly in the following order, the causes were: 1) Crop failure, and other factors affecting the earnings of farmers; 2) mining slump, and other factors reducing the income from mining; 3) bank failures; 4) thriftlessness and debts; 5) unemployment; 6) high freight rates. The other classes of explanations given relate to taxation. High tax rates, excessive special assessments, excessive assessed valuations, excessive school taxes, and kindred factors make it inexpedient to hold the property and pay future taxes. The conclusion is inescapable that the treasurers are aware of the effects of high taxes and excessive assessed valuations on particular properties. And it is probable that these factors are much more important than the taxing officials and even the taxpayers have recognized.

E. Remedies Suggested

There is almost complete unanimity in the report on the proposition that in case of delinquent personal property almost nothing is gotten from sale of the property for taxes. The property is moved and cannot be found. In another county in Colorado it can be reached only with the cooperation of the treasurer and sheriff of that county, and such cooperation is seldom forthcoming for the obvious reason that these officials have no interest in collecting taxes for a foreign county. And if the property is moved into another state, collection is next to impossible. A few treasurers employ a collection agency to collect delinquent personal property taxes. But more common is the practice of employing a special collector, either on a salary, ranging from $100 to $200 per month, or on commission, ranging from 10% to 20% of collections. But most of the counties apparently despair of collecting anything from delinquent personal property taxes, and collect only such as comes in of its own accord upon customary notice. The amounts realized from sales of personal property for taxes are zero in three-fourths of the counties and trivial in all the rest.

Nearly all the suggestions of remedies relate to the delinquent taxes on motor vehicles. The suggestions obviously relate not only to the collection of taxes already assessed, but also to the assessment of motor vehicles. Nearly all the reports suggest that the property tax on automobiles should be collected at the time when the license is issued.

It is obvious that the most important remedy has been overlooked, at least as far as delinquent real property is concerned. If the assessments were fairly made, so that the assessed value represented a fair capitalization of the net income, present or anticipated, from the real property, it cannot be doubted that much less real property would become delinquent.

Yet it is easy to understand the predicament of the taxing officials. Let a prolonged depression hit a district, perhaps with no visible relief. In their efforts to retain a valuation on which to raise taxes, so as to keep the tax rates down, the assessors and boards of equalization keep in force assessed values that perhaps were once fair. The principal result is an increase in the delinquency, and the accumulation of delinquent real property in the hands of the county, that must be disposed of at a sacrifice. But a heavy injustice is also imposed on the taxpayers before they decide not to pay the taxes. A legal assessment, on the basis of the net income would be far better than the repeated delusions resulting from taxes based on valuations so high that the taxpayer cannot hold the property. The first remedy for excessive delinquency is a fair and legal assessment.

It appears that the sale of tax certificates has become a device operating in many cases to extinguish title to privately owned real property that is worthless, without any taxes, or that has been made worthless by excessive taxes due to excessive assessments. It would be expedient to extinguish title to property that is really worthless, for though such property may have no value to a private person, it may have a value to the public, the state. But it is unjust to use excessive assessments as devices to dispossess owners whose property would have a value under just assessment practices.

SECTION IV

THE TAXATION OF BUSINESS CORPORATIONS

The constitution and general laws of Colorado are based upon the idea of taxing uniformly all property, real and personal, whether owned by individuals or corporations, under the general property tax. "The power to tax corporations and corporate property, real and personal, shall never be relinquished or suspended." (Art. X, Section 9.) "All corporations in this state or doing business therein, shall be subject to taxation for state, county, school, municipal and other purposes, on the real and personal property owned or used by them within the territorial limits of the authority levying the tax." (Art. X, Section 10.)

I. Corporate Property Taxes

It is necessary to distinguish between those taxes paid by the corporations which are essentially ad valorem taxes, under the general property tax, or are special forms of taxes in lieu of such general property taxes, on the one hand, and special taxes on corporations on the other. Of the latter kind there are not many in Colorado, and they yield but little revenue; but they are not very suitable forms of taxation. The property taxes of corporations will first be discussed in so far as they differ from property taxes on individuals and partnerships. Since the forms and methods differ for different types of corporations it is necessary to consider them separately.

A. Public Utility Corporations

Railroads, telegraph, telephone, express, sleeping car and private car companies are assessed by the Colorado tax commission upon the true value of the property of such companies in the state, determined by the unit rule. In the case of railroads, telegraph and telephone companies the tax commission first determines the true value of the entire corporate plant wherever situated. The state is entitled to that proportion of the total value of the companies that the mileage of the company within the state bears to the total mileage of the company wherever situated. Similarly the total assessed value of the companies so determined for the state is apportioned to the several counties of the state in proportion to the main track mileage of the railroads and the number of miles of telegraph and telephone wire in each county. Each school district and each municipal corporation within the county is then assigned its proportion of the assessed value of the railroad, telegraph or telephone company based upon the number of miles of main trackage or miles of wire located within each school district or municipality.

The statute provides in substance that in the case of express companies, sleeping car and fast freight companies the Colorado tax commission determines the total value of the companies as a whole and apportions the assessed value to the state in the proportion that the total number of miles made by such cars within the state bears to the total number of miles made by the cars of such companies within and without the state during the preceding year. Each county, municipality and school district is entitled to such share of the assessed value of such companies as the number of miles of railroad within their limits, upon which said companies operate, is to the total number of miles, upon which the companies operate within the state.

The law defines public utility to include, in addition to those mentioned above, power companies, pipe line companies, water companies, street railway companies, gas lighting and heating companies and all other classes of companies, however owned and operated, having a continuity of business in two or more counties of the state, and places the power of original assessment of all such public utilities under the jurisdiction of the Colorado tax commission. (C. L. 1921, 7361-7362.)

A survey of the practice of the various states in the taxation of public utility corporations shows a variety of methods, used singly and in combination. Nearly all the states have found it necessary to employ central assessment or some special form of taxation for this type of corporation. The three methods most widely used are, (1) the ad valorem or property basis, (2) the capitalization basis, and (3) the earnings basis.

In the absence of specific guidance in the law, the tax commission has used various principles and various combinations of principles in arriving at the "full cash value" of the corporations whose property it has to assess because it has found that no one principle will apply satisfactorily in all cases. It is recognized that this is a most difficult and complicated task, especially in the case of interstate companies and in the case of concerns whose securities are not freely dealt in on the exchange. Although charges are brought that such property is undervalued for purposes of taxation, the evidence available does not warrant a conclusion to the effect that such undervaluation is greater or less than is the case with property in general.

On the ad valorem basis the tax is imposed upon the value of the property of the corporation. It involves a more or less expert valuation of the property as a whole and an apportionment of that proportion of the value which belongs to a particular state. In determining the value of the corporation's property, a variety of evidence is used, such as the value of the

securities and the capitalized value of the net earnings. In some states ad valorem taxes are used in connection with other methods.

A survey of the situation throughout the United States made by the New York Joint Committee on Taxation and Retrenchment in 1922 showed that "about half the states relied on the ad valorem basis exclusively for the taxation of railroads and nearly as many states used it as the exclusive tax for telephone and telegraph companies. About a dozen states used it as the only method of taxing street railways and water, gas and electric companies." (Leg. Doc. 1922 No. 72 p. 112.)

The capitalization basis involves the imposition of a tax upon the value of the securities of the corporation. The total value of a corporation is obtained by adding together the current cash value of its outstanding capital stock and of the outstanding funded debt. The real value of the corporation is the amount for which its stock can be bought and sold. The New York Committee reported that "this basis has generally proved unsatisfactory and is of declining importance. Only three or four states rely upon this method alone for the taxation of one or more of the classes of public utility corporations. About half a dozen states use this in connection with other methods." (Ibid p. 112.) It is apparent that this method would be practicable only when the securities of the utility have a broad market and are frequently bought and sold.

The earning basis is widely used and seems to be growing in favor due to its simplicity of administration. The amount of the tax is stated as a certain percentage of the earnings. The earnings tax is almost always based on gross earnings. Only two states make use of the net earnings basis. The New York committee reported in 1922 that "The gross earnings basis is used for the taxation of railroads in eleven states, for street railways in twelve states, for telephone and telegraph companies in fourteen or fifteen states and for water, gas and electric companies in a dozen states. In more than half of these states the gross earnings tax is the exclusive state tax." (Ibid, p. 113.) In Table 69 following are shown the states using this form of tax.

The ad valorem method, though most widely used, is subject to serious objections. The process of valuation requires a large staff of technical experts familiar with the technical details of corporation finance, so that it is expensive and difficult. The element of personal judgment must enter to a large degree in the valuation of physical properties and in the use made of facts regarding financial condition, earnings, etc. The value of a corporation's tangible property alone is not a true measure of a corporation's ability to pay taxes. It is probably due to a recognition of this fact that some states have found it necessary to employ the capitalization basis and the earnings basis in arriving at the value of the corporation's property.

TABLE 69

Source: New York state tax commission report, 1927, p. 615-617.

*Recently abolished gross earnings tax and changed to a tax measured by net income.

**Also 3% of dividends in excess of 4%.

Note: Illinois by charter requirements imposes a tax of 7% on gross receipts on that part of the Illinois Central Railroad, which operates under the original charter. The following states, in addition to those of the table, impose taxes on gross earnings on express companies: Idaho, 3.0%; Kansas, 4.0%; Missouri, 2.5%; Montana, 4.0%; Nebraska, 2.0%; New Jersey, 2.0%; and New Mexico, 5.0%.

The gross earnings tax possesses the marked advantage of simplicity. Gross earnings can readily be determined; they fluctuate with the prosperity of the corporation and are the real basis of its worth and tax paying ability. If the choice must be between the ad valorem method and the earnings basis, the latter would seem to be preferable. Nevertheless, the experience of some of the states, notably California, with the earnings tax as a method of taxing public utility corporations, indicates that this plan is not the ideal system. It raises the difficult and almost insuperable problem of securing equality of the tax burden as between the corporations which are taxed on the basis of gross earnings and other kinds of property and

other corporations which are taxed by other methods. After an exhaustive study of the operation of the gross earnings tax in California, covering a period of eighteen years, the special California tax commission of 1929 reached the following conclusion:

"Not only is the determination of the rates of the gross receipt taxes incapable of satisfactory solution, even with the most refined technique available but the gross receipts method itself even when applied to a revised and complicated grouping of the utilities, yields results which from the point of view of equity are crude beyond any reasonable limit of tolerance." (Final report of the California tax commission, 1929, p. 66.)

The California Commission made two important recommendations with respect to the taxation of public utilities. First, that the operative real estate of all public utilities be valued by the state and then returned to the counties to be added to the local tax rolls and subjected to the same tax rates as are imposed upon the real estate of corporations and individuals; Second, that a franchise tax be imposed by the state on all public utilities measured by their net income in the same manner and at the same rate as the similar tax on banks and other corporations. The effect of this action, it was pointed out, would be to establish ultimately a uniform business franchise tax on all corporations, the public utility corporation being treated exactly as other corporations.

The tax revision commission of Utah, which made its report in 1929, recommended the introduction of a business income tax upon the net income of all business conducted for profit, except insurance companies which were to be taxed upon their premiums. The rate of the tax suggested was 4% on net income.

The present tendency in taxation is without doubt in the direction of imposing taxes on net income. At present 20 states impose taxes on the incomes of individuals or business corporations or both. In the light of the experience of other states, it would seem that the adoption of gross earnings tax on public utilities would be a progressive step, but that the wisest course would be to impose a tax on the net income of public utility corporations as an excise or license tax on the privilege of doing business within the state.

Elsewhere in this report it is suggested that a business franchise tax measured by net income might be imposed upon all business corporations doing business in Colorado. It is believed that public utilities should be within the scope of this tax. A uniform business franchise tax measured by net income and imposed upon all corporations, including public utilities,

seems to be the simplest plan to follow in order to insure that all corporations shall be treated fairly and equitably. The reasons for such a tax are not fully apparent at this point, but they will be more so as different types of corporate enterprises are discussed.

B. Banks and Other Financial Corporations

In one sense the taxation of commercial banks is the most pivotal factor in the entire taxation problem. The strategic position of the banks arises from our dual form of government and from the fact that both the national government and the state government have chartered banks in Colorado. The state may tax the national banks only with the consent of Congress and only in such manner and to such extent as that body permits; and since the state would not want to tax the state banks more heavily, and cannot tax them more leniently, taxes on all commercial banks are uniform in the state. Moreover, all the states taxing banks under the general property tax are in the same situation as Colorado. In case of all other corporations Colorado may substantially devise its own tax system; in case of commercial banks the state is restricted by Congress. And this restriction involves serious problems in the equalization of taxes on commercial banks with taxes on other financial corporations, with taxes on corporations in general, and with taxes on intangible personal property.

1. Commercial Banks

The law of Colorado, complying with the federal law (Section 5219 U.S.R.S.), contemplates the taxation of the shares of capital stock of national and state banks as personal property in the county where the bank is located, and the taxation of bank-owned real estate "according to its value, as other real estate is taxed." (C. L. 1921, Sec. 7450.) The bank is made the agent of the stockholders for the assessment returns and payment of the tax, and is required to make an annual statement of its true condition to the assessor as of April first, together with a sworn statement of the market value of the stock, or, if it had no market value, then the book value. (Ibid, Section 7453.)

The actual practice followed in the taxation of banks follows the administrative interpretation of the law. The assessed value of the real estate owned is deducted from the value of capital, surplus and undivided profits and only the excess of the value of capital resources over the value of the real estate is assessed on the share basis. In addition to this excess share value, the real estate owned is assessed. Possibly the law contemplated that the banks should be assessed on all their cap-

ital resources, without any deductions, and also on their real estate. Opinions of the attorney general and rulings of the tax commission have developed the present practice, and the present practice is as nearly in conformity with the practice of not taxing shares of other corporations as the law permits, and conforms to the practice in other states, with regard to the taxation of banks. According to the annual report of the Comptroller of the Currency for 1929, page 114, the total capital stock paid in, surplus and undivided profits of the 278 banks in Colorado, amounted to $35,921,000 as of June, 1929. This figure includes the 121 national banks and the state banks, loan and trust companies, savings and private banks. The total assessed valuation of bank stock for the year 1928 was $23,694,356. Presumably the difference between the assessed valuation and the book value of bank stock amounting to $12,227,000 represents the amount of real estate owned by banks. The value of the banking house, furniture and fixtures as reported by the Comptroller of the Currency was $8,112,000 and other real estate owned amounted to $2,291,000, making a total of $10,403,000.

There is no practical way of ascertaining the assessed value of the bank-owned real estate; but if the assessed value and the book value are identical, the total assessed value on which the banks paid taxes is the sum of the $23,694,356 assessed value of the shares and the $10,403,000 bank value of the bank-owned real estate, or $34,097,356. This latter sum differs from the book value of the total resources as shown by the Comptroller above, $35,921,000, by only $1,823,644, or by 5.07%. The banks appear to be taxed, then, at an assessment ratio of 94.93% of full value. This conclusion is in almost complete agreement with the conclusion, arrived at by a different method, shown in Table 41, to the effect that the banks paid taxes on an assessment ratio of 94.5% of full value. It is beyond dispute that the average assessment ratio of other property is below 94.5% or 94.93%.

The grievance, as stated by the banks, appears to be well founded. They are substantially the only corporations whose corporate excess is taxed. (For explanation, see subsection above entitled: Remedies for Defective Assessment.) They are taxed on a valuation only slightly less than 100% (94.5% or 94.93% as shown above), not only on the bank-owned real property but also on their corporate excess, while property in general is assessed at an undetermined but admittedly much lower ratio. Their stocks are matters of record, so that the banks cannot participate in the prevailing evasion of taxes by non-listing of property. They are the only corporations that

are, in effect, required to include tax-exempt securities among their gross taxable credits. These propositions are more fully discussed in the subsection mentioned above, in Tables 39, 40, and 41, and the accompanying text.

Some of the Colorado banks paid their 1929 taxes under protest and have filed protests against their 1930 assessments. The contention is that the present system of taxation in Colorado discriminates unjustly against national banks, which are overtaxed as compared with taxes on other competing moneyed capital. Under Colorado laws secured debts are not taxable and the negligible amount of bonds, notes and other kinds of intangible property assessed for taxation demonstrate that this class of property virtually escapes. A series of court decisions in other states, where similar conditions obtain, have established the rule that national bank shares cannot be taxed at a higher rate than that applied to other kinds of intangible property. A decision from Oregon has held a tax on national banks invalid because certain competing moneyed capital of individuals, although by law subject to the general property tax, was in fact not taxed at all. A similar decision has been rendered in Florida. While these decisions are not of courts of last resort, it is highly probable that the present Colorado system of taxing national banks would be held invalid.

Colorado, in common with other states, is confronted with the problem of revising its tax system in such a manner as will permit it to tax national banks doing business within the state in a lawful manner. The experience of other states with the classified property tax, under which a low rate of tax is imposed upon money and credits, indicate that adoption of the classified property tax is not the correct solution of the problem. In fact the low-rate taxes on intangibles has been the specific occasion for the difficulties which many states now have in taxing banks. Where classified property taxes on intangible property are in force, the courts have held that higher rates cannot be imposed on the shares of national banks. And other decisions hold that the state bank shares must be accorded the same rate. This means that if Colorado should adopt a classified property tax on intangible property at 4 mills, this rate would also apply to bank shares. In 1928 the total assessed valuation of bank shares in Colorado was $23,694,356. A tax of 4 mills on this valuation would produce $94,776. The tax actually paid on bank stock, assuming an average rate for the state of 28 mills, was $660,000. While the latter amount is evidently excessive, the former would doubtless be deemed inadequate. The present federal statute, Section 5219 U. S. R. S., permits four or five alternative methods of taxing national

banks, as follows: (1) A property tax on the shares, but not at a greater rate than is assessed upon other moneyed capital in the hands of individual citizens in competition with the business of the banks, and a property tax on the real estate of the bank. (2) An income tax on the dividends received by shareholders, provided the rate is not greater than is assessed upon the net income from other moneyed capital, and a property tax on the real estate. (3) An income tax on the net income of the bank, and a property tax on real estate. And (4) a franchise tax, based on the net income, and a property tax on the real estate of the bank. Under the fourth alternative the tax may possibly be based upon the entire net income of the bank received from all sources and, furthermore, dividends received from bank shares may be included along with other income under a personal income tax, provided dividends of other domestic corporations are similarly taxed. The rate of the franchise tax imposed on national banks may not be higher than the rate assessed upon other financial institutions, nor higher than the highest of the rates assessed by the state upon mercantile, manufacturing and business corporations doing business within the state.

The fourth alternative seems to be the one best adapted to the situation in Colorado and is the method which is being recommended and adopted by other states which have recently revised their tax system. Such a tax should be in the form of a business franchise tax based upon net income of banks and made applicable to at least all classes of corporations designated in the federal act. Prior to 1929 only three states, Massachusetts, New York and Wisconsin taxed banks on or according to their income. The 1929 legislatures of Washington, Oregon and California added their three states to the list, making six in all. In Massachusetts the rate is determined by the state tax commissioner. New York imposes a rate of 4½% on net income from all sources. In Wisconsin the rate varies from 2% to 6%, plus a 1% surtax for soldier's bonus. In Washington the excise rate is 5% and the tax applies only to banks and other financial institutions. In California, at the rate of 4% and Oregon at the rate of 5% it applies to corporations in general.

While the fourth alternative, as followed in the six states listed above, is the best for two reasons, namely because it permits 1) a personal income tax on the dividends and also 2) a corporate income to the bank, it is by no means free from objections, and these objections should be frankly faced. In Macallen vs. Mass., 49 Sup. Ct. Rep. 432, (May 27, 1929), the United States Supreme Court, in a majority opinion, held that a

so-called excise tax based in part upon interest derived by a manufacturing company from tax exempt federal securities was invalid, and that, where the tax is ostensibly on the corporate privilege of doing business, the court will look beyond the words of a statute to ascertain the real legislative intent. There is a strong dissenting opinion by Justice Stone, concurred in by Justice Holmes and Justice Brandeis. A tax imposed according to or measured by net income is alternative 4 of Section 5219. If the Macallen case applies to both alternatives 3 and 4 the taxable income of banks may be materially reduced. The principal difference between alternatives 3 and 4, was supposed to be that under 3, a straight income tax, such income would be excluded, but under 4, an excise tax, it might be included. The Macallen case may have obliterated this distinction. The excise tax laws of the three Pacific Coast states are now being contested and it is not yet finally accepted that the disputed income must be excluded in these states. But in any event, alternative 4 is the best because it is the only one that permits the following three taxes on banks: 1) A property tax on the real property; 2) a personal income tax on the dividends; and 3) a corporate income tax on the bank. The present Colorado method, namely the general property tax on bank shares will probably not long survive.

It should be stated that a committee of the American Bankers Association and a committee representing the state tax officials in the states having troubles with bank taxation are cooperating to evolve an amendment to Section 5219. These committees have arrived at a compromise which they suggest should be submitted to Congress. But it is very complicated and its adoption is problematical.

2. Building and Loan Associations

The problem of the taxation of commercial banks is strikingly illuminated by a comparison with the taxation of building and loan associations. These enterprises find themselves in a peculiarly favorable position with respect to taxation. Yet that position does not result from any special statute exempting building and loan associations, as such. The statute defining the method and scope of taxing these organizations (3 M.A.S. 6254) requires them to pay taxes on their real property and tangible personal property. In this respect they are in the same position as any other corporation and presumably the taxation of their tangible property is as equitable or as inequitable as that of corporations in general. Building and loan associations also pay certain fees and corporation charges in the same way as such fees are paid by other corporations.

The associations are required to pay taxes on the net value of their intangible property. The revenue act of 1902 requires the associations to list their taxable moneys, notes and credits, and also to list the liabilities to share holders and all other liabilities. When the liabilities are deducted from the taxable intangibles, there is seldom, if ever, any excess left to tax. The explanation is simple. The business of the associations is to make loans on real estate secured by mortgages. By far the largest item in the assets of the association is that of loans secured by mortgages, but these secured debts are not taxable, the real property on which they are based being taxed without deduction. Hence, their taxable money, notes, and credits, less the liabilities is ordinarily a negative quantity of large magnitude.

Most of the associations are mutual and have only mutual stock. There is, therefore, no equity of the stockholders other than those holding savings certificates or shares. The savings certificates or installment shares are not taxed in the hands of the holders. This exemption follows from the fact that the deposits made by the savers are represented by the real estate mortgages held by the association. The savers are indirectly, through the medium of the building and loan association, lending their money on real estate secured by mortgages.

The majority of the associations do business in rented premises and employ very little personal property. The building and loan inspector (Auditor of State, ex officio inspector) states in his 1926-1928 biennial report that there were 68 associations operating under certificate of authority from the bureau of building and loan associations. But from the separate reports of these 68 organizations it appears that only 24 paid any property taxes. The tangible property, the taxes paid thereon, and the percentage the taxes were of the book value of the tangible property, are shown in Table 70 following. It will be seen that the percentages which taxes were of the property vary widely. These variations do not necessarily reflect corresponding inequalities in the property tax burdens. For these organizations do, often against their will, hold real property temporarily taken in the satisfaction of debts. The property held at the close of the fiscal year may therefore not be the property on which the taxes were paid during the fiscal year, especially in view of the excessively long assessment and collection procedure. But the total of $31,281.84 is in excess of the total of property taxes paid by the 68 associations. For over one-half of it is paid by one association, which, as shown in Table 70, includes repairs and insurance with taxes. Another lumps all taxes under the heading "Miscellaneous Taxes".

Except for certain inspection fees and corporation stock taxes which in common with all corporations they pay, at a low rate, to the secretary of state, and which will be discussed below for corporations in general, the business of the building and loan associations, and the intangible property of the associations and of the savers or investors went free of taxes. That the business of these organizations is considerable and growing is shown by the statement of the deputy building and loan inspector in his 1926-1928 report to the effect that the assets had increased from $7,500,000.00 in 1920 to $50,465,705.54 in 1928.

*Includes repairs and insurance.

**Miscellaneous taxes. This is an out-of-state company.

The inequality in the taxation of building and loan associations as compared with the taxes on other corporations arises from the fact that certain other corporations and commercial banks are required to pay taxes on intangible property

as represented by the general property tax on their shares, without corresponding deductions for liabilities.

The remedy, whatever else it may be, is not to require the associations to pay property taxes on their loans or to tax as property the withdrawal value of shares to the savers. To tax the underlying real property and also to tax the securities to the association and also to tax the shares to the holders would be taxing the same property three times. To tax the underlying real property without deducting debts, and also to tax the shares to the association or to the holders would be double taxation. The proper remedy would seem to be to find some other bases on which the building and loan associations might be required to pay taxes in respect to the business they do.

The most suitable tax for these corporations would seem to be an income tax. But there is some difficulty involved in ascertaining the earnings of the association. In case of mutual associations most or all the earnings are paid as dividends to the holders of the running shares. They would seem to have no earnings in the sense that non-mutual corporations show earnings. It would be possible, however, to define the income of the associations so as to consist of the gross interest earned, less the expense of conducting business. Such an arrangement would be equivalent to taxing the dividends before they are paid or credited to the share holders, which is the equivalent of the corporation income tax. If Colorado were to adopt a corporation income tax and a personal income tax it would be fair to tax the income thus defined to the association, and also to require the recipient of the dividends to include them, when received, as part of the income subject to the personal income tax. Such a tax system applied to both commercial banks and building and loan associations, would place both on an equal basis. And the states that are adopting income taxes of both kinds are following this practice. Such is the case with the three Pacific Coast states having adopted income taxes for the taxation of banks and other financial corporations.

3. Other Financial Enterprises

There are other types of financial enterprises such as finance companies, investment houses, acceptance companies, and others known by other names. It is not necessary to discuss them in detail, partly because in Colorado they are not numerous or relatively important, and partly because it is not necessary to report more than the observation that they are not easily taxed on a property basis, and should be subjected to income taxation for the purpose of putting them as nearly as possible on the same basis as other business.

4. Insurance Companies

From such study as can be given to the taxation of insurance companies it appears that no change should be made in the present methods of taxing them. They are practically the only enterprise, which it is not practical to tax on an income basis and for which property taxation on their reserves has been almost universally abandoned. The reason why insurance companies should continue to be taxed on their net premiums, as at present, instead of taxing them under a business franchise tax based on net income, is that the determination of net income presents a peculiarly difficult problem, on account of the nature of the business. The subject was exhaustively studied and discussed by the 1929 California tax commission under the leadership of Dr. R. M. Haig of Columbia University, and it was decided to retain the gross premium tax in California. The 1929 tax revision commission of Utah reached the same conclusion, and such is the prevailing view of investigating commissioners. The method of taxing insurance companies by means of the tax on gross or net premiums is now employed in thirty-four states. Three states employ gross receipts as the tax base. Five states impose a tax on capital stock. Two states employ net income and several states impose a flat fee in addition to other taxes.

Colorado imposes a tax of 2% on all premiums collected, which is in lieu of all other taxes except taxes on real estate and tangible personal property. Certain fraternal and mutual companies are exempt. If a company has 50% of its assets invested in bonds or warrants of the state or its political subdivisions or other Colorado property, it is not required to pay the premium tax. It is not known how much revenue is lost to the treasury by reason of this exemption. But it is extremely doubtful whether such a policy is wise. It is not necessary in order to induce insurance solicitation in the state; nor is it necessary, but on the contrary detrimental for the purpose of getting the insurance business in the best insurance companies. Good insurance principles and practices require that the risks, whether life, fire, damage or what not, shall be widely distributed and that the investment of reserves shall be widely diversified. Possibly the exemption may foster the organization of several small local companies; but smallness is not a virtue in an insurance company. Possibly also some inducement to the investment of foreign capital in the state; but in view of the extreme mobility of moneyed capital it is questionable whether the result is more than merely to displace an equivalent amount of capital that would otherwise be invested in the state. In any event, the inducement, amounting to complete exemption is excessive. Other states, while

some offer inducements of the same kind, do not go as far as complete exemption. It would seem that a credit for, say, 50% of the regular premium tax might be adequate inducement to local investment, and such an adjustment in the rate might serve as an experimental step toward the complete elimination of the exemption. In view of the heavy tax burden on property it is probable that such exemptions are in effect harmful to property and business of Colorado.

A comparison of the rates imposed on gross premiums in the various states reveals that 15 states impose the same rate as Colorado, 13 impose a higher rate than Colorado and 9 impose a lower rate. A number of these states, however, levy an additional tax ranging from one-fourth of 1% to three-eighths of 1% for fire prevention purposes and 12 states permit local subdivisions to impose special taxes for local purposes. In view of these facts and in view of the need for relief from excessive property taxes, an increase in the rate from 2% to 2.5% might be justified in Colorado, without making the rate unduly burdensome or out of line with taxes paid by insurance companies in other states. Such increase might be expected to yield $167,000 additional revenue.

C. Other Business Corporations

The special forms of taxes imposed in lieu of the general property tax, or some special form of this tax, or some special method of assessment of this tax, do not usually apply to the remaining corporations, such as mercantile, manufacturing, and other business corporations. For them, the property tax, even when locally administered, is not incapable of administration. The nature of the taxation ills can be cured, in so far as any taxation ills can be cured at all, by such assessment and other administration improvements as have already been discussed above. It would be well to supplement the property tax on these corporations by a business or corporate income tax in common with all other corporations.

D. Taxation of Mines

The constitution of 1872 exempted from taxation for ten years mines and mining claims of gold, silver and precious minerals, except surface improvements and net proceeds. Subsequent legislation has favored the mining industry in the matter of taxation.

Mines are divided into two classes, producing and non-producing. A producing mine is defined as one yielding more than $5,000 gross per annum. Such mines when yielding gold, silver, lead, copper or other precious metals are assessed at one

fourth of the gross product unless that be less than the net product, in which case the latter governs. Surface improvements and machinery are assessed separately. Mines of iron, coal, asphaltum and quarries are assessed as other property. Non-producing mines are assessed at a rate not higher per acre than the lowest producing mine in the same location.

In addition to the general property tax levied on value and on output there is a tax of one tenth of 1% levied upon all producing and non-producing metalliferous mining properties. This fund constitutes the metal mining fund and is used for promotional activities and research affecting the metal mining industry. In 1928 the tax was levied on mining properties located in 32 counties and yielded $16,260.

A tax of one third of 1 cent per ton of coal mined is levied on each owner operating a coal mine and constitutes the coal mine inspection fund and is used to defray the expenses of the office of state coal mine inspector. This tax produced $39,863 in 1928.

It appears that the policy of the state has been to grant special favors to the mining industry by taxing metalliferous metal mines on the basis of 25 per cent of their gross output instead of taxing them upon the value of their properties. This plan allows the very wealthy mining properties to escape their just share of the public burden and is unjust to other taxpayers in the mining counties.

Assuming that the mining industry is to be fairly taxed on as nearly as possible the same basis as other industries are taxed, there are two possible methods available. First, mining corporations may be taxed in the same way that it is proposed to tax all other business corporations namely, by imposing a tax on the value of their tangible property, and by imposing a business franchise tax, measured by net income and by taxing dividends from mining shares along with other dividends and income received by residents of the state. Second, some form of occupation or severance tax may be used. Various states now use the severance tax. But such a tax does not appear to be desirable or fiscally productive in Colorado. It would be better to use the business franchise tax along with the property tax, instead of the severance tax for the following reasons. First, in the interest of uniformity and simplicity of the tax system. Second, because of the difficulty of fixing rates on production basis which will result in imposing the same tax burden on mining property that other forms of property bear. Third, because a business tax will be more equitable as between large and small producers or among those operating under different conditions of cost.

II. Corporation Taxes Proper

In addition to the foregoing taxes on, or taxes in lieu of, corporate property, certain taxes are imposed on corporations as such, as distinct from individuals and partnerships. The corporate franchise is a convenient handle upon which to hang taxes. For this reason taxes are often imposed on corporations which, if justified at all, should really apply to all business enterprises, unincorporated as well as incorporated. Doubtless the corporate franchise has value, but it is, with general incorporation laws, relatively simple and not costly to create a corporate franchise. For purposes of ascertaining the ability of a business enterprise to pay taxes, incorporation makes little difference. Nevertheless taxes on corporations, as such, in diverse forms, occur in every state. They are rather low in Colorado; but the form in which they appear is capable of improvement.

It is necessary to distinguish two forms of contributions made by corporations in Colorado. One is really a fee, based on the capital stock, and paid only on the occasion of incorporation. Of the same kind is the annual fee paid on the occasion of filing required reports. But of a different kind is the recurrent corporate license (flat) tax. The latter is a tax, while the former and a variety of other minor payments are fees.

A. Organization and Similar Fees

Colorado, in common with practically all the other states, imposes a fee on new corporations when they file their articles of incorporation, based upon the amount of capital stock, although some states charge a flat fee. In Colorado the rate on domestic corporations is $20 where the capital stock is less than $50,000 and 20 cents for each additional $1,000 of capital stock. For foreign corporations the rate is $30 where the capital stock is less than $50,000 and 30 cents for each additional $1,000. The organization tax is collected by the secretary of state along with other fees for filing annual reports and in recent years has been as shown in Table 71 following. The figures in the column headed "other receipts" include receipts not closely related to corporations. Thus, for 1926, of the $27,177 listed in Table 71 as "other receipts," only $12,958.45 are classifiable as miscellaneous fees from corporations. The figures in the column headed "totals" are therefore probably $15,000 to $20,000 too high. The data in the table are incomplete because the successive reports of the secretary of state contain fewer and fewer details, and the matter is not of sufficient importance to warrant analysis of the original entries.

TABLE 71

Number of Incorporations and Fees for Specified Years

Year	Number of Incorporations		Receipts from Fees			
	Domestic	Foreign	Articles, Renewals, Amendments	Annual Reports	Other Receipts	Total
1920	1,244	166	$94,569	$30,381	$24,591	$149,541
1921	984	113	51,921	31,348	24,662	107,931
1922	1,299	111	60,050	29,966	23,482	113,498
1923	1,199	128	67,590	29,757	35,983	133,330
1924	1,218	143	77,189	29,432	27,701	134,322
1925	.....	.....	70,854	30,003	29,371	130,228
1926	.....	.....	62,645	30,915	27,177	120,738
1927	.....	.....	.....	.....	.....	145,030
1928	.....	.....	.....	.....	.....	198,031

In thirteen states the organization fee is one tenth of 1%. A similar rate for Colorado would produce $100 for a corporation capitalized at $100,000 instead of $30 as at present. It is estimated that an organization fee of one tenth of 1% would yield approximately $175,000 annually, which would represent an increase of $100,000 over present yields. But if a corporate franchise tax measured by net income is to be enacted, these fees ought not to be increased. The fees are based on authorized capital stock which is a poor basis for taxation, since it has no necessary relation to the corporate income or the value of the corporate property. Fees should be adjusted so as to pay the cost of the regulating service, and not much more. And the amounts now collected are in excess of the cost of maintaining the regulatory state offices. The fees might even be reduced.

B. Annual Franchise Tax

Every corporation doing business in Colorado, except insurance companies, is required by law to pay annual corporation license tax for the privilege of transacting business within the state, in addition to all other fees and taxes. The rate on domestic corporations is $10 on a capitalization of $100,000 or less and thereafter 10 cents per $1,000 of capitalization. Foreign corporations are taxed at the same rate on that portion of their capital which is employed in Colorado. Practically every state in the United States levies an annual franchise tax upon all domestic and foreign corporations. In a majority of the states this tax is based either upon the capital stock of the corporation or on the capital stock plus surplus and undivided profits. A few states use, as the tax base, the value of the property of the corporation. Massachusetts, and Rhode Island

use the corporate excess. California, Connecticut, New York, North Dakota, Tennessee and Wisconsin impose a rate on net income only. Many of the states which have developed a business franchise tax measured by net income have also retained the annual franchise tax on capital stock; in other states the franchise tax on net income is the sole tax, while still others retain the capital stock tax for certain classes of corporations and employ the tax on net income for other classes.

Table 72 following shows the amounts collected from the annual corporation license tax in recent years in Colorado. About 7,000 corporations file annual reports with the secretary of state each year. Assuming the figure of $200,000 as the total amount collected annually from these corporations under the license tax, it appears that the average amount paid per corporation for the privilege of exercising its corporate franchise is less than $30 per year. During the year 1925 the federal government imposed a tax of one tenth of 1% upon the fair value of the capital stock of all Colorado corporations and collected therefrom $865,511. This federal tax on capital stock was repealed July 1, 1926.

TABLE 72

Receipts from Annual Corporation License Tax, 1920-1928

Year	Receipts
1920	$214,200
1921	206,905
1922	188,757
1923	200,236
1924	190,683
1925	182,501
1926	183,679
1927	182,664
1928	189,561

Source: Reports of Secretary of State.

The yield of the present annual corporation license tax is so small as to bear no adequate relation whatever to value to corporation of exercising their corporate franchises. The total net income of all corporations in Colorado reporting net incomes to the federal government under the federal income tax amounts to about $60,000,000 annually. The states which have

adopted business taxes measured by net income impose rates varying from 1% to 5%. If Colorado should impose a business franchise tax at the low rate of 3% upon the net income of Colorado corporations, instead of the annual license tax now imposed, it might be expected to yield $1,800,000 annually. This figure probably represents a fair average of the additional tax burden now imposed on business corporations in other states, for the privilege of exercising their corporate franchises. The states which have developed the business franchise tax as measured by net income, have in most cases imposed this tax in addition to the taxes paid on real and tangible personal property.

The proceeds of the present tax are appropriated for the payment of the principal and interest of the National Defense Bonds, Series 1917. At the close of 1928 there remained but $229,000 of these bonds outstanding so that these bonds will probably be retired by 1931 and the franchise tax need not be collected for this purpose.

If it is desired to have a simple system of taxation, having as few different kinds of taxes as possible, and in order to secure as nearly as possible equality of tax burden as between different kinds of corporations, the annual corporation license tax imposed on capital stock should be abolished and there should be substituted for it a business franchise tax imposed at moderate rates upon the net income of all business corporations.

Another circumstance has recently arisen which makes this form of business taxation desirable, and which adds weight to the foregoing considerations, namely the bank tax situation already discussed. The only practical way now available to the state of Colorado to tax national banks is that provided under the fourth alternative of the federal act, namely, a franchise tax based on the net income of the bank. One of the conditions provided in Section 5219 U.S.R.S., in connection with the taxation of national banks based on net income, is that the rate of tax imposed shall not be higher than the rate assessed upon other financial corporations nor higher than the highest of the rates assessed by a state upon the net income of mercantile, manufacturing and business corporations doing business within the state.

Such being the situation, it appears that the simplest and at the same time the most equitable course to pursue is to extend the business franchise tax to include all classes of corporations.

C. The Problem of Apportionment

The taxation of corporations involves the apportionment to each state of its proper share of the earnings, net income or property of corporations, especially of foreign corporations and those which are engaged in interstate business. Constitutional provisions require that a state may tax only that proportion of the property or income of a corporation which may reasonably be attributed as belonging to the state.

For many years the National Tax Association has had a committee at work on the problem of determining a standard uniform rule of apportionment, but a complete and satisfactory rule has not yet been evolved. The proper allocation of income from interstate sources is perhaps the most difficult and complicated problem in the field of state income taxation. However, Colorado already deals with the equally difficult problem of allocating that portion of the stock of foreign corporations that is subject to the franchise tax.

The above mentioned committee of the National Tax Association has offered the following plan of apportionment:

1. Specifically allocate any and all income received from intangible properties.
2. Wherever possible or desirable, allocate the profits arising from business transacted in the state concerned. Many corporations engaged in business in more than one state keep their books and accounting records in such a manner as to report profits actually derived from business operations conducted at their various factories or branches in different states.
3. In event that the second option is not practical, then apportion the income as follows:
   a. First, divide the remaining income in two equal parts and apportion the one half thereof in accordance with physical properties.
   b. Next, apportion the second half of the remaining income based on business activities. The measure suggested consisted of purchases, pay roll and sales.

A majority of the states establish in the statute the rule to be followed in the allocation of the property or net income to the state, although some states leave allocation to the administrative officials in charge of the tax.

Sixteen states now impose income taxes on corporations; of these, 13 have allocation fractions either expressly set up in the law or provided, through regulation permitted by law. Fifteen states, Colorado among them, have annual capital stock taxes. All of them have more or less definite allocation fractions based on the taxing law. A complete digest of the rules now in force in the various states is found in the Proceedings of the Twenty Second Annual Conference of the National Tax Association, 1929, pp. 163-184. Two illustrative formulas are given herewith in Table 73 following.

TABLE 73

California and Massachusetts Allocation Fractions

State	Allocation Fraction
California	$\frac{\text{Cal. property}}{\text{Total property}} + \frac{\text{Cal. payroll}}{\text{Total payroll}} + \frac{\text{Cal. sales}}{\text{Total sales}}$ 3
Massachusetts	$\frac{\text{Mass. property}}{\text{Total property}} + \frac{\text{Mass. payroll}}{\text{Total payroll}} + \frac{\text{Mass gross receipts}}{\text{Total gross receipts}}$ 3

The right of a state to tax the income of a domestic corporation doing a strictly intrastate business has never been in doubt. With regard to taxing the income of foreign corporations doing business within a state the decisions of courts indicate that a state may not only tax the income of non-resident corporations, but that it may also tax such portion of the income derived in part from interstate transactions, as is legitimately attributable to property owned or activities pursued within the taxing state. The Supreme Court has not prescribed any definite method of apportioning net income between different states but it has held valid several different methods which various states have adopted. It may be inferred that any method will be accepted provided it is not inherently arbitrary and does not produce unreasonable results. The constitutional status of a state tax on the net income of a corporation engaged in interstate commerce exclusively may be regarded as extremely doubtful.

III. The Tax Burden on Corporations

It would be desirable to make a statistical analysis of the actual tax burden borne by corporations in order to answer the question whether they are bearing their just share of taxation. Such a study should determine the relation between the tax burden imposed upon corporations and other classes of taxpayers; the relative weight of the tax burden on different classes of corporations, such as business corporations, public

utilities and financial institutions; the relative weight of the tax burden upon different corporations within a given group as for example, whether a given tax falls most heavily upon small or large corporations and the relative weight of the tax burden imposed by neighboring states in which the same corporations operate.

Such a study is beyond the scope of the present inquiry because of the lack of time and the difficulty of obtaining the basic data needed to make such statistical comparisons. This work could more properly be performed by an official tax investigating commission, which possessed the authority to demand the information needed. In the absence of such an analysis, such data as are available are presented and will throw some light on the problem.

Table 74 (Page 158) shows the gross receipts, net profits before taxes, the state and local taxes, all taxes of all corporations in the United States reporting to the United States Bureau of Internal Revenue for purposes of the federal corporation income tax. It also shows the percentages which taxes were of the gross receipts and of the net profits before taxes. In Table 75 following is shown the position in 1924 of all Colorado corporations, the original data not being segregated for corporations of each state by industrial groups. Presumably the relationship to each other of the various groups of Colorado is not far different from that for the United States as a while. But it appears that Colorado corporations are not overtaxed, at least not for the year covered. Colorado and California corporations paid the lowest percentages of their net profit in state and local taxes of all the Mountain and Pacific Coast states, both being slightly above the average for the United States as a whole.

TABLE 75

Net Profits and State and Local Taxes on Domestic Corporations of Specified States, 1924

State and Geographic Division	Net Profits Before Taxes (000 omitted)	State and Local Taxes (000 omitted)	Percentage of Net Profits Taken by State and Local Taxes

Source: National Industrial Conference Board, "Cost of Government in the United States", 1925-1926, p. 123.

There are of course limits to the taxes that can, in the interest of the state and in the interest of the owners of taxed

property themselves, be lifted from property and placed on the business of corporations (and on personal incomes and on sales if such taxes are also to be used). The National Industrial Conference Board, in an elaborate statistical analysis, the results of which are published in two volumes entitled, "The Shifting and Effects of the Federal Corporation Income Tax," arrived at the conclusion that that tax could not be shifted to the patrons of the corporation, but would be borne by them and presumably pro tanto reduce the dividends available for the stockholders. Such is doubtless also true of the state corporate franchise tax measured by the net income of corporations. The statistical analysis of the Board corroborates the theoretical conclusion that such taxes are not shiftable.

The state corporate franchise tax differs however from the federal corporate income tax in that it is, relatively speaking, a local tax. If the burden of unshiftable taxes in Colorado should be too heavy relative to the burden of such taxes in other and competing states, it might be detrimental to such business as is peculiarly mobile, in causing it to migrate from the state, or to check its influx into the state. But a comparison of the percentage of corporate income taken in state and local taxes in Colorado and in other states, as shown in Table 75, would strengthen the conclusion that such increase in corporate tax as would result from the substitution of a corporate franchise tax measured by income at, say 2% to 4% for the present annual flat tax, would not be detrimental. For it is to be borne in mind that such relief to property owners as would be made possible by the revenue these other taxes would yield would be shared pro rata by the corporations since they also are property owners.

SECTION V

TAXATION OF PERSONAL INCOME

From the foregoing analysis of the Colorado general property tax it should be apparent that some sources of revenue supplementary to the general property tax are desirable. While other sources such as the sales tax and possibly other forms of taxes may be used, it is probable that the personal income tax is the best possible supplementary source. The following paragraphs will discuss the adaptability of a personal income tax to meet the condition in Colorado.

I. Historical Development

The practice of taxing income is not new. Four or five thousand years ago income taxes occurred in a primitive form in China. They have occurred in primitive forms in other countries. In commercially undeveloped states, gross income taxes or taxes on produce, which have been common, were to a large extent taxes on net income.

The modern development of income taxation began with the British income tax of 1797. In Continental Europe the modern income taxes began at a later date. It is not necessary to trace this development. It is enough to say that all the commercially and industrially developed European countries, at the present time, rely heavily on income taxes. During the Civil War and for some years later, the United States used the income tax. In 1913 the 16th Amendment was adopted. It permitted the federal government to levy income taxes on income from whatsoever source derived without apportionment among the states in proportion to the population. A federal income tax law was then enacted, which has since produced an enormous revenue, especially during the late war. It is still the principal source of federal revenue, although the rates have been reduced and the exemptions increased.

Income taxes have been used for state purposes more or less continually in some states during and since Colonial times. They were not very successful, chiefly due to the fact that they were administered by the local tax officials. It was therefore supposed, prior to 1911, that state income taxes were not practical. In that year Wisconsin adopted its income tax which has since been in continued use. The rates have been somewhat increased and the revenue correspondingly increased. Other changes have been made in that law as experience has proved to be wise and necessary. Wisconsin, at present, collects about $18,000,000 per annum from income taxes on individuals and corporations. It is probably true that the income tax in Wisconsin is as effective and as economically administered as any tax in any state.

Since that date a number of states have adopted income taxes and in those, such as Massachusetts, in which there have been continuous income taxes, important improvements have been made. At present 20 states have income taxes on personal incomes or on the incomes of corporations or both. In 13 states which have used income taxes during the entire period the revenue from state income taxes increased from $97,568,000 in 1922, to $183,000,000 in 1928, or from $2.68 to $4.60 per capita, and the total collections in 1928 were over $184,004,000. For further details the reader is asked to consult Table 76 following. Slow but fairly steady growth has occurred in not only the number of states using the income tax but also the amount of revenue derived from that tax during the past decade.

TABLE 76

Income Tax Collections, Personal and Corporate, Aggregate, Per Capita, Percentage of All State and Local Taxes, and Percentage of All State Taxes, 1928

State	Amounts	Per Capita		Percentage of All	
		Amount	Rank	State and Local Taxes*	State Taxes*
Connecticut	$2,623,000	$1.57	6	3.0%	10.0%
Delaware	1,551,000	6.36	3	11.5	20.1

Note: Five states, Arkansas, Georgia, California, Oregon and Washington, do now, but did not then have income taxes.

*For the year 1927.

**All distributed to local districts.

***Part distributed to local districts; but figures given indicate ratio of total income tax revenue to total state taxes.

II. Arguments for Personal Income Taxes

The present argument in favor of a personal income tax for Colorado is that such a new tax is needed to supplement the general property tax for the purpose of relieving the tax burden on property. There are various reasons why the income tax is more suitable for that purpose than any other tax.

In the first place, it will reach a certain taxable capacity not reached by the present tax system of Colorado. This escaping taxable capacity is found in the income from labor, professional, and certain business activities, involving the use of no, or at least of relatively little property, as well as the income from intangible property that now escapes assessment. Exactly how much taxable capacity now escapes no one knows but some indication of it may be had from the federal personal income tax returns from Colorado. Table 77 following presents total incomes returned, and their distribution according to the various sources for the years 1918 to 1927 inclusive.

TABLE 77

Total Income and Percentage Distribution of Personal Income Returned from Colorado, According to Sources, for Specified Years

Year	Total Income Returned (000 Omitted)	Percentages Consisting of Labor and Business Incomes				Percentages Consisting of Income From Property			
		Wages and Salaries	Business and Partnerships	Profits Real Estate Sale	Total	Rents and Royalties	Dividends	Interest and Investments	Total
1918	$173,815	50	23	2	75	6	10	9	25
1919	212,525	46	27	6	79	4	9	8	21
1920	242,057	56	19	5	80	4	8	8	20
1921	211,311	58	20	2	80	5	7	8	20
1922	216,508	58	15	5	78	5	9	8	22
1923	238,373	49	22	4	75	6	9	10	25
1924	236,927	48	25	3	76	7	8	9	24
1925	172,298	43	23	5	71	6	13	10	29
1926	189,881	37	24	6	67	7	14	12	33
1927	176,895	38	25	5	68	6	15	11	32

Source: U. S. Bureau of Internal Revenue, "Statistics of Income, 1927.

It will be seen that the returned incomes amounted to $173,815,000 in 1918, rose considerably during the period, and declined to $176,895,000 in 1927. The decline is due of course in part to the decline in the price level, but also in part to the higher federal exemptions of the later years. In most of the states taxing personal income the exemptions are lower than the federal exemptions. In Colorado they should be so in order to reach as many as possible and as much as possible of the income of persons not paying property taxes. On the assumption of exemptions of $1,000 per return the income taxable would probably exceed $200,000,000.

It will also be observed that the returned income that consisted of wages and salaries was 50% of the total in 1918, rose to 58% in 1921 and 1922, and then declined to 38% in 1927. The higher exemptions are partly responsible for this decline, since the sources of salaries and wages are most important in the lower incomes. With $1,000 exemptions, it is probable that at least 50% of the total returned income would consist of labor incomes. At least $100,000,000 may therefore reasonably be fixed as the returnable income from wages, salaries and professional earnings. Assuming an average rate of tax thereon of 2% the revenue would be $2,000,000.

The income from business and partnerships are also largely untaxed for state purposes, with the result that all labor and returnable business income may be safely placed at 75% of the total or $150,000,000. The total labor and business income of Colorado is of course much larger, but that sum, now constituting a largely untaxed capacity, might be expected to be reached. To this amount should be added the amounts from dividends and interests and investments. Allowing for all errors in estimates, one may conclude that the escaping taxable capacity is large.

The personal income tax may be used in other ways to equalize the tax burden not only of all taxes but of those that now are levied in property. What the existing inequalities are and how a personal income tax would equalize them has been shown above in discussing remedies for the defective assessment of property. In so far as income is the basis for the tax, there will be no tax when there is no income; and the tax will be based on the income from the property rather than on its capital value.

III. Arguments Against the Personal Income Tax

The argument most freely used against the state personal income tax is not directed against the tax, as such. Disregarding the merits and demerits of such a tax the opponents argue

that the tax will be merely another tax added to existing taxes, and that the aggregate tax burden will be increased by as much revenue as is raised from the income tax. The net result alleged will be merely an increased cost of government.

This argument is equally valid or invalid, as the case may be, as to other new taxes that may be proposed, whether corporate income taxes or sales taxes; but it has been used more effectively in blocking the personal income tax than any other tax. Unfortunately it cannot be completely proved or disproved. For it involves the necessity of comparing what a given state, having the revenue from the income tax, actually did spend with what it would have spent, had it not had this revenue. But some light can be gained by comparing the governmental costs of states having income taxes with states not having such taxes, over a period of years, for two purposes: First to see whether the former states spend more per capita; and, second whether these states have increased their governmental costs during their period of use of the income tax. Such comparison can be made, as to state governmental costs, from the data provided by the Bureau of the Census, published in Financial Statistics of States annually, beginning in 1915. For local governmental costs such comparison cannot be made. But since the income tax is chiefly for state use, the comparison of state costs will suffice, except as indicated in the following analysis.

Table 78 following shows the aggregate and per capita governmental costs of the 48 states, the 14 states having income taxes in 1925, whose income tax revenue could therefore be available in 1927, and the remaining 34 states, and also the increases in per capita costs in these three groups of states. It will be seen that for the 48 states the per capita costs rose from $4.06 to $10.30 or 155.4%; the costs of the 14 states having income taxes, from $4.09 to $14.06, or 270.7%; while the 34 states not having income taxes rose from $4.05 to $8.33, or only 104.7%. If the 14 states using income taxes in 1925 had been restricted to $8.33 per capita for state costs, the same as the other 34 states, their costs would have been only $307,570,333. On the face of the analysis so far, the income taxes might be charged with having given occasion to increased spending to the extent of the difference, or $231,337,545.

But that argument, if it proves anything, proves too much. For the total income tax revenue in these 14 states in 1927 amounted to only $161,524,000, or about $4.00 per capita, or $3.73 per capita less than the increased spending of the 14 states. It is obvious therefore that, while the income tax revenue may have caused increased expenditures, some other factors must have operated with the same result. To see what these factors are, it is necessary to carry the analysis further, to compare the several income taxing states with adjacent, otherwise similar states, and to notice the disposition of the income tax revenue.

TABLE 78

Governmental Costs of 48 States, States Having, and States not Having Income Taxes in 1925, Aggregate and Per Capita, and Increases in Per Capita Costs, 1927 and 1915

Groups of States	Governmental Costs				Increase in Per Capita Costs 1927 Over 1915
	1927		1915		
	Amount	Per Capita	Amount	Per Capita	
All 48 states	$1,208,201,448	$10.30	$399,714,285	$4.06	155.4%
14 states (a)	538,907,878	14.06	132,343,909	4.09	270.7%

Source: Financial Statistics of States.

Table 79 (Page 167) shows separately the distribution of the states taxing income in 1930, and those taxing income in 1925, according to the increase in their per capita state governmental costs. It will be seen that the variations in per capita costs are much greater among those states taxing income than among those that do not tax income. Especially noticeable is the fact that among those states having high per capita costs the states taxing income are relatively more numerous.

In Table 80 (Page 168) are presented comparisons of the per capita state costs of the 7 states that derived the highest per capita income tax revenue, namely all those in which it amounted to $1.25 or more per capita, with other comparable states not taxing income.

In the New England group Massachusetts and Connecticut make some use of income taxation, ranking fourth and sixth in per capita yield. In Massachusetts the per capita costs increased from $5.28 in 1915 to $10.02 in 1927, or 89.8%; and Connecticut from $5.70 to $12.86, or 125.6%. These increases are lower than the average increase for the entire United States where the increase was from $4.06 to $10.30, or 155.4%. Moreover the 1927 per capita costs were considerably lower than for the three other New England states. It is true that New Hampshire has a limited income tax and shows an increase in state costs of from $3.65 to $13.18, or 261.1%. But this increase can hardly be attributed to the income tax. For the yield is only $1.25 per capita, and the entire proceeds are distributed to the local units; and the tax is essentially a classified property tax with a low rate on certain intangibles. In New England the highest per capita costs and the greatest rates of increase occur in states not using the income tax.

New York ranked highest in per capita yield of the income tax, namely $9.99. That state's per capita state costs rose from $5.00 to $13.94, or 178.8%. This rate of increase is greater than in New Jersey where the increase was from $6.08 to $12.73, or 108.9%. A part of the explanation of the greater increase lies in the lower costs of New York in 1915. If the unexplained balance of the increase is due to the income tax, then at least the state government is not insatiable, for it distributes one-half of the proceeds of the personal and one-third of the corporate income tax to the local units. Moreover, these two states, more than most others, distribute from the general fund large sums to the local units. Thus in 1927 New York apportioned $55,500,000 as an equalization fund to the public schools. New York spent 50 cents per capita more for education than did New Jersey, and 25 cents more per capita for charity in 1927.

Virginia and Delaware rank seventh and third, respectively, in the per capita collections of income taxes. In Virginia the per capita costs rose from $3.92 to $9.69, or 147.2%. The increase is almost the same as for Maryland which has no income tax, and whose per capita costs rose from $5.04 to $12.35, or 145.0%. The 1927 per capita cost however is higher in Maryland. Delaware shows the tremendous increase from $3.53 to $21.03, or 495.8%. This fact taken together with the fact that Delaware collects $6.36 per capita, ranking third highest, would seem to provide basis for a contention that the income tax had raised the costs, until it is remembered that all of the income tax revenue is distributed to the school districts on the basis of school population. Whatever may be the cause of the expanded state costs, it can not have been the income tax revenue; for the state treasury gets none of that.

North Carolina and South Carolina rank, respectively, fifth and ninth in per capita yield of the income tax, with, respectively, $2.79 and $1.21. North Carolina per capita costs rose from $1.94 to $8.44, or 386.6%; and South Carolina costs rose from $1.81 to $7.16, or 290.1%. These increases are heavy but they are partly accounted for by the extremely low costs in 1915, considerably less than one-half of the per capita cost for the entire country. Georgia costs rose from $2.24 to $6.36, or 183.9%. Florida, however, with no income tax, showed an increase in costs of from $3.06 to $11.03, or 260.5%. It is well known that the two Carolinas have experienced a considerable industrial revival, and the increased costs reflect the increased prosperity of these states, bringing them more nearly in line with the rest of the country. Georgia has been cramped for state revenue owing to constitutional tax limits, and in 1929 the legislature in desperation passed both an income tax law and a sales tax law. Here is the clearest case, perhaps, of an increase in state costs made possible through the income tax. But the costs are, by comparison, not excessive; and assuredly Georgia would have raised more revenue in 1927 had not the arbitrary tax limit coupled with the lack of state control of the assessed valuation prevented.

On the other hand, Wisconsin costs rose from $5.65 to $10.75, or 90.3%. Compare with this the increases of from $5.65 to $12.84, or 127.3% in Michigan and from $6.22 to $15.20, or 144.4% in Minnesota. One would hardly argue that the income tax revenue had checked state costs, although there is some basis for saying that the Wisconsin income tax assessors, working between peaks of collection activity, and being trained assessors, have improved the local assessment and facilitated local economy. But at least it has not caused unreasonable costs in Wisconsin.

And, finally, among the 11 states which in 1927 had per capita costs in excess of $15.00, ranging from $15.09 in Washington to $28.37 in Nevada, only 2 did then have income taxes. One is the aforementioned Delaware, whose income tax revenue goes to the schools. The other is North Dakota. But any one familiar with North Dakota politics for the past 20 years will hardly argue that the increase in per capita costs of from $5.07 to $23.85 is caused wholly, or even primarily by the revenue from the income tax, which in 1927 amounted to less than $500,000 or 71 cents per capita. Besides, the income tax, there as elsewhere, is in lieu of property taxes on the taxable intangibles. And among the 10 states whose per capita state costs were the lowest of all the states in 1927, there are six states having income taxes. These states which might have used the income tax to raise larger sums have not done so, and their percentage increases in per capita costs are not above the average for the 48 states.

It appears then that the governmental costs of a state are determined by factors that bear no very close relation to the forms of taxes in use. Thus the very high per capita costs prevailing in the Mountain and Pacific states are not caused by the complete absence of the income tax any more than the costs of Wisconsin, low for that geographical division, are determined by its presence. Doubtless the level of prosperity in a state affects the amount of public service desired and hence the governmental costs, as is evidenced by the relatively low costs in the hitherto less affluent South, in comparison with the relatively higher costs of the industrial New England and Middle Atlantic states. In a crude way the people and their representatives determine what they want and can afford, regardless of the methods of paying for it.

Another argument against the state income tax is that it involves double taxation. This objection assumes two different forms. It is said that the federal government already taxes income and that if the state should also tax the same income, double taxation would result. Obviously the contention is true in a sense. But such double taxation is not objectionable so long as no serious inequalities result to incomes of different taxpayers similarly situated. But federal tax rates have been materially reduced and the exemptions have been nearly doubled during the past eight or nine years. The states might reasonably refrain from imposing income taxes during the war period when the federal rates were high but there seems to be no reason why moderate state income taxes may not now be imposed in addition to the federal tax.

The second form of objection to double taxation runs as follows: If an income tax is imposed and if the property on which the taxed income is earned is taxed as property, there will be double taxation unless the property tax is credited on the income tax. Here again there is no objection to such double taxation. The personal income tax on the entire income of the individual taxpayer may be justified on the ground that the taxpayer derives personal benefit from the government where he resides through such services as schools and police protection and the more general governmental functions. The tax on property, on the contrary, can be justified on the ground that the owner of the taxed property involves the government in costs for services which benefit the property where it is located. There is no objectionable double taxation resulting from taxing the property assets and also taxing the income derived from property.

Certain kinds of double taxation are objectionable. If, for example, the same property or income is taxed by several different coordinate governmental units such as two different states or counties while other similar property or income is taxed only by one governmental unit or by none at all. Such objectionable double taxation may arise within any particular tax and does not arise from the imposition of more than one kind of taxes.

A third objection to the income tax is that it is costly to administer. The National Industrial Conference Board, in "State Income Taxes", volume II, page 139, found that the cost of administration is not excessive. In Wisconsin the cost has ranged from 1.5% to 2% of collections in recent years. In New York the cost has been decreasing steadily and is reported for 1927 as being 1.43% of collections. In other states, especially for the early years, the cost ranges somewhat higher; but a reasonable estimate would place the probable cost for Colorado at possibly 2%, which cannot be said to be excessive. It is not known what the cost of collection is of the general property tax, but it is probably not much lower, in spite of the heavy collection.

Objection is also raised to the income tax as a new tax in any state where it is unfamiliar to the taxpayers. A familiar tax is of course, other things equal, superior to an unfamiliar tax. The state of Wisconsin might have objected in 1911 to the income tax on the ground that it was new and unfamiliar but Colorado cannot raise that objection to it in 1930 when nearly twenty years of successful experience with the state income tax is available for guidance and nearly as long a period of successful federal income tax administration is also

available. The Colorado income tax law, if enacted, could and doubtless would, follow rather closely the provisions of the federal law. Such is increasingly the practice on the part of states taxing income. It is therefore, not true, to any serious extent, that the tax would be unfamiliar. Another phase of the same objection is that the computation of a taxable income is a complicated procedure. That is equally true of a successfully administered property tax, which is also complicated. The complexity of both kinds of taxes arises from the complexity of our economic system rather than from anything inherent in any part of the tax. Moreover it will not be more complicated to prepare the state income tax returns than it is to prepare the federal returns, which are already being successfully prepared, and no great additional labor or cost or inconvenience to the taxpayer will be involved in preparing the state returns.

IV. Proper Precautions

Nevertheless, various precautions ought to be taken by a state when first imposing an income tax. One is that the administration should be centralized in a state tax commission. In Colorado such a state agency already exists. All that is necessary is that the tax commission be given the required additional funds and trained help with which to handle the new function assigned. As previously stated, the state should provide adequate assistance if only for the reason of collecting greater revenue. It is to be borne in mind by those opposing an income tax that such adequate assistance is also required for the purpose of bringing about equity in the administration of the general property tax. In no case has the local administration of an income tax proved successful, any more than has the local unsupervised administration of the property tax. It would also be well, in the case of the new personal income tax, as in case of a new corporate income tax, to be moderate in respect to the rates of the new tax and to be reasonably liberal in the exemptions allowed. For while income taxation in general cannot be completely unfamiliar, there are difficulties in beginning a new tax and in familiarizing the taxpayers with the making of a state tax return which must in some respects differ from the federal income tax return.

There is another reason for moderate rates and liberal exemptions to begin with. A state income tax like a corporate income tax, is to a certain extent, a local tax as compared with a federal income tax which may operate uniformly as a general tax. If the state rates are very high, and if adjoining and competing states have either low income tax rates or do not

have an income tax at all it is probable that business might be adversely affected. It does not appear from the experience of states employing the income tax that business has been so affected, doubtless due to the fact that the rates are in all cases moderate and in all cases very much lower than the rates of the federal tax. Moreover, a rate structure low enough not to hurt business in a well developed state such as New York, may cause some harm in an industrially undeveloped state, such as Colorado. The rate structure which is suggested in the following paragraphs is one which it is believed Colorado could employ without harming the business of the state.

Table 81 following shows the business incomes and state business taxes paid, and the percentages which these business taxes took of the business incomes of individuals rendering federal income tax returns for the year 1924, the latest year for which such data are available. It will be seen that the percentage taken in taxes is lower in Colorado than in all the other states of the region covered except California and Kansas. And California has since adopted an income tax, while a

constitutional amendment permitting progressive income taxes is pending in Kansas.

Even more favorable is the position of individuals in Colorado, making federal income tax returns, with respect to the percentage which all state and local taxes are of the total income thus reported. This is shown in Table 82 following. The percentage taken in taxes in Colorado was only 2.64%, which is lower than the percentage of any other state covered in the table, and lower than the average for the entire country which was 3.94%. If then the property taxpayers are overburdened, as it is believed is shown above, and if those who are making federal returns are in a relatively favorable position, the conclusion would seem to be clear that greater equality could be secured through a change in the tax base so as to reach the income that now goes free, for state purposes.

Doubtless the most important precaution is to make sure that the new revenue shall not result merely in increased expenditures. Any new tax law should specify that the extra revenue must displace an equal amount of property tax rev-

enue, either in the state treasury or in the local treasuries. Further details are given in Section VII below.

V. Rates and Probable Yield

The rate structure and the amount of revenue which it is expected to raise from the personal income tax are of course interdependent. In Tables 83 and 84 are presented computations of the probable yield, computed by two different methods, using the incomes reported for the federal income tax.

The method followed in Table 83 and the underlying assumptions made are as follows: There is assumed for the sake of simplicity in the computation a uniform exemption of $1,000.00 to every taxpayer. The rate on the first $1,000 taxable income in excess of the personal exemption is assumed to be 1%. On the second $1,000 the rate is 2%. On the third $1,000 it is 3%. On the fourth $1,000, 4%; and on all in excess of $4,000.00 the rate is 5%. The table shows that under these assumptions on the basis of the federal returns the revenue would amount to about $3,850,000.

In Table 84, using the second method, is computed the yield when the rates assumed are the same as those assumed in Table 83, with no exemptions, but instead a credit is allowed for each single return of $8.00, deducted from the tax as computed without personal exemption, and a similar credit of $15.00 allowed to each joint return. This method is used in the Wisconsin 1927 tax law, but is otherwise not used in the United States. The effect is to make the rates more steeply progressive. For the effect of the exemption is to exempt, in each case, the amount allowed from the highest tax rate at which any part of the income is taxable. Consequently the yield computed by Method II is considerably higher than that obtained by Method I, $4,437,870 as compared with $3,847,373. In itself, Method II is simpler. But being different from the more complicated, though more familiar Method I, its suitability would depend upon the psychological attitude of the taxpayers toward it.

Doubtless, the actual yield would be somewhat less than the amount indicated. In the first place, the state administration will not, in all probability, be found to be as effective as the federal. Such is the general experience of the states, especially where inadequate assistance is provided for, though not noticeably so in Wisconsin, New York, and Massachusetts, where reasonably adequate funds and assistance are provided for administering the tax. In the second place, certain items of income taxable under the federal income tax could not be reached under the state income tax. For example, in-

come earned from purely interstate business could not be taxed by the state. Also, salaries of federal employees and interest on federal bonds could not be taxed by the state. On the other hand the state might and should include the salaries of its own employees and the interest on its own bonds as well as the interest on other public bonds. It is believed that the state and local public salaries and state and local bonds will more than counter-balance the federal salaries and federal interest so that the loss from this particular source will not, at any rate, be very great. Of course, interest from already existing state and local public bonds of Colorado could not be taxed; but reference is here to future issues. Again, the exemptions have been placed rather low and no exemptions on account of dependents have been provided for, although, there probably should be.

From taxable gross income should be deducted all necessary business expenses, including depreciation and in general, interest paid. As in the federal income tax the Colorado state income tax should guard against deducting personal expenditures but this probably is not serious. From the amount of taxable income thus extended there should be deducted stated sums depending upon the family status of the taxpayer, unless the Wisconsin alternative already described is substituted. If the method of allowing personal exemptions is followed, it is suggested that these be lower than are the federal exemptions. The latter, at the present time are $3,500 for persons filing joint returns and $1,500 for those filing single returns. In the computation in Table 83 of the probable yield there is an assumed exemption in all cases of $1,000. This amount may be too small, but it is believed that a low personal exemption will serve better than a high one. Especially since the federal personal exemptions have been raised, it is true that relatively low exemptions in the state income would work no hardship. One of the aims of a personal income tax is to reach income from wages and salaries, since they are not reached under the property tax. But if the personal exemptions are put too high a great deal of that income will escape.

VI. The Composition of the Taxable Income

What should constitute taxable personal income? Two principal classes of personal income taxes exist. One class, the so called schedular income tax, is represented by Massachusetts and New Hampshire, where income from special sources only is taxed. In Massachusetts the net income from intangibles and from interest and dividends is taxed at the rate of 6%. The excess of gains over losses from trade in intangi-

bles is taxed at 3%, and the entire property income, less 5% of assessed value of tangible property at varying rates. In New Hampshire only interest and dividends from intangibles, excluding savings bank deposits, are taxed at the average rate in the state of all property taxed. The other class is more common. The entire is lumped together and subjected to the tax, usually at progressive rates. It is called the general income tax, and is probably the better form.

It has been suggested that every able bodied person ought to pay some direct tax so that he might develop an interest in the services of the government under which he lives and help to bear the cost thereof. Two ways of doing this are possible. One is by means of a poll tax of say $3 to $5 But that method seems to be impossible, the state having once adopted and repealed it as unsatisfactory. The experience of other states indicates that a poll tax is collected only from those who are already paying property taxes or those who vote at the elections and thus get their names on lists available to taxing officials. A better way would be to require all persons to file a return and pay a minimum tax of say $3.00 to $5.00. However, the only state which has tried this method has abandoned it, as not yielding enough revenue to pay for the trouble of receiving and auditing all the extra returns.

Although it is possible that a progressive personal income tax might be held by the courts to be valid in Colorado under the state constitution as it now is, it is possible that it might be held to be violative of the uniformity rule. Hence the constitution should be amended so as to permit, specifically, the legislature to enact an income tax law, if such a tax is desired.

SECTION VI

SALES TAXES

Instead of, or in addition to, personal and corporate income taxes, some revenue may be obtained from taxes on sales. Such taxes were seldom considered until in Europe the pressure for revenue during the great war made emergency sources necessary. They were strongly advocated in 1918-1921 for federal purposes, to take the place of heavy federal income and profits taxes. As federal taxes they are no longer advocated; but they have been urged in many states as sources supplementary to the property tax. At present many states are considering them in two different forms.

I. General Sales or Turnover Taxes

Only two states have taxes that approximate general sales

TABLE 85

Record of the West Virginia Classified Sales Tax, Year 1927-1928

General Class of Taxed Enterprise	Specific Business Activities		Revenue 1927-1928	
	Name	Rate since 1925	Amount	Percentage
Extractive industries	Coal mining	0.42%	$1,022,000	26.8
	Oil production	1.00		
	Natural gas production	1.85	615,500	16.2
	Limestone, Sand, etc.	0.45	30,200	0.8
	Timber production	0.45	30,200	0.8
Manufacturing	Manufacturer's sales	0.21	788,300	20.7
Merchandizing	Retail	0.20	562,200	14.8
	Wholesale	0.05	85,900	2.2
Financial and Public Utilities	Banks	0.30	399,300	10.5
	Steam railroads	1.00		
	Street railways	0.40		
	Pipe lines	1.00		
	Telephone, telegraph express, light and power	0.60		
	Others	0.40		
Contractors	Gross income	0.30	272,400	7.2
Amusements	Gross income	1.00		
Residuary	All other	0.30		
Total			3,806,000	100.0
Total state tax revenue			$18,619,500

taxes, West Virginia since 1921 and Georgia since 1929. Table 85 (Page 181) shows the rate structure of the West Virginia classified sales tax and the revenue, amount and percentages, realized from each class of taxed enterprises. It is not a general sales tax because, with the exception of the wholesale and retail sales, and possibly in manufacturing where the same material may be processed at successive stages by different concerns, it is aimed at final sales. The revenue yield for 1927-1928 was $3,806,000, which was 20.4% of the total state revenue. It has not completely relieved the state of the necessity of levying a property tax for state purposes. The greatest revenue yield was in 1926-1927, $4,067,100; but the 1927-1928 yield is well above the annual average. There is an exemption of $10,000 to every taxpayer. The result is that few individual enterprises and farmers pay the tax, which probably accounts for its retention. For, while the manufacturers and the merchants object to the tax, and those engaged in the extractive industries object to paying it alone, the majority of the people are rather willing that the few shall pay it. In the deadlock and owing to difficulties in agreeing to find some other source to take its place, it continues. The manufacturers and wholesalers especially object to it as being detrimental to their business in competition with other states. In general the tax has at least not seriously checked the growth of the state as indicated by the fact that during the past decade the population increased at the rate of 18.1% as compared with 16.1% for the entire United States.

On a per capita basis (1930 population) the West Virginia yield is $2.20. On the same basis the possible yield for Colorado should be $2,272,943. But analysis of the West Virginia yield, in such details as are available, warrants the conclusion that the Colorado per capita yield would not be equal to that of West Virginia. It will be noted that the high rates apply to, and that 44.6% of the revenue came from, the extractive industries. No data are available to show the cost of collection.

The 1929 temporary sales tax of Georgia is expected to yield between $1,000,000 and $1,200,000 the first year, on the basis of its performance so far, according to a statement made by the tax commissioner, who states that, except for the business depression, the yield would have been considerably higher. The rates are uniform at 2 mills on each dollar of gross sales, except that on manufacturer's sales the rate is 0.5 mill. This low rate has caused trouble, not only through reduced revenue but also through the efforts of a large number to get themselves classified as manufacturers. There is an exemption of $30,000, which the tax commissioner, with good reason, considers excessive. The percentage yield from the different groups is distributed as follows: Retailers, 40.15%; wholesalers, 18.78%; manufacturers, 18.29%; amusements, .87%; public utilities, 9.98%; and all other, 11.93%. On a per capita basis the Colorado yield at the Georgia rates would be only in the neighborhood of $350,000. That figure could be considerably increased, as could the Georgia yield, by reducing the exemption from $30,000 to say, $10,000, or even lower. It might be further increased by eliminating all exemptions and requiring a minimum tax of person or firm engaged in selling anything, as is done in the Connecticut merchants' and manufacturers' tax.

In Pennsylvania there has been, almost unchanged since 1821, though there is strong opposition to it, and its repeal has been recommended by a recent special tax commission, a mercantile license tax, which has some of the earmarks of a general sales tax. It consists of a $2.00 annual license charge plus a 0.1% tax on gross annual business transactions of retailers; a $5.00 license charge plus a 0.05% tax on the turnover of wholesalers; and a 0.025% tax on exchange sales. The yield in 1927-1928, considerably higher than for any other year, was $4,269,000, or 44.3 cents per capita (1920 population). On a per capita basis this tax should yield in Colorado $458,688. It is apparently fairly effectively administered in Pennsylvania, by means of self assessment, checked by a corps of local "mercantile appraisers." The cost of collection is high, being estimated for recent years at 7.8% of collections. Whether this figure, which was considerably higher in earlier years, represents the probable costs of this form of taxation effectively administered cannot be stated. If it does, it would constitute an effective argument against the tax.

There are a few less complete examples of state or local general sales taxes, such as the Connecticut merchants' and manufacturers' tax and a similar tax in Delaware, as well as the optional Missouri local turnover tax used in St. Louis and Kansas City. But they are too limited to require detailed description here.

II. Selective Sales Taxes

More familiar are the sales taxes on selected commodities. The federal government since the Civil War has imposed sales taxes, or excises on tobacco and intoxicating beverages, as well as a few others of minor fiscal importance. These federal taxes were expanded during and for a short time following the recent war into the so called nuisance taxes, most of which

have since been abolished. The federal tobacco tax is very productive and not objectionable. According to the preliminary reports of the Bureau of Internal Revenue, the total revenue from tobacco taxes for the year ending June 30, 1930 was $450,339,060.50, distributed as follows: Cigars, $21,442,-527.24; cigarettes, $359,881,375.18; and other tobacco products, $69,015,158.08. The federal cigarette tax is especially productive, for two reasons. First, the rate is high, being $3.00 per 1,000 of ordinary cigarettes, or 6 cents per package of 20 cigarettes, which usually sells for 15 cents at retail. Since the tax is collected from the manufacturer (the point of greatest concentration) it must be in excess of 100% of the value at that point. The second reason is the enormous consumption. Preliminary figures indicate that the number on which taxes were paid during the fiscal year 1929-1930 was but a little less than 120,000,000,000; and the consumption appears to be increasing.

On a per capita basis Colorado should consume a little more than 1,000,000,000 cigarettes, and a tax of 2 cents per package of 20 should yield $1,000,000. But on a per capita basis Kansas should collect $1,800,000 at that rate. The actual Kansas collections for the most recent year amounted to $750,000 or about 42 cents per capita. If the Colorado yield should turn out to be no more favorable, it could be only $414,444. In Utah, at a rate of 1 to 2 mills per cigarette, the yield was about $120,000 or 23 cents per capita. In North Dakota, at the rate of 1.5 to 4 mills per cigarette, the collections were $332,695, or 49 cents. In Iowa, at the rate of 1 to 2 mills per cigarette, the yield was $1,183,032, or 48 cents per capita. These states only have segregated the yield from the cigarette tax from the other excise taxes. The federal tax at the rate of 1 mill per cigarette, the Kansas rate, would raise $120,000,000 or about $1.00 per capita. The aforementioned states, although they have rates somewhat in excess of 1 mill per cigarette, show collections of less than 50 cents per capita. The cost of collection is high. In Iowa it is reported to be 6.7% of collections, and in Utah 8.0%. In Arkansas where cigars and cigarettes are taxed at 15% of the wholesale price, which for cigarettes is equivalent to 1 to 2 cents per package or less than 1 mill per cigarette, the yield was $1,300,000 or about 49 cents per capita. It is therefore doubtful whether Colorado, through a tax of 15% of the wholesale, or 10% of the retail price, could raise as much as $500,000 from sales taxes on tobacco. The experience of Tennessee where, since 1925, a tax of 10% of the retail price has produced annually about $1,258,000 or about 48 cents per capita strengthens this conclusion.

The recent 1927 census of distribution conducted by the Bureau of Census shows sales of Denver cigar and tobacco establishments of $1,202,900. Since nearly three tenths of the Colorado population lives in Denver, the value of the total Colorado consumption of tobacco might therefore be set at $4,000,000, if all the tobacco were sold in cigar and tobacco establishments, which of course is not the case, and if the consumption outside of Denver were the same as in Denver. A 10% tax would raise only $400,000 plus 10% of such sales as are made elsewhere than in cigar and tobacco establishments. It would seem that the $500,000 estimate above was rather too high than too low.

Anyone so disposed can make similar estimates of yield of taxes on the sales of other articles on the basis of the Denver distribution survey, subject to correction for sales in miscellaneous establishments, and for different, probably lower per capita consumption in areas outside of Denver. Sales of jewelry, for example, were $2,350,700, which, if raised on the basis of three tenths of Colorado sales, would be $7,835,667; and with a 10% tax would yield $783,567, a figure that is obviously much too high.

There are few other articles than tobacco that have been regarded as acceptable tax bearers. And they may all be exemplified in the experience of South Carolina. That state has carried the practice of taxing sales further than any other state. The general assembly in 1923 imposed the tax on cigars, cigarettes, smoking tobacco, candy, ammunition and admissions. The rate on cigars ranged from $2.00 to $10.00 per 1,000; on cigarettes, $1.00 to $2.41 per 1,000; on smoking tobacco, 6 cents per pound; on ammunition, $2.00 per 1,000 pounds; on candy retailing for 80 cents or more per pound, 10 per cent; on admissions, 10 per cent. In 1925 the consumption excises were extended to include all soft drinks, ice cream, cosmetics, chewing tobacco and snuff. The tax was 20% on the first three articles named and on the last two 1 cent for each 3 ounces. It was in the nature of an emergency measure and was enacted for only one year. In 1926 the soft drink tax was reenacted as part of the general appropriation act but the excises on milk drinks and cosmetics were dropped. The repeal of the tax on milk drinks and ice cream resulted from the belief that it was hurting the dairy industry. It was felt that the tax on cosmetics was evaded through purchases from outside the state. In 1927 all the consumption excise laws were rewritten as one revenue measure. The tax on tobacco was increased approximately 5%; on ammunition, 100%, while a levy of 10% was imposed upon playing cards,

cut glass goods and sporting paraphernalia. The tax on soft drinks was not changed. It appears that these consumption excise taxes are being accepted as a permanent feature of the state tax system.

The results obtained by the limited number of states which have thus far imposed excise consumption taxes show that the revenues are not inconsequential. Alabama gets $1,300,000; Arkansas, $1,100,000; Georgia, $737,000; Iowa, $1,200,000; Kansas, $750,000; North Dakota, $330,000; South Dakota, $338,000; and Tennesse, $1,259,000. In 1924 the yield in South Carolina was $991,000; 1925 it was $2,170,000; and the last year it was $3,276,000 or approximately one third of the annual appropriation for the state government. As a result the state levy on real estate was reduced from 14 to 5 mills while appropriations for the state agencies and institutions have not been reduced.

III. Arguments for Sales Taxes

It is argued, and correctly, that sales taxes will reach a class of persons who have neither much taxable income nor much taxable property. Taxes on non-essentials, widely used and persistently demanded can be made to yield considerable revenue. Moreover, if the taxes on such articles as tobacco, cosmetics, jewelry, and candy should alter the consumption in favor of more useful articles, the result would be beneficial. These taxes may thus be used to regulate consumption. The taxes, when they are shifted, are conveniently paid in small amounts, the ultimate tax bearer not always being aware of the tax. It is also argued that the tax is relatively easy to collect. It appears however that the cost of collection is high. Otherwise the arguments in favor of sales taxes may be accepted for what they may be worth. The arguments are stronger for the specific or selective sales taxes than for the general sales or turnover taxes.

IV. Arguments Against Sales Taxes

It is argued on the other hand that sales taxes are regressive, not in proportion to the income of the ultimate bearer of the taxes, the ultimate purchaser of the taxed article. That argument would be strong if the tax were the only or the principal source of all the revenue raised for state and local purposes. If it is merely a minor part of the tax system, yielding, say, 1% or 2% of the total revenue this objection is not valid, especially against a selective sales tax where the principal reliance is upon non-essentials.

The argument that these taxes are "painlessly paid" has another side. One of the reasons for requiring persons of moderate means to pay taxes is to influence their voting so that they may exercise some restraint in demanding public services that cost money and consequently necessitate taxes. But that restraining influence must be largely lost if the payment is not felt. In that respect a minimum tax imposed in connection with a personal income tax would be superior. However, the principal arguments against both forms of sales taxes do not relate to the taxpayer, but to the business firms handling the taxed article. The assumption that the tax may be added to the price is not always valid. Extravagant statements are made sometimes to the effect that such a tax is always added to the price, and sometimes to the effect that it never can be. The truth lies somewhere between. Where the competition of outside non-taxed business is keen, as on the borders of a state, or where as in case of nationally advertised goods, the price is fixed, the dealer must largely absorb the tax. Here is one reason why a selective sales tax is preferable to a general tax. In the former case it is possible to select for taxation those articles the taxation of which will hurt not only the consumer but also the dealer the least.

Sales taxes, especially general sales taxes, are also objectionable because they are state taxes, that is, local taxes as compared with a similar national tax. Interstate sales cannot be taxed at all, which necessarily involves a discrimination against local dealers. If general sales taxes are to be used, they should be used by the national rather than the state government.

General sales taxes also tend to discriminate against the single-process industries as compared with the multiple-process industries. In the former case several taxes may be paid by successive industries on the same material, while that will not be so in the latter case, since no sales intervene. A provision in the West Virginia sales tax law of 1925 gives the tax commissioner power to determine, in case of multiple-process industries, the value of production where no sales intervene; but such a procedure is not practical. Moreover, this discrimination operates against the basic industries of a state, where the raw material is extracted, processed, sold, and consumed within the state. For in such cases, a general sales tax must always impose successive taxes, while in the case of imported articles even the retail sale may be made interstate and therefore tax-free. As for raw material produced in the state there will be a tendency to ship it out at as early a stage

as possible in order to avoid the tax, thus harming not only local markets but also local industries.

The conclusion would appear obvious that if sales taxes are to be used they should assume the form of selective rather than general sales taxes. The only objection to this choice is that the dealers in the taxed articles regard themselves as invidiously selected to make reports, or to affix adhesive stamps, and possibly to absorb losses where they cannot shift the tax. That objection has some weight, but after a temporary adjustment most of that weight will be lost. The popular demand that if anybody is to be taxed in any form, then all must be taxed in the same form is too exclusively sentimental to be acceptable.

SECTION VII

CHECKS ON GOVERNMENTAL COSTS

It has always been necessary to exercise checks upon public spending. Colorado now limits levies and expenditures in two ways: (1) Maximum tax rates are prescribed in the constitution or revenue laws of the state for all taxing units; (2) and tax levies are limited to 105% of the amount raised by taxation for the preceding year. There are other forms of administrative control, that should be used more effectively than they now are used. But if new sources of revenue are to be tapped, as suggested in the three preceding sections, it becomes necessary to devise new checks, checks that will prevent the revenue from these new sources from becoming merely so much more revenue raised and spent.

I. Transition Checks

The revenue produced from possible new taxes might be disposed of in diverse ways. It might be used to relieve the state of the necessity of levying a property tax. If such were to be its use, the requirement should be stated in the revenue act. The relief would then amount to the state levy, uniformly spread all over assessed property in the state. The state levies were 3.84 and 3.56 mills for 1927 and 1928, respectively. If the new sources of revenue are so adjusted as to yield the amount now raised by these levies, the aggregate property tax rate would be reduced by 3 to 4 mills uniformly throughout the state.

Much can be said for this method of using new revenue. It would eliminate the last vestige of justification for the prevailing practice of assessors of keeping the average county valuation down, for the purpose of reducing the county's share of the state tax. There is very little reason for doing so now, but what little reason there is does some harm. The suggested method would furnish an almost automatic check upon the state spending and would leave the local levies as they were. The objection is that by this disposition of the new funds no step is taken toward remedying the inequalities flowing from the variations in the distribution of property among the taxing districts, as discussed in Section III above.

New revenue might be distributed to the counties or to the school districts and possibly to the cities, and towns, in varying proportions, in part or in full. If a distribution is made to any of these localities it is important to determine to which of the local units the revenue should go, and on

what basis the allocation should be made. The New York method of allocating 50% of the proceeds of the personal income tax, and one third of the not otherwise allocated part of the proceeds from the corporate income tax, to the various local units in proportion to their assessed valuation, places the responsibility for checking expenditures locally, where it is not so simple of application. It would not in Colorado relieve the state of the need for a property tax levy. Moreover, the absence of the township organization in Colorado would make it difficult to distribute any part of the proceeds to the cities and towns. But the distribution could readily be made to the counties, or to the school districts, or to both. This method also does nothing toward solving the problem of inequalities in the local tax rates discussed in Section III above.

The Wisconsin method of apportioning 60% of the revenue from the income tax to the local districts according to the origin of the income tax revenue differs not much in its results from the New York method, except that the origin of income is likely to be even more concentrated than property, and such concentration is less fixed and more likely to vary with changes in local industry. The Wisconsin provision that, when the 50% allocated to a locality smaller than a county exceeds 2% of the assessed valuation, then the excess is divided among the towns, cities and villages of the county on the basis of school population, is a check upon excessive local expenditures resulting from excessive allocation of revenue originating in any locality. If this method of apportionment does anything toward alleviating the hardships that result from the unequal distribution of taxable property, it must be accidental. The distribution might do harm by still further concentrating funds, where taxable property, and hence revenue, is already relatively abundant.

The Delaware method of apportioning all the new revenue to the school districts on the basis of school population would help to remedy the aforementioned difficulty. But it does so rather haphazardly. There is proposed now by the Colorado Education Association a rational plan for the equalization of school tax rates. Briefly stated it is proposed to establish equality of educational tax burdens throughout the state on a minimum level of $1,000 per classroom, by providing that whenever a county levies 3 mills and the local districts 2 mills upon the assessed valuation of property, the state will contribute the additional amount necessary to produce an equivalent of $1,000 per classroom. Assuming that practically all districts are now providing education costing at least $1,000 it follows that if they are content with school facilities on the

$1,000 level, they can cut their school district levies to 2 mills. It is expected that most of the poor districts will spend more nearly the present average amount for the state. But they would do so at the cost of higher school district rates. It has been computed that about $2,200,000 of state funds will be required for this equalization of educational costs on the $1,000 level. If it should be desired to equalize on a higher level at, say, $1,200 or $1,400, the required state fund would have to be considerably larger.

It is obvious from the foregoing sections on new sources of revenue that the possible revenue would be adequate to finance an equalization program on a level somewhat higher than the $1,000 level. If these sources were pressed for all the revenue they could safely be made to yield, it might be possible not only to finance an equalization program on a minimum level of $1,000 but also to dispense with the state property tax. Such an arrangement would be advantageous, for it would establish an automatic check on state costs by dispensing with the property tax, thus giving general relief to the extent of a 3-mill or 4-mill reduction in the aggregate property tax rate; it would also give much needed relief to those districts whose school levies are now unreasonably high and threatening to go higher; and, what is perhaps equally important, it would tend to equalize educational facilities in the state, by leveling them upward where they are now inadequate. The extent and the importance of the relief may be seen from the following example: Several districts levy in excess of 30 mills. By the equalization program on the minimum level of $1,000, the reasonably necessary minimum of education could then be financed by a county levy of 3 mills and a district levy of 2 mills, 5 mills in all. Such excess over the $1,000 minimum, as they felt they could afford, they would finance by local levies.

There is another possibility, and in view of the fact that the revenue from new taxes will at first be uncertain, it would probably be the most expedient disposition. Colorado is almost unique among the states in having a system of classified appropriations. If the state appropriations exceed the revenues, as they usually do, the appropriations of Class I are to be met first, then those of Class II, and so on until Class V is reached. In practice a working arrangement obtains whereby most of the departments or agencies agree to spend less than their appropriations. The effect upon the legislature is to stimulate liberal appropriations in the higher classes; and the appropriating function passes to the administrative authorities. But the significant aspect of the situation for the present

purpose is that bitter experience of the past has made the several state agencies apprehensive of their support. They would fear being made dependent upon the general fund instead of upon the specific mill levies they now have. Until the new sources shall have demonstrated their yield, and until the mill levies for the state educational and similar institutions can be satisfactorily displaced by general fund appropriations, it might be expedient to retain these mill levies, now amounting to somewhat less than 2 mills, using a part of the new revenue to meet other state costs, and allocating the balance to the schools for equalization on the $1,000 level. Experience would teach what to do later. On this basis the state levy would be reduced to less than 2 mills, giving pro tanto uniform relief to all property, and the local school rates would be reduced where such reduction is now most needed.

II. Tax Rate Limitations

State Levy. The maximum rate of taxation on property, for state purposes was originally limited by Article X, Section 11, of the constitution to 4 mills. That section was amended in 1920 to authorize an additional levy of 1 mill for the erection of buildings and for maintenance of the state educational institutions. The present maximum rate is 5 mills.

County levies. Counties are classified for purposes of limitations upon the levy for county purposes. The classification is detailed and elaborate, and ranges from a maximum levy of 6 mills in counties having a valuation of $1,000,000 or less to a maximum of 1 mill in counties having assessed valuation of $400,000,000 or more. This levy is for ordinary current expenses, including the support of the poor and contingencies. Additional limitations are specified in the law for specific purposes as follows:

Levies for road purposes not to exceed 10 mills.

Levies for purchase of land for fair grounds, one half of 1 mill per year, not exceeding $20,000.

Tax levy for bounty on certain animals not to exceed 4 mills.

Judgments against county, 15 mills.

Outstanding warrants, 3 mills.

Mothers' compensation, ⅛ of 1 mill.

Bond and interest, amount sufficient to create yearly fund equal to 10% of bonds issued.

Minimum salaries of school teachers, 5 mills.

Additional levy for payment of unpaid warrants, 5 mills.

Levy to promote immigration and advertising, ⅛ of 1 mill.

School district levies. Third-class district rate shall not exceed 20 mills.

Levy sufficient to pay off outstanding bonds in equal annual installments according to date of maturity.

Refunding bonds require annual levy sufficient to pay not less than 10% or more than 20%.

Union high school tax not to exceed 4 mills.

School teachers retirement fund in first-class districts, ⅖ of 1 mill.

All statutory rates making provision for fixing the limit of indebtedness of any school district or incorporated town shall be computed upon 70% of the assessed valuation instead of upon the full assessed valuation. This adjustment was made in 1913 as the result of raising assessed values to full valuation from one third of full valuation.

Cities and towns. No maximum limits are prescribed by the constitution or revenue laws of the state governing the tax levies of municipalities, either for current operation or for bond and interest purposes, except levies for public libraries, parks and pension funds.

Tax levy for public libraries, 1 mill.

Parks fund, 1.5 mills.

Cities over 100,000 population may levy 1 cent on each $100 of assessed valuation for firemen's pension fund and the same amount for the policemen's pension fund.

The charters of several of the home rule cities contain maximum limitation on levies. The Boulder charter limits the levy for current operation to 10 mills and the Fort Collins charter to 15 mills.

III. The Five Per Cent Limitation

In 1913, when the legal assessed valuation of the state was raised from one third of its full value to full value, an adjustment was made in the authorized tax rates. The law prohibited the levying of a greater amount of revenue on the assessed valuation of the year 1913 than was levied for the year 1912 plus 15%, and for each year after 1913 the tax rate was to be so adjusted as not to levy a greater amount of revenue than was levied the preceding year plus 5%. Levies made to provide for the payment of bonds and interest are exempt from the above limitation.

In case any taxing district believes that the maximum levy permitted by law will not produce sufficient revenue for the current year, it may petition the Colorado tax commission for the privilege of increasing the maximum levy. If, upon investigation, the tax commission grants the request, the maximum levy may be increased not to exceed 5 mills. In case the tax commission refuses to grant the request, or in case the excess levy of 5 mills is insufficient, the question may be submitted to the voters of the taxing district. If three fourths of the votes cast at such election favor the increased levy it can be made.

Table 86 following shows the number of petitions which have been made to the tax commission for increased levies.

TABLE 86

Petitions to Tax Commission for Increased Levies in Specified Years

Year	Counties	Cities and Towns	School Districts	Total
1915	28	35	344	399
1917	41	29	480	591
1918	35	32	476	548
1919	52	59	595	706
1920	40	66	762	868
1921	37	35	88	160
1922	30	17	342	389
1923	27	30	294	351
1924	30	16	240	286
1925	40	16	315	371
1926	35	15	374	424
1927	39	29	385	453
1928	42	14	328	384

Source: Reports of Tax Commission.

During the disturbed conditions immediately following the world war the number of petitions for increased tax levies was greater, but even during the more stable period of the past 5 years about two thirds of the counties and 17% of the school districts of the state found that the maximum limits

prescribed by law would produce insufficient revenue and sought permission to increase their levies.

The petitions for increase are nearly all granted. In practically every case where the petition has been refused, the matter has been referred to the voters and their approval has been secured over the veto of the tax commission. The tax commission has recommended in several annual reports that the law should be amended so as to relieve cities, towns and school districts from the necessity of applying to the tax commission in order to make increased levies above 5 per cent over the preceding year. The commission has also pointed out that with the small force available to the commission, its actions in these applications are necessarily more or less perfunctory, as it is impossible for it to examine the needs of these taxing districts as contemplated by the statutes (15th annual report 1926, p. 5.).

Colorado's experience with tax limits conforms to that of other states. Tax limits may make it more difficult to increase the levies but the voters themselves will authorize increases when they regard them as necessary, either by amending the constitution itself or overriding the decision of any state authority. In a democracy there is no way to block permanently a genuine popular demand for increased governmental service through an arbitrary limitation of the tax levy.

IV. Tax Limits in Other States

Two methods have been employed in the various states to check tax levies of local governments. First, restriction of tax levies to a certain rate on the assessed valuation, and second, restriction to a certain per cent of the last levy. The first method is now in use in about 40 states. In 18 states tax limit provisions are contained in the state constitutions; The restrictions in 14 states apply to counties, in 10 to municipalities, and in 7 to school districts. In the other states the provisions are prescribed by the state laws. Some of these limitations are liberal, others miserly; some have regulated only in broad outlines, others have gone into the utmost detail. Some states have a maximum levy for counties, school districts and municipalities. Other states establish a graduated scale of tax limitations based upon the population or assessed valuation, similar to Colorado tax limitations imposed on counties. Others fix separate tax limitations for the specific purposes of county and municipal expenditures, as is the case in Iowa, Kansas, Nebraska and Washington. In Iowa the legislature has fixed separate tax limitations for no less than 20 county purposes and more than 50 specific limitations for municipal

purposes. The Juul law of Illinois provides that the combined levies upon any piece of property may not exceed 20 mills. The Smith one per cent law of Ohio provided, with certain exceptions, that the sum of all levies of all taxing authorities should not exceed 10 mills, and placed internal limits upon each taxing authority. Special levies for current operation voted by the people and certain levies for indebtedness were exempt from the 10 mill limitation but must not exceed the aggregate maximum limit of 15 mills.

The Ohio tax limit law represents the most drastic and effective attempt ever made by an American state to limit taxation of local government by state law and was originally hailed as a solution of the taxation problem. The results of the operation of this law were serious. It did not result in increasing the assessment of personal property, which was one of the objects sought by its sponsors. It did effectually check the growth of tax rates but it did not prevent the steady growth of expenditures. Municipalities were the most seriously affected, and they evaded the law by increasing their public debts; floating debts began to rise almost immediately, long-term bonds were issued and used for repairs of streets and buildings and for other strictly current expenses; special assessments were resorted to to finance various types of current activities; sinking funds were skimped and depleted and the funds used for current operation and financial malpractices of various kinds developed, such as deliberate planning to appropriate and expend in excess of revenue; inadequate provision was made for the upkeep of public improvements such as streets and buildings; new services relating to health and public welfare were retarded; and the future taxpayers were required to bear the added cost of retiring the millions of dollars of deficiency bonds. The plan did not result in producing greater administrative efficiency, nor wiser and more efficient use of public funds and, as has been pointed out, the economies which it compelled were false rather than true economies. Ohio's experience warrants the conclusion that rigid limitation of tax rates will not solve the problem of controlling public expenditure.

The second plan of tax limitation, which places restrictions upon the amount of tax revenue is used in a dozen states, of which Colorado is one. Six states determine the maximum by the amount levied in previous years. Arizona restricts the levies for counties and municipalities to a 10% increase over the preceding year, exclusive of levies for school and debt purposes. Colorado limits all local government tax levies to an amount 5% in excess of the previous year's tax levy, except for bonded indebtedness. Missouri restricts all governmental levies, except those for indebtedness, to a maximum of 10% in excess of the previous year's levy except with the approval of the voters. New Mexico provides that the amount levied shall not exceed the levy of the preceding year by over 5%, except with the consent of the state tax commission. North Dakota uses as the base figure the average of the levies for 1918, 1919, and 1920 and provides that local tax levies may exceed the base figure only in the same proportion as the present assessed valuation exceeds the assessed valuation in 1919, except upon a majority vote of the people, in which case the amount may be increased to the extent of 25%. In Oregon the state constitution provides that no taxing district may levy more than 6% above the amount levied in the preceding year except for debt purposes but permits additional levies with the approval of the voters. Minnesota limits municipal levies to $100 per capita, while Nebraska fixes the maximum levy in dollars for a few cities.

V. Administrative Central Control over Local Finances

Several states, notably Indiana, New Mexico, Oregon and Colorado, confer upon a central state agency, authority to determine the final levy of taxes. The Colorado practice has already been described.

Indiana in 1919 conferred upon the state tax commission power to examine and revise local budgets as it saw fit. This proved to be unpopular, as it violated the principles of home rule and the law was changed. At present the state tax commission is limited to a consideration of only those budgets which are presented to it. Ten or more taxpayers may appeal to the tax commission to conduct a public hearing and make recommendation regarding any budget or tax levy which they feel is excessive or unreasonable. The hearing is held in the county in which the taxing district is situated. The state tax commission has the power to affirm or decrease the total tax levy or any item thereof and after its action is certified to the county auditor, its decision is final. Table 87 following summarizes the work of the Indiana commission since 1921.

In the opinion of the commission the actual reductions effected do not represent the measure of economies resulting from the system, because many local budgets are now more carefully and intelligently studied by taxpayers, and local public officials work with the knowledge that their budget and tax levies may be appealed to the tax commission.

New Mexico also vests its tax commission with extensive control over local finances. Each taxing district is required

TABLE 87
Tax Levy Complaints Filed with and Reductions Made by Indiana Tax Commission for Specified Years

Year	Complaints Filed	Reductions	
		Number	Amount
1921	42	39	$1,254,448
1922	74	46	1,034,572
1923	37	25	1,874,070
1924	42	41	1,467,345
1925	113	65	1,554,004
1926	95	51	1,639,187
1927	134	77	4,674,623
1928	65	65	1,554,004
1929	134	83	3,649,212

to prepare a budget on standard forms prescribed by the commission and to file it with the commission. The commission must approve, amend, or revise these budgets and certify its action to the board of county commissioners. A district must appeal to the commission for authority to increase its tax levy over the 5% increase allowed by law. If an excess over the statutory levy is approved the tax commission must specifically authorize the amount; if it is disapproved the commission must so state, giving its reasons, and its decision is final.

Oregon in 1921 created a special tax supervising commission, consisting of three persons appointed by the governor, to supervise tax matters in Multnomah County, in which Portland is situated. In 1923 the legislature established similar commissions in each county of the state. The law was declared invalid on the ground of a defective title. This legislation was intended to place the tax levies and expenditures under the control and supervision of an independent county commission and differed from the Indiana plan which vested control in a central state authority. The commission in Multnomah County is still functioning.

The Oregon constitution limits tax levies imposed by tax levying bodies in any one year to 6% of the amount levied during the previous year. Taxes and bond issues voted by the people are exempt from the limitations. There has been a tendency of tax levying bodies to refer any expenditures proposal or large increases in existing expenditures to a vote of the electors, rather than to attempt to meet new needs within the amount available under the 6% limitation. The Property Relief Taxation Committee makes the following statement: "Your committee is convinced that in so far as the 6% limitation has made it necessary to secure popular approval of tax and bond proposals, it has resulted in larger expenditures than would have been incurred if the full responsibility for expenditures had remained with the elected tax levying official." "There is abundant evidence that these bodies have been compelled to take into consideration the danger of reducing taxes any one year to a base so low that 6% increase would not yield sufficient funds to cover necessary expenditures during ensuing years. In many instances this has resulted in levying higher taxes than were necessary for a particular year." "That the so-called 6% limitation is responsible for many of our tax difficulties and a contributory cause of heavy increases in the tax rate is an opinion held by many of the students of the Oregon tax situation."

Massachusetts in 1912 examined municipal finances and found that most of the cities which were operating under tax limits had about the same tax rates and were rendering practically the same service as the smaller cities and towns which did not have tax limitations, but the debts of the cities had grown by leaps and bounds as the direct result of the effort to escape tax limitations, while the towns had few debts. Cities with tax limits were in a worse financial condition than towns of the same size furnishing the same public services and improvements, but without tax limits. On the discovery of this situation Massachusetts repealed all tax limits throughout the state, except for the city of Boston, where it was retained for other than fiscal reasons, and enacted sound bonding and budget laws which have proved entirely satisfactory.

New York's Special Joint Committee on Taxation and Retrenchment studied the subject of municipal tax limits and reached the following conclusions: (1) "Tax limits do not limit. Cities with tax limits spend as much and raise as much by taxation as cities without tax limits. The tax limit may serve to curtail expenditures for one or two years, but as soon as the restraint is felt an amendment is secured which encourages expansion since the tendency is to levy the full amount permitted whether it is necessary or not; (2) Tax limitation encourages unsound bonding; (3) Tax limitations

should never apply to debt service; (4) In a democracy there is no way of blocking a genuine popular demand for increased governmental service through an arbitrary limitation upon the tax levy; (5) The only effective method of securing a restriction of tax levies without hampering municipal services, encouraging unsound bonding and promoting periodic expansion and extravagance, lies along the lines of centering full responsibility upon a single elected official through (a) the establishment of a comprehensive and binding budget system, (b) the enactment of a complete bonding act which will prevent unsound bonding and (c) the wide distribution among the electorals of the direct tax burden." (Leg. Doc. No. 80, pp. 106-7).

Dr. R. C. Atkinson, after a comprehensive study of tax limitations in Ohio and other states, reached the following conclusions:

"Limitations in the rate of levy are objectionable because they fail to take account of the variations in the taxable wealth of different communities and they disregard variations in financial requirements of different types of communities." "It is simply impossible in an industrial state where great variations in governmental needs exist to devise a set of limitations which will allow adequate revenue for all districts without at the same time permitting extravagance in others, unless the legislature is prepared to deal with each community separately."

Limitations in the amount of taxation fail to take into consideration changes in the level of prices or the uneven growth of local requirements. The scheme of permitting tax commissions to authorize additional levies in excess of statutory limitations introduces a much needed element of elasticity, but places control in the hands of a body not intimately acquainted with conditions in the district involved nor in any way responsible to the people of the community affected.

The plan of allowing the voters to authorize additional levies at their discretion may be commended as a method of arousing popular interest in public finance and of increasing the responsibility of local officials in raising the burden of taxation. It encounters the danger that the needed relief legislation will not be secured, due to the unwillingness of officials to call upon the voters for additional levies until every expedient has been exhausted, and due to the natural inclination of the voters to vote "no" on increased levies even when the necessity is clearly apparent. The result of this situation is the temptation to amass a floating debt and impose added cost for current operation upon future generations.

Where rigid control and final authority over tax levies and local finance is vested in a state administrative body such as the state tax commission, it practically results in the abrogation of local government and places the control of local affairs in the hands of the state. In addition to destroying the home rule principle of government, it would be almost an impossible task for a central state body to attempt to examine into all the details of local finance and reach sound conclusions as to whether or not increases are justified. Moreover, such a plan if made effective would be very expensive.

VI. Conclusion

The data and analysis of the present section should show that central control of local finance is necessary, but that rigid tax limitations, especially if incorporated in the state constitution are not desirable means to effect such central control. The principal objection to central control is that it interferes with the so-called principle of home rule in government. But, in 1930, when improvements in transportation and communication have largely annihilated distances and have widened community areas, "home rule" should be a very different thing from what it was in the days of the stage coach, though some of the most voluble apologists for home rule appear not to have sensed the differences. Local governmental functions of 50 or 60 years ago are no longer of merely local interest. Not only the assessment of property for taxation but also the local fiscal policies should be subject to state administrative control and guidance.

SECTION VIII

BOND ISSUES

The state cannot contract indebtedness except to provide for casual deficiencies in revenue, erect public buildings, and suppress insurrection or defend the state in time of war. The amount of debt contracted for deficiencies of revenue is limited to $100,000, and for public buildings to $50,000 except that a debt for the purpose of erecting public buildings may be created by law on majority vote of the electors, not exceeding in the aggregate 3 mills on each dollar of valuation.

On three different occasions the people of the state have amended the constitution to permit the issuance of bonds in excess of the original limits prescribed. In 1910 a bond issue not exceeding $2,115,000 was authorized for the purpose of paying the outstanding warrants issued during the years 1887, 1888, 1889, 1892, 1893, 1894 and 1897. In 1920 an amendment was passed authorizing the issuance of $5,000,000 for the construction of public highways, and again in 1922 a $6,000,000 bond issue was authorized for public highways.

Bonds issued for the erection of public buildings and supplying deficiencies of revenue shall run for not less than 10 nor more than 15 years (Art. X, Section 4). The bond issue authorized in 1910 to fund the outstanding warrants was optional after 10 years and finally payable in 50 years. The $5,000,000 bond issue of 1921 was payable at any time after 10 years and the $6,000,000 of 1922 issue matured in 20 years.

Counties may not contract indebtedness except for the purpose of erecting public buildings and making or repairing roads and bridges. The amount issued in any one year and total amount outstanding varies with the assessed valuation as shown in Table 88 following (Art. X, Section 6).

TABLE 88

Bond Issue Limits in Colorado Counties

Counties Having Valuation	Amount Issued Annually	Maximum Amount Outstanding
Less than $5,000,000	$3 per $1000 valuation	$6 per $1000 valuation
Greater than $5,000,000	$1.50 per $1000 "	$3 per $1000 valuation

No maximum limit is prescribed for school bonds but the proposition must be approved by a majority vote of qualified electors voting thereon. Qualified electors to vote must have paid a school tax in the preceding year (Art. X, Section 7).

The aggregate municipal debt must not exceed 3% of the assessed valuation but debts contracted for supplying water are excluded. The maximum tax levy for debt purposes is 12 mills. Bonds run for not less than 10 years and not longer than 15 years. Debt must be approved by majority vote of such qualified electors as shall have paid a property tax the preceding year. This section prohibits the issuance of serial bonds (Art. X, Section 8).

I. Extent of Public Indebtedness in Colorado

A study of public indebtedness in Colorado indicates the need for a radical revision of the bonding laws of the state.

The total public bonded debt has increased from $13,363,276 in 1905 to a total of $110,181,708 in 1927. The per capita bonded debt rose from $18.96 in 1905 to $102.51 in 1927. The total interest requirements rose from $1,517,000 in 1913 to $5,405,789 in 1927. The bonded debt of all taxing districts has doubled about every eight years since 1905. The increase is shown in Table 89 following.

TABLE 89

Debts of Specified Colorado Political Divisions in Specified Years

	1905	1915	1927
State	$693,500	$3,774,000	$12,002,700
County	3,776,100	3,103,200	2,281,500
Schools	2,753,076	4,894,340	31,045,800
Cities	6,140,600	21,376,800	64,848,708
Total	$13,363,276	$33,075,111	$110,181,708

The largest increases in public indebtedness are for municipalities and school districts, and hence a state bonding law placing reasonable restrictions on these two subdivisions would be most useful in controlling bond issues. A study of the public debt in Colorado shows that serious financial abuses have arisen in connection with it: First, a large part of the existing bonded debt has arisen from deficits incurred in current operation; second, regulations governing debt retirement have been entirely inadequate.

Twenty-two per cent of the present state bonded debt consists of bonds issued to take care of deficits in current operation. Sixty-eight per cent of the total county bonds are either funding or refunding bonds. The total floating indebtedness

of all taxing units in Colorado in 1922 was $10,000,000. The outstanding interest bearing warrants and non-registered warrants of school districts increased from $738,000 in 1905 to $2,576,000 in 1927, indicating that school districts are not meeting current expenses out of current revenues. The large amount of refunding bonds outstanding indicates that taxing units have not made proper provision for retiring bonds at maturity. Bond interest payments consumed, in 1927, 3.5% of total state disbursements and 6.2% of total school disbursements. The total cost of debt service, including bond redemption and interest payments, constituted 12.18% of total school disbursements.

II. Model Bond Law

A number of states, notably Massachusetts, New Jersey and North Carolina, have adopted sound bonding laws and the National Municipal League has prepared a draft of a model municipal bond law based upon the experience of these progressive statutes.

Colorado should amend Article X, Section 8, of the constitution, which prohibits the issuance of serial bonds by municipalities, and adopt a state-wide bond law designed to bring all taxing districts, but particularly school districts and municipalities, up to modern standard practices. The provisions of the model bond law will serve as a guide in this effort.

Its principal features are as follows:

1. Bonds may be issued for capital purposes, but not to meet current expenses.

2. The term of the bonds shall not exceed the probable life of the property or improvement acquired, and a definite schedule of the estimated periods of usefulness of the several classes of improvements should be inserted in the law.

3. Bonds should not be issued except upon authorization of three-fifths vote of the governing body, and should provide for a referendum vote on any bond issue if 10% or 15% of the voters so petition.

4. The bond ordinance should include a complete statement of the debt condition of the taxing district.

5. Only serial bonds should be permitted but provision may be made for the so called serial annuity plan.

6. Bonds may not be sold at less than 95% of par.

7. Every bond issue should contain provisions for levying taxes sufficient to pay the interest and retire the bonds at maturity.

In addition to the above general principles, the bond law should regulate the issuance of refunding bonds, to provide that they may not be issued to mature over a longer period than 10 years. All floating indebtedness should be funded and every taxing unit be placed on a cash basis as soon as possible. In so far as possible all taxing units should adopt the pay-as-you-go policy of acquiring capital assets, especially those which are of a recurring nature. Plans for capital expenditures should be laid out in advance for a 5 or 10 year period, and a definite budget should be prepared and followed.

It would be desirable to require all proposed new indebtedness to be reported to some central state authority and that there should be prepared on standard forms an annual debt statement to be filed with some state authority so that there would be available a complete record of all public indebtedness incurred by all taxing districts in the state. In connection with new bond issues, this central authority could render a valuable service to local taxing districts by calling their attention to any violations of the statutes in connection with the proposed issues.

SECTION IX

BUDGET MAKING

Colorado, in common with two thirds of the states, has, by law, made the governor responsible for preparing and submitting the state budget to the legislature. The governor appoints a budget and efficiency commissioner to assist him in this work. The legal provisions making the governor responsible for the formulation and execution of the budget are largely without force. In practice the finance committees of the legislature pay scant attention to the document submitted by the governor, and they proceed to prepare and formulate another budget. The legislative committees are usually without special training for this kind of work. They have few or no records to assist them and very limited time to devote to the work. In the absence of exact knowledge regarding the needs of the various departments and institutions, which can only be obtained by months and years of patient study and research, the committees are largely influenced and guided by personal opinions, prejudices and hearsay evidence, and political motives play a conspicuous part in the decisions reached. During the hurry and excitement incident to the closing days of the legislative session, it is difficult if not impossible to keep a careful check upon appropriations, which must be made by separate bills for each state institution, and keep appropriations within the estimates of revenues. The system is haphazard, unbusiness-like and wasteful and results in over-appropriations of revenues each biennial period and in the accumulation of annual deficits.

Before Colorado can have an effective budget system there will need to be a fundamental change in the attitude of the legislature, which will recognize that the formulation and execution of the budget is essentially an executive function. The approval of the budget is the function of the legislature, and in modern budgetary practice the legislature is left practically free to modify, either upward or downward, the budgetary proposals of the governor.

It is now quite generally recognized that the work program for the year and the cost thereof can only be formulated by the executives and administrators who are in direct charge of the work, and that the execution of the budget is purely administrative in character. The determination of the amount of work to be undertaken and the methods of raising the revenues needed to finance the budget is a legislative function. In those states which have developed modern budgetary practices the law provides that neither house of the legislature shall

consider further appropriations until the appropriation bills proposed by the governor shall have been finally acted upon. The legislature may increase or decrease items in the budget bill as it may deem to be in the interest of economy and efficiency in the public service, and may enact further or special appropriations after the governor's budget has been finally acted upon. The budget law of Colorado should be amended so as to provide that the legislature shall first act upon the governor's appropriation bill before any other appropriation bills are considered. In case a constitutional convention is called, the question of incorporating such provisions in the state constitution should be considered. Section 32, Article V, of the Colorado constitution, which now requires that all appropriations shall be made by separate bills, should be changed, as it is extremely cumbersome and difficult to adopt modern budget procedure to this provision. The budget should present a complete picture of all receipts and expenditures of all state activities, and the appropriation bills should follow closely the budget document.

A few of the larger and more progressive cities, a few counties and a few school districts in Colorado are operating under genuine budget systems, but the vast majority of the local taxing units have not developed effective budget procedures.

The state government can aid in placing local finances on a sounder basis by the enactment of a general budget law, applicable to all taxing subdivisions and by promoting and encouraging the installation of budget systems. Failure to plan expenditures contributes largely to waste in local governments. Iowa, Indiana and New Mexico have undertaken the supervision of local budgets through a central state agency. In Indiana the state tax commission has the authority to reduce a local budget upon the protest of ten taxpayers of the community affected. In New Mexico all local budgets are made up according to a general form, and a copy is required to be filed with the state tax commission. This commission has power to examine, increase or decrease items, and the decision of the commission is final. It is doubtful if other states will go as far as that.

Ohio, Oregon and Oklahoma provide for a certain amount of supervision and control of local budgets through a county commission or other agency. In Ohio, local budgets must be adopted on July 15 of the preceding year, and be submitted, on uniform blank forms provided by the county auditor, to the county budget commission. Oklahoma has a county excise board which examines local budgets and has the power to revise

and correct any estimates certified to it, and to increase, decrease, or add any items thereto.

The New Jersey statute provides that every county, school district and municipality in the state shall adopt a full and complete annual budget, specifying in detail the items of anticipated revenues and expenditures. Appropriations may be later increased or diminished to the extent of 10% by tax ordinance or resolution, but the gross additions or deductions must not exceed 5% of the total appropriations adopted in the budget. The municipal finance act passed by the legislature of North Carolina in 1927 is closely patterned upon the New Jersey statute.

A committee of the National Municipal League in 1927 prepared a model budget law in the hope that state legislatures would find it suggestive as to the elements of a sound and adequate budgetary procedure. The committee proposed that the act should apply to all subdivisions of the state. The model budget law fixes the fiscal year, outlines the form and content of the budget document, the method of preparation and calendar of events are prescribed, including public hearings and final adoption, the method of control to be exercised is specified, and provisions for transfer, additional appropriations and temporary loans are made.

Colorado should enact a general budget law, applicable to counties, school districts and municipalities, patterned after the model budget law. The law should require that a copy of every local budget be transmitted and filed with some central supervisory agency. This central supervising agency should examine local budgets with respect to sufficiency of appropriations for debt service and payment of deficits, and with respect to compliance with all state laws governing tax limitations or debt limitations, and it should be charged with the duty of promoting and encouraging the adoption of modern budgetary procedure by all taxing subdivisions. The central supervising agency might be a state agency, or a county agency, or a combination of both. The supervision over county and municipal budgets might be placed under a state agency and the supervision of school district budgets might be placed under some county agency. In this connection, further study should be given to the work of the county superintendent of schools in Delta County, where central control of finances, budgetmaking, purchasing and reporting has been established under the supervision of the county school superintendent.

SECTION X

STATE SUPERVISION OF ACCOUNTING, AUDITING AND REPORTING OF LOCAL FINANCES

The laws of Colorado provide for a public examiner, appointed by the state auditor, whose duty it is, together with the state auditor, to prescribe and install a uniform accounting system for every state and county office or institution, and to make annual examinations thereof. Every state and county office or institution is required by law to make annual reports to the state auditor, and he is required to publish an annual volume of comparative statistics which shall be submitted to the governor for transmittal to the legislature.

The staff of the public examiner's office consists at present of the public examiner and four assistant state examiners, and a total annual budget of $12,950 is provided. Their work is confined to an examination of certain state and county offices and institutions. The annual volume of comparative statistics is published as a part of the state auditor's report, and for the biennial period ending November 30, 1928, contained tables showing for each of the 63 counties the total receipts, total disbursements and balances of the offices of county commissioners, treasurer, recorder, sheriff, county court and district court, together with comparative figures for the preceding year. Total disbursements of all state offices, boards and institutions were segregated to show the cost and percentage for salaries, maintenance, equipment, improvements and miscellaneous expenses.

The law is rather comprehensive in scope, providing for the installation of uniform accounting system, an annual audit of all financial transactions and the publication of an annual volume of comparative statistics. During the 20 years this law has been on the statute books the results have been extremely mediocre in character and unsatisfactory. The reports of the public examiner in the earlier years reveal that many irregularities were discovered and contain numerous suggestions for improvement. In recent years the examination of accounts seems to have been rather perfunctory and to consist largely of the transcription of total receipts and disbursements for the purpose of the annual comparative report. Many counties employ private accounting firms annually to audit their accounts, which would indicate that they do not regard the auditing work of the public examiner's office as adequate. Concerning the accounting systems in state offices much evidence exists as to its unsatisfactory character. The weakness and defects of the general accounting system of the

state is readily apparent to anyone who takes the time to examine a copy of the biennial report of the state auditor. The subject was covered rather completely in reports of Survey Committee of State Affairs in 1917, and the need for modern accounting practices and procedures exists today as strongly as when that report was made. An examination of the published biennial report of the public examiner reveals that the information contained therein is of little practical value to anybody. It is of little value to the public official directly concerned or to the public because the information relates largely to total cash receipts and disbursements by fund or appropriation accounts and neither the public administrator nor the public can reach any sound conclusion relative to the efficiency or economy with which the various offices or institutions are conducted from an examination of such figures.

In view of Colorado's experiences with state control and supervision over state and county offices with respect to finances, it would be a rash person who could recommend that the scope of the work should be extended to include municipalities and school districts.

The theoretical arguments in favor of state supervision of local finance appear to be rather conclusive. It is claimed that competent auditing and accounting service can thus be secured at low cost; that the men engaged in the work become specialists and thoroughly conversant with the peculiar problems arising in connection with public accounting as contrasted with private commercial accounting; that uniform methods of accounting and reporting are more easily obtained if the work is directed by a central state agency; and that uniform reports can be secured and valuable comparative statistics made available.

In practice, however, these results are seldom attained. About two-thirds of the states have laws providing for some kind of state supervision of local finance but in only a few states is the work being done in a creditable manner, and even in those states which have been most active and aggressive there is a wide gap between the legal requirements and what has actually been accomplished. The task of installing uniform accounting systems and auditing the accounts of every taxing district is so enormous that no state has yet succeeded in providing a large enough staff of competent accountants to do the job thoroughly and completely.

The states which appear to be most active in the work of supervision are Iowa, Massachusetts, Minnesota, New Jersey, New York, Ohio, and Wisconsin.

Iowa in 1907 created a department of municipal accounts in the auditor's office to compile and publish annual financial statistics of municipalities, and to prescribe a uniform system of accounts, and to audit all cities and towns of over 3,000 every two years. The cost of the audit is borne by the cities.

Massachusetts in 1905 created a division of accounts which now functions under the commissioner of corporations and taxation. Annual reports on statistics of municipal and county finances are published, and the division conducts audits and installs accounting systems. During 1927 the division made 142 audits and installed systems in 8 cities and towns. Up to 1927 the division had installed its uniform accounting system in 194 towns and cities out of a total of 355.

The Minnesota law requires that an annual audit be made of the three first-class cities, but audits of other cities and school districts are made by the public examiner on request.

The New Jersey law requires a yearly audit of cities having an assessed valuation of over $3,000,000 and an audit every two years of cities having a less valuation. The department of municipal accounts maintains a list of registered accountants who upon registration are authorized to audit local accounts. All audits are filed with the state department.

New York has a Division of Municipal Accounts in the Comptroller's office which has prescribed uniform accounting systems for the various sizes of municipalities, and which installs the system and audits accounts of all counties, cities (except those of the first-class), towns and villages.

Ohio has a bureau of inspection and supervision of public offices in the auditor's office, which is required to examine all state and county offices and every taxing subdivision, including private institutions receiving public money. Annual financial reports are required to be filed with the bureau annually and a volume of comparative financial statistics is published.

The Wisconsin law imposes upon the tax commission the duty of auditing the books of towns, cities and counties upon the request of the taxing district or upon its own motion. During the two years 1927 and 1928 the department made 163 audits, 129 closing inspections, 18 installations, 84 financial report inspections and 58 miscellaneous inspections, making a total of 352 field engagements.

In California the state controller published an annual volume of comparative statistics relating to financial transactions of municipalities and counties, based upon annual reports required to be filed with him by county auditors and city clerks.

Sixteen states make legal provision for the installation of accounting systems in cities. In 9 states the adoption of the prescribed system is compulsory and in 7 the system is installed on request of the city. Twenty-eight states provide for the installation of accounting systems in counties. In 6 states such systems are confined to certain offices handling state money. In 3 states the systems are installed only on request. Thirty-three states require the public examiner or some similar officer to install an accounting system uniform for all state offices and institutions.

Thirty-nine states make provision for some form of audit of state offices, 37 states provide for some form of audit of county accounts and twenty states include municipal accounts.

Twenty-eight states require financial reports of county affairs to be filed with the state agency supervising these matters and 18 states require financial reports from municipalities.

The experience of Colorado in this field does not seem to warrant an extension of the work of a state department into the field of installing uniform accounting systems nor of auditing municipal or school district accounts. Unless the state is willing to properly equip and finance an adequate state department of supervision and inspection of local finances, it had better not undertake the task at all. Half-way measures in this field fail to command the respect which would justify the expenditure. The state should, however, provide for the collection, compilation and publication of comparative financial statistics of counties, school districts and municipalities so that there would be available at some central point complete information regarding these matters. Such a law should require every taxing district to file with the central state supervising agency as annual financial report on prescribed standard forms, and a copy of every audit of a taxing district should also be required to be filed in this department. An annual volume of comparative statistics should be published. The present law requiring publication of semi-annual financial statements of county finances should be amended so as to require the publication of annual statements only. The central supervising agency should be empowered to do such field work as is necessary to obtain these annual reports. It should be authorized to encourage and promote the installation of uniform accounting systems and the auditing of financial transactions, and be empowered to make such installations and audits upon request of any taxing district or upon petition signed by 25 taxpayers in any such district. The cost of such work should be charged to the taxing district served.

SECTION XI

GOVERNMENTAL REORGANIZATION AND BUSINESS PRACTICES

A comprehensive reorganization and consolidation of the 70 more or less independent offices, boards and commissions of state government into a simpler, more compact and workable organization, similar to that employed in the national government, in 15 state governments, in 411 municipalities, and which is practically universal in the business and commercial world, would undoubtedly result in securing greater economy in state governmental expenditures. It has been estimated that $500,000 could be saved annually in Colorado through reorganization of the state government, along the lines followed in other states.

The administrative reorganization of local governmental units, counties, school districts and cities, offers large opportunities for securing more economical administration, the adoption of the city manager plan in municipalities and the application of the county manager plan to counties have all been tried and proved successful. The state constitution and statutes of Colorado should be so amended as to make it possible for local governments to avail themselves of these newer and more efficient types of governmental organization.

In Colorado, the secretary of state purchases office supplies and certain printing for the various state departments and offices. The board of capital managers furnishes the legislature and executive departments with furniture, fuel and light. The commissioner of public printing has direction and supervision of public printing, including stationery, blank books and printing of the annual or biennial reports. The state highway department maintains its own purchasing department. The board of corrections is responsible for the purchasing for the state insane hospital, penitentiary and reformatory. Each state educational institution and other state correctional and charitable institutions do their own purchasing. The purchasing agents of the higher educational institutions, however, have entered into a voluntary cooperative purchasing association which has resulted in standardizing various types of commodities in common use by each institution and in very considerable centralized purchasing. It is clear that the state's purchasing is now performed by too many different agencies, and that some degree of centralization would be desirable. There is general agreement that the office of secretary of state is not the proper department to carry on this activity. The suggestion has been made that the purchasing division of the state

highway department might form the nucleus of the new centralized purchasing department. The present trend in state government is in the direction of administrative centralization, including purchasing. All of the 15 states that have reorganized their governments since 1917 have adopted or continued centralized purchasing. Since centralized purchasing is intimately related to strict budgetary control, many political economists agree that the purchasing agency should be a division of the finance department. Such is the practice in 11 states.

At present 36 states purchase all or a considerable part of their requirements in supplies, materials and equipment through a central office. Twenty-five states centralize the purchasing for both state institutions and departments. Eleven states centralize the purchasing of state institutions only. For a full description of centralized purchasing in state governments the reader is referred to "Governmental Purchasing" by Russell Forbes.

It is estimated that there are over 3,000 counties in the United States, and not over 100 practice centralized purchasing. Under the general law of New York state, passed in 1921 and amended in 1925, any county is permitted to establish centralized purchasing. Under a general law in California boards of supervision may appoint a purchasing agent. Under these provisions 22 California counties have centralized purchasing. All elementary school districts are required to purchase standard school supplies through the office of county superintendent of schools, or through the county purchasing agent, if the superintendent so delegates the power. High school districts may elect to come under the provision of the act. North Carolina requires all counties to centralize purchasing in the hands of a member of the county board or some person appointed by that body.

Centralized purchasing is confined to the large cities in Colorado. Denver has a well organized purchasing department, and in a number of the city manager cities, such as Colorado Springs, Grand Junction, and Boulder, the city manager acts as purchasing agent. In a few other cities, such as Fort Collins and Sterling, the city council has designated the city clerk as purchasing agent.

About 250 cities of the United States had adopted the principle of centralized purchasing in 1926. 95 cities of over 10,000 population have full-time purchasing executives. In 60 cities of over 10,000 the purchasing is a part time duty of some official, and in 44 cities the city manager is the purchasing agent. In cities of less than 10,000 population purchasing is usually a part-time function of some unit of the government.

The adoption of a general state law, similar to the laws of California, New York or North Carolina, permitting the county commissioners to establish centralized purchasing, permitting school districts to centralize their purchasing through the office of county superintendent of schools as is now being done in Delta county, and permitting city councils to create purchasing departments would tend to promote economy in government.

Any complete reorganization of state or local governments will require constitutional change. The present form of state organization is set forth in Article IV, and county organization is specified in Article XIV. A limitation on municipal organization is contained in Article XIV, section 12, which limits the term of office of county, township, precinct and municipal offices to two years. These sections could be eliminated and a general provision inserted instead requiring the General Assembly to provide by statute for the organization of state and local governments. The proper organization of state and local government is of vital importance in securing economy in expenditures, since otherwise it is difficult, if not impossible, to inaugurate methods that will reduce costs. It is hardly possible for any kind of a budget plan to succeed when there is no responsible administrative head. There must be some form of central administrative control, in order to prepare and execute a budget.

In order that the General Assembly may have the basic information necessary to enable it to draft a general law for the organization of local government, a comprehensive survey should be made of county, school district and municipal organization in Colorado. Such a study would undoubtedly reveal many opportunities for retrenchment in local government in connection with elections, printing, business methods and office procedure. Similar surveys made in other states have pointed out opportunities for savings in connection with elections through establishing systems of permanent registration by votes, by reducing the number of election officials and increasing the size of election precincts or districts, and by adopting modern tabulating machines in the work. These surveys have indicated possibilities for saving in connection with public printing, through standardization of reports, better arrangement of subject matter, elimination of useless material, reducing the number of publications required and the use of pamphlets, instead of newspaper space in certain cases. For example the Colorado Survey Committee on State Affairs of 1917 pointed out that the cost of printing initiative and referendum measures and constitutional amendments could be reduced by adopting the plan used in the state of Washington, thus saving the

state hundreds of thousands of dollars. Instead of publication in newspapers, the State of Washington requires measures to be printed in pamphlet form and mailed to the voters. The possibilities for reducing expenses by installing machine methods in many government offices, both state and local, have been demonstrated in many states, counties and cities. Mechanical methods installed in assessor's offices and treasurer's offices, eliminate unnecessary clerical help and reduce costs. Photographic recording of public documents is both cheaper and better than the old methods. A comprehensive survey of county government would reveal the possibility of effecting savings through consolidation of counties and similar studies of local district school administration would indicate the lines which school district consolidation should take. These illustrations indicate some of the possibilities which exist for effecting economies in public expenditures, but they cannot be adequately treated within the limits of this report.

In concluding this survey, it is appropriate to warn those who may undertake to formulate measures to create a modern and scientific revenue system. Colorado as a comparatively young and undeveloped state with great natural resources should be slow to adopt changes that would tend to drive capital or people from the state. On the contrary, wisdom would dictate such modifications as in the light of experience elsewhere would attract such capital and settlers as the state can economically employ. Experience elsewhere demonstrates that the need for tax reform grows pari passu with economic development. It should be possible, therefore, for Colorado to follow rather than lead in adopting innovations in the tax system.

The aggregate tax burden is here—it may possibly be decreased. It should be increased, if at all, only by slow gradations, dependent upon the legitimate demands of the people for more governmental service. A readjustment of the burden, however, is desirable. To superimpose upon the present ad valorem system any substantial additional tax would probably produce disastrous results. It would tend to add to the burden upon urban real estate, farms, and homes by driving capital from the state and further diminishing the salability and rentability of real estate.

In short, if any new system of taxation be resorted to, it should be conditioned upon at least the abolition of any ad valorem tax on intangible property.

ACKNOWLEDGMENT AND FOREWORD

The City Club of Denver takes this occasion to acknowledge the splendid research facilities of the Bureau of Business and Social Research, University of Denver, through which agency this study has been compiled. The report was written by Messrs. F. L. Carmichael and E. T. Halaas, Director and Associate Director of the Bureau. Collaboration in this work by the Public Finance and Government Committee has assured a blending of research, business and civic viewpoints.

It is the expressed purpose of the City Club—

> "To insist upon the importance of public affairs; to ascertain conditions; to impart, not opinions but the basis for opinions; to discipline our public acts with private thinking; to co-operate with public officials in seeking to improve conditions susceptible of improvement, and, only as a last resort, to publish criticism; to kill germs of iniquity and neglect with the light of truth; to seek to inform rather than to reform; not to take sides in public issues but to equip individuals to do so effectively; to foster good-humored friendship among ourselves; all to the end that, in Denver, public administration, commerce, the arts and sciences may thrive."

We submit that these worthy purposes are ideally served in this report entitled "Financing Government in Colorado." The report is factual, free from partisan viewpoints and presents no recommendations. Certain pertinent facts are nevertheless readily apparent.

1. Total taxation is now at an all-time high in Colorado, even though business conditions have been depressed for a period of years.
2. The Sales Tax was passed expressly for emergency relief, but 85% of collections has since been diverted by constitutional amendment to other purposes.
3. If the Colorado old age pension of $45 per month were to be paid in full, the resultant annual income per pensioner would exceed the average per capita income in this state and in the United States.
4. Even though taxes are at a peak in Colorado, they must be greatly increased if the present old age pension amendment continues in force.

Citizen sponsored audits, studies, comparisons and publications of expenditures of tax moneys of this state and its governmental sub-divisions are to be commended. Such surveys and publications should be productive of greater effciency and economy in government.

This report deals generally with various phases of state government finance. It is contemplated that subsequent reports will deal specifically with such financial problems as those pertaining to highways and educational institutions.

FINANCING GOVERNMENT IN COLORADO, 1926-1937

The purpose of this study is to present certain basic information concerning public revenues and expenditures in Colorado. The subject matter is divided into three parts: first, a description of the state and local tax system, wherein the various kinds of taxes and the receipts therefrom are indicated; second, an analysis of the character and trend of receipts and disbursements of the state government; and third, a review of certain current problems of state finance. It is recognized that matters relating generally to taxation and government expenditures raise many controversial questions of public policy. As a factual presentation, which this study purports to be, argument and theories cannot be brought within its scope. It is hoped, however, that such information as is offered herein may contribute in some measure to a fuller understanding and appreciation of the problems of state and local government which today, more than ever, merit the whole-hearted attention of all citizens.

TAXATION IN COLORADO

Tax Revenues. A government, like any private business, is created for the purpose of rendering certain services, presumably desirable from a social point of view. By the same token these services must be paid for. This necessitates taxation, without which no government could exist. The various taxes and the revenues which they produce for all government in Colorado—state, county, city, and school—are indicated in Chart 1 and Table 1.

For state and local governments combined thirteen separate taxes and licenses are employed.* Total collections from such sources for the 1937 fiscal year amounted to $61,180,000, a figure which exceeds that for any previous year in the history of the state. The general property tax alone accounted for $38,139,000, or 62 per cent of the total.** The sales tax amounted to $6,762,000 or 11 per cent of the total. The tax on motorists, including both the gasoline tax and the motor vehicle license, amounted to $10,592,000 or 17 per cent. Other taxes and licenses, among which the liquor license was the most important, accounted for the remainder of $5,687,000 or approximately 10 per cent of total tax receipts.

The trend of total tax revenues in Colorado since 1926 resembles, to a degree, the movement of general business activity during the same period, viz., the steady rise from 1926 to 1931, the downturn after 1931, and the rise again from 1934 (Chart 1). In rates of change, taxes for the first period showed an increase of 18 per cent; in the second period, a decline of 20 per cent; and in the third period, from 1934 to 1937, an increase of 27 per cent. The movement of receipts from separate taxes does not necessarily conform to that of the aggregate collections. Thus we find that revenues from the general

*The use and service taxes were not counted as separate taxes, being included under the general designation of sales tax. The income tax which has since become operative is not included in the count.

**General property tax revenues shown for any year are the levies made for the preceding year.

Acknowledgment is made to the following agencies and persons for valuable cooperation in the preparation of this report: Department of Auditing, Thomas Annear, Auditor of the State, and James A. Nooman, Bookkeeper; Colorado Tax Commission, James A. Savage, Secretary; and R. G. Montgomery, State Budget and Efficiency Commissioner.

Acknowledgment is made also of the assistance in the statistical analysis rendered by: Betty Reid, Secretary of the Bureau; Harold C. Wiedeman, Supervisor of the Laboratory; Sam Butler, Research Assistant; and Vincent Covillo, Shelton Doyle, Carl Fulkerson, Dorothy Jones, Glenn Lewis, and Keith McChesney.

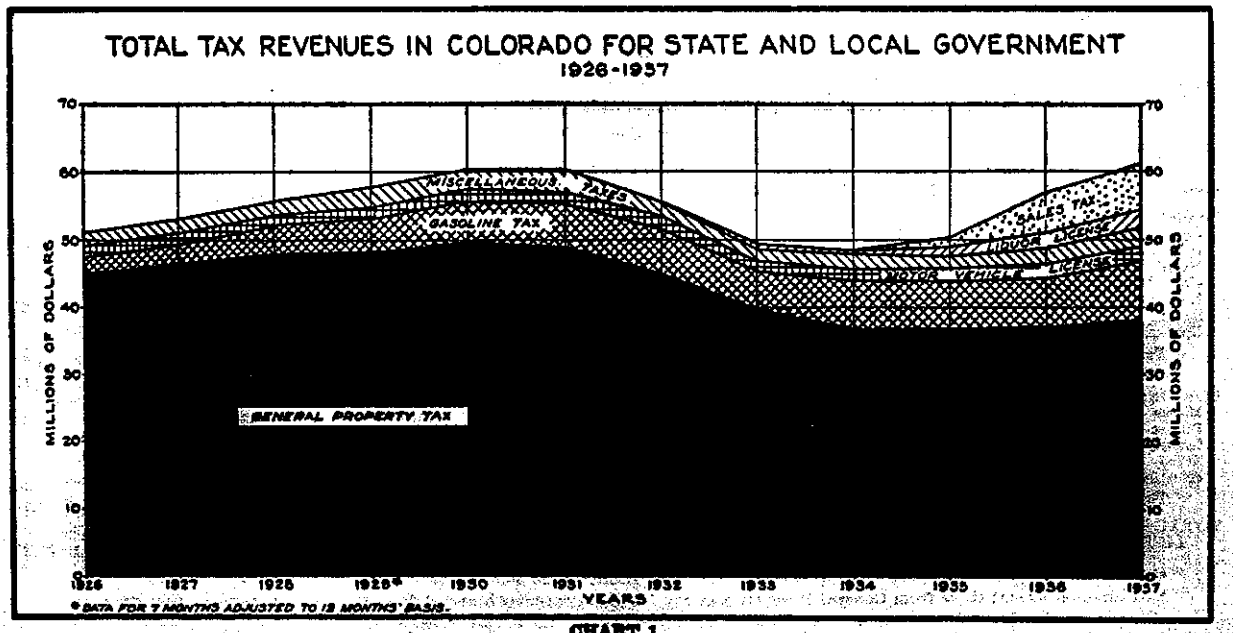

CHART 1

property tax rose from 1926 to 1930 by only 10 per cent, dropped during the second period by 19 per cent, and rose from 1934 to 1937 by only 4 per cent. The addition to the tax structure of the liquor and sales taxes accounts for the rapid rate of increase in total tax revenues since 1934. Other taxes, such as those on gasoline and motor vehicles, although constantly increasing in importance, are relatively stable producers.

The foregoing total of tax revenues does not include receipts of either the state or local government derived from minor licenses and department earnings. These, however, do not represent a sizable portion of government income and were therefore omitted in this section of the study.

Finally, of the total amount of taxes collected in 1937, approximately 38 per cent was used for state government purposes, the remaining 62 per cent going to local tax jurisdictions such as the counties, towns and cities, and school districts. The distribution between state and local governments is shown in Table 2 for 1937 and 1926. From this table it may be seen that most of the general property tax receipts were used by local governments. Other taxes, shared in various proportions by state and local governments, are those on gasoline, motor vehicles, and public carriers. The revenues from the nine remaining taxes and licenses, the most important of which were the sales tax and the liquor license, were available exclusively for state purposes. However, under the old-age pension amendment of 1936, 85 per cent of the revenue from the sales tax and the liquor license must be used for old-age pensions. Since pension allotments are made on a county basis, it follows that the greater part of this revenue was actually used for local government purposes. Taking this into account, the local governments' share of the receipts in 1937 was 75 per cent rather than the 62 per cent noted above.

Table 2

Distribution of Total Tax Revenues in Colorado between State and Local Governments Fiscal Years 1937 and 1926

(In thousands)

Taxes and Licenses	Taxes, 1937			Taxes, 1926		
	Total	For State Purposes	For Local Government Units	Total	For State Purposes	For Local Government Units

Source: Annual Reports of the Colorado Tax Commission and the Biennial Reports of the Auditor of the State.

The General Property Tax. This tax has always been the chief source of public revenue in the state. Administered locally, for the most part, it is virtually the sole support of county, city, and school administration. Of the total property tax revenues in 1937, which amounted to $38,139,000, 49 per cent went to the schools, 21 per cent to cities and towns, and 21 per cent to county governments, leaving only 9 per cent for state purposes. The trend of general taxes since 1926, by major purposes, is shown in Table 3. It will be seen that annual revenues going to each of the four government groups decreased steadily from 1929 to 1934 or 1935. During the past two years general property taxes levied increased by approximately $4,000,000, of which increase nearly one-half went to the state.

The assessed value of all property in Colorado was $1,110,851,000 in 1937 as compared with $1,586,920,000 in 1929, and $1,546,830,000 in 1926. The relative importance of major classes of property composing the total tax base in 1937

is shown in Table 4. It is clear that the two groups of properties designated as real estate and corporations, which together account for 85 per cent of the total state valuation, are the main source of general tax revenues. The amount of the intangibles listed was only 1.2 per cent of the tax base.

The trend of the total state valuation by years, as noted in Table 5, marked a downward course from 1930 to 1935 which was more pronounced than that of total taxes—the assessed valuation decreased 31 per cent, while taxes fell only 25 per cent. This means that mill levies were increased during the period to offset the reduced assessments.

Table 4

Assessed Valuation by Principal Classes of Property in Colorado, 1937

PROPERTY CLASS	Valuation (In thousands)	Per Cent of Total Valuation
REAL ESTATE		
Farm Lands and Improvements	$ 276,556	24.9

Total Assessed Valuation	$1,110,851	100.0

Source: Annual Reports of the Colorado Tax Commission.

As indicated by Chart 2, farm land and improvements as a subject of assessment have declined in relative importance. In 1926 this property class represented 31.6 per cent of the total state valuation, while in 1937 the ratio was 24.9 per cent. The total decrease from 1926 to 1937, with reductions occurring in each year of the interval, amounted to 43.4 per cent. The valuation of city properties fell sharply after 1930, as did the valuations of all property groups with the exception of public utilities, the latter declining only moderately. The 1937 assessment

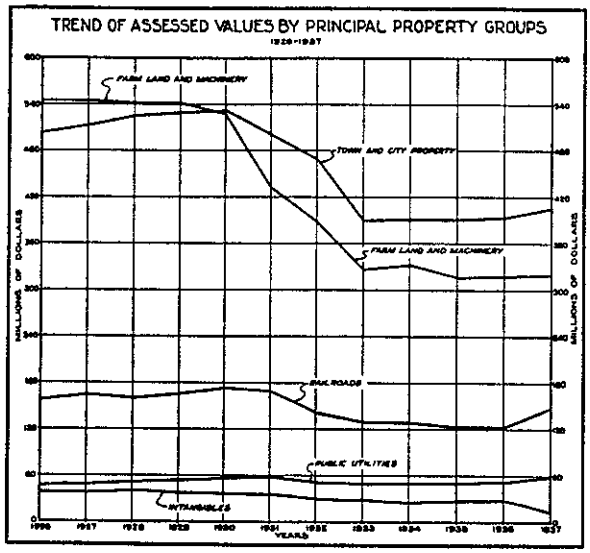

CHART 2—Trend of Assessed Values in Colorado

showed an increase for all groups excepting farm real estate, the 19 per cent increase in the assessment of railroads over that in 1936 being particularly marked.

Offsetting to some extent the decreases in annual valuation, average tax rates increased generally throughout the entire period 1926 to 1937. Contrary to the general trend, the levy for state purposes generally decreased dropping from 3.67 mills in 1926 to 3.00 mills in 1936 (Table 6). In 1937, however, the rate was raised

Table 6

Average Mill Levies of State and Local Governments in Colorado, 1926-1937

Year	General Average	State	County	City and Town	School[a]
1926	29.74	3.67	6.03	11.67	14.40

to 4.50 mills. Taking city jurisdictions as a further example, it is clear that revenues tended to be sustained by increased mill levies as valuations were reduced. Thus, we find that for a group of twenty Colorado cities the average drop in valuations from 1926 to 1937 was 21 per cent, while total mill levies in those cities (for state, county, town, and school purposes) were increased on an average by 24.8 per cent (Table 7).

Wide differences in the over-all assessment rates exist among the various towns and cities. Property in Leadville, for example, was assessed at 80.85 mills in 1937, while the rate in Fort Morgan was only 41.30 mills. The comparatively low rate of 38.50 mills—the 1937 levy in Denver—illustrates also how rates may be held down when the overhead costs of government can be distributed over a substantial tax base.

[a]Total mill levy includes levies for state, county, town, and school purposes.
Source: Annual Reports of the Colorado Tax Commission.

The lack of uniformity in tax rates is further indicated by data for school districts in Colorado (Table 8). Although the greater proportion of the districts have succeeded in keeping their total tax rates under 8 mills, there were, nevertheless, 667 districts in 1937—approximately one-third of the total—whose assessments ranged from 8 to 32 mills. A comparison of the 1937 and 1926 distributions of districts according to rates of levy shows clearly that present rates are on a materially higher average level than they were twelve years ago. We note, for example, that in 1926 approximately three-fourths of the total number of districts were assessed at rates under 8 mills, while in 1937 two-thirds of the districts had rates below this level.

Table 8

Distribution of School Districts in Colorado According to Mill Levies[a] in 1937 and 1926

Rate Groups (mills)	Districts, 1937 Number	Districts, 1937 Per Cent of Total	Districts, 1926 Number	Districts, 1926 Per Cent of Total

[a]Includes levies made by a school district for all purposes but does not include the general school levy made by the counties.
[b]Not all district reports were available. The total number of districts in Colorado approximated 2,000 in both years.
Source: County Superintendents' annual reports.

To conclude this analysis of the general property tax mention may be made of tax delinquencies. This has always presented a problem in the administration of the general property tax and during the recent depression it was a prob-

lem of major proportions. Delinquencies varying from county to county are the differences between the collections within a year's time and the assessments. It is to be recognized, however, that over a series of years collections will closely approach the 100 per cent mark. The percentages of collections within a year's time, presented in Table 9, show what the general trend has been.

Table 9

Proportion of General Property Taxes Collected Within the Given Year in Colorado, 1926-1937

Year	Per Cent	Year	Per Cent
1926	97.8	1932	81.9
1927	95.1	1933	81.8
1928	96.6	1934	85.9
1929	95.7	1935	89.3
1930	90.9	1936	90.9
1931	84.8	1937	91.8

Source: Figures from 1926 to 1932 computed from data prepared by Tax Department of The Denver & Rio Grande Western Railroad Company and thereafter from the Annual Reports of Colorado Tax Commission.

Other Taxes. In addition to the general property tax, but considerably less productive, are the twelve other taxes and licenses, a brief description of which will be included in a later section of this study. It may be observed here, however, that in number and relative importance of the different items, the tax pattern for Colorado is substantially the same as that for the majority of states. Reference to Table 10, which shows the tax structures of twenty representative states, indicates, for instance, that nine principal taxes are quite uniformly employed and that the general property tax found in all of them accounts on an average for approximately two-thirds of the public revenues in the states noted.

A count of the different principal taxes found in all of the American states at the end of 1937 showed that the sales tax was employed in 23, the income tax in 37, the gasoline tax in 48, the motor vehicle license in 48, and the inheritance tax in 47.

The "Tax Burden" in Colorado. Closely related to the question of how many different taxes a given state has seen fit to devise is that of the "tax burden." To some people taxation is a "burden" in any event; to others it becomes a burden only when there are needless government activities and extravagance. These latter conditions must, of course, rest on individual opinion which may or may not be sound. There are, however, certain criteria, somewhat limited but reasonably valid, for judging the degree to which taxes are cutting into the personal incomes and perhaps the living standards of the general public. Taxes expressed on a per capita basis is such a criterion, as is the ratio of per capita taxes to per capita income. The latter attempts to show what portion of average incomes is appropriated by the government. Standard or ideal ratios for any time or place have as yet to be devised. For purposes of comparison between localities or intervals of time, however, they may prove to be quite significant.

Total state and local taxes in Colorado for the 1937 fiscal year amounted to $57.12 per capita (Table 11). This is the third largest annual

per capita figure for the period from 1926 to 1937, being exceeded only by those in 1930 and 1931, $58.02 and $57.79, respectively.

When the 1937 per capita tax is related to the per capita income in the state for that year, estimated at $501, a ratio of 11.4 per cent is obtained. In other words, 11.4 per cent of every dollar earned by Colorado citizens in 1937 went for state and local government purposes. The proportion of incomes taken by taxes increased rapidly from 1929 to 1933—the ratio in 1929 was 8.9 per cent as compared with 14.2 per cent in 1933—but decreased steadily after that date. The rise during the depression was natural in view of falling incomes and the increasing need for revenues to finance relief. After 1933, incomes increased at a faster rate than taxes, resulting in reduced ratios. Although the proportion of the per capita income going for taxes in 1937 was considerably lower than the average since 1930, it was materially higher than that for 1929 and therefore for the preceding years if the averages of all states can be taken as a criterion.

When per capita state and local taxes in Colorado are compared with the average or over-all figures for forty-eight states, the position of the taxpayer in Colorado appears to have been somewhat less favorable than the average. This is equally true when the comparison is made by relating per capita taxes to per capita incomes (Table 11).

The comparison of Colorado with the general average does not, however, reveal how the individual states were distributed according to individual per capita figures. This might change the picture to some degree, insofar as Colorado's position in relation to the median is concerned. For eighteen states, for which reasonably complete tax information could be secured for comparative purposes, per capita taxes in 1936 ranged from $21.93 in South Carolina to $81.09 in New Jersey (Table 12). In this group Colorado's position is seen to be below the median in per capita taxes but somewhat above that measure when ratios of taxes to incomes are compared. Of additional interest is the record showing comparative changes in these states in per capita taxes. For the period from 1933 to 1936, taxes in Colorado on a per capita basis increased 14.4 per cent, an increase exceeded only by the increases of six other states in the group. The range of percentage changes for the period was from an actual decrease of 1.5 per cent in South Carolina to an increase of 55.5 per cent in California.

The foregoing description of the total tax structure in Colorado has been presented as a setting for a more detailed consideration of

state government finance. The following two sections will be confined to an analysis of the receipts and disbursements of the state government. Reference is made to local governments only in their position as recipients of funds collected and disbursed by the state.

RECEIPTS AND DISBURSEMENTS OF STATE GOVERNMENT IN COLORADO*

The total revenue and non-revenue receipts of the state government of Colorado for the fiscal year ending in 1937 were $59,844,000. These included a $15,000,000 bond issue for highway improvements. Disbursements for all purposes amounted to $54,670,000. These totals are the largest for any single year in the state's history. It is the purpose of this section to consider the manner in which the state secured this money as well as the manner in which it was spent. For purposes of noting changes over a period of time annual data are included reaching back to 1926. See charts 3 and 4 (tables 13 and 14).

A. Receipts

Total receipts are classified as revenue and non-revenue receipts. Revenue receipts include all money or wealth received under such conditions that they increase the assets of the state government without increasing the liabilities. The principal general items in this classification are taxes, fines and forfeits, Federal government grants, interest receipts, and department earnings. Non-revenue receipts are included in state accounts to secure a complete statement, although they do not result in an increase in the net value of assets. Principal among these are receipts from bond issues and the sale of assets. Receipts for funds such as Workmen's Compen-

*All data for state government receipts and disbursements are from the Biennial Reports of the State Auditor. Since these reports fail to show any classification of revenues and expenditures suitable for the purposes of this study, it was found necessary to examine for each year over 300 separate cash funds or items of appropriation which are listed alphabetically in the reports. Receipts and disbursements were accordingly placed in general categories which were deemed most descriptive of their character.

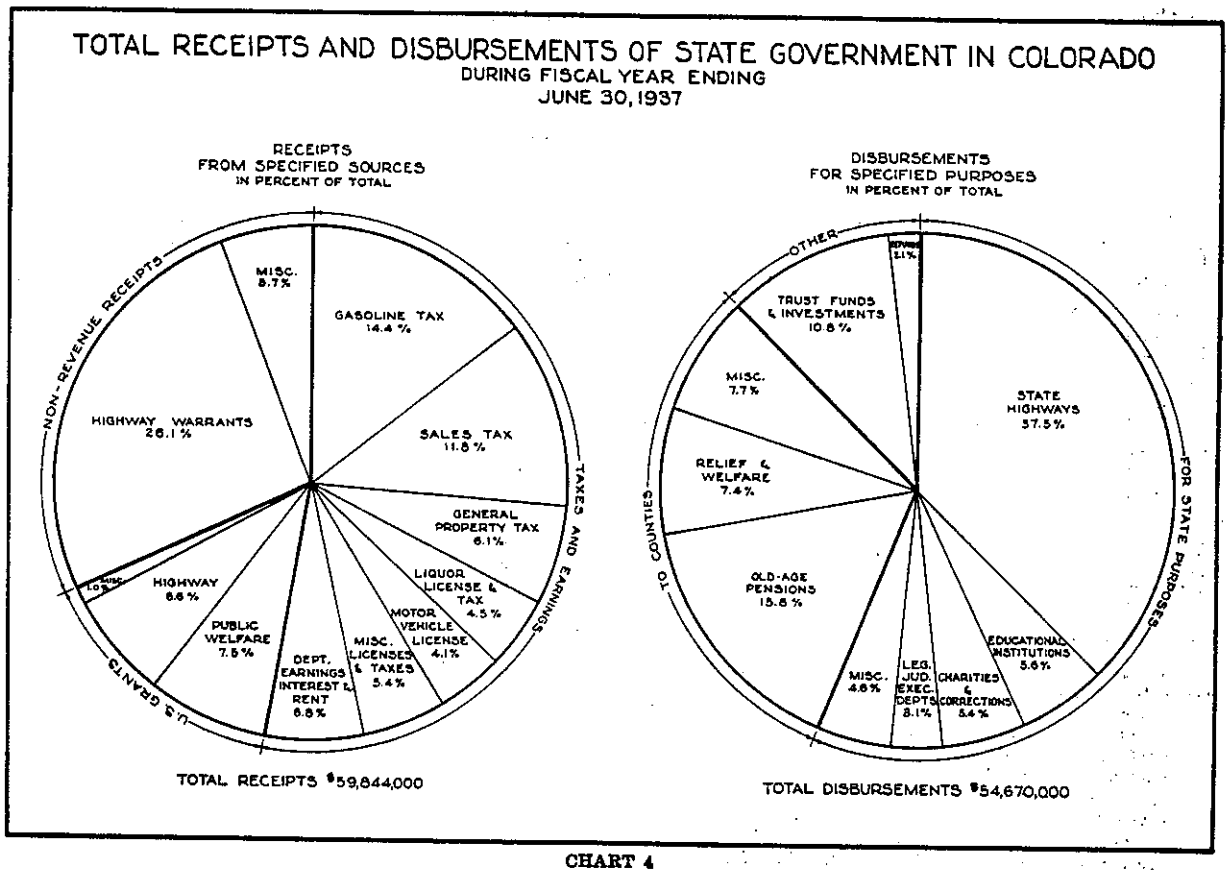

CHART 4

sation are also non-revenue receipts, as are those which are immediately transferred to other civil divisions. In Table 13, however, taxes collected to be used by local governments, such as a portion of gasoline tax collections, were not placed under the non-revenue receipts classification, although technically they belong there.

Taxes. Total receipts from taxes and licenses amounted to $26,546,000 or 44 per cent of the total revenue and non-revenue receipts in 1937. This proportion is somewhat distorted by the unusually large non-revenue receipts total which includes the bond issue for road purposes. Typically, taxes have represented considerably more than one-half of total state revenues. At present, revenues from this source are materially above the totals from taxes of preceding years. The newer state taxes, such as the sales and use tax and the liquor tax, account for this increase.

General property tax collections for all state purposes amounting to $3,505,000 in 1937 were approximately 13 per cent of state tax and license revenues. The total state levy, 4.5 mills in 1937, collectible in 1938, is divided into 23 continuing smaller levies made for specific purposes but mainly for educational and eleemosynary institutions. In 1937 the levy for the state departments or general revenue was .44 of a mill, the remaining 4.06 mills going for other purposes.

The combined sales and use tax collections for the fiscal year ending in 1937 amounted to $6,762,000 or 25 per cent of all tax and license collections. The use tax was of minor importance, contributing only $72,006 to the total. The more recently enacted service tax had not been in operation long enough to make any significant contribution during the 1937 fiscal year.

Total collections from the gasoline tax were $8,260,000 in 1937 or 31 per cent of all state tax and license collections. Of this amount 11 per cent was refunded and 23 per cent was allocated to the counties.

The liquor tax produced $2,602,000 in revenues in 1937, which amount represented approximately 10 per cent of tax and license revenues. Annual license fees are paid by manufacturers, wholesalers, and retailers in amounts varying with conditions of operation and location.

Motor vehicle license fees brought in revenues of $2,332,000 in 1937. This represented a gain of 10 per cent over revenues from this source in 1936 and 35 per cent over those in 1926.

The remaining state taxes and licenses produced revenues aggregating $3,085,000 in 1937 or 12 per cent of total taxes and licenses. A brief description of these follows:

The annual corporation tax is imposed on all domestic companies at the rate of $10.00 on $100,000 capitalization plus 10 cents per thousand or fraction thereof over $100,000. Foreign corporations are taxed at the same rate, which is applied to the portion of capitalizations represented by property located and employed in Colorado.

[e]Refunding issue of $3,590,649 excluded.

[f]Includes item of $2,321,459.66 for Unemployment Insurance.

[g]State Highway Transfer Trust of $467,000 excluded.

[h]State Highway Transfer Trust of $428,000 excluded.

Source: Biennial Reports of the Auditor of the State.

The state inheritance tax, imposed when property is transferred by will or statute or by survivorship, is measured by the value of property in excess of exemptions. The rate varies from 2 to 16 per cent. In addition there is an estate tax and a gift tax.

The insurance tax is an assessment of 2 per cent on the gross premiums collected by all insurance companies doing business in the state. In addition to this tax there are a number of miscellaneous licenses and fees which together represent approximately one-eighth of the total revenue from insurance.

The metal mining tax amounts to 0.1 per cent of the assessed valuation of all metalliferous mining property. The proceeds are used to defray promotional activities and research affecting the metal mining industry.

A tax of one-third of 1 cent per ton of coal mined, levied on all coal mining operations, constitutes the coal-mine inspection fund. It is used to defray the expenses of the office of State Coal Mine Inspector.

The public carrier tax, as here designated, refers to fees paid by two types of carriers: commercial carriers pay a monthly fee varying from 2 mills to 3¾ mills per ton mile for the right to use public highways; and public carriers pay monthly fees of 2 mills per ton mile and 1 mill per passenger mile.

The hunting and fishing license is a flat fee, the rates being $2 and $5 for residents and $3 and $25 for non-residents.

United States Grants. Total grants and subsidies by the United States government for state highways, schools, and general welfare purposes amounted to $8,685,000 in 1937, an increase of 54 per cent over 1936 and 595 per cent over 1926. The grant of $3,950,000 for old-age pensions accounts for the large increase in the total in 1937 over the preceding year. In proportions of the total, United States grants and subsidies were distributed according to purpose as follows: highways 44 per cent, old-age pensions 46 per cent, other welfare 4 per cent, vocational education 1 per cent, and grants to educational and eleemosynary institutions 5 per cent.

Receipts from Interest and Rent. Receipts under this classification consist principally of interest earnings on delinquent taxes, deposits, and various trust funds. Among the latter are the public school fund and a number of land income funds, appropriations from which are for specified purposes.

Department Earnings. These consist of a large number of miscellaneous items such as rents, fees, interest, and income from special services paid to various state departments. The more important of these with the amount of receipts collected by each for the fiscal year 1937 are indicated in Table 15.

Table 15

Receipts from Licenses and Fees Collected by Various State Departments, Boards, and Bureaus, Fiscal Year 1937

Licenses and Fees	Receipts

Non-Revenue Receipts. Non-revenue receipts amounted to $20,747,000 in 1937 or approximately one-third of all receipts of the state government. Of this amount, three-fourths resulted from the $15,000,000 bond issue for highway purposes. The payroll tax for unemployment insurance accounted for $2,321,000. Other receipts included those for permanent trust funds, such as the permanent school fund, state compensation insurance, etc., and an item of $1,331,000 derived from the liquidation of certain investments.

B. Disbursements

In appraising the expenditures of the state government it is important to recognize four broad classes, namely, (1) operating expenses of the state departments and institutions, (2) payments on account of debt or debt service, (3) outlays for capital or permanent improvements, and, (4) non-governmental payments. The last do not result in a decrease in the net value of assets.

Operation and Maintenance. The cost of operating and maintaining the various departments and institutions of the state amounted to $8,849,000 in 1937 or 16 per cent of total disbursements (Table 14). As indicated in Chart 3, the increase in total government expenditures since 1933—154 per cent—finds no close parallel in the trend of operating costs. During the same period total operating costs increased only 20 per cent; and this increase may be attributed to the introduction of new state services noted in Table 16. Prior to 1933 state overhead costs maintained a fairly uniform level.

Table 16

New State Activities in Colorado Since 1933

New Services	Year of Beginning	Total Cost 1937[a]	State Share	Federal Grants
Liquor Control	1933	$ 125,017	$125,017	-----

The three principal classes of operating costs, which together normally account for about 80 per cent of the total, are those which relate, first, to general government, that is, to the legislative,* judicial, and major executive departments; second, to institutions of charity and correction; and, third, to institutions of higher learning. It is noteworthy that such increases as have occurred in the total of operating expenses since 1933 are largely accounted for by the first two classifications referred to, with no significant change in the cost of operating the university and the state colleges. As a matter of fact, the level of costs since 1932 for the latter group has been distinctly below that for the years immediately preceding. Although important items of expense of the State University—not reflected in the accounts of the State Treasurer—do not appear in this tabulation, there is reason to believe that their inclusion would not materially alter the situation.

In general it may be said that overhead costs of the entire state government in Colorado, exclusive of those attributable to new services, have remained relatively constant since 1926. Although economies could undoubtedly be made in operations thereby reducing expenditures, it nevertheless appears clear that a reduction of expenditures on any substantial scale would have to be made elsewhere.

Debt Service. The policy of the state has been to reduce continually the size of its bonded debt. This is clear from an examination of Table 17, which shows that the state's debt was reduced from $12,762,200 in 1926 to $4,039,700 in 1937. There is, however, one qualification to the above.

By a law passed in 1935 and amended in 1936 the State Highway Department was authorized to borrow $25,000,000. The bonds issued were to be special obligations against the State Highway Fund and not a part of the indebtedness of the state within the meaning of any constitutional provision or limitation. A

*Expenses of the General Assembly approximate $200,000 for each regular session in every odd-numbered fiscal year.

Table 17

Bonded Indebtedness of Colorado[a] Fiscal Years 1926-1937

Year	Amount	Year	Amount
1926	$12,762,200	1932	$7,346,100
1927	11,793,700	1933	5,672,200

part of the total issue was sold in 1936 amounting to $10,000,000 and an additional $15,000,000 in 1937. The effects of this issue are reflected in the sharp rise in the state's total receipts and disbursements shown in tables 13 and 14.

The debt position of the state is compared with that of seven other states in the mountain area in Table 18. Of those states, six had larger per capita debts in 1937 than did Colorado in so far as direct general obligations were concerned. When special revenue obligations are included it will be seen that Colorado's per capita debt is exceeded by only one state in the group.

Table 18

Per Capita Net Debt of Eight Mountain States in 1937

State	Per Capita Debt (General Obligations[a])	Per Capita Debt (Including Revenue Obligations[b])
Colorado	$ 3.77	$27.11[c]
Arizona	3.22	3.22
Idaho	3.58	3.58
Montana	12.07	18.23

Capital Outlays. Expenditures for permanent improvements have been made mostly for highway construction. Funds for this purpose have been received principally from the Federal government and from gasoline tax and motor vehicle license collections. The large expenditure for highway purposes in 1937, amounting to $20,502,000, and financed to a large extent by funds raised through the bond issue mentioned above, was about double the average annual expenditure for roads since 1932 and over four times as great as outlays made in either 1926 or 1927.

The results accomplished by state highway expenditures during the past eleven years are reflected in Table 19.

Table 19

Status of Highways in Colorado, December 31, 1937, and December 31, 1926

Kind of Highway	Number of Miles 1937	1926

Surfaced	2,983.1	3,247.5
Oiled	2,618.7	None
Paved	536.2	251.8
All Kinds	9,420.2	8,966.6

Source: State Highway Department.

Non-Government Payments. Transfers to counties constitute the bulk of the non-government payments. In 1937, $16,957,000 or approximately 31 per cent of total state disbursements were of this character. Table 20 shows the principal revenue sources and the proportions of each which are allocated to counties.

Table 20

Proportions of Revenues from Specified Sources Which Are Allocated to Counties

Revenue Source	Percentage of Total Collections to Counties
Gasoline Tax	27%
Motor Vehicle License	50
Motor Vehicle Driver's License	75
Public Carrier Tax	20-22½
Sales Tax (old-age pensions)	85
Liquor Tax (old-age pensions)	85
Corporation Franchise (old-age pensions)	10
Inheritance Tax (old-age pensions)	10

Certain relief and welfare items paid to counties are derived from several sources, one of the most important being the Federal government.

Old-age pensions and other forms of public relief, amounting to more than $13,000,000 during the fiscal year ending in 1937, constituted nearly one-fourth of total disbursements of the state in that year. Furthermore, this amount was 38 per cent as large as the total of property taxes collectible in that year for the support of all government units—county, city, and school. The pension payments alone, amounting to $8,671,000, approximated the total of operating expenses of the state—$8,849,000—and 45 per cent of the general property taxes collectible for the support of the entire public school system. The character and trend of relief expenditures since 1933 are shown in some detail in Table 21. It will be observed that prior to 1934 the burden of carrying relief had not become a state function. Since that date, however, local

governments have tended to look more to the state and the Federal government for assistance in providing general relief. The old-age pension payments beginning in 1934 were, of course, made by the state in the first instance.

Other non-governmental disbursements in 1937 consisted of payments to trust funds, including the unemployment insurance fund kept in the Federal treasury and payments on account of investments and refunds. The last named consist mainly of gasoline tax refunds, the law providing for a refund of taxes paid on such gasoline as is used for all purposes except highway transportation. Refunds on this account have increased at a faster rate than total collections from the tax itself (Table 22). In all, non-governmental disbursements amounted to $7,023,000 or 13 per cent of total disbursements.

Table 22

C. *Balance of Receipts and Disbursements*

When the aggregate receipts of the state by years or by bienniums (including the balance on hand at the beginning of the period) are compared with the total of disbursements for similar intervals it will be observed that in each instance a sizable net balance has existed throughout the entire period from 1926 to 1937 (Table 23). A balance of $24,752,229 at the end of the 1937 fiscal year, for example, would hardly suggest the imminence of the current "fiscal crisis" in the state. This paradox is explained by considerations of the nature of the balance itself.

Table 23

Summary of Total Receipts and Disbursements of State Government in Colorado, 1924-1937

(In thousands)

Biennium	Balance at Beginning of Biennium	Total Receipts for Biennium	Total Disbursements for Biennium	Balance at End of Biennium	Net Change in Cash
12/1/24-11/30/26	$ 5,407	$36,865	$36,259	$ 6,013	$+ 606

[a]Includes warrants issued, but not paid, totaling $716,697.01.

Source: Biennial Reports of the Auditor of the State.

First it should be noted that a balance of a certain size may exist because money has been borrowed. Funds secured through bond issues are recorded as receipts the same as tax revenues. Receipts and hence the ensuing balances were swelled in this manner during the fiscal years ending in 1926, 1936, and 1937. Even so, there was a margin in each instance after allowing for the increase in net indebtedness.

A second and most important consideration is the fact that the balance is an over-all balance, a kind of an average which seems to tell much but in reality tells little. As the financial organization of the state of Colorado may be visualized there exists a large assortment of "funds" or pools—over 200 in number—into which the revenue stream empties. Each of these pools is fed as ordained by law or practice, but each, in any event, sustains some state function. It happens that at any given time, say at the end of a fiscal year when the levels of the pools are measured, that some are found to be dried up, while others are over-flowing. The present "fiscal crisis" of the state is a condition wherein we find one of the pools, the "general fund," inadequate to meet the demands placed upon it. This is true despite the fact that the average level has apparently been satisfactory.

It is important to recognize also that balances in the funds are not "free" balances in many cases. Revenues allocated for any one function can be used only for that purpose. It must be further recognized that expenditures may have been postponed. Thus we find certain building or highway funds showing a large balance pending a decision on bids and contracts. There is also the fact that "working balances" are essential to continuous and normal operations.

PROBLEMS OF STATE FINANCE

The General Fund—Financing the Current Biennium. Much has been heard in recent months concerning the "fiscal crisis" in the state government. Events contributing thereto may be discussed from the point of view of their relation to the general fund.

This fund, one among many from which state activities derive their support, occupies a central position in the state's financial system. This arises from the fact that appropriations made by the General Assembly from this fund, the only one available for legislative appropriation, provide for the key activities of government represented by the constitutionally established legislative, judicial, and executive departments of the state. In addition, appropriations are made from this fund for the support of educational and eleemosynary institutions. These institutions are not entirely dependent on appropriations, since they have an income from such sources as continuing mill levies, endowments, and fees. Without appropriations from the general fund, however, they would be greatly handicapped in their operations. Other activities are financed through this fund from time to time as conditions may require. In this regard the general fund is a device by which flexibility is maintained in the financial opera-

tion of the government not possible in respect to other funds existing for fixed purposes.

The revenues known as general revenues which enter the general fund and become available for appropriations are those which escape diversion into other funds. The latter have increased in importance in recent years by virtue of new functions assumed by the state until at present they require over 90 per cent of total state revenue from taxes and earnings (Chart 5).

The division of the state's revenue receipts between general fund purposes and all other purposes combined is shown by the following prescribed application of taxes to specific uses: sales and liquor taxes, 85 per cent of net collections earmarked for old-age pensions; incorporation fees, 10 per cent for old-age pensions; inheritance tax, 10 per cent for old-age pensions; gasoline tax, 100 per cent for state and county highways; motor vehicle licenses, 50 per cent for local government; commercial and public carriers tax, 20-22½ per cent for local governments; motor vehicle registration, 100 per cent for old-age pensions; operators and chauffeurs licenses, 75 per cent for local government; income tax, 85 per cent for school purposes; interest on delinquent taxes, 100 per cent for employees retirement fund; and state general property tax collections, 90 per cent (1937) for educational institutions and other stated purposes.

An additional circumstance of less importance, the effect of which, however, is to earmark revenues for special purposes, arises from the fact that certain revenue-producing agencies, departments, boards, and bureaus are permitted by law to withhold sufficient funds to cover their expenses before anything can revert to the general fund. In many instances, as a matter of fact, the balances need not be transferred at all.

When new activities are financed by new revenues earmarked for the purpose, activities financed by general appropriations are not affected thereby. The general fund deficit for the current biennium has resulted from added burdens being placed upon the general fund without commensurate increases therein.

For the fiscal year ending in 1934, general relief, a new state activity costing $670,740, was financed from the proceeds of a portion of the regular gasoline tax plus an additional tax of one cent per gallon on gasoline sales. Since gasoline tax receipts had until then been used for highway purposes and not as general revenue this did not affect the general fund. Neither did the cost of the newly established old-age pension plan which was financed mainly by the new liquor tax.

In the fiscal year ending in 1935 the gasoline tax again met the general relief cost, while pension payments were taken care of by receipts from the liquor tax, the newly introduced sales

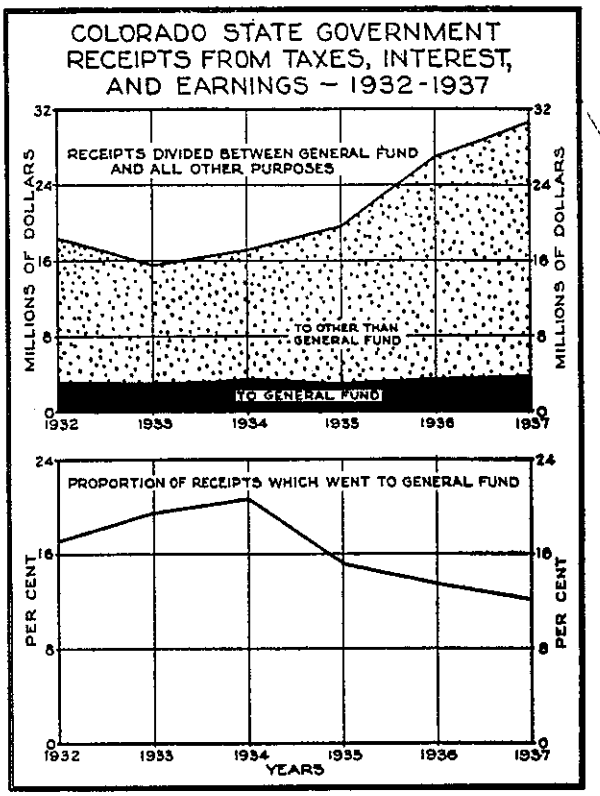

CHART 5

tax, and a small part of the collections from corporation and inheritance taxes. The use of the latter taxes tended to cut into the ordinary income of the general fund, but not materially so. In the meantime, however, the Constitution was amended providing that revenues from the gasoline tax could be used only for highway purposes thereby shutting off this source of revenue for relief purposes. During the fiscal year ending in 1936, general relief, amounting to $2,896,295, was provided by revenues from the liquor and the sales taxes. Pensions were paid from the liquor and the sales tax supplemented to a small degree by the corporation and the inheritance tax. So far, then, no serious inroads had been made on the ordinary revenues going to the general fund nor had any new activities of any importance been thrown on the general fund.

In 1936 the Constitution was again amended, providing for old-age pension payments on a larger scale, earmarking for the purpose 85 per cent of the receipts of both the sales and liquor taxes. It was further provided that the first $870,000 of the remaining collections should be used for the aid of dependent children. All this meant that thereafter virtually all the new taxes, in addition to portions of others such as the inheritance and corporation tax, would be used exclusively for pension payments. It meant also that general relief which was averaging $3,000,000 a year and which had until then been taken care of along with pension payments from liquor and sales taxes would have

to be financed by general fund revenues. The consequences are now known. The appropriation for the biennium beginning July 1, 1937, and ending June 30, 1939, amounted to $12,717,806, far in excess of the 1935-1937 appropriation of $6,500,451. The difference between the present and preceding biennium appropriations was due to the new items of expense shown in Table 24.

Table 24

Appropriations for Activities New to the General Fund in 1937-1939

New Activity	Appropriation
Relief for Unemployables	$5,000,000
Tuberculosis Control Fund	100,000
Public Health Service	24,000
Maternal and Child Health	80,000
Crippled Children Service	90,000
Aid to Dependent Children	1,000,000
Aid to Blind	100,000
Child Welfare Services	40,000
Total	$6,384,000

The remainder of the appropriation, amounting to $5,633,806, pertained to activities ordinarily financed from general revenue.

But an appropriation or authority to spend state funds is one thing, money with which to make the necessary payments is another. The fact was soon discovered that the revenues for the biennium available to the general fund, including those from the service tax, would run far short of the appropriations. The estimated deficit for the biennium is placed at approximately $3,000,000, with the third, fourth, and fifth class appropriations amounting to $697,299 omitted from the reckoning.

Devices already employed for dealing with the present deficit have been drastic as they have been heroic. None has looked to a permanent solution. The opinion is now widely held that the old-age pension amendment as now constituted, earmarking large sums of money which might have been available for other purposes, stands in the way of such a solution.

Old-Age Pensions. Both the number of recipients of old-age pensions and the amount paid have increased rapidly in Colorado during the past two years. The number receiving the pension in February, 1938—35,314—was 27 per cent greater than in February, 1937, and 66 per cent greater than in February, 1936. The amount paid in February of this year—$1,117,000—was 45 per cent greater than in the same month a year ago and 207 per cent greater than in the same month two years ago. In this connection it should be pointed out that the February, 1938, payment was $240,000 less than that of December, 1937.*

At the February, 1938, rate Colorado's old-age pension bill for the year will approximate $13,000,000. Since this is roughly 50 per cent over the amount which the state will spend for "operation and maintenance," it becomes a matter worthy of careful study by every citizen of the state. Consideration will therefore be given in following paragraphs, first, to certain comparisons of Colorado with other states of the United States, and second, to the amount paid per recipient of old-age pensions in relation to the amounts available per person and per case on general relief.

Taking data for December, 1937, the latest month for which country-wide information is available, it is found that the average old-age pension per recipient in Colorado—$39.61—was more than double the general average for the country. In terms of the proportion of persons 65 years old and over who received the pension, Colorado is third among the states; and the Colorado figure—45 per cent—is approximately double the average for all of the states.* Moreover, persons 65 years old and over constitute a larger proportion of the total population in Colorado than in the country as a whole—6.7 per cent in Colorado as compared with 6.1 per cent in continental United States (Table 25).

To summarize the facts discussed briefly in the preceding paragraph, the December, 1937, payments in the various states were multiplied by 12 to place them on an annual basis. The resulting figures were then divided by the respective state populations estimated by the Bureau of the Census as of July 1, 1937, to obtain annual per capita payments for old-age pensions. As shown in Chart 6, the December rate in Colorado was equivalent to $15.20 per year for every person in the state, whereas for the country as a whole (exclusive of Virginia, which does not have an old-age pension plan approved by the Social Security Board) the per capita payment was only $2.92. In other words, the per capita payment for old-age pensions in Colorado in December, 1937, was five times the general average for the country and more than double the figure for any other state. It may be observed also that, at the February, 1938, rate, the annual per capita figure for Colorado is $12.50, or four times the country-wide average noted above.

The number of cases or families receiving general relief through the Colorado State Department of Public Welfare—16,648 in December, 1937—was roughly one-half the number of recipients of old-age pensions.** Assuming three persons per case on an average, this means that

*The decline in the Colorado old-age pension payments from $1,356,000 in December, 1937, to $1,116,000 in February, 1938—in the face of an increase of 1,064 in the number of recipients—was caused by lack of sufficient funds to pay the increased amounts authorized by the Old-Age Pension Amendment to the state Constitution. This amendment, after approval by the Social Security Board, became effective September 1, 1937.

*Colorado is the only state which makes pension payments to people under 65 years of age. This group—not included in the figure of 45 per cent presented here—totaled 2,116 in December, 1937.

**Source: Quarterly Bulletin, Vol. I, No. 4, Colorado State Department of Public Welfare.

the number of persons on general relief was substantially larger than the number receiving the pension. In contrast, the December bill for general relief was less than one-fifth as large as the December old-age pension bill.

Looking back to the early months of 1936, as shown in Chart 7, the old-age pension per recipient was at that time larger than the relief grant per case on general relief and several times as large as the grant per person on relief. These disparities have been greatly widened by the rising trend of old-age pensions during the past two years.

Proposed Changes in State Government. During the past year, and particularly since it became generally known that the budget was unbalanced, numerous proposals have been made for reform in state government. Constructive in the main, these proposals have come from both civic organizations and state officials. Only one of the suggested changes meets directly the state's immediate problem of securing adequate revenues to meet necessary operating expenses. The others are, for the most part, measures which in the long run will tend to reduce government cost. They will not contribute much in the direction of wiping out the estimated deficit of $3,000,000 for the current biennium.

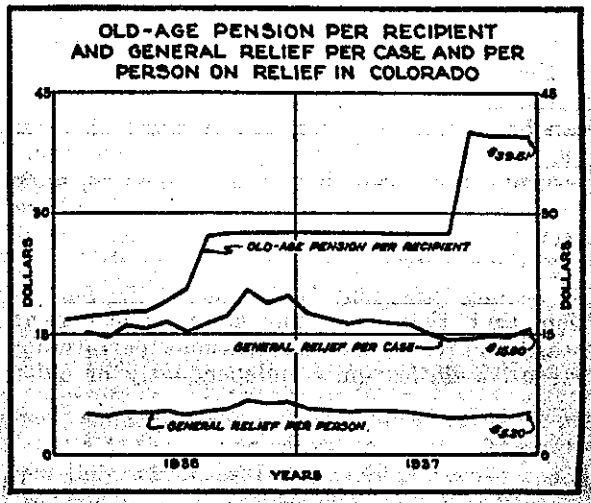

CHART 7—Monthly Payments of Pensions and Relief

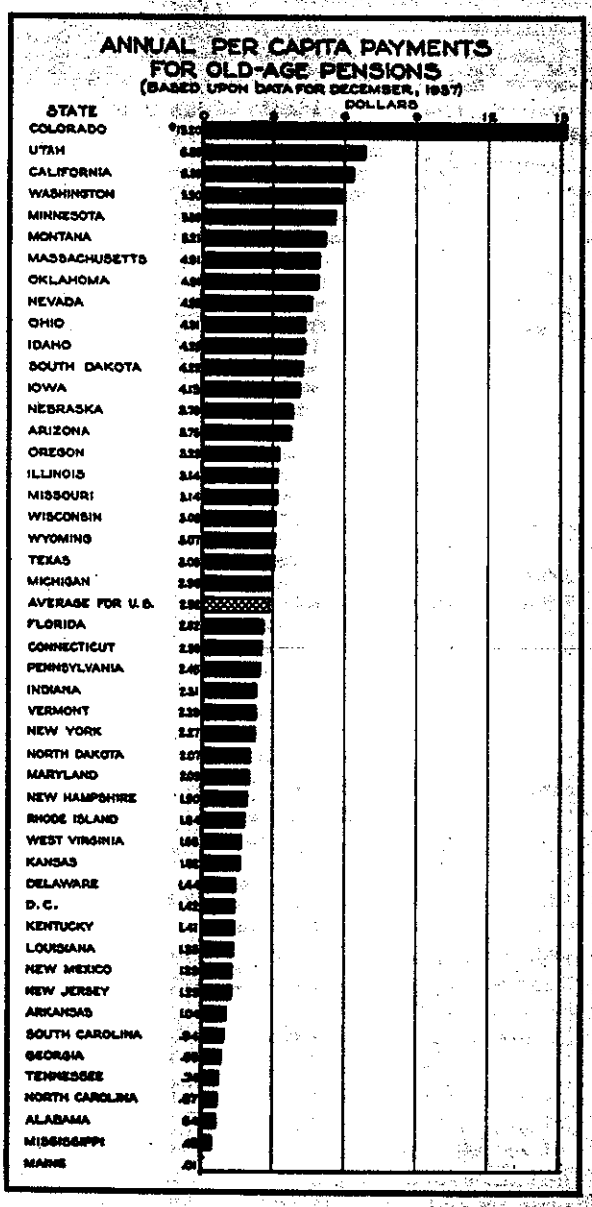

CHART 8

The proposal that the old-age pension amendment be modified is, to date, the only submitted alternative to increased taxes whereby general revenues may be materially and speedily increased. Further drastic reductions in anything but old-age pension payments seem out of the question. A rapid enough increase in tax revenues without lifting rates is equally unlikely. Those who advocate then that something be done to reduce pensions point to the fact, indicated in a previous section, that Colorado's payments on account of old-age pensions are far in excess of those in other states. This fact, coupled with the situation in which the state now finds itself, of being obliged to curtail important functions for lack of funds, indicates that the case for pension modification does not rest on grounds of mere expediency.

Other suggested changes and reforms are of the variety which look generally to more economy and efficiency in government operation. As such, they are deserving of full consideration. In the course of time, when the conflict of practice and theory will have spent itself, these proposals will likely receive the stamp of legislative approval. Chief among these are the measures which aim at an overhauling of the executive and legislative machinery. According to this point of view, the present way in which the government gets things done is cumbersome, out-of-date, and generally wasteful. Under the leadership of the state executive, as a matter of

fact, steps have already been taken to bring about improvement in this regard. By means of "surveys" or fact-finding activities it is believed that a sound basis for suitable legislation can be found. Pending the outcome of these fact-finding activities and the recommendations resulting therefrom, it may be well to consider weaknesses in state organization which have been pointed out by persons in close contact with the government as it is now constituted.

Among these may be mentioned the contention that there are too many independent boards, bureaus, and commissions performing executive duties quite independently of chief executive or legislative control. Overlapping of functions with consequent failure to operate at the highest efficiency, accentuated by almost complete independence of these bodies with no coordination possible, leads both to waste of money and inadequate service. The proposal has been advanced then that related activities be merged into a limited number of major administrative units with responsible and competent heads accountable for their stewardship to the governor or other selected state officials. For example, the consolidation of all tax-collecting agencies under one supervising head, the State Treasurer, is advocated. At the present

time taxes are collected by various tax and license departments reporting to different agencies.

Incidental to the foregoing weakness in organization is the fact that many administrative units are sustained financially by separate cash funds built up through taxes, fees, and receipts from other sources. The agency in question has first claim to these moneys to the extent of its own costs of operation. The expenditure of such funds is not subject to control either by the General Assembly or the executive council —and approximately 66 per cent of state expenses are paid from cash funds. Some hold the view, therefore, that cash funds should be abolished, that revenues from all sources should go into the general fund in the first instance and be appropriated therefrom to the major departments in accordance with approved budget procedure. In this manner, control over expenditures will be effected and the situation will no longer exist wherein some departments are over-supplied with funds while others are under-supplied.

Other proposals looking toward a change in the long run, several of which are closely related to the general question of organization and control of government, as noted above, may be briefly indicated. These are: (1) repeal the statute authorizing the issuance of certificates of indebtedness except in case of insurrection, (2) prohibit the issuance of anticipation warrants, except by vote of the people, (3) organize the purchasing department on a state-wide basis, (4) abolish the general property tax for state purposes, (5) enact a severance tax, (6) repeal the service tax, (7) establish a legislative council to improve the work of the state legislature, (8) give the State Auditor power to compel uniform accounting by every state department and agency, (9) amend the sales tax to eliminate tax on foods, and (10) provide qualified state examiners to audit each governmental agency—state, county, municipal, and school—at least twice a year and publish such audits and examinations.

GENERAL SUMMARY

The foregoing analyses may be summarized in the following general statements:

1. Total tax collections in 1937 for all government in Colorado—state, county, city, and school—exclusive of minor licenses and fees, amounted to $61,800,000. This total was secured from 13 different taxes distributed as follows: general property tax, 62 per cent; sales tax, 11 per cent; gasoline tax, 13 per cent; motor vehicle license, 4 per cent; liquor license and tax, 4 per cent; and all others, 6 per cent.

2. Total taxes increased 18 per cent from 1926 to 1931, fell 20 per cent from 1931 to 1934, and increased 27 per cent from 1934 to 1937. The 1937 tax level was slightly above the previous high point reached in 1931. The movement of individual taxes did not conform to that of the aggregate as witnessed by general property taxes. The total of property tax collections increased 10 per cent from 1926 to its highest point in 1930 and declined during the five years thereafter to a point (in 1935) 19 per cent below the 1930 level. The two-year rise since 1935 has amounted to only 4 per cent.

3. Per capita state and local taxes in Colorado for 1937 amounted to $57.12. The average for all states was $56.07. Over the twelve-year period examined per capita taxes in Colorado have been generally above the average of forty-eight states. This is equally true when comparisons are made using the computed ratios of per capita taxes to per capita incomes. The ratio for Colorado in 1937 was 11.40 per cent; that is, for every dollar earned 11.4 cents was paid out in state and local taxes. The average of all states amounted to 10.76 cents for every dollar earned.

4. The trend of per capita taxes in Colorado has followed a pattern comparable to that of the average for the country, namely, a general increase from 1926 to 1930, the subsequent downturn to 1934, and the sharp rise thereafter bringing the total in 1937 back to the level of 1930, the previous high point.

5. The trend of the ratios of per capita taxes to per capita incomes, both in Colorado and in the United States, has shown a movement similar to that of per capita taxes with one exception. Whereas per capita taxes increased from 1934 to 1937, the proportion of incomes going for taxes remained fairly constant. The latter movement is to be attributed to rising incomes which increased at approximately the same rate as taxes. Present ratios are, however, on a higher level than they were before 1930.

6. From a sample of 18 states for which complete tax data were available for 1933 and 1936, taxes were found to have increased from 2.3 per cent to 55.5 per cent. Colorado's percentage increase of 14.4 per cent was exceeded by the percentage increases of only six of these states.

7. Approximately 91 per cent of general property tax collections in 1937 went for local government purposes. The total distribution was as follows: state, 9 per cent; schools, 49 per cent; cities and towns, 21 per cent; and counties, 21 per cent.

8. The general property tax base was reduced 28.2 per cent from 1926 to 1937. The average reduction in the assessment of farm properties was the most marked, the present valuation being only 56.6 per cent as large as the 1926 valuation. For town and city lots and for total corporation properties the 1937 valuations were 80.5 per cent and 101.6 per cent, respectively, of the 1926 valuations.

9. Average mill levies generally increased throughout the period, offsetting only in part,

however, the decrease in assessed valuations. Wide variations exist among assessment units with regard to mill levies for all purposes, ranging in 1937 from 38.5 mills in Denver to 80.85 mills in Leadville.

10. The total revenue and non-revenue receipts of the state government of Colorado for the fiscal year ending in 1937 were $59,844,000. This included, however, a $15,000,000 bond issue for highway improvements. Of the total receipts 53.1 per cent came from taxation and earnings, 15.1 per cent represented federal government grants, and 31.8 per cent was realized from the highway bond issue and the sale of assets. The trend of total state receipts, generally upward since 1926, rose sharply in 1936 and 1937 because of highway bond issues. With the introduction of new taxes in recent years, state tax collections have increased 98 per cent since 1933. Federal grants increased 143 per cent during the same period.

11. Total state disbursements in 1937 amounted to $54,670,000, of which 56.2 per cent was used for state purposes, 30.9 per cent was paid to counties, and 12.9 per cent represented trust fund payments and various refunds. Similar to receipts, disbursements have increased sharply in recent years.

12. The cost of operating the state departments and institutions has increased only moderately from 1926 to date. Recent increases were due to the introduction of certain new activities associated with relief. The annual cost of administering the institutions of higher learning has been generally lower since 1932 than it was prior to that date.

13. Capital expenditures of the state have been confined largely to highways. Federal grants plus the $25,000,000 issue of highway warrants sold in 1936 and 1937 and receipts from the gasoline tax brought expenditures on roads in 1937 up to $20,502,000, which exceeded by a wide margin any previous annual expenditure for this purpose.

14. The policy of the state has been to retire its general bonded debt. The recent issue of highway warrants payable from gasoline tax revenues raised the aggregate debt, however, to $29,039,700. On a per capita basis this amounts to $27.11.

15. Expenditures on account of general relief and old-age pensions allocated to counties have increased rapidly in the past two years. For the fiscal year ending in 1937 over $13,000,000 or nearly one-fourth of the total disbursements of the state were for this purpose. The pension payments alone, amounting to $8,671,000, were approximately equal to total operating expenditures of the state. At the February, 1938, rate of payments—$1,117,000—Colorado's old-age pension bill for the year will approximate $13,000,000. Adding this to an estimated state expenditure for general relief of $4,500,000, the total is only a million and one-half under the $19,054,000 figure representing property taxes collectible in 1938 for the support of the entire public school system of the state.

16. Taking data for December, 1937, the latest month for which country-wide information is available it was found that the average old-age pension per recipient in Colorado—$39.61—was more than double the general average for the country. In terms of the proportion of persons 65 years old and over who received the pension Colorado is third among the states and the Colorado figure—45 per cent—is approximately double the average for all of the states.

17. The present deficit in the general fund has come about because of activities being thrown upon it for financing without a commensurate increase in general revenue. Principal of these activities is general relief, heretofore financed from certain tax revenues which, by constitutional amendments, are now earmarked for other purposes, the most important being old-age pensions. The old-age pension amendment has therefore been an important cause of the deficit in the general fund.

18. Changes in Colorado government which have been suggested by various individuals and groups and which have as their object the reduction of expenditures as well as balanced budgets, call for economies in operation and for modification of the present old-age pension plan. Plans for economy in operation may be considered as looking to changes in the long-run. Modification of pension payment, on the other hand, looks for a rapid and material reduction in state expenditures.

THE COLORADO INCOME TAX

Conclusions

1. The Colorado income tax was established in 1937 after a struggle among various economic groups extending over a period of 25 years.

2. Prior to the establishment of Colorado's income tax, thirty-two other states had already enacted such laws.

3. The 1937 Colorado law provided for relatively liberal personal exemptions and low tax rates. However, at the time the measure was enacted there was common understanding that after an experimental period the law would be strengthened so as to make the tax contribute a larger proportion of the total revenue of the state.

4. During the nine years of operation since 1937, with one exception, personal exemptions and tax rates have remained unchanged. The exception was a change in 1943, to lighten the tax, establishing a $200 exemption per taxpayer (no exemption previously) for the 2 percent surtax on income from intangibles.

5. In 1944, the state collected $6,359,497 or 13.6 percent of total state tax revenue in the form of the income tax. Of this amount slightly more than half (52 percent) was paid by individuals while the remainder (48 percent) came from corporations.

6. The states in the west with income taxes are Arizona, California, Colorado, Idaho, Kansas, Montana, New Mexico, Oklahoma, Oregon, and Utah. The taxes in these ten states (Colorado and her neighbors) were analyzed on a comparative basis and results indicate a wide variation regarding relative income tax yields.

7. Among this western group, states with the heaviest personal income taxes are Idaho, Montana, Oregon and Utah; those classified in the middle of the group are Arizona, Kansas, and Oklahoma; while states with the lightest personal income taxes are Colorado, New Mexico, and California.

8. Because of liberal personal credits and exemptions accompanied by a slow progression of tax rates, in comparison with most other states of the group (all except New Mexico and California) the Colorado personal income tax is especially light upon incomes ranging from $2,000 $10,000. For example, a married person with two dependent children receiving a net income of $3,500 would pay

a tax of only $2; the same individual with an income of $4,000 would pay $7; receiving $5,000 he would pay only $17 tax.

9. In 1944 in Colorado, 77,701 taxable returns were filed by individuals. Thus only one out of every fifteen people paid an income tax. Expressed in terms of number of families in the state, only one out of every four or five heads of families paid a tax.

10. The Colorado corporation income tax rate (6 percent for financial and 4 percent for general corporations) is about average for the states in the group studied. However, collection of revenue in the state on a relative basis appears to be somewhat lower than average.

11. The yield of the Colorado income tax (personal and corporation combined) represents an amount which is about five percent of Federal income tax collections from the state. This ratio is an excellent index for making comparisons with other states. According to the index (ratio of state collections to Federal for each state), Colorado's income tax, with one exception (Kansas), is the lightest of the ten states in the group studied.

12. If Colorado were to increase her income tax to the relative level of Idaho's -- the state with the most successful tax in the group -- additional revenue above that collected at present would be about $9,500,000. In order to be comparable to average collections for the group as a whole, additional revenue would equal $2,600,000.

13. It is sometimes argued that Colorado's income tax should not be increased until Federal reductions have been made from existing high levels of war income and excess profits taxes. However, the Federal tax has already been lowered. The 1945 Federal Revenue Act materially reduced the individual and corporation income tax collections which will be made from Colorado, while the excess profits tax was repealed in its entirety. As a consequence, beginning with the calendar year 1946, there will be an estimated annual savings to individuals in the state of over $16 million and to Colorado corporations of about $10 million. Thus the combined savings represent an amount over four times greater than present state income tax collections from individuals and corporations.

14. By common agreement and embodied in the original law, the income tax was to be a replacement tax -- to lighten the burden on property owners. This was to be accomplished by allocating the income tax revenue to a school fund, the proceeds from which were to be used for elementary and secondary schools of the state.

15. However, in 1939 by statutory amendment, the original plan for allocating the income tax revenue in its entirety to the school fund was changed -- 65 percent was diverted to the general fund

of the state. In 1943 the diversion ratio was made 50 percent to the general fund, leaving, under limiting provisions, 50 percent for school purposes. The ratio was again changed by the special legislative session of 1945 and, as a consequence, at present the net revenue from the income tax is distributed as follows: 30 percent goes to the general fund, 35 percent goes to the county general school fund to reduce property taxes, and 35 percent goes to the state school equalization fund to finance an expanded educational program of participating counties and school districts.

16. The amount of state support for public education has always been relatively low in Colorado. Although more assistance will be given under the present income tax law than formerly, the aid will still be inadequate. It is estimated that for the school year 1946-47 not more than 19 percent of the cost of Colorado elementary and secondary schools will come from state revenue sources. This would put Colorado about fourteenth from the bottom in rank on the basis of the relative amount of state support to public schools.

17. A number of special problems are presented relative to the present form of the Colorado income tax. One of these problems is the provision permitting a deduction for the Federal income tax. As war expenditures increased, Federal tax collections began encroaching more and more upon the amount of revenue which the state can collect. At least 15 states have reduced the effect of this competition by disallowing any deductions for Federal taxes when figuring the state income tax. Colorado is not one of these states.

18. Because of the provision in Colorado permitting deductions for the Federal income tax, in effect, the state tax is actually regressive in the upper brackets. For example, a net income (before Federal income tax deductions) of $100,000 is taxed at the rate of 1.8 percent while a net income of $1,000,000 is taxed at only .9 percent.

19. Another special problem of the Colorado income tax is the surtax on income from intangibles. The two percent rate ($200 exemption), in lieu of all property taxes on intangibles, appears to be extremely light as compared with the property tax on real and personal tangible property. In 1943 (the last year before the $200 exemption became operative) the owners of approximately one billion dollars of intangible wealth paid total surtaxes (in lieu of any property taxes) of $861,649. In striking contrast, during the same year, owners of real and personal tangible property having an assessed valuation of $1.2 billion paid total property taxes of $42,671,467. Even though assessments averaged as low as 50 percent of true value, real and personal tangible property in the state was being taxed about 20 times as much, per dollar of value, as intangible wealth. Since the $200 exemption became operative (beginning with collections in 1944) there has been an even greater contrast.

20. Finally, another problem of Colorado income taxation relates to the legal ownership of property. Nine states (Colorado not included) have community property laws. In these states married individuals are permitted to file separate Federal income tax

returns, each declaring half of the family income, regardless of which person earned it. This arrangement materially reduces the amount of Federal tax liability for individuals in the nine respective states. For a number of years there was a question as to the constitutionality of community property laws which might be enacted after 1913 (for the purpose of reducing Federal income taxes); however, in January, 1946 the Bureau of Internal Revenue ruled that it would not challenge the 1945 community property law of Oklahoma. Consequently, beginning in the legislative year 1947, other states may be expected to follow the example of Oklahoma by enacting community property laws. Should Colorado do so, approximately $15 million dollars would be saved in Federal taxes.

Recommendations

1. The legislature should strengthen the income tax so that it will yield a larger proportion of the total state public revenue. This would have a double advantage in that (a) the tax system would be more in accordance with tax paying ability of the people and (b) additional revenue would be obtained more adequately to support public functions.

2. The income tax upon individuals should be strengthened by making the following changes in the income tax law:

   a. Normal rates on net income should increase by one thousand dollar instead of by two thousand dollar brackets. Assuming rates and exemptions remained the same this change would result in an estimated increase of revenue amounting to $975,000.

   b. The $200 exemption for the surtax upon income from intangibles should be abandoned and the surtax rate might well be increased from two percent to three percent. These changes would increase income tax collections by an estimated $220,000 and $430,000 respectively.

   c. The deduction for Federal income taxes should be eliminated. With this change the yield of the individual income tax would increase about $2,000,000 -- the corporation income tax about $1,000,000.

3. Should the state need still more revenue than would be forthcoming by the above recommended changes, a revision of exemptions and normal tax rates are recommended as follows:

Individual Income Tax

Proposed exemptions

Single person	$1,000
Head of family	2,000
Each dependent	200

Proposed normal tax rates	Percent
Bracket of income under $1,000	2
$1,000 and under $2,000	3
$2,000 and under $3,000	4
$3,000 and under $4,000	5
$4,000 and under $5,000	6
$5,000 and under $6,000	7
$6,000 and under $7,000	8
$7,000 and under $8,000	9
All over $8,000	10

Corporation Income Tax

Rate on general corporations should be increased from four percent to six percent to bring it to the level of the rate on financial corporations.

These changes in the tax on individuals and corporations would put the Colorado income tax on a basis more comparable with those in such states as Idaho, Oregon, and Wisconsin. The resulting increase of revenue would be an estimated $4,500,000 from the tax on individuals and $1,500,000 from the tax on corporations.

4. The legislature should investigate the advisability of enacting a community property law. It appears that such legislation would save Colorado taxpayers enough Federal taxes to more than make up for the above recommended increase in the state income tax.

5. Although the present corporation income tax rates are about equal to the average of other states, collection of revenue is relatively less. Consequently, the law and its administration might well be examined to see if additional revenue can be collected (to make collections conform more closely on a relative basis with those in other western states). Moreover, it is hoped that in the future the courts will liberalize their decisions relative to the taxation of income earned in Colorado by interstate corporations. In the past the Department of Revenue has been unable to collect considerable amounts of such revenue because of restrictive court decisions.

6. Should the income tax be strengthened as recommended above, the present allocation of revenue may prove to be satisfactory. However, should the existing inadequate law be continued, all of the net proceeds of the tax should be allocated for the support of elementary and secondary education in the state.

Historical Background

In 1912 the newly created Colorado Tax Commission pointed out advantages of the income tax and recommended that Wisconsin's revenue measure, enacted the year previously, be carefully watched.[1] It was suggested that should the experience in Wisconsin prove successful the commission subsequently would urge a similar tax for Colorado.

---

1 Wisconsin's tax of 1911 was the first comprehensive income tax measure adopted by any of the states. Rates were progressive and the tax was administered by a centralized state tax commission.

It was not until 1916, however, that the commission again officially referred to the income tax. At that time it recommended that certain constitutional restrictions on the legislature relative to taxation be removed. The fear was expressed that the state constitution might interfere with the introduction of new forms of taxation such as the income tax.

The recommendation for a change in the constitution was repeated by the commission in 1918 when it suggested that an income tax should supplant the general property tax upon intangible property. The commission argued that:

> "Years of experience by every state in our nation has conclusively demonstrated that a success cannot be made of trying to tax money, notes, bank deposits, stock, bonds and other intangibles under the general property system. Experience has likewise demonstrated that the income tax for all purposes is the only rational solution of the problem.
>
> "Of all systems, the income tax system is by far the fairest. It measures the exact tax paying ability, and when levied in reasonable amounts is scarcely felt by the taxpayer.
>
> "Under the present system in Colorado a taxpayer with $5,000 worth of property, though he may be in debt for one-half the amount, pays annually an average of about $90 in taxes; and a person who owns property and has a cash income of $5,000, pays nothing, although he is well able to pay at least ten times as much as the one who has to depend upon the slender income from his property. Such a condition is the height of inequity.
>
> "Many foreign countries have realized this condition and are depending chiefly upon income taxes. Our federal government and several of our states have adopted income systems.
>
> "....the Tax Commission recommends that some form of income tax for state and local purposes be adopted, and suggests that the salaries of all public officials be made taxable."[1]

The commission sponsored an income tax constitutional amendment in the 1921 legislature but the bill did not get out of the committee stage.

The subsequent year in 1922, a movement was inaugurated which eventually grew into the formation of a Colorado State Tax Revision Committee. This committee was backed by farmers who wished relief

---

1 Colorado Tax Commission, Seventh Annual Report, 1918, pp. 7-8.

under the general property tax as well as by others who were generally interested in making the state tax system more equitable. Largely through efforts of this committee a proposed amendment to Section 6 of Article 10 of the Constitution was initiated and presented to the people at the November election. This proposed amendment empowered the legislature to impose a uniform or a graduated tax on any or all income. However, the proposal failed and defeat was attributed to an organized minority opposition in the state -- those with large incomes who would be called upon to pay most should an income tax be enacted. Nevertheless, it was believed by sponsors of the amendment that if, through better publicity, a majority of the voters had understood the true nature of the amendment it would have carried in the election.

In his inaugural address, January 1923, Governor William E. Sweet made a strong appeal for an income tax. He pointed out inequities of the property tax, stating that owners of real estate, live stock, and merchandise had to bear the brunt of the tax while owners of intangible properties were going virtually tax free. He further stated that justice demanded that owners of intangible wealth should be compelled to pay a reasonable tax upon the income derived therefrom. In conclusion he recommended:

> "....that the Legislature now consider an income tax law as a step toward the removal of the injustice and inequality which are inevitable in our present tax system. Such a law is no longer an experiment and there is a widespread movement throughout the country for an income tax. I believe the proposed amendment to our state constitution failed to carry because of lack of information on the subject. I am advised by competent authorities that an income tax law can be passed without an amendment to our state constitution.
>
> "The only reasonable argument against an income tax is that it would result in raising more money which might be spent extravagantly. I believe that proper safeguards against this possibility could be placed in the law. It is of primary importance that we earnestly seek the fairest possible method of imposing taxes. An income tax is the only way of protecting the honest taxpayer against the dishonest return of the unscrupulous taxpayer."[1]

However, no income tax bill survived in the Twenty-Fourth Legislative Session. One reason was that the state had partially recovered from the economic difficulties of the 1921 depression and, consequently, the general property tax yielded with less difficulty the necessary public revenue.

---

1 William E. Sweet, Governor of Colorado, Inaugural Address, delivered before the 24th Session of the General Assembly, January 9, 1923, pp. 9-10. Governor Sweet was the only governor of the state who ever actively supported an income tax measure during the years between 1911 and 1937 when such a proposal was being generally debated throughout the state.

Nevertheless, interest in tax reform did not completely disappear. In 1926, the tax commission reiterated its recommendations previously made in 1912 and 1918, relative to an income tax. It reported that real estate, utility corporations, live stock, and merchandise were paying over 90 percent of state and local taxes and that in the process, particularly against homeowners and farmers there was gross discrimination. The commission announced that a bill would be introduced in the legislative session of 1926, providing for an income tax, and expressed hope that the legislature would seriously consider adopting provisions "to lay this just and proper tax upon all individuals and corporations which now entirely escape taxation."[1] However, the measure was again defeated.

For some unknown reason the commission had a "change of heart" by 1928. It no longer was certain that an income tax would be desirable.

> "We have for years recommended an income tax, because it was the judgment of a majority of this commission that, in looking for new sources of revenue, it would be well to consider this possible relief to tangible property which now bears most of the burden. But as at present constituted, and in the light of further study of the subject, and the experience of other states, we are not unanimously of the opinion that this is the proper panacea for Colorado."[2]

The above quotation is interesting in view of the fact that two years earlier when membership of the commission had been exactly the same there was enthusiastic support of the income tax. No explanation was given as to why "in the light of further study of the subject, and the experience of other states" the commission had changed its attitude. By 1928 twelve states had obtained considerable experience with the income tax and, relative to all of these jurisdictions, studies indicated that the tax had greatly improved the revenue systems of the respective states.

The doubt at that time in the minds of the tax commissioners is perhaps particularly significant in view of the fact that a commodity sales tax as well as an income tax was being considered by the legislature. The commission may have favored the sales tax over the income tax. In any event, it missed an opportunity for genuine constructive leadership in the state and once again the fight for an income tax was lost.

---

1 Colorado Tax Commission, Fifteenth Annual Report, 1926, p. 6.
2 Colorado Tax Commission, Seventeenth Annual Report, 1928, p. 7.

Beginning with the depression of 1929, Colorado's state and local tax revenue was greatly reduced and at the same time a further strain was placed upon the already over-worked property tax. As a consequence, among many people of the state there was a revival of general interest in a state income tax. Dr. Klemmedson of the agricultural college in numerous articles pointed out that if owners of Colorado real estate and farm lands were to obtain effective tax relief there would have to be an amendment to the state constitution permitting a progressive income tax.[1]

Dr. Sowers of the University of Colorado wrote profusely upon the subject, strongly recommending a personal and corporation income tax.[2]

In 1930 the Denver Chamber of Commerce employed Dr. Jens P. Jensen of the University of Kansas, a national tax authority, to conduct a survey of the Colorado State Tax system. One of the recommendations growing out of his study was a proposal for the adoption of a personal income tax.[3]

In November, 1933 two initiated amendments to Article X of the Constitution were voted upon by the people. Both proposed amendments would have authorized the General Assembly to levy an income tax, but both measures were defeated. Strenuous opposition came from corporation and financial interests. The principal argument used was that the income tax would be just another tax which would increase <u>everybody's</u> burden.

The legislature of 1933 submitted an income tax amendment to the people to be voted upon in November, 1934. The results of the election were 107,457 votes in favor and 161,952 votes against the amendment. The proposal carried in seventeen counties and lost by small margins in all other counties except Denver. The vote in Denver was a ratio of 3 to 1 against approval.

Some legal authorities expressed the opinion that Colorado could legally establish a graduated income tax even though the constitution was not amended. There was precedent for such a decision in a number of states whose constitutions contained uniformity clauses similar to the constitutional limitation in Colorado.

1 G. S. Klemmedson, <u>Colorado Tax Problems</u>, December 1930, Colorado Agricultural College Extension Service.

2 Don C. Sowers, <u>Possible Ways of Meeting the Financial Emergency</u>, 1930, Bureau of Business and Government Research, University of Colorado.

3 Jens P. Jensen, <u>Survey of Colorado State Tax System</u>, 1930, Denver Chamber of Commerce.

Such legal opinion, together with past failures in amending the Constitution, induced the legislature of 1935 to pass a graduated income tax bill. The bill allocated the proceeds of the tax to the support of public schools and required a corresponding reduction in the property tax for the support of these schools. However, Governor Edwin C. Johnson vetoed the bill, stating that in his opinion the measure was unconstitutional. The House failed by two votes to override the Governor's veto. This veto was a big disappointment to those who had worked, many of them for years, for tax reform.

Apparently nothing was left to do except to make another attempt at amending the constitution. Accordingly, the same legislature submitted an amendment to the constitution which, if adopted by the people, would clearly remove any constitutional question as to the power of the legislature to pass a graduated income tax law. The measure was approved in the House by a unanimous vote. In the Senate only three votes were recorded against the amendment.

This amendment appeared on the election ballot of November 1936 as Amendment No. 3. During the summer and fall preceding election, considerable debate occurred throughout the state -- in the press, over the radio and in public forums -- relative to the issue. Organized groups supporting the income tax amendment included the State Federation for the Graduated Income Tax Amendment, the Colorado Education Association, Colorado State Grange, Colorado Farmers' Union, Colorado Farm Bureau, Denver Central Committee of the American Federation of Labor, and Colorado Congress of Parent Teachers Association. Also several newspapers including the Rocky Mountain News endorsed the proposal.

Most frequent arguments presented in favor of the amendment were: (1) Thirty-two other states already had successful income taxes, (2) A graduated income tax is in accordance with tax paying ability of the people, (3) The amendment would make it possible for the state to contribute tax revenues to local units of government including schools, (4) Instead of hopelessly trying to tax intangibles as property, the legislature could tax the income derived from these intangibles, and (5) The income tax would relieve the tax burden upon owners of real estate including homes and farms.[1]

Principal arguments against the amendment were: (1) An income tax would drive industry out of the state,[2] and (2) People of Denver would be required to pay most of the state tax, whereas, principal benefits from the tax would be received by schools in other parts of the state.

In the election the amendment passed by a vote of 167,268 to 159,143 -- a majority of 8,125 votes. The balloting in Denver was 35,490 "yes" and 71,377 "no" votes or a majority of 35,887 against.

---

1 Rocky Mountain News, October 23, 1936
2 This has been a favorite argument used against any tax.

Therefore, the agricultural areas and smaller communities of the state were responsible for approval of the income tax amendment.

The amendment added a new section to Article X of the Constitution as follows:

> "Section 17. Income Tax. The General Assembly may levy income taxes, either graduated or proportional or both graduated and proportional for the support of the State, or any political subdivision thereof, or for public schools, and may, in the administration of an income tax law, provide for special classification or limited taxation or the exemption of tangible and intangible personal property."

Finally, after years of struggle, uncertainty and defeat, the legislature had clear authority to enact a graduated income tax. Accordingly, a measure was introduced in the Thirty-First General Assembly, January, 1937.

The bill was passed by the House but encountered considerable opposition in the Senate. According to the Rocky Mountain News, the Senate was placed under heavy pressure by wealthy lobbyists who gave "little dinners" to "explain" the income tax to senators. The lobbyists wished to defeat the measure or failing that, to obtain amendments to lighten the tax as much as possible upon larger incomes.[1]

On May 12, the Senate approved a greatly modified bill which had little resemblance to the House bill. It contained a series of crippling amendments representing concessions to special interests of the state.

After some compromising, a joint House and Senate Committee came to agreement relative to the bill. A few of the original House provisions which had been dropped or changed were restored; however, the Senate won most of its points, consequently, the final form of the bill as passed and referred to the Governor was considered by many to be weak and inadequate.

On June 2, 1937, Governor Ammons signed the bill which became effective the first of July of the same year.[2]

The point should be stressed that in 1937 many, if not most, of the sponsors of the income tax were greatly disappointed with the bill as finally enacted into law. It was believed that tax rates were too low upon income from intangible wealth and upon all income in the upper brackets. However, these disappointed groups obtained an informal agreement from members of the legislature that after a trial period the tax would be strengthened.

---

1 Rocky Mountain News, May 11, 1937.
2 House Bill No 48, Thirty-First General Assembly.

These conditions relative to the final enactment of the 1937 measure are particularly significant in view of the fact that the most important subsequent amendment has weakened instead of strengthened the law.

Briefly, the law of 1937 levied a tax on the individual net incomes of all residents, and of non-residents if derived from sources within the state, from corporation and from fiduciaries. Returns were to be filed by individuals with a gross income of $5,000, or a net income of $1,000 if single or not living with husband or wife, and $2,500 if married and living with husband or wife.

A single person was allowed an exemption of $1,000 and a married person or the head of a family, $2,500. For each dependent, other than husband or wife, a further exemption of $400 was allowed.

Tax rates upon net income of individuals after exemptions were applied as follows:

Net Income	Percent
Under $2,000	1
$2,000 and under $4,000	2
$4,000 and under $6,000	3
$6,000 and under $8,000	4
$8,000 and under $10,000	5
All over $10,000	6

In addition, without exemptions, a surtax of two percent was imposed upon the income received by individuals from intangible property. This surtax was in lieu of all property tax levies upon intangibles which previously had legally been included under the property tax.[1]

Corporations were required to pay four percent on their entire net income and banks, trust companies, financing and loan associations six percent. Various non-profit organizations were made exempt under the law.

The Personal Income Tax

Thirty-one states now provide for the taxation of personal net incomes. These states are listed in Table 1. It may be observed that with the exception of Virginia, whose income tax was not successful until recently, the earliest law was enacted in 1911 in the state of

---

1 However, in practice most intangible wealth had been escaping assessment under the property tax.

3 Tax on income from intangibles only.

Wisconsin. Wisconsin's law proved to be so successful that tax reform -- application of the ability-to-pay doctrine as measured by net income -- soon spread to other states. By 1937 all of the states now administering income taxes had enacted laws. Colorado's law was passed in the latter year.

Table 1 also shows individual income tax collections for 1944. As would be expected there is a wide variation in amount of collections for the various states. For example, collections are large in New York and California, at least partly because many people reside there who receive large incomes. On the other hand, collections are relatively small in New Hampshire and Tennessee because their laws apply only to income from intangibles. Other determiners of the productivity of an income tax include such factors as tax rates and exemptions, definitions of income, and effectiveness of administration.

			Average (10 States)	3.84

1 State Finances, Vol. 2, No. 1, Bureau of Census, 1946, Colorado figures obtained from Fourth Annual Report, Colorado Department of Revenue, 1946
2 Per Capita calculations are based on the Census Bureau estimates civilian population, November 1, 1943.

In order to assist in the evaluation of the Colorado income tax a number of comparisons will be made with the other western and neighboring states which also have income taxes. These states (10 in number including Colorado) have much in common relative to geographic location,

industries, population, distribution of incomes (with exception of California) and many other aspects. Consequently, the effectiveness of Colorado's income tax as compared with the other states in this group should be of particular interest and significance.

The relative emphasis placed upon the personal income tax as compared with all state taxes for the individual states is shown in Table 2. Colorado collected seven percent of her total state revenue in the form of the personal income tax. This was about the same percentage as in California, Kansas, Montana, Oklahoma, and Utah; considerably less than in Idaho and Oregon but appreciably more than in Arizona and New Mexico.

Another comparison of some interest is the per capita personal income tax collections. Table 2 indicates that in 1944 Colorado had an average per capita collection of $3.10; the range for the group of states being from $6.13 in California, the highest; to $1.10 in New Mexico, the lowest. Colorado's collection stood below the level of the average state for the group.

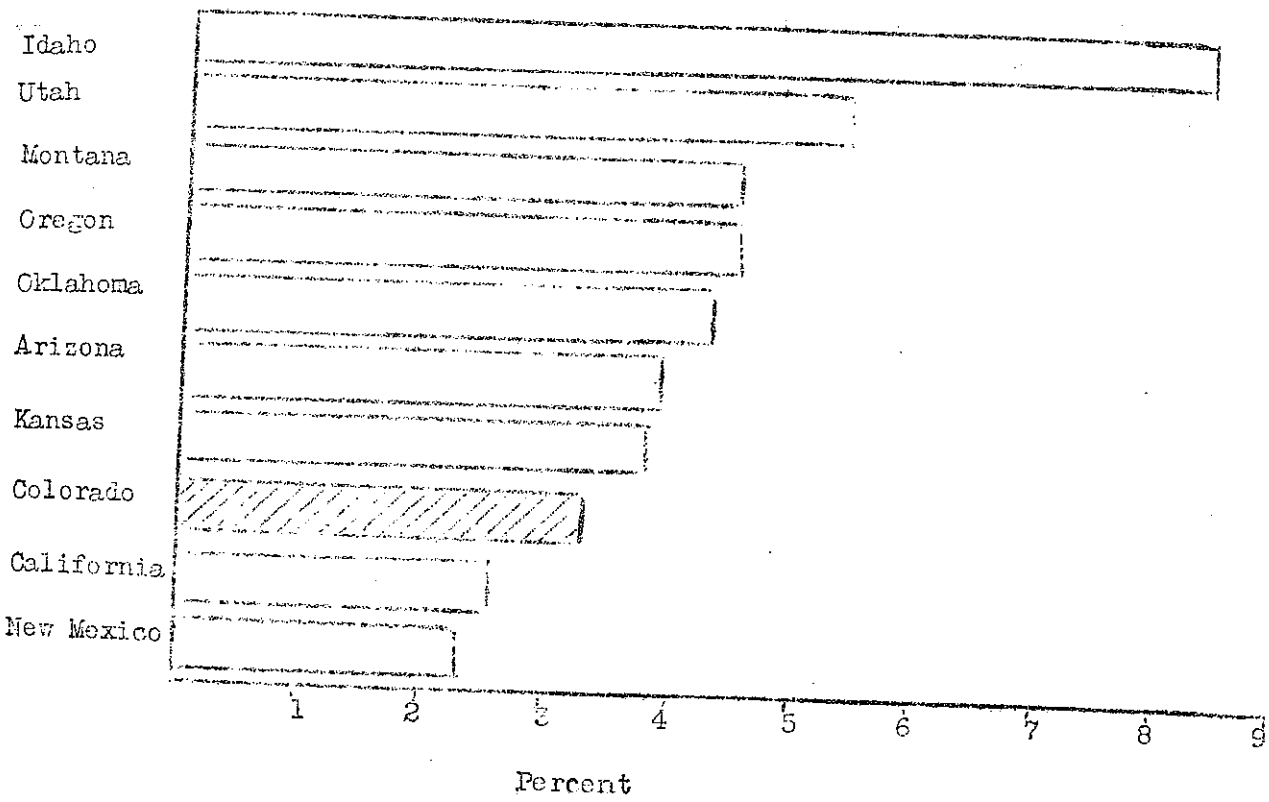
PERSONAL INCOME TAX



State Collections as Percentage of Federal

For Ten Selected States

However, some states are more wealthy than others and, consequently, have more income relative to size or population. Therefore, a significant comparison is the amount of personal income tax collections as a percentage of total income payments within each state. Table 3 indicates that for Colorado this was .29 percent, again somewhat below average -- the group of states ranging from a high of .56 percent in Idaho to a low of .15 percent in New Mexico.

Perhaps the most significant comparison of all is the ratio of state collections to Federal personal income tax collections (from corresponding states). This comparison reflects ability to pay income taxes by allowing for variations among the states according to size, population, amount of income, and distribution of income among various income levels. It may be seen from Table 3 that the ratio in Colorado was 3.3 percent, third lowest in the rank of states as shown in the accompanying chart.

Judged by the latter index and to a lesser extent by the other indices, western states with the heaviest personal income taxes are Idaho, Utah, Oregon, and Montana; Oklahoma, Arizona, and Kansas have taxes in the middle of the group; while Colorado, New Mexico, and California have the lightest personal income taxes.

Table 4

Personal Exemptions in Terms of Net Income Otherwise Taxable Which One May Receive Without Paying a Tax; and Tax Rates (January 1, 1946), Ten Selected States

	Exemption for:			Rates		
	Single Person	Married Person	Each Dependent	Min. and Max. Rates	First Bracket	Last Bracket
Arizona[1]	10	20	4	1 - 4½	0 to $2,000	Over $6,000
California	2,000	3,500	400	1 - 6	0 to 5,000	" 25,000
Colorado[2]	1,000	2,500	400	1 - 6	0 to 2,000	" 10,000
Idaho	700	1,500	200	1½ - 8	0 to 1,000	" 5,000
Kansas	750	1,500	200	1 - 4	0 to 2,000	" 7,000
Montana	1,000	2,000	300	1 - 4	0 to 2,000	" 6,000
New Mexico	1,500	2,500	200	1 - 4	0 to 10,000	" 100,000
Oklahoma	850	1,700	300	1 - 9	0 to 1,000	" 8,000
Oregon[2]	750	1,500	300	2 - 7	0 to 500	" 4,000
Utah	600	1,200	300	1 - 5	0 to 1,000	" 4,000

1 Tax credit deductible from amount of tax rather than from net income.
2 Rates do not include special surtax on income from intangibles (replacement for property tax).
Source: Copies of personal income tax laws and regulations obtained from various state offices.

So far in our discussion we have compared various states from the standpoint of income tax collections. However, according to this criterion alone, a state's tax might represent a heavy, moderate, or light total burden, yet certain individual income brackets could be favored or discriminated against on a relative basis without being evident.

Table 4 gives the personal exemptions and tax rates for the ten states in our selected group. If the exemptions for Arizona were put on an equivalent basis with those in other states they would be approximately the same as Montana's. It may be observed that California, Colorado, and New Mexico have the most liberal exemptions for a single or married person; California and Colorado have most liberal credits for each dependent. Thus income receivers in these latter states pay little or no income tax even though, for example, their incomes may amount to $3,000 or $5,000 per year.

Table 4 also shows minimum and maximum tax rates for the first and last brackets of income in the selected ten states. Because of the slow progression of rates accompanied by relatively low maximum rates, New Mexico's tax is much lighter than any of the others. Second lightest, at least on incomes below $10,000, is California's. Colorado's tax is third lightest on incomes below $10,000.

Table 5
Liability for Personal Income Taxes under 1946 Income Tax Laws for Selected Brackets of Income, in Ten Selected States (Married Person with Two Dependents)

	Net Income						
	$2,000	$3,000	$5,000	$10,000	$50,000	$100,000	$1,000,000
	Amount of Tax						
Arizona	$ 0	$ 4½	$ 39	$ 214	$ 2,014	$ 4,264	$ 44,764
California	0	0	7	64	1,992	4,992	58,992
Colorado[1]	0	0	17	148	2,502	5,502	59,502

1 Excluding surtax on income from intangibles (replacement tax for property tax)
Source: Copies of personal income tax laws and regulations obtained from various state offices.

The effect of the various exemptions and tax rates upon the amount of tax required in selected income brackets may be seen in Table 5. An income receiver in Colorado who is married, with two dependent children, would pay no income tax on net income of $3,000; $17 and $148 taxes on net incomes of $5,000 and $10,000 respectively. With the exception of New Mexico (whose tax is one of the lightest in the whole country) and California, Colorado's tax upon these lower and middle bracket incomes is much less than for any other state in the group.

A more detailed indication of the amount of tax required in Colorado for various incomes receivers may be seen in Table 6. Upon the basis of ability-to-pay and in comparison with most other states, the Colorado personal income tax is especially light upon incomes ranging from $2,000 to $10,000.

Table 6

Liability in Colorado for Personal Income Taxes
Selected Brackets of Income (1946)

Amount of Income	Tax Paid by Single Person (no Dependents)	Tax Paid by Married Person

Source: Regulations Relating to Colorado Income Tax, Department of Revenue, 1945.

In 1944, 77,701 taxable returns were filed by individuals in the state. Thus only one out of every 15 people paid an income tax. Expressed in terms of number of families in the state, only one out of every four or five heads of families paid a tax.[1]

[1] Estimated number of families based upon U. S. Census Report for 1940.

Corporation Income Tax

In most instances, the states which tax personal incomes (Table 1) also tax net incomes of corporations. Exceptions are to be found, however, in the laws of Delaware and New Hampshire, which provide for a tax on personal incomes but not on corporate incomes. Connecticut and Pennsylvania, on the other hand, tax corporation incomes but not personal incomes. Finally, Massachusetts, which has a personal income tax, has a corporation income tax on financial institutions only.

There are, accordingly, 30 states whose income tax laws provide for the taxation of corporate net incomes.

For our purpose in this study further analysis of the state taxation of corporate net income will be confined to comparisons among the 10 states of the west with corporation net income taxes.

Table 7 indicates the relative emphasis placed upon the corporation income tax as compared with all state taxes for the respective

Table 7

2 Taxes on unincorporated business when measured by net income are classified with "Corporation Income."
3 Per capita calculations are based upon the Census Bureau estimated civilian population, November 1, 1943.
4 Figures for Colorado taken from Fourth Annual Report, Colorado Department of Revenue, 1946

states. In 1944 Colorado collected 6.5 percent of her total state revenue in the form of the corporation income tax. This was about the same as in Arizona and Montana; a greater percentage than in Kansas, New Mexico and Utah; and less than in California, Idaho, Oklahoma, and Oregon. Consequently, relative to all state tax collections, Colorado's corporation income tax is approximately average for states of the group.

Table 7 also shows the per capita corporation income tax collections for the ten states. In 1944 Colorado collected $2.86 per capita in this form of tax -- less than in five and more than in four of the states in the group.

On the basis of corporate income tax collections as related to total income payments (Table 8), again Colorado's tax stands about mid-way in the group of states.

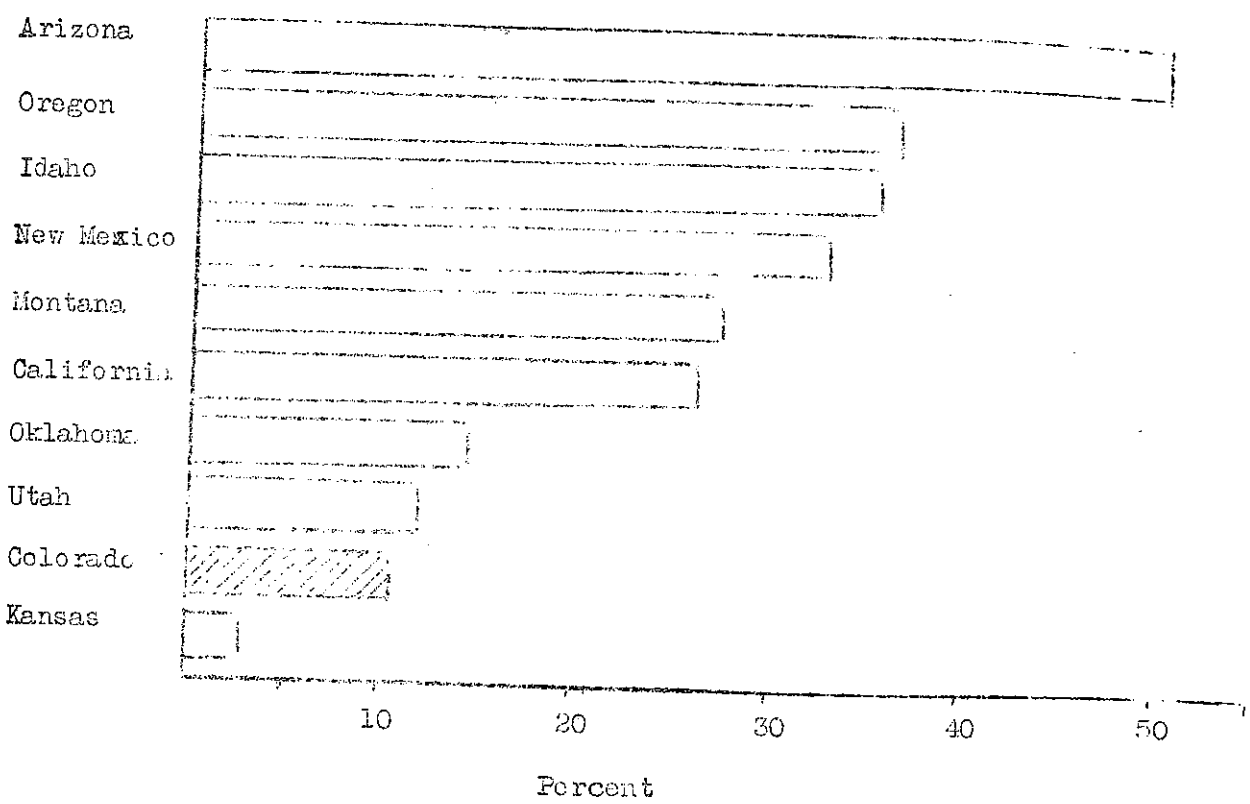
3 Taxes on unincorporated business, when measured by net income, are classified as Corporate Income.

CORPORATION INCOME TAX



STATE COLLECTIONS AS PERCENTAGE OF FEDERAL

FOR TEN SELECTED STATES

Finally, Table 8 gives the most significant comparison of all, the ratio of state collections to Federal corporation income tax collections (from corresponding states). It may be seen that judged by this standard, Colorado's tax is considerably lighter than in any other state of the group except Kansas. The relative position of Colorado may be easily seen in the accompanying chart.

The various corporation income tax rates and the amount of taxes paid upon a $25,000 net income are shown for the group of ten states in Table 9. Colorado has a four percent flat rate -- about average for the group. Thus the reason for relatively low corporation income tax collections in Colorado as compared with Federal collections from the same corporations (Table 8) is not explained in terms of rates. Information is not available to indicate whether or not the variation can be explained in terms of relative effectiveness of tax administration.

Table 9

Corporation Income Tax Rates and Amounts Paid on $25,000 of Net Income for Ten Selected States - 1946.

State	Rate (Percent)	Amount of Tax on $25,000 Net Income
Arizona	1 - 5	$1,115
California	4	1,000
Colorado	4	1,000
Idaho	1½ - 8	1,795
Kansas	2	500
Montana	3	750
New Mexico	2	500
Oklahoma	6	1,500
Oregon	8	2,000
Utah	3	750

Source: Copy of laws and regulations relating to corporation income taxes obtained from the various state offices.

Perhaps at least a partial explanation of the low yield is the difficulty in Colorado of taxing the income of interstate corporations. The state should collect a tax from these corporations on that portion of the income earned within the state. However, because of crippling court decisions, the state frequently has been denied the right of enforcing these tax payments. The Department of Revenue is well aware of the problem and is hopeful that in the future it will be more successful in obtaining favorable rulings from the courts; if so, the corporation income tax will become significantly more productive of revenue.

Income Tax - Personal and Corporate

Collections of Colorado income tax revenue for calendar years since the law was enacted in 1937 are shown in Table 10. It may be observed that a rather steady increase has occurred in collections throughout the seven years. This increase has undoubtedly been largely due to rising levels of income among individuals and corporations in the state. Should incomes decline in the future, unless tax rates and exemptions are adjusted, we may expect reductions in income tax collections.

Table 10

Colorado Income Tax Collections
By Type of Return,
Calendar Years 1938 - 1944[1]

Year	Total Collections	Individuals	Corporations	Fiduciaries
1938[2]	$1,284,403			
1939	2,829,302	$1,729,629	$1,054,447	$45,226
1940	3,361,132	2,091,243	1,224,768	45,121
1941	3,543,432	2,398,859	1,106,286	38,287
1942	4,596,081	3,084,783	1,441,273	70,025
1943	6,160,740	3,620,668	2,455,802	84,270
1944	6,359,497[3]	3,302,384	2,976,493	80,445

1 Fourth Annual Report, Colorado Department of Revenue, 1946.
2 Six months only.
3 Includes $175 in the form of partnership penalties.

Table 11 shows total Colorado income tax collections as a percentage of Federal income tax collections in comparison with the nine other states of the western group. The figures are also portrayed in an accompanying chart.

According to this comparison -- an excellent one from the standpoint of indicating relative tax burdens -- Colorado's income tax with one exception (Kansas) is the lightest of the ten states.

Table 11

Total State Income Tax Collections (Personal and Corporate) as Percentage of Total Federal Income Tax Collections (Personal and Corporate) from Corresponding States for 10 Selected States - 1944[1]

(Dollar Amounts in Thousands)

State	Total Federal Income Tax Collections[2]	Total State Income Tax Collections	Total State Income Tax Collections As Percentage of Total Federal Income Tax Collections
Arizona	$ 45,106	$ 3,515	7.8
California	2,183,705	115,994	5.3
Colorado	129,865	6,359	4.8

Kansas	204,943	7,096	3.5
Montana	34,673	2,584	7.5
New Mexico	25,142	1,235	4.9
Oklahoma	171,009	11,801	6.9
Oregon	197,864	14,934	7.5
Utah	55,814	3,742	6.7

1 State Finances, Vol. 2, No. 1, January, 1946, and Statements of Internal Revenue Collections during the Calendar Year 1944, U. S. Bureau of Internal Revenue.

2 Corporate tax includes normal tax, surtax, victory tax: excludes excess profits tax.

The various amounts of income tax revenue which Colorado could obtain if her collections were comparable, in each case, with the other nine income tax states of the region are shown in Table 12. If Colorado were to increase her income tax to the level of the average for the nine states, the excess revenue above the present collections would be about $2,624,000.

Should Colorado need additional revenue to support necessary functions of government, or should a more satisfactory source of revenue be desired to replace, for example, part of the property tax or the sales tax, then an examination of the income tax for the purpose of increasing its productivity would be appropriate.

Table 12

Various Amounts of Income Tax Revenue Which Colorado Could Obtain If Her Tax Burden Were Comparable in Each Case, with Other Income Tax States of the Region.

State	Percentage State Collections to Federal Collections[1]	Percentage in Column I multiplied by Federal collections from Colorado[1]	Possible excess Revenue in Colorado above Actual (Amounts varying According to Relative Tax Burdens in each State)[2]
Idaho	12.2	$15,844,000	+ $9,485,000
Arizona	7.8	10,119,000	+ 3,760,000
Montana	7.5	9,740,000	+ 3,381,000
Oregon	7.5	9,740,000	+ 3,381,000
Oklahoma	6.9	8,961,000	+ 2,602,000
Utah	6.7	8,701,000	+ 2,342,000
California	5.3	6,823,000	+ 464,000
New Mexico	4.9	6,363,000	+ 14,000
Colorado	4.8	6,359,000	- -----
Kansas	3.5	4,545,000	- 1,814,000
		Average	+ 2,624,000

1 See table 11.
2 Colorado collections subtracted from amounts in Column 2.

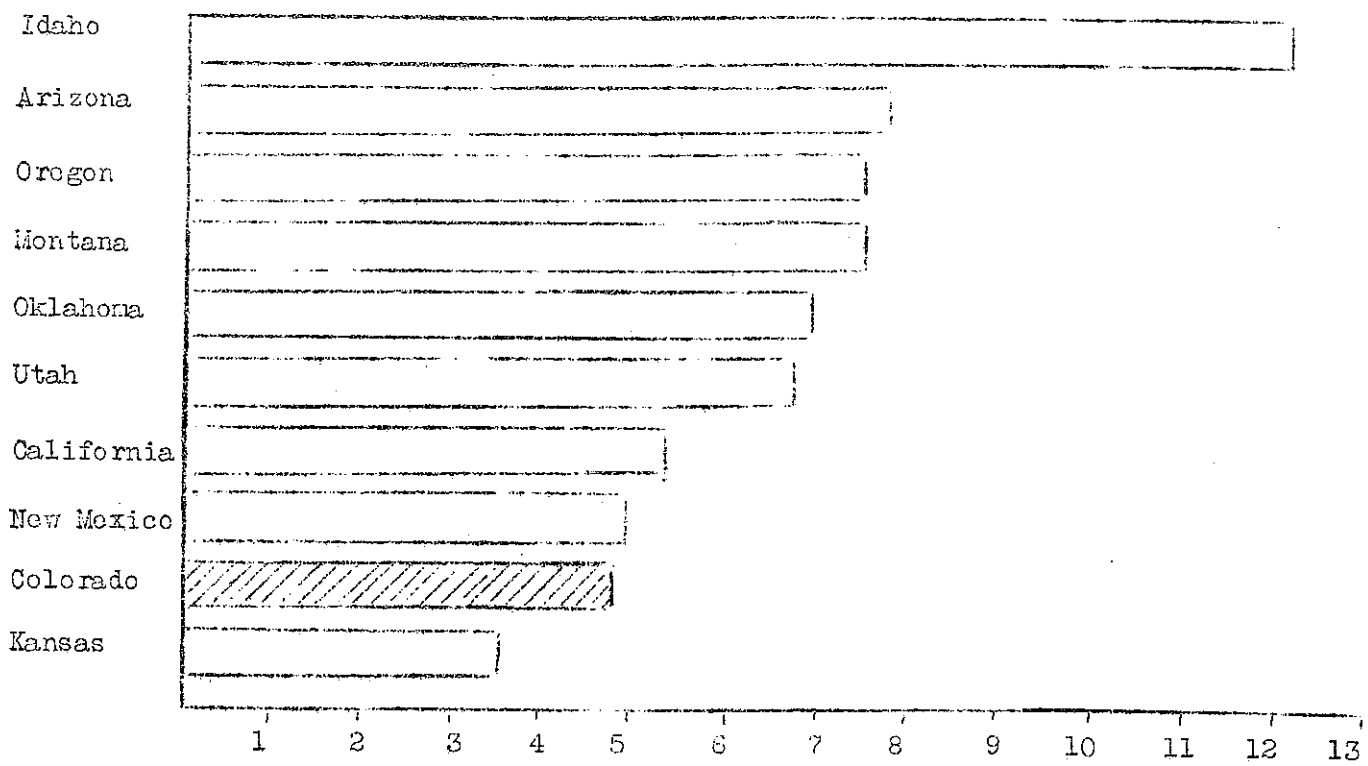
A moderate change strengthening the law could be made by increasing normal tax rates by $1,000 instead of $2,000 brackets of income. The effect of this revision would be to tax somewhat more heavily the taxable net incomes between $2,000 and $10,000 -- those especially favored under present law. If such a change were made an estimated additional $978,000 would be collected annually from the personal income tax.[1]

A more thoroughgoing modification of the law -- revision to bring the tax in line with the successful measures found in such states as Idaho, Oregon and Wisconsin -- would be to reduce personal exemptions to the level of $1,000 for a single person, $2,000 for the head of a family and $200 for each dependent; and to apply normal rates graduated from two percent on the first $1,000 of taxable income to 10 percent on incomes over $8,000. The effect of such changes would materially strengthen the personal income tax by making it correlate more closely with tax paying ability. Moreover, the yield of the tax would increase significantly. Details relative to these proposed changes in tax rates and exemptions as well as estimated additional revenue resulting from such changes are shown in Appendix A, Table 3. It may be seen that the estimated additional revenue would be about $4,489,000.

1 See Appendix A, Tables 1 and 2.

INCOME TAX

(CORPORATE AND PERSONAL)



STATE COLLECTIONS AS PERCENTAGES OF FEDERAL

FOR THE SELECTED STATES

Should the above changes be made in the personal income tax, in order to keep the two more nearly in balance, the general corporation tax rate should probably be raised from four to six percent. This change would raise the rate to the level now prevailing for financial corporations and would result in an estimated increase of $1,000,000 of revenue.

An objection to increasing rates or lowering exemptions for the state income tax might be set forth on the basis that the federal government is taxing incomes very heavily. In fact it is sometimes argued that state income taxes should not be increased until federal reductions have been made from the high levels of war income and excess profits tax rates.

However, in reply to this argument it can be pointed out as indicated in Table 13 that already the federal tax has been lowered. The 1945 Federal Revenue Act materially reduced the individual and corporation income tax collections which will be made from Colorado, and repealed in its entirety the excess profits tax. As a consequence, beginning with the calendar year 1946, there will be an estimated annual savings to individuals in the state of over $16 million and to Colorado corporations of about $10 million.

Table 13

Estimated Reductions in Federal Income Tax Collections (from Individuals and Corporations) in Colorado Due to Changes in 1945 Revenue Act.

Taxes Upon	1945 Collections[1]	1946 Estimated Collections[2]	Estimated Savings
Individuals	$123,504,500	$107,111,700	$16,392,800
Corporations			
Excess Profits	32,417,340	---	8,431,500[3]
Corp. Surtax	27,048,945	25,071,045	1,977,900
		Total -	$26,802,200

3 Estimate based upon an expected reduction in profits.

Allocation of Income Tax Revenue

Considerable controversy has developed in Colorado relative to the public functions to be supported from income tax funds. Although it was not considered desirable to place limitations in the Constitution, there was common understanding among the organized groups and various individuals supporting the income tax constitutional amendment that the income tax would be applied as a replacement tax. This was to be accomplished by placing the revenue in a fund for the support of elementary and secondary education in such a manner as to reduce property taxes. Accordingly, the 1937 income tax law provided that, after deductions for the cost of administration, all net proceeds of the income tax would go into a reserve for general county school funds. Out of this reserve, allocations were to be made to counties on the basis of the number of children of school age in each county. The law specified that in order to participate, property tax levies for the county general school fund would have to be reduced by an amount equivalent to the revenue received from the state.[1] The income tax law became effective on July 1, 1937, and first collections were made in 1938. Because Colorado does not collect income taxes on the pay-as-you-go basis, collections in 1938 were merely for a six months' period. However, during this first year, after allowing for administrative expense, $879,351 was made available for the support of public schools of the state.

In his inaugural address before the Thirty-Second General Assembly, January 1939, Governor Ralph L. Carr recommended that the law be amended to provide for the transfer, beginning with 1939, of all income tax money to the general fund for general state purposes. Governor Carr's position can best be stated by quoting from his speech as follows:

> "A net income tax was imposed by the 1937 session of the General Assembly with a view to providing revenues to replace, in part, general property tax levies for school purposes. It is now apparent that the income tax is not, and will not be a replacement tax, but rather an addition to the tax burden. I am told that in forty-two counties the old levy for the school tax has been converted into a part of the general revenue funds and the income tax has been merely a windfall. You and I take office burdened by the existing deficit and faced by another for the next biennium. The people were advised of this in the campaign and they know that the fiddler must be paid. Either a new tax must be voted or we must find the solution in some such fund as this.

1 An exception was made in the case of the city and county of Denver. A compromise provision stated that the amount allotted to Denver should be divided equally between the city government and the schools, and no tax levy reduction would be necessary in order to share in the funds.

"I recommend that the income tax be amended to provide that the entire proceeds of the tax for the year 1939 and subsequent years be paid to the general fund and made available for appropriation for general state purposes."

It was argued by those who opposed the diversion plan, that the Governor's proposal would defeat the original intention of the income tax which in effect had begun to operate in 1939, namely, to lighten the property tax burden relative to the support of education. It was further contended that by transferring the revenue from the school fund to the general fund, the equalizing advantage as among rich and poor school districts would be reduced because of the loss of income tax revenue contributed by the state for the support of education. A compromise bill was enacted which provided that for a period of two years, 65 per cent of the proceeds of the income tax should be placed in the general fund of the state to pay legislative appropriations for current state expenditures. The remaining 35 percent of the proceeds were to be distributed to the schools.[1]

Thus the amount of state support, at least for a temporary period, which the public schools had looked forward to receiving was materially reduced. Although income tax collections for 1939 were $2,829,302, the share allocated for the school fund was $1,087,575.

In 1949 an initiated proposal to amend the constitution relative to the allocation of income tax revenue was placed upon the ballot. The proposal came as a result of the efforts of the Colorado Federation for Constructive Legislation of which various other organizations were affiliated. One of the latter organizations especially active in supporting the initiated amendment was the Colorado Education Association. The proposal specified that beginning July 1, 1941, all income tax revenue should be allocated for the use of the public schools, on a property replacement basis -- a proposal to restore the situation prevailing under the original income tax law of 1937.

The result of the election was a decisive defeat for the proposed amendment. This was largely because of overwhelming opposition expressed by the people of Denver who voted nearly six to one against the proposal.

A statutory amendment approved April 8, 1941 extended the temporary diversion of income tax revenue for another two-year period. The diversion ratio remained the same -- 65 percent being paid to the state general fund and 35 percent going to the general county school fund.

In 1943 the legislature again allocated, for a period of two years, 35 percent of the proceeds of the income tax to the county school fund. However, the amount going to the state general fund was reduced to 50 percent, leaving 15 percent available for a school equalization fund. The use of the latter fund was carefully limited to the purpose of assisting local units in setting up a minimum program of

1 Approved March 31, 1939.

$1,000 for each elementary classroom unit and $1,333 for each high school classroom unit. The law stipulated that in order to participate in this type of state aid, special county and school district tax levies must be applied. Counties and school districts were given the option of deciding whether or not they wished to participate in the program. Any money remaining in the equalization fund at the end of the biennium was to revert to the state general fund.

During the subsequent two-year period, only 14 counties chose to participate in the minimum educational program act of 1943. Consequently, only these 14 counties received financial assistance through the state 15 percent equalization fund. At the end of the biennium, July 1, 1945, an unused balance of $1,491,204.31 reverted to the state general fund. The extent to which proceeds of the income tax have been used for support of education during the years from 1938 to 1945 is shown in Table 14. It should be noted that allocations to the county general school fund are shown on a calendar year basis while apportionments from the school equalization fund are shown by fiscal year.

Table 14

Allocations to Public Schools in Colorado from State Income Tax Revenue, 1938-1945

To County General School Funds

The full significance of the problem of state support for public education in Colorado can not be appreciated unless reference is also made to the distribution of state aid from the income of the permanent school fund.

When Colorado became a state, it was given certain public lands for a permanent public school fund. This gift from the United States Government amounted to 3,753,939 acres. Of this total, about 800,000 acres have been sold, and about 2,950,000 acres remain. Money obtained from the sale of school land can not be spent but must be invested in approved securities. Thus, the permanent school fund obtains an income either in the form of interest from investments or rentals from unsold lands.

Income from the state permanent school fund is distributed through the counties to school districts in the form of state aid for the payment of teachers' minimum salaries of $75.00 per month. This state aid goes to the financially weaker counties and districts -- those which cannot raise enough revenue from specified special mill levies to pay the minimum salaries. After the state aid is distributed, any money remaining in the public school fund is apportioned to the counties and through the counties to the school districts in proportion to the number of children on the school census. However, during recent years, all of the public school income fund has gone for state aid, none being left over for apportionment. Actually, the fund has been insufficient to pay all of the state aid applied for.

Deficiencies in the public school income fund for state aid since 1939 are shown in Table 15. A reduction in the shortage for the last two years has come about through a higher return from investments of the school fund and the rental of school lands and in increased property valuations in the counties that draw upon the state school income fund.

Table 15

Deficiencies in Public School Income Fund for State Aid[1]

School Year	Amount of Deficiency
1939-40	$538,003.01
1940-41	667,209.10
1941-42	481,367.66
1942-43	516,000.00
1943-44	125,063.00
1944-45	9,759.00

1 Office of Colorado State Superintendent of Public Instruction.

As previously noted, the state distribution of income tax revenue to the general county school fund has been for the purpose of reducing county and district special mill levies which are otherwise necessary if the counties and districts are to participate in the state aid program for minimum teachers salaries.

Income from the permanent school fund and revenue from a portion of the income tax represent the two forms of state assistance to elementary and secondary schools in Colorado. Both together represent a very small portion of the total cost of public education in the state. Table 16 indicates that for the school year 1944-45, the amount was 12 percent of total cost, which placed Colorado ninth from the bottom among the states relative to the proportion of state aid for public education. The highest state, Delaware, contributed almost 84 percent while the median state was about 34 percent -- nearly three times the figure for Colorado.

In the 1945 regular session of the legislature, House Bill 271, known as the Minimum Education Program Act, was approved March 3, 1945. This bill amended the law of 1943 by increasing the amount per elementary classroom unit from $1,000 to $1,200; the high school classroom unit from $1,333 to $1,500. Furthermore, the effectiveness of the minimum education program was increased by a provision requiring the counties to levy the deficiency tax of one mill (or less) if a deficiency should appear in the General School Fund. Also, the matching levy to make it possible for a district to participate in the state school equalization fund was eliminated.

It was believed that these changes would improve the minimum education program by raising the standards and at the same time by broadening the participation. During the previous two years, only 14 counties had elected to come under the act.

Also the regular legislative session of 1945 in House Bill 447 extended, without time limit, the method of allocation of income tax revenue which had prevailed since 1943, namely, 50 percent going to the state general fund, 35 percent to the general county school fund, and 15 percent to the state school equalization fund.

By the summer of 1945, it was apparent that the changes made in the methods of state assistance to public education in Colorado, although representing some improvement, were still distressingly inadequate. Rising costs of living due to war and postwar conditions, accompanied by opportunities for higher salaried school positions in other states and better paying jobs in other occupations, were responsible for a crisis in the schools of the state. Poorly qualified teachers were being employed in many districts to an extent that was erasing gains in educational standards which had been built up with difficulty over many previous years. Furthermore, the shortage of teachers with any qualifications was threatening to compel some districts to close their schools completely.

As a consequence, when Governor Vivian called a special session of the legislature in the fall of 1945, several educational finance bills were placed upon the agenda. After considerable debate, two important education bills were finally passed. However, they contained compromise features disappointing to many supporters of education in the state. Nevertheless, they provided for some increase in the amount of state aid for public education in Colorado.

House Bill 10 of the special legislative session raised the minimum education program, effective January 1, 1946, to $1,800 per classroom unit, both elementary and high school. It provided that three-fourths of this amount must be paid for teachers' salaries. Thus, in effect it established a minimum salary of $1,350 for the teachers in those counties and districts electing to participate in the program.[1] Undoubtedly, because of additional mill levies required within the counties and districts which share in the state funds, not all jurisdictions will elect to come under the program. In fact, during the first half-year following January 1, 1946, only 42 of the 63 counties of the state were participating in the fund. Furthermore, not all of the districts within the 42 counties elected to come under the plan. Therefore, the minimum education program is still a long way from being a comprehensive program for the whole state.

The second important bill relating to education, passed by the 1945 special session of the legislature, was House Bill number 12. It became effective July 1, 1946, and provides for a new allocation of the state income tax revenue. Under the new law, 35 percent continues, as formerly, to go to the county general school fund to reduce the property tax; 35 percent (increased from 15 percent) goes to the state school equalization fund to finance the expanded program under House Bill 10, described above; while the remaining 30 percent (reduced from 50 percent) goes to the state general fund to assist with the current costs of state government.

In the future, should income tax collections, after deductions for administrative cost, amount to $6,000,000,[2] distribution of revenue under the new law would be $2,100,000 to the county general school fund, $2,100,000 to the school equalization fund, and $1,800,000 to the state general fund. This would represent an increase, because of the new law, of about $2,000,000 contributed by the state for the support of public education.

Table 17 shows approximate revenue sources for Colorado public schools for the academic year 1941-42 and 1944-45. Estimates are also indicated for the year 1946-47. It may be seen that the percentage of state assistance has increased from 71.6 percent in 1941-42 to 12.7 percent in 1944-45. The estimate for 1946-47 is about 19 percent. However, this estimate is probably high because it assumes that county and district school taxes will remain constant, whereas they are likely to increase in order that the schools may participate in the state equalization fund.

---

1 The original bill had provided for a $1,500 minimum salary to be applied generally throughout the state.

2 On the basis of collections for the first 10 months of the 1945-46 fiscal year, $6,000,000 is a conservative figure.

Table 17

Revenue Sources For Public Schools In Colorado

(Dollar amounts in thousands)

Source	Academic Year 1941-42[1]	%	Academic Year 1944-45	%	Academic Year 1946-47	%
Federal Gov't	$ 162	.6	$ 162[2]	.7	$ 162[4]	.6
State Public School Income Fund	854	3.4	803[3]	3.3	803[4]	3.1
State Income Tax	1,069	4.2	2,248[3]	9.4	4,200[5]	16.2
County Taxes	4,000	15.9	3,363[3]	14.0	3,363[4]	13.0
District Taxes	19,000	75.9	17,280[3]	72.4	17,280[4]	66.9

1 Approximate figures. See O. L. Troxel, Public Education in Colorado, Colorado Education Association 1944.
2 Federal Government Funds for Education, U. S. Office of Education, 1945
3 State Department of Education, Denver, Colorado. Figures supplied July 3, 1946.
4 Assuming these amounts will remain approximately the same as for 1944-45.
5 Estimate based upon 1945 law relative to income tax allocations.

Should the relative amount of state assistance for public education under the new law be about 19 percent, Colorado will still be far down on the list of states according to rank on the basis of relative support for public education. If ratios for other states stay the same as for 1944-45 (see Table 16), Colorado would be fourteenth from the bottom and her contribution would represent a relative amount not much more than half the percentage contribution made by the average state.

Special Problems Relating to the Colorado Income Tax

1 - Federal Income Tax Deductions

With the development of Federal income and excess profits taxes in World War II, state governments encountered more and more competition from the National government relative to their own income taxes. For example, Federal income tax collections from Colorado increased from a total of $15,209,000 in 1939 to over $146,000,000 in 1945. Table 18 shows the amount of collections by fiscal years from Colorado corporations and individuals since 1939.

A number of states anticipated the increase of Federal taxes by adjusting their own income tax laws. They eliminated or at least reduced the effect of the increasing National competition for revenue by disallowing any deductions for Federal taxes. Therefore, an individual

Table 18

Federal Corporation and Individual Income Tax Collections from Colorado by Fiscal Years 1939 to 1945.[1]

Fiscal Year Ending June 30	Corporation	Individual	Total
1939	7,533,678	7,675,816	15,209,494
1940	6,105,331	7,260,695	13,366,026
1941	8,793,265	8,440,073	17,233,338
1942	15,150,515	19,375,455	34,525,970
1943	21,100,690	45,334,795	66,435,486
1944	26,483,617	117,300,417	143,784,036
1945	28,804,634	117,345,655	146,050,290

1 Annual Reports of Commissioner of Internal Revenue, U. S. Treasury Department. Excess profits taxes are not included.

in one of these states can no longer deduct the Federal income tax before figuring the state tax. By 1946, fifteen states had such provisions in their revenue laws.[1] Western states included in the list of jurisdictions not allowing deductions for Federal income taxes are California, Oregon, and Montana.

It has been proposed that the Colorado law be amended so as no longer to permit deductions for Federal income taxes. Should such a change be made, considerably more revenue could be obtained from the state income tax. Table 19 indicates the effect upon taxpayers in selected brackets of income if the amendment were enacted into law. For example, a net income, before Federal taxes, of $4,000 received by a married person with two dependents is now taxed $3; the proposed change would increase the tax to $7.

The same table also shows Colorado's income tax as a percentage of net income for selected brackets under the present and proposed laws. It may be noted that at present, because of Federal tax deductions, a $10,000 net income is taxed by Colorado at a rate of only .8 percent, a $100,000 net income at the low rate of 1.8 percent, and a $1,000,000 net income at the rate of only .9 percent. Should the provision be dropped for Federal tax deductions, as has occurred in at least 15 other states, the Colorado tax rate progression (Column e) would be much more in accordance with correct standards of equity. Now, however, the Colorado income tax is actually regressive in the upper brackets of income.

1 Colorado Dept. of Revenue, Regulations Relating to Colorado Income Tax, 1945

2 Calculations based upon Federal Taxes under Revenue Act of 1945 (Effective January 1, 1946).

It is possible to estimate the approximate amount of additional revenue which could be obtained from the state income tax if the provision were to be discontinued permitting deductions for Federal income taxes. Personal income tax collections would increase by about $1.5 to $2 million,[1] while the yield of the corporation income tax would increase by an estimated $1 million.[2]

1 This estimate was obtained by applying 1946 Federal income tax rates and exemptions to average net income received by Colorado residents by income levels. The resulting estimates of federal taxes were deducted from the levels of average income and Colorado income tax rates and exemptions were then applied to these levels of income. The actual tabulations are not included in this study as the procedure followed as well as much of the basic data are similar to those found in Appendix A.

2 This figure is based upon federal corporation income tax collections in 1945. It disregards the excess profits tax as the latter was repealed effective January 1, 1946.

2 - Surtax on Income from Intangibles

As previously discussed, at the time the income tax law was enacted in Colorado, all intangible personal property was made exempt from taxation under the property tax. Thus the application of the tax was confined to the owners of real and personal tangible property located in the state, while approximately one billion dollars of intangible wealth was legally freed from paying any mill levy tax to state or local governments.

Prior to 1937, most intangible property had escaped taxation because it was generally conceded that the property tax rates (a state wide average of about 35 mills) was so heavy that the effect of the application of the tax would be confiscatory. It was generally agreed, however, that the large body of intangible wealth in the state represented some tax paying ability and, consequently, the arrangement of levying a two percent surtax (based upon income from the intangible) in lieu of the property tax became part of the new income tax measure.

Thus a very moderate tax, as compared with the property tax upon real and personal tangible property, was levied upon intangibles. Even this restrained tax was reduced in 1943 by legislative amendment. Since January 1, 1943, an exemption of $200 of income from intangible personal property,[1] per individual taxpayer has been permitted before a surtax is applied.

The effect of the 1943 amendment as compared with the 1937 law and the property tax law prior to 1937 is shown in a number of hypothetical cases in Table 20.

Table 20

Tax Liability of Owners of Intangible Property (Stocks, Bonds, Mortgages, etc.) under the Colorado Law Prior to 1937, 1937-42, and Since 1942.

Value of Intangibles	Amount of Income[1]	Tax Liability		
		Under Property Tax Prior to 1937[2]	Surtax Under Income Tax 1937-42	Surtax Under Income Tax Since 1942
$ 5,000	$ 200	$ 175	$ 4	0
10,000	400	350	8	4
100,000	4,000	3,500	80	76

1 Assuming a 4% average yield. Should the yield be less than 4%, the contrast would be even greater.
2 Assuming an average rate of 35 mills.

It may be observed that under the old property tax before 1937, rates were high enough to tax away practically all income. However, the sub-

1 According to the income tax law, such income includes dividends, royalties and interest from stocks, bonds, mortgages, deposits, etc.

stitution of a two percent surtax for the property tax under the 1937 income tax law appears to have been the other extreme -- a $5,000 investment paying merely $4 and a $100,000 investment, $80. Nevertheless, in effect, these low rates were reduced still further by the 1943 amendment -- a $5,000 investment paying no tax whatsoever.

The owners of approximately one billion dollars of intangible wealth in Colorado paid total surtaxes (in lieu of any property taxes) of $861,649 in 1943.[1] In striking contrast, during the same year, owners of real and personal tangible property having an assessed valuation of $1,193,836,023 paid total property taxes of $43,671,467. Even though assessments averaged as low as 50 percent of true value, real and personal tangible property in the state was being taxed about 20 times as much, per dollar of value, as intangible wealth. The discrimination was even greater in 1945 as surtax collections amounted to only $639,864 as contrasted with $861,649 in the earlier year. This decline of $221,784 or 25.6 percent can be attributed to the $200 exemption which has been permitted since 1943.

3 - Community Property Laws

Community property laws affect the income tax by generally reducing the amount of tax liability of income receivers. This is because under community property laws, in the absence of contracts to the contrary, all property is held to be owned equally by husband and wife. Therefore, as income when received is considered property in those states recognizing community property, the husband and wife may file separate returns, each declaring half of the income, regardless of which one may have earned it. Thus the income tax may be reduced because of avoiding higher surtax rates in the upper brackets of income.

This reduction of income tax liability is especially significant relative to the federal government. Eight states had community property laws prior to the enactment of the federal income tax in 1913 and since then these states -- Arizona, California, Idaho, Louisiana, Nevada, New Mexico, Texas and Washington -- have contributed relatively less income tax revenue to the national government than other states. The Supreme Court has upheld the right of husbands and wives to file separate returns in these states.

---

1 Collections in 1943 were for the previous year -- the last year before the $200 exemption was applied. As the surtax rate was two percent, the income from intangibles would be $43,082,450 in order to yield $861,649 in taxes. By capitalizing this income at an average yield of four percent, an estimate of $1,077,061,250 is obtained -- approximate value of intangible wealth in Colorado. This estimated amount is in addition to federal government securities owned by individuals in Colorado -- the latter being tax exempt for state and local purposes.

In 1939 Oklahoma, and in 1943 Oregon, passed voluntary community property laws for the purpose of reducing the federal income tax liability of married individuals who might elect to come under the state's community property law. However, the Bureau of Internal Revenue challenged the right of states to pass voluntary laws for the purpose of reducing Federal income tax payments. The case involving the Oklahoma law was carried to the Supreme Court and in 1944 by a seven to two decision the law was invalidated.[1]

In 1945, Oklahoma's legislature enacted a community property law with provisions intended to avoid the constitutional difficulties of the earlier law. The bill was patterned after the compulsory laws of the eight states previously mentioned. Although the Supreme Court has not ruled upon the validity of the 1945 measure, in January, 1946 the Bureau of Internal Revenue agreed to accept the new Oklahoma law, permitting husbands and wives to file separate returns.

Therefore, other states may be expected to enact community property laws, perhaps several in the legislative year 1947. Oklahoma expects to save from 15 to 25 million dollars in federal income taxes, yearly. Should Colorado decide to establish such a law, the savings to her citizens would be approximately the same as in Oklahoma. An illustration of the savings based upon the tax law effective 1946 for several income brackets may be seen in Table 21. It may be observed that although there would be savings for all incomes above $3,000, the greatest percentage saving would come in the brackets around $20,000.

Table 21

Comparison of 1946 Federal Personal Income Tax Payments By Selected Brackets of Income, in States With and Without Community Property Laws.[1]

Under 1,000	.....	.....	.....	.....	
1,000 - 2,000	$ 5.70	$ 63,845	.....	.....	$ 63,845
2,000 - 2,500	14.80	85,810	.....	.....	85,810
2,500 - 3,000	24.80	107,830	.....	.....	107,830
3,000 - 4,000	41.70	184,647	$ 3.90	$ 46,675	231,322
4,000 - 6,000	90.00	194,310	25.00	145,900	340,210
6,000 - 8,000	201.60	138,700	94.40	175,772	314,472
8,000 - 10,000	325.20	88,804	205.20	225,720	314,524
Over 10,000	1,162.50	930,000	1,042.50	2,257,012	3,187,012
					$4,645,025 (c)

(a) If tax rates were to be applied to net income after exemptions and credits as follows:

Net Income (Dollars)	Rate (%)
Under 1,000	1
1,000 - 2,000	2
2,000 - 3,000	3
3,000 - 4,000	4
4,000 - 5,000	5
Over 5,000	6

(b) For estimated number of returns and average net income per return see Table 1, Appendix A.

(c) This figure needs adjustment for margin of error (Table 1) and for changes in collections since 1942. It is assumed that the margin of error ($644,373 as found in Table 1) would remain constant. $4,645,025 - $644,373 = $4,000,652. Actual collections in 1944 were $3,302,384 -- 7 percent more than the collections of $3,084,783 in 1942. Thus multiplying $4,000,652 by .07 and adding the product ($280,045) to $4,000,652 we obtain a revised estimate of total collections from individuals in 1944 (if rates had been same as above proposal) amounting to $4,280,697. This would be an estimated increase over actual collections of $978,313.

SHOULD COLORADO ADOPT A SEVERANCE TAX?

Summary and Conclusions

1. A severance tax is a levy upon units of production or of gross value resulting from the severing of natural resources from the soil or water. Products most frequently taxed are oil and natural gas, metals, coal, and other minerals. Less frequently included are fish and forest products.

2. By January 1, 1946, 25 states had severance tax measures on their statute books. About half of these (including Colorado) were applying the tax on a very limited basis, the revenue being allocated for such purposes as inspection, regulation, and conservation of the natural resources being taxed. However, in at least a dozen states, severance taxes were important revenue measures. These states in order of relative rank were Louisiana, Minnesota, Oklahoma, Texas, Mississippi, Arkansas South Dakota, Montana, Utah, New Mexico, Alabama, and Michigan.

3. Most of the leading mineral producing states of the Union now apply severance taxes. Out of the top 20 in mineral production, 12 jurisdictions have such taxes. Out of the 15 leading oil producing states, only three (Illinois, Pennsylvania, and Colorado) have no production tax on oil.

4. Severance taxes usually represent additional taxes upon natural resources, the states also levying a general property tax. One possible exception is the state of Louisiana where exemptions are permitted under the ad valorem tax; however, in this state a series of special license fees, in addition to the severance tax, are placed upon natural resources.

5. The states differ rather widely regarding the disposition of severance tax revenue. Those jurisdictions with extremely low rates on selected products place the revenue in special inspection, regulation, or conservation funds. Allocation by the other states (those with important revenue collections) is usually to the state's general fund. If the revenue is not placed in the general fund, it is earmarked for special purposes -- usually public education. A number of states distribute part of the severance tax money back to the local units from which the natural resource was severed. Local units (counties or townships) dispose of their share by placing it in their general fund or else by allocating it for schools or roads.

6. At present Colorado's severance tax is limited to a levy of 4/10 of one cent per ton on the production of coal. Revenue is negligible

and intended merely for a coal mine inspection fund. Thus, the tax is so restricted and the rate is so low that, practically speaking, the state has no severance tax.

7. Colorado's mineral production is sufficient to justify a productive severance tax. In 1944 the value of output was $79,598,000, placing the state twenty-first in the Union on the basis of mineral production. Leading minerals are coal and molybdenum. In 1944 production of coal amounted to about eight million tons at a value of almost $29 million; production of molybdenum exceeded 23 million pounds at an estimated value of nearly $19 million.

8. Recent oil developments in the state, notably in the Rangely field, have added to the significance of a possible severance tax. During 1945 the net increase in proved oil lands in Colorado was 12,800 acres -- second largest increase among the states of the Union. By January 1, 1946, estimated proved oil reserves amounted to 206 million barrels and will undoubtedly go much higher. Estimated production of crude oil in the state during 1946 is about 11 million barrels -- 125 percent increase over production in 1945.

9. The yield of a severance tax in Colorado would depend upon a number of factors, two important considerations being (a) the number of natural resources included and (b) the particular rates applied. Should all minerals be included under the tax (at the average level of mineral production during the last 20 years) with rates comparable to those in Louisiana and Minnesota, the annual yield would be about $3,000,000. If the tax were relatively as heavy as the average of 12 leading severance tax states, collections would amount to about $1,600,000. If one or more products were singled out and taxed, for example, oil and natural gas, a rate of five percent of gross value would yield approximately $650,000 at current rates of production.

10. Thus, even under the most favorable conditions, a severance tax would not likely be a panacea for all of Colorado's financial ills. However, with a comprehensive tax and average rates, the yield would be sufficient to have real significance. Moreover, there are several non-fiscal advantages of a production tax on natural resources.

11. Advantages of the severance or production tax (in addition to the revenue aspect) are (1) simplicity and ease of administration, (2) the tax can provide an opportunity of equalizing to a greater extent the weight of taxation upon all property owners (under existing laws mineral resources are not taxed as heavily as most other forms of real property), (3) the tax can be easily adapted to any particular conservation policy of the state or nation, for example, rates can be raised to encourage conservation or lowered to promote more rapid exploitation of a currently needed resource, (4) the tax is equitable in that collections are made only when mines and oil wells are producing, and (5) an exhaustible natural resource, being a heritage of the state, should be taxed in such a manner as to reimburse the

state to some extent as the wealth becomes depleted. This last argument becomes particularly significant when mines and oil wells are owned and operated by absentee capital or when the raw products are exported directly from the state.

12. Limitations of the severance tax are (1) yield may be unstable and unpredictable--revenue fluctuating with variations in production from year to year, (2) neither volume of output nor gross revenue is an entirely satisfactory measure of ability to pay taxes (even so the tax is probably superior to the property tax from this standpoint), and (3) the tax needs to be supplemented with some other form of taxation because it does not apply to non-producing mines and mineral lands and the owners of these properties should pay something to the government under ability-to-pay and benefit doctrines.

13. Because of certain provisions in the Colorado constitution, there is some question as to the legal status of a possible severance tax. However, it may be concluded with some reasonable assurance that the state can enact a tax upon production which will not be ruled by the courts to be a property tax; thus avoiding possible legal difficulty because of the uniformity clause of the constitution. Also it may be assumed that the court, although ruling a severance tax to be an excise, will not likely decide that the old age pension fund has a claim upon it. Retail sales, use, and liquor taxes, rather than taxes on production appear to be the kinds of excises constitutionally belonging to the pension fund.

14. Considering all factors, the evidence in Colorado appears to indicate that the adoption of a mineral severance tax at this time would be advantageous.

Introduction

A severance tax is a levy placed upon the production resulting from exploitation of natural resources. In other words, it is a tax applied to mineral, forest, and fishery products severed from the soil and water. The tax is of two general types. It may be a general severance tax applicable to all natural resources, or it may be a selective tax limited to certain products. Also, the levy may be applied according to units of output, for example, tons of coal or barrels of oil; or it may be a percentage tax based upon value of gross output.

Technically speaking, Colorado already has a severance tax; however, its application is so restricted and the rate is so low that in practice the tax can be practically disregarded. It is a levy of .4 of 1¢ per ton on coal mined in the state. Revenue goes into a coal mine inspection fund, the tax being suspended when the fund exceeds $20,000 at the end of any quarter year. Collections of this "so-called" severance tax amounted to only $33,000 in 1945. This figure represented .06 of one percent of total state tax collections[1].

A better appreciation of Colorado's severance tax -- or lack of tax -- may be obtained by referring to the production taxes in other states.

Severence Taxes in Other States[2] 1946

1. Alabama

The severence tax in Alabama applies to coal, iron ore, oil, natural gas, and forest products. The rates are 1½¢ per ton of coal, 3¢ per ton of iron ore, two percent of gross casinghead value of oil and natural gas and 8¢ - 20¢ per thousand board feet log scale of lumber. Collections (preliminary estimate) in 1945 amounted to $504,000.

2. Arkansas

Arkansas applies a severance tax to all natural resources extracted, except timber for personal use and hand-produced switch and cross ties. The rates are based upon gross cash market value, except that coal, timber, and manganese are taxed on the basis of amount produced. The rates are 1¢ per ton of coal, 7¢ per thousand board feet of timber, 10¢ per ton of manganese, and 2½ percent of market value

---

1 Colorado state tax collections in 1945 were $47,234,000. State Finances, 1945, Bureau of the Census.

2 Information in most cases was obtained directly from the various revenue departments of the respective states. Also useful was State Taxes on Natural Resources, Research Report, Federation of Tax Administrators, March 12, 1946.

for all other natural resources. In addition there is a tax of one mill per ton of manganese and .1 percent of gross market value of all other minerals except coal. There is also a severance tax on oil and gas according to the quantity produced. The rates are set by the Oil and Gas Commission but cannot be more than five mills per barrel of oil nor more than .5 mills per cubic foot for gas. Total severance tax collections in 1945 were $1,030,713.

3. California

The severance tax in California is confined to the production of petroleum and natural gas. Rates are based upon units of production and are fixed annually according to the need for revenue. Proceeds of the tax are used for maintenance of the Department of Natural Resources. The revenue need (basis for fixing rates) is found by subtracting the amount of departmental funds on hand at the end of the year from $275,000. Collections in 1945 (preliminary estimate) were $593,000.

4. Florida

Florida's severance tax is levied upon the production of oil and natural gas. The rate is five percent of gross market value. Collection figures are not available; however, estimates based upon oil and gas production in 1944 indicate that the amount of revenue would be negligible.

5. Georgia

The tax in Georgia is applied to oil and natural gas produced in the state. Rates are $\frac{1}{2}\phi$ per barrel of oil and $1/20\phi$ per thousand cubic feet of natural gas. No revenue has been collected recently as the state has had no production of the taxed products.

6. Idaho

Strictly speaking, the severance tax in Idaho is confined to forest products, although there is also a special tax of three percent on the net proceeds from mines. The latter tax is sometimes called a severance tax; however, a true severance tax is based either upon units of output or gross value. The tax upon forests is 12.5 percent of full current stumpage value. Collections in 1945 (preliminary estimate) were $81,000.

7. Kansas

The tax in Kansas is based upon the severance of oil and natural gas. Rates are $1/10\phi$ per barrel of oil and $1/20\phi$ per thousand cubic feet of gas for conservation. There is also a tax of $1/25\phi$ per barrel of oil for a fund to prevent stream pollution. Collection figures are not available; however, estimates based upon production in 1944 indicate approximately $212,200 of revenue.

8. Kentucky

Kentucky has a severance tax upon petroleum which is based upon the market value of crude oil. The state rate is .5 percent; there is also an optional county maximum rate of one percent. 1945 collections were $240,322.

9. Louisiana

Louisiana's tax is based upon the severance of all natural resources from the soil or water. The amount of tax is determined by quantity of the resource severed. Specific rates are as follows: coal, lignite and ores, 5¢ per ton; gravel, shells and stone, 1.5¢ per ton; salt, 4¢ per ton; sand 1¢, and marble 10¢ per ton. Sulphur has a rate of $1.03 per long ton; gas, .3¢ per thousand cubic feet; oil, 6 - 11¢ per barrel (depending upon specific gravity). Distillate or condensate from oil or gas has a rate of 11¢ per barrel; natural and casinghead gasoline, 1¢ per barrel. Timber has a rate of 7 - 26¢ per thousand feet log scale (depending upon kind), except six percent market value if grown under reforestation conditions; pulpwood, 6¢ per cord; crude gum turpentine, 10¢ per barrel; per barrel: oysters, 2½ - 3¢ shrimp, 10¢ fresh and 35¢ (for canning). Collections (preliminary estimate) in 1945 amounted to $16,253,000.

10. Michigan

The severance tax in Michigan is applied to oil and natural gas and is based upon the gross cash market value and quantity of product. Rates are two percent of gross value plus 1/8¢ per barrel of oil. Collections for the fiscal year 1945 were $571,367.

11. Minnesota

Minnesota's severance tax is confined to the mining of iron ore. Rates are based upon gross value after certain specified costs have been deducted. The rate is 10½ percent for 1945 and 1946, and nine percent thereafter; in addition for taconite, 5¢ per ton marketable ore concentrate plus some additional tax if iron content is heavy. Collections in 1945 were $6,249,985.

12. Mississippi

The tax in Mississippi applies to oil and forest products. For oil the rate is 6¢ per barrel or six percent of value at point of production, whichever is greater; for forest products the rate is 15¢ per thousand board feet except for poles and piling, one percent of market value; pulpwood, 6¢ per cord; light wood, 5¢ per ton; turpentine, 6¢ per barrel. In 1945 the tax yielded $1,440,437.

13. Montana

Montana has a severance tax upon metalliferous products, coal, oil and natural gas. The metals are taxed at a rate ranging from one fourth to one percent of gross value; coal at the rate of 5¢ per ton; oil two percent plus 1/4¢ per barrel; gas 3/8¢ per thousand cubic feet. Collections in 1945 (preliminary estimate) were $777,000.

14. Nevada

Strictly speaking, the tax in Nevada is not a severance tax because it is applied to not instead of gross proceeds of mines. However, because the tax upon patented mines is in addition to the property tax, the former is commonly classified with severance taxes. The rate is set by the Tax Commission on the basis of state and local property tax rates and is based upon net proceeds. Collections in 1945 (preliminary estimate) were $49,000.

15. New Mexico

The severance tax in New Mexico is upon all natural resources severed from the soil. The measure of the tax is gross value of product minus royalties paid to the United States, New Mexico, or Indians. The rate on oil and gas is 2-1/8 percent; on coal, copper, gold, lead, silver, stone, asphalt, zinc, and timber the rate is 1/8 percent; on potash, one percent. New Mexico also applies the property tax on oil and gas upon the basis of gross value of products. Collections of the severance tax in 1945 (preliminary estimate) amounted to $884,000.

16. North Carolina

North Carolina's tax is applied to the severance of oil and natural gas. Rates are ½¢ per barrel of oil and 1/20¢ per thousand cubic feet of gas. As no production of oil or gas occurred in 1945 there were no tax collections.

17. Oklahoma

Oklahoma applies a severance tax upon natural resources according to gross value of output. The rate upon asphalt and ores is 3/4 percent; upon oil and gas, five percent. There is also an additional excise on oil of 1/10¢ per barrel. Collections in 1945 (preliminary estimate) were $8,626,000.

18. Oregon

Oregon's severance tax is upon oil and timber cut from reforestation lands. Rates are ½¢ per barrel of oil and 12½ percent of the gross yield of timber. Collections in 1945 (preliminary estimate) amounted to $134,000.

19. South Dakota

The severance tax in South Dakota applies to the extraction of mineral products. The measure of the tax is actual value at place of production after mining, severing, and processing. There is a yearly exemption amounting to the value accruing from the first 100,000 tons severed. The tax rate is six percent. Collections in 1943 were $1,110,000 but dropped to $2,000 in 1945 because of low production.

20. Tennessee

Tennessee's severance tax law, enacted in 1943, is applied to the production of oil and natural gas. Rates are 5¢ per barrel of oil and five percent of selling price of gas. Provision has not as yet been made for administration of the act. There are no figures regarding collections of possible revenue; however, the amount would be negligible. Besides having no provision for administration, there has been almost no production of oil and gas.

21. Texas

The Texas tax applies to the severance of natural resources. There is a tax of $1.272 per long ton of sulphur production. Oil is taxed at a rate of 4.125¢ per barrel if market value is $1.00 per barrel or less, otherwise 4.125 percent of market value. There is also an additional tax on oil of 3/16¢ per barrel for administrative purposes. Natural gas is taxed on the basis of value of gross production less two percent, the rate being 5.2 percent with certain provisions for minima. Ores are taxed at the rate of 5¢ per ton; marble and cinnabar at 10¢ per ton. Collections (preliminary estimate) in 1945 were $41,651,000.

22. Utah

Utah's severance tax is restricted to metalliferous ores extracted from mines in the state. The rate is one percent of gross value of the metals sold less an exemption per year of $20,000. Collections in 1945 were $1,023,000.

23. Washington

The Washington tax applies to fish and is based upon quantity taken. Rates vary according to products. Collections (preliminary estimate) in 1945 were $180,000.

24. Wisconsin

The tax in Wisconsin is upon forest products only. The rate is ten percent (with certain exceptions) upon the stumpage value of the timber. Collections were $61,000 in 1943 (complete figures not available for 1945).

It will be noted that 24 states, in addition to Colorado, have severance tax provisions on their statute books. However, a number of these states either have no current production of the taxed products or else make no provision for collection of revenue. Table 1 lists the 21 states, with available figures, in their rank according to amount of collections in 1945 and indicates the products in each case to which the tax is applicable.

Table 1

Severance taxes by Rank of States According to Collections in 1945.

State	Tax Applicable To	Amount Collected in 1945[1]
Texas	All Natural Resources	$41,651,000
Louisiana	" " "	16,253,000
Oklahoma	" " "	8,626,000
Minnesota	Iron Ore	6,249,985
Mississippi	All Natural Resources	1,440,437
Arkansas	" " "	1,030,713
Utah	Metalliferous Ores	1,023,000
New Mexico	All Natural Resources	884,000
Montana	Metals, Coal, Oil, Natural Gas	777,000
California	Oil, Natural Gas	593,000
Michigan	" " "	571,367
Alabama	Coal, Iron Ore, Oil, Gas, Forests	504,000
Kentucky	Crude Oil	240,322
Kansas	Oil and Natural Gas	212,200
Washington	Fish	180,000
Oregon	Forest Products, Oil	134,000
Idaho	" " "	81,000
Wisconsin	" " "	60,000
Nevada	Metals of patented mines	49,000
Colorado	Coal	33,000
South Dakota	Mineral Products	2,000[2]

It may be observed that of the 21 states in the group, six apply the tax to all natural resources severed from the soil. Products subjected to the tax most frequently by the other 15 states are oil and gas, coal, iron ore, all metals and forest products.

Total collections in 1945 amounted to about $80,595,024. Among the states using the severance tax, probably only a dozen jurisdictions have sufficiently high rates and broad enough coverage for tax yields

1 - Preliminary estimate by Bureau of the Census except for Minnesota, Mississippi, Arkansas, Michigan, and Kentucky; for these states figures were obtained directly from state revenue departments. Independent estimates were made for Kansas and Wisconsin.
2 - Yield in 1943 was $1,110,000.

to be really significant. They are Texas, Louisiana, Oklahoma, Mississippi, Arkansas, New Mexico, and Michigan which all receive revenue primarily from the tax upon petroleum and natural gas; and Minnesota, South Dakota,[1] Montana, Utah, and Alabama which depend upon extraction of metals for most of their severance tax revenue.

Tax collections are available for 17 states which apply the severance tax (at least to some degree) to minerals. The value of mineral output for 1944 in these states is shown in Table 2. The same table also gives the yield of the severance tax as a percentage of mineral production in each state. This is a good index for comparing the taxes of the respective states. It may be seen that Minnesota and Louisiana with a rate of about five percent depend relatively more upon the severance tax than other states in the group; while Nevada, California, Kansas, and Colorado with rates of .1 percent or less have lightest taxes. Actually the five latter states do not apply the severance tax as a general revenue measure at all and collections of revenue are insignificant.

Table 2

States Applying Severance Taxes upon Minerals, Value of Mineral Production and Yield of Tax as Percentage of Production (1944)

State	Value of Mineral Production in 1944, (all minerals)[2]	Severance Tax Collections in 1944[3]	Percentage
Minnesota	170,465,000	8,690,000	5.1
Louisiana	304,894,000	15,126,000	4.9
Oklahoma	260,576,000	7,965,000	3.1
Texas	1,319,378,000	31,889,000	2.4
Mississippi	18,988,000	405,000	2.1
Arkansas	68,423,000	1,357,000	2.0
South Dakota	5,465,000	99,000	1.8
Montana	89,479,000	966,000	1.1
Utah	150,153,000	924,000	.7
New Mexico	126,230,000	923,000	.7
Alabama	108,460,000	533,000	.5
Michigan	151,992,000	606,000	.4
Nevada	51,800,000	55,000	.1
California	606,918,000	553,000	.09
Kansas	219,678,000	212,000	.09
Kentucky	273,597,000	180,000	.06
Colorado	79,598,000	33,000	.04

1 Although the yield of South Dakota's tax was very low in 1945, this was because the silver mines were practically closed. Collections in the state in 1943 were $1,110,000.

2 Minerals Year Book, 1944, Bureau of Mines

3 State Finances, 1944, Bureau of Census

It is interesting to calculate the various amounts of revenue which a severance tax could yield in Colorado if rates were comparable, in each case, with those in other states. Such estimates are given in Table 3. Only those states taxing natural resources as a source of revenue for purposes other than inspection, regulation, conservation, etc. are included. It may be seen that if Colorado had a tax comparable with taxes in Minnesota or Louisiana the yield would be about $4 million. However, if the tax were comparable with Michigan's the yield would be little more than $300,000; if relatively equal to the average for the 12 states, collections would be about $1,600,000.

Table 3

Various Amounts of Severance Tax Revenue which Colorado could Obtain if Her Tax were Comparable, in Each Case, with Leading Severance Tax States.

State	Severance Tax as Percentage of Production[1]	Amount Colorado could Obtain if her Tax were Comparable to:[2]
Minnesota	5.1	$4,059,498
Louisiana	4.9	3,900,302
Oklahoma	3.1	2,467,538
Texas	2.4	1,810,352
Mississippi	2.1	1,671,558
Arkansas	2.0	1,591,960
South Dakota	1.8	1,432,764
Montana	1.1	875,578
Utah	.7	557,186
New Mexico	.7	557,186
Alabama	.5	397,990
Michigan	.4	317,392
	Average Amount	1,636,608

1 Table 2
2 Calculations based upon Colorado 1944 mineral production valued at $79,598,000.

Of course such calculations are based upon Colorado's mineral production in 1944. Should production decline, the amount of severance tax revenue would decline also. On the other hand, if output of minerals should increase -- perhaps due to extensive oil developments in the state -- then tax collections would correspondingly become greater than those shown in Table 3.

With reference to taxation of natural resources it may be significant to consider the number of states with important mineral production which apply severance taxes to the exploitation of such minerals.

Table 4

Leading States in Mineral Production
With and Without Severance Taxes

State	Rank	Value of Products[1] 1911-44 Incl. (Thousands)	Severance Tax on Minerals
Pennsylvania	1	$25,083,338	No
Texas	2	14,309,453	Yes
California	3	11,941,625	Yes
West Virginia	4	10,344,866	No
Oklahoma	5	9,805,350	Yes
Illinois	6	6,630,003	No[2]
Ohio	7	5,944,592	No
Kentucky	8	3,862,501	Yes[3]
Kansas	9	3,769,955	Yes
Michigan	10	3,744,812	Yes
Minnesota	11	3,658,344	Yes
Louisiana	12	3,292,703	Yes[4]
Arizona	13	3,129,226	No
Utah	14	2,710,359	Yes
Indiana	15	2,552,981	No
New York	16	2,470,257	No
Montana	17	2,444,899	Yes
Missouri	18	2,162,690	No
Colorado	19	2,052,805	Yes[3]
Alabama	20	1,991,473	Yes

1. Minerals Year Book, 1944, Bureau of Mines
2. Illinois had a severance tax until 1944 when the law was invalidated by the courts.
3. Severance taxes in Kentucky and Colorado are so restricted and rates are so low that revenue is insignificant.
4. In lieu of property tax. In all other states the tax is in addition to the property tax.

Table 4 gives the rank of the 20 leading mineral producing states of the country and indicates which of these have severance taxes. It may be noted that six out of the top 10 states have production taxes while 12 out of the leading 20 states apply such revenue measures. The mineral production tax in all 12 states (except in Louisiana) is in addition to the regular property tax upon mines and oil wells.

Because of the recent extensive petroleum developments in Colorado, people in the state are particularly interested in a severance tax upon oil and natural gas. From Table 5 it may be seen that of the 15 leading oil producing states in the Union only three (Illinois, Pennsylvania, and Colorado) do not have a production tax on oil while one of these three (Illinois) did apply a severance tax to oil production until its law was invalidated by the courts in 1944.

Table 5

Leading States in Petroleum Production
With and Without Severance Taxes Upon Petroleum

State	Rank	Oil Production in 1945[1] (Barrels)	Severance Tax on Oil
Texas	1	749,373,000	Yes
California	2	325,995,000	Yes
Oklahoma	3	139,379,000	Yes
Louisiana	4	137,409,000	Yes
Kansas	5	96,496,000	Yes
Illinois	6	73,460,000	No[2]
New Mexico	7	37,686,000	Yes
Wyoming	8	36,319,000	Yes[3]
Arkansas	9	28,565,000	Yes
Mississippi	10	19,024,000	Yes
Michigan	11	17,278,000	Yes
Pennsylvania	12	12,237,000	No
Kentucky	13	9,938,000	Yes
Montana	14	8,507,000	Yes
Colorado	15	4,862,000	No

1 Oil and Gas Journal, January 26, 1946
2 Law invalidated in 1944 — no new law as yet enacted.
3 Although the tax is not commonly called a severance tax it has most of the features. Property tax rates are applied to the gross value of oil production.

The states applying production taxes to natural resources differ rather widely regarding the disposition of revenue. Those states with extremely low rates on selected products, for example, Colorado with a 4/10 of 1¢ per ton of coal mined, apply the revenue to special funds for inspection, regulation, conservation, etc. Disposal of revenue among the other states (those with most important severance taxes) is shown in Table 6.

Table 6

Disposition of Revenue
Among Leading Severance Tax States

State	Disposition of Revenue
Alabama	Forest products, oil and gas: conservation purposes. Iron ore, coal: Schools -- state and lo
Arkansas	Forest products: conservation Other products: 2/3 to schools, 1/3 returned to counties for highways and schools.

Source: Communications from revenue departments of various states.

1 Revenue allocated by state in various percentages to schools, roa pensions, general functions, etc.

It may be seen that half of the states in this group place the revenue in the state's general fund. Among the other half, the revenue is divided between the state and local units, requirements in most cases being that the revenue must be spent for special purposes -- usually public education.

Present Taxes on Colorado Mines and Oil Wells

Before considering the relative merits of a severance tax for Colorado, it is desirable to see how such a tax would fit into the existing scheme of state and local taxation. Consequently, a brief outline of the development and current status of Colorado mine taxation is presented.[1]

A. Taxation of Producing Metalliferous Mines

Since the time when Colorado was a territory, taxation has been a basis for rivalry between the agricultural and mineral interests of the state. Each group has attempted to relieve itself from what was considered onerous taxes by transferring as much of the total burden as possible to the other group. Several times the ranchers and farmers appear to have possessed superior political power while during other periods the miners have been able to exert more influence relative to taxation.

When Colorado became a state in 1876 the new constitution specifically exempted mines from taxation for a period of 10 years, except for taxes upon net proceeds and surface improvements. The legislature provided for no net proceeds tax and consequently the mines were largely tax free during this early period. Lake county did attempt for three years to tax the net proceeds of mines but the effort[2] ceased in 1881 when the courts declared the measure to be illegal.

The tax discrimination in favor of mining interests of Colorado during the first decade under the constitution caused a growing demand, especially from the farmers for the inclusion under the property tax of all mining properties. Consequently, upon expiration of the exemption period several bills were sponsored in the legislature providing for taxation of the mineral wealth of the state. The mining men strenously opposed an ad valorem tax on property and held out for a production tax. They argued that should mines be taxed in the same manner as farms and other real estate, the industry would be crippled to such an extent that mines would close, capital would migrate to other states and unemployment would become widespread.[3]

---

1 An article by the writer entitled "The Taxation of Minerals in Colorado With Special Reference to Oil Shale Deposits" published in the Bulletin of the National Tax Association, April, 1945, was used as a principal basis for discussion in this section.

2 The Little Pittsburgh Mining Company successfully fought the tax levy through the courts on the grounds that the legislation had not provided a method for taxing mines according to the net proceeds principle. Stanley vs. Little Pittsburgh Mining Company, 6 Colorado 416.

3 This argument against taxation has frequently been used by many industries in other states as well as in Colorado.

Finally, in 1887, a compromise measure was adopted. Mines were included under the property tax; however, assessments were to be moderate because of the fear of discouraging further development of mineral resources. The law provided that producing mines with an output exceeding $1,000 annual value were to be assessed at one-fifth of the gross proceeds. Non-producing mines were taxable as before, on their surface improvements only.[1] The miners accepted this law without opposition. They still were being favored under the tax system of the state.

At the turn of the century, lack of sufficient revenue to support expanding functions of state and local government led to the appointment of a special revenue commission to investigate state finances. Its report, published in 1901, when referring to mines stated that:

> The taxation of mines and mining property is a farce, notwithstanding that a large part of them are owned by non-residents. The value of the gold and silver mines of Colorado is more than the entire assessed value of all taxable property of the state; yet, while one mine last year sold for $10,000,000, all of the gold and silver mining properties of the state were only assessed at $8,502,217 for the year 1898, and Colorado the principal mineral state in the union.[2]

The same year the legislature revised the state's revenue law in an effort to increase its yield as well as to make the system more equitable. All producing mines, whose annual value exceeded $1,000, were to be assessed at one-fourth of the gross proceeds, rather than one-fifth as previously. However, this tax based upon gross proceeds was to apply only to mines producing gold, silver, lead, copper, or other precious or valuable metals.[3] A state board of assessors was appointed to help administer the law but its legal status was considered dubious and the mining interests took advantage of the uncertainty by contesting the action of the board as they were opposed to higher assessments on mines.

In order to untangle the situation, Governor Oram called a special session of the legislature. Having support from the farmers, the Governor accepted the challenge of the miners and requested the legislature to go further than it had in 1901 in authorizing higher assessments on mines. Accordingly, a bill was introduced providing for the taxation of all mines on their full cash value, like other property. After a bitterly fought contest the bill was defeated by a narrow margin. The mining group then sponsored a compromise measure which was finally passed and approved by the Governor.

1 Laws of Colorado, 1887, p. 340.
2 Report of the Revenue Commission of Colorado, 1901, p. 6.
3 Laws of Colorado, 1901, ch. 94, sec. 82.

The new measure of 1902, like that of the previous year, applied only to mines producing gold, silver, lead, copper, or other previous and valuable metals. These mines were divided into two classes, those yielding $5,000 annually in gross revenue to be called producing mines, those with less to be called non-producing. Producing mines were to be valued for assessment purposes at one-fourth of the gross or upon the total net proceeds, whichever was the greater. When determining net proceeds, the mines were permitted to deduct the actual cost of extracting the ore from the mine, the cost of transporting it to the place of reduction or sale and the cost of reduction or treatment. Mines, producing coal, iron, or asphalt, quarries, or lands valuable because they contain other metals, minerals, or earths were to be taxed as other property in the state.[1]

Although the new law improved the revenue system of the state its provisions were still too lenient to bring an equitable distribution of the tax burden. Then as years passed, conditions became even less satisfactory due to under-assessments, especially in some of the mineral producing counties of the state. Production from metalliferous mining claims, as reported in the abstracts of assessment by county assessors, dropped from $8,451,255 in 1908 to $1,479,146 in 1912, while the actual value of production in those years rose from $32,718,573 to $37,320,966.[2]

Rather profound changes occurred in the Colorado tax system following 1911. Warren A. Roberts summarizes some of these developments as follows:

> "The wave of tax reform that swept the Western States just before the first World War also left its imprint on the state of Colorado. In 1911 the legislature provided for a state tax commission and following the specific recommendation of the state board of equalization directed it to assess all property at full cash value. But a companion bill to prevent any appreciable increase in taxation by limiting tax rates failed of passage, as did a proposed constitutional amendment giving the tax commission direct power to equalize valuations. The failure of this amendment at the general elections left the commission little control over the assessment of mines or any other property, except through moral suasion of local officers and of members of the state board of equalization. The board of equalization, in turn, had little legal authority, for the court in 1900 had declared that it could not change the valuation of classes of property within counties."[3]

The new tax commission used what little power it possessed trying to obtain full cash valuations for property throughout the state and

1 Laws of Colorado, Extra Session, 1902, ch. 3, sec. 81
2 First Annual Report, State Tax Commission, p. 38
3 State Taxation of Metallic Deposits, P. 169

argued that mines should be assessed the same as all other property. It emphasized that "In view of the state going onto a full cash valuation, the gross output from mines, if taken as a basis of value at all, should be assessed at not less than 100 percent."[1] The legislature of 1913 considered the latter proposal and, in spite of strenuous opposition from the miners, made provision for the tax base on producing mines (those producing gold, silver, lead, copper or other precious or valuable minerals exceeding $5,000 per annum gross output) to be increased to 50 percent of the gross and all of the net proceeds.[2] County assessors responded remarkably well to the desires of the tax commission and as a result the total state valuations of all property increased from $422,330,199 in 1912 to $1,119,985,034 the year following.

Although mine valuations were increased they did not increase as much as valuations on other property and as a consequence inequality of tax burdens as between agriculture and mining probably remained about the same as before 1912. Nevertheless mining men contended that the larger tax base worked a hardship upon mines with a large gross and, through effective pressure, induced the legislature to readopt in 1915 the old base of one-fourth of the gross or the net proceeds, whichever was the greater. The 1915 provisions have never been amended.[3]

After 1915 for several years the commission (in its own words) "consistently and persistently urged that metalliferous mining property should be assessed at its actual value."[4] Agitation for mine tax reform died down during the 1920's and 1930's as most mines no longer were receiving high profits. However, with the onset of the second World War in 1939 profits increased again for many mining companies. As war activity developed, these profits continued to grow among those mines producing metals and minerals needed in war industries, the most notable example being the Climax Molybdenum properties located in Lake County. Also after extensive oil discoveries beginning in 1945 in the Rangely field, the exploitation of petroleum reserves became much more profitable. As a consequence, renewed efforts to revise the tax system may again be expected relative to the mineral wealth of the state

B. Taxation of Other Mines and Oil Wells

The preceding discussion has been confined largely to an outline of the taxation of producing metalliferous mines. A brief reference should be made to other mines and oil wells of the state.

1 First Annual Report, State Tax Commission
2 Laws of Colorado, 1913, ch. 139, sec. 2.
3 Colorado Statutes Annotated, ch. 142, par. 84. (1935)
4 Eighth Annual Report, State Tax Commission, 1919

Since 1887, according to law, non-producing metalliferous mines,[1] quarries, coal and iron mines, and oil and oil shale lands have been included under the property tax with assessments to be on the same basis as all other property in the state, namely, 100 percent of the true market value.[2] However, during much of the time in this period, perhaps because of the difficulty of placing valuations upon underground deposits, assessments have been based primarily upon the surface value and the value of improvements of these mines. Consequently, they have frequently been undervalued even to a greater extent than has been true of producing metalliferous mines. Yet because changes in property tax assessments and levies tend to lag behind changes in value of output, relative tax burdens have increased significantly during periods of low mine activity. Throughout these slack periods, when profits have not only been nonexistent but also costs not always covered, many mining claims have probably been taxed excessively.

During recent years, what has been the relative condition of these mines whose properties, under the law, are subject to assessments at full cash value? Some idea may be obtained by referring to the taxation of coal mines in the state.

Table 7 indicates that since 1920 the assessed valuation has had little relation to the value of output.

Assessed valuations expressed as percentages of coal production increased from 50.0 percent in 1920 to 87.2 percent in 1930 and then declined to 20.8 percent in 1944. Such fluctuation from year to year in the relative burden of taxation is not conducive to stability and prosperity in the coal mining industry. However, as it is fantastic to assume that full market value of coal mines would likely ever fall below the corresponding value of their annual output, the mines were probably greatly underassessed even in 1930, but by 1944, underassessments were very much greater.

---

1 Until 1902 this classification referred to any mine producing gold, silver, lead, copper, or other valuable or precious metal the annual output of which did not exceed $1,000 gross product. Since 1902 the same kind of mine has been included when the gross product has not exceeded $5,000.

2 Colorado Statutes Annotated, ch. 142, par. 82 and 89. (1935)

Table 7

Value of Colorado Coal Production and Assessed Valuation of Coal Mine Properties for Selected Years

Year	Value of output[1]	Assessed Valuation[2] Total	As % of output
1920	$42,829,000	$21,416,182	50.0
1925	30,694,738	26,325,299	85.7
1930	21,583,805	18,823,708	87.2
1935	14,753,521	8,389,311	56.9
1940	17,749,060	4,602,540	25.9
1944	28,791,000	5,998,201[3]	20.8

1 Colorado Year Book, 1943-44, State Planning Commission
2 Compiled from figures in Reports of Colorado Tax Commission for Years indicated.
3 Includes value of coal mining equipment and machinery

Table 8 gives the relationship between assessed valuation and value of output in the crude oil industry for selected years since 1925. It may be seen that the ratio increased from 45.8 percent in 1925 to 133.7 percent in 1940 and then fell to 60.5 percent by 1945. If assessments were satisfactory in 1940 (the writer could find no evidence that they were too high) then assessments were definitely too low by 1945. This conclusion is borne out by the figures relative to proved oil reserves (Table 15). Known reserves increased from a total of 20 million barrels in 1940 to 58 million barrels in 1945.

Table 8

Value of Petroleum Production and Assessed Valuation of Oil Properties for Selected Years

Year	Value of Output[1]	Assessed Valuation[2] Total	As % of Output
1925	$1,817,553	$ 833,219	45.8
1930	1,242,257	1,448,437	116.5
1935	1,410,209	1,776,060	125.9
1940	1,700,090	2,273,412	133.7
1945	5,348,200[3]	3,482,957[4]	60.5

1 Colorado Year Book, 1943-44.
2 Compiled from figures in Reports of Colorado Tax Commission.
3 Based upon a valuation of $1.10 per barrel. (See Oil and Gas Journal, Jan. 1946)
4 Estimated.

Tax assessments upon other non-metallic minerals of the state have probably fluctuated to as great an extent as those upon coal mines and oil wells and reserves. Consequently, the taxation of mineral deposits, which under the law should be assessed at full market value, has been no more satisfactorily administered than the taxation of metallic ores.

Because of past rivalries between agriculture and mining, it might be of interest to compare the two industries relative to present tax burdens. The only available common denominator for drawing such a comparison is the value of output in each industry. The writer recognizes the shortcomings of gross product as a basis for measuring tax paying ability; however, if comparisons are confined to general considerations between the two industries, without reference to particular mines or farms, conclusions are probably significant.

In 1944 the assessed valuation of all mining properties was $45,945,304.[1] The average tax levy for all property in the state was 36.1 mills.[2] Thus it may be estimated that mining properties paid a total property tax of about $1,657,000. This figure probably exceeds the actual amount paid inasmuch as several mines, notably the molybdenum mines in Lake County, are located in tax districts with mill levies considerably below the state average.[3] The total value of output from Colorado mines in 1944 was $79,598,000 (Table 9). Relating this output to estimated property taxes paid of $1,657,000, we obtain a ratio of 2.07 percent. Thus, mines of the state paid an average property tax amounting to about 2.07 percent of the value of their gross output.

In 1944 the assessed valuation of all farm property was $334,254,444.[4] Applying the average tax levy for all property in the state (36.1 mills) to the farm valuation, we obtain an estimate of property taxes paid by farm properties of $12,066,585. The

---

1 Annual Report, Colorado Tax Commission, 1944

2 This average was calculated by dividing the total taxes levied for state, county, municipal, school and other purposes ($43,769,331) by the total assessed valuation of all property ($1,212,134,905). See Annual Report, Colorado Tax Commission, 1944.

3 The average levy in Lake County in 1944 was 15.2 mills which was considerably less than half the state average. It is in this county that more than one-third of the value of all mining property of the state is located.

4 This figure includes farm lands, $196,235,442; improvements on farms, $62,229,837; livestock, $66,965,988; agricultural machinery, implements, etc. $8,823,177. Annual Report, Colorado Tax Commission, 1944.

estimated value of output from Colorado farms in 1944 was $346,623,000.[1] Relating this output to estimated property taxes paid ($12,066,585), we obtain a ratio of 3.4 percent. Thus all farmers in the state paid an average property tax amounting to about 3.4 percent of the value of their gross output for the year.

Obviously, judged on the basis of value of annual output, Colorado mines, as a group, were not paying property taxes in proportion to those paid by agriculture. In order for the same proportion to prevail, assuming farm taxes remained constant, mines would have had to pay at least $2,706,000 in property taxes. Whereas actually in 1944 they paid about $1,657,000, or an estimated $1,049,000 less. A comparison made for the year 1940 indicates that at that time the discrepancy between property taxes paid by mine owners and farmers was even greater -- the latter paying taxes over three times as heavy as the former. However, it should be kept in mind that comparisons between two industries based upon value of output should not be considered conclusive evidence unless supported by figures indicating relative costs of production. Unfortunately the latter figures are not available.

In addition to the property tax, Colorado has several miscellaneous taxes whose incidence may be considered to be upon the mining industry.

(a) Tax levy for metal mining fund. An annual tax of one-tenth of one percent of assessed valuation of producing metalliferous mining properties. Revenue is placed in the fund to be used for inspection and regulation of the metal mines. The yield of this tax in 1942 was $47,633.[2]

(b) Ore buyer's license tax. This is a flat annual license of $100 per person or firm. The basis of the tax is the right to mill, sample, concentrate, reduce or purchase ore for sale. The yield of the tax is less than $10,000 annually.

(c) Coal mine inspection license. An annual tax upon producing coal mines, the amount of tax ranging from $10 to $50 per year depending upon the volume of output, Annual collections are less than $10,000.

---

1 This includes value of crops marketed, $131,090,000; livestock and livestock products marketed, $187,012,000; Government payments, $12,312,000; value of products consumed on farms where produced, $16,200,000. Colorado Agricultural Statistics, U. S. Department of Agriculture, May, 1945.

2 Tax Systems, Supplement to Ninth Edition, 1943, Tax Research Foundation.

(d) Coal mine inspection tax. This is a tax of four-tenths of one cent per ton of coal mined in the state. It is the only severance tax in Colorado. The yield in 1942 was $28,000.[1]

The above listed special taxes upon mineral resources, combined, yield less than $100,000 per year. Revenue is placed in special funds, the money to be spent largely for the benefit of the industry. Thus, from the standpoint of revenue to support general functions of government, these taxes upon mines, nominal in amount, are relatively unimportant.[2]

If the state were to adopt a comprehensive mineral production tax, how much might it be expected to yield? Or, should there be a severance tax merely on coal, or molybdenum, or petroleum, or all three combined, what could be the expected revenue in each case? Although preliminary estimates have already been suggested, in order to better answer these questions,[3] let us briefly consider Colorado's mineral production in past years.

Colorado Mineral Production

In 1944, Colorado ranked twenty-first among the states of the Union in production of minerals. The value of output for the year was $79,598,000 (Table 9).

---

1 State Finances, 1942, U. S. Department of Commerce, Bureau of the Census.

2 Incorporated mines of the state, along with other corporations, pay state and federal income taxes when earnings are sufficient. However, as these taxes apply alike to all business corporations, regardless of particular industry, they are not considered pertinent to this part of the study.

3 As the severance of timber from forests and of fish from streams and lakes in Colorado is commercially relatively unimportant, a discussion of these resources is not included. Another reason for not considering these products in connection with a severance tax is that under proper conditions of exploitation, in contrast with minerals, ultimate depletion of the resources need not occur.

Table 9

Mineral Production of Colorado, 1944

Product	Quantity	Value
Coal -- Short Tons	8,110,000	$28,791,000
Molybdenum -- Pounds	23,608,421	18,886,000[1]
Zinc -- Short Tons	39,955	9,109,740
Gold -- Troy Ounces	111,455	3,900,925
Petroleum -- Barrels	2,944,000	3,380,000
Lead -- Short Tons	17,698	2,831,680
Fluorspar -- Short Tons	65,209	1,604,043
Silver -- Troy Ounces	2,248,830	1,599,168
Sand and Gravel -- Short Tons	2,369,521	1,518,718
Natural Gas M Cubic Feet	5,900,000	1,327,000
Vanadium -- Pounds	3,058,727	1,288,326
Clay Products (Other than Pottery & Refractories)	---	600,000
Stone -- Short Tons	680,620	568,095
Tungsten Ore (Concentrates) Short Tons	296	433,303
Miscellaneous		3,560,002
	Total Value	$79,598,000

Source: Minerals Year Book, 1944, Bureau of Mines.

1 Estimated minimum value.

Coal and molybdenum accounted for almost 60 percent of the total value. Other leading minerals were zinc, gold, petroleum, lead, fluorspar, silver, sand and gravel, natural gas and vanadium. In all, about 40 kinds of minerals were being commercially produced. The relative importance of these minerals on the basis of value of output fluctuates from year to year. For example since recent developments of the Rangely oil field, the value of petroleum production has advanced from 5th place in 1944 to 3rd place in 1946. Table 10 shows the value of all minerals produced in the state by years since 1925.

Table 10

Value of All Minerals Produced in Colorado
By Years, 1925-1944

Year	Total Value	Year	Total Value
1925	$63,148,959	1935	$44,413,477
1926	65,597,487	1936	56,214,827
1927	58,855,263	1937	67,338,547
1928	58,594,688	1938	60,369,440
1929	55,331,911	1939	64,144,557
1930	46,270,545	1940	63,188,421
1931	32,970,230	1941	73,960,602
1932	25,800,227	1942[1]	95,278,822
1933	27,259,095	1943[1]	88,534,000
1934	39,473,123	1944[1]	79,598,000
		Total (20 Years)	$1,166,342,221
		Average Annual (20 Years)	$58,317,111

Source: Colorado Year Book, 1943-44

1 Information from Minerals Year Book, 1944.

During the 20 year period, production fluctuated from a low of $25,800,000 in the depression year, 1932, to a high of $95,278,000 in the peak war year, 1942. Production for the entire period amounted to nearly $1.2 billion in value while the average annual value was about $58.3 million.

Because of the extraordinary significance of coal and molybdenum and because of the rapidly developing importance of oil and natural gas, these minerals will receive special discussion in our analysis.

A. Coal

The annual production of coal in Colorado normally exceeds in volume and value the output of any other product of the mines. Total production since 1864, when coal mining was first reported in the state (including output in 1944) amounted to 445,734,855 tons valued at $967,063,621.[1]

Coal production fluctuates considerably from year to year, the output depending to a large extent upon whether there is general economic prosperity or depression. During the first and second World Wars, production reached relatively high levels. The output and value by years since 1939 is shown in Table 11.

1 Colorado Year Book, 1943-44 and Minerals Year Book, 1944.

Table 11

Colorado Coal Production and Value by Years since 1939

Year	Tons	Value
1939	5,991,022	$14,797,774
1940	6,672,579	16,881,624
1941	6,996,692	19,800,637
1942	8,131,764	25,615,056
1943	8,371,282	27,039,242
1944[1]	8,110,000	28,791,000

Source: Colorado Year Book, 1943-44

1 Minerals Year Book, 1944.

Production increased from about six million tons in 1939 to over eight million tons in 1944 while the value of output almost doubled, going from less than $15 million to almost $29 million. Average annual production for the last 20 years -- a period of time which has included depression and prosperity -- was approximately 7,600,000 tons with a value of $20,700,000.

Colorado has vast coal reserves. According to estimates of the United States Geological Survey, in 1937 the state possessed deposits amounting to over 212 billion tons of bituminous coal or 15.1 percent of the total for the United States. This makes Colorado the leading state in the Union in bituminous coal reserves. The deposits are sufficient to supply the whole country for almost 500 years at the current rate of consumption and export. In addition, the state ranks second in sub-bituminous reserves, being exceeded only by Wyoming, and ranks fourth in anthracite coal, Pennsylvania, Virginia and Arkansas, possessing more than Colorado.[1]

Production of coal in the state may be expected to increase in the years ahead. In the past, heavy transportation costs have limited production -- only about 10 percent of output has been exported from the state. Should freight rates become more favorable for the shipment of coal or should the chemical industry develop in the West, the state's vast coal reserves will acquire new significance.

Perhaps the chemical industry may sometime in the future require millions of tons of Colorado coal as the fuel is becoming an important raw material in the production of many chemical products. Gasoline, natural gas, ammonium sulphate, creosote, dye stuffs, explosives, plastics and many other products are now being synthetically developed from coal. It is believed that conditions are favorable for the production of many of these chemical products in the state.

1 Colorado Year Book, 1943-44.

B. Molybdenum

Colorado ranks first among the states in the production of molybdenum, a rare metal used in the manufacture of special steel. One firm, the Climax Molybdenum Company located in Lake County, is responsible for most of the production in the state and nation. In 1939 this company produced 72 percent of the domestic output and 66 percent of the world production. At that time it had a milling capacity of 12,000 tons daily. During World War II plant expansion brought the capacity up to about 18,000 tons per day.

Although war requirements intensified the demand for molybdenum, the metal will continue to be used extensively in peace time in the manufacture of special steels for aircraft and automobiles, for fabrication into bearings, steel castings, and in corrosion and high temperature resisting alloys.

The known ore reserves in Lake County amount to over 100,000,000 tons. As only a small part of the area has been developed, it is believed that actual deposits probably greatly exceed this figure. Colorado's reserves are estimated to be sufficient to meet the world demand for 200 years.[1]

Table 12

Molybdenum Production in Colorado[1]

Year	Production in lbs.	Value
1918-38[2]	108,302,341	$75,000,000[3]
1939	25,437,893	(4)
1940	18,600,897	(4)
1941	27,751,273	(4)
1942	48,294,878	(4)
1943	36,940,975	27,705,730
1944	23,608,421	18,886,000[3]

3 Estimated Value.
4 Figures not available

Molybdenum production in the state since 1918 when mines were first operated is shown in Table 12. It may be seen that production reached the high level of over 48 million pounds in 1942 and then declined to 23 million pounds in 1944. Most available figures are not very reliable

1 Colorado Year Book, 1943-44.

relative to value of output for the state. However, the Bureau of Mines gives a definite value for production in 1943 as $27,705,730. An estimate for 1944 is $18,886,000. Since 1938 among Colorado minerals, the value of molybdenum out put has been second only to the value of coal production. In the future, production of the metal may reasonably be expected to average at least 20 million pounds at an annual value exceeding $15 million.

C. Petroleum and Natural Gas

Until recently the state was never a large producer of petroleum and even now in comparison with heavy producing states such as Texas, California and Oklahoma the output is not large. However, the industry is rapidly growing and since the recent expansion of oil production in the Rangely field, authorities predict that crude petroleum may soon become one of the state's leading products.

Colorado has the distinction of being the second oldest oil-producing state in the country, a producing well having been drilled near Canon City in 1862. During the years since then total production in the state has exceeded 50 million barrels. Table 13 shows the amount of production from 1862 to 1939 and by years since 1939.

Table 13

Petroleum Production in Colorado[1]

Year	Barrels	Percentage Increase over Previous Year
1862-1939	38,049,000	---
1940	1,626,000	---
1941	2,150,000	32.2
1942	2,199,000	2.3
1943	2,320,000	5.5
1944	2,944,000	26.9
1945[2]	4,862,000	65.1
1946[3]	10,950,000	125.2

1 Minerals Year Book, 1944, Bureau of Mines.
2 Oil and Gas Journal, January 26, 1945
3 Estimate based upon production for first 6 months, Oil and Gas Journal, July 6, 1946

An estimate is also given for 1946. It may be observed that production in 1945 was 65 percent greater than for the previous year, while the output in 1946 promises to be more than double the production in 1945. The 1945 output for the 20 important oil producing states of the union is shown in Table 14.

Table 14

Crude Oil Production in the United States by States in 1945[1]

State	Rank	Production (Barrels)
Texas	1	749,373,000
California	2	325,995,000
Oklahoma	3	139,379,000
Louisiana	4	137,409,000
Kansas	5	96,496,000
Illinois	6	73,460,000
New Mexico	7	37,686,000
Wyoming	8	36,319,000
Arkansas	9	28,565,000
Mississippi	10	19,024,000
Michigan	11	17,278,000

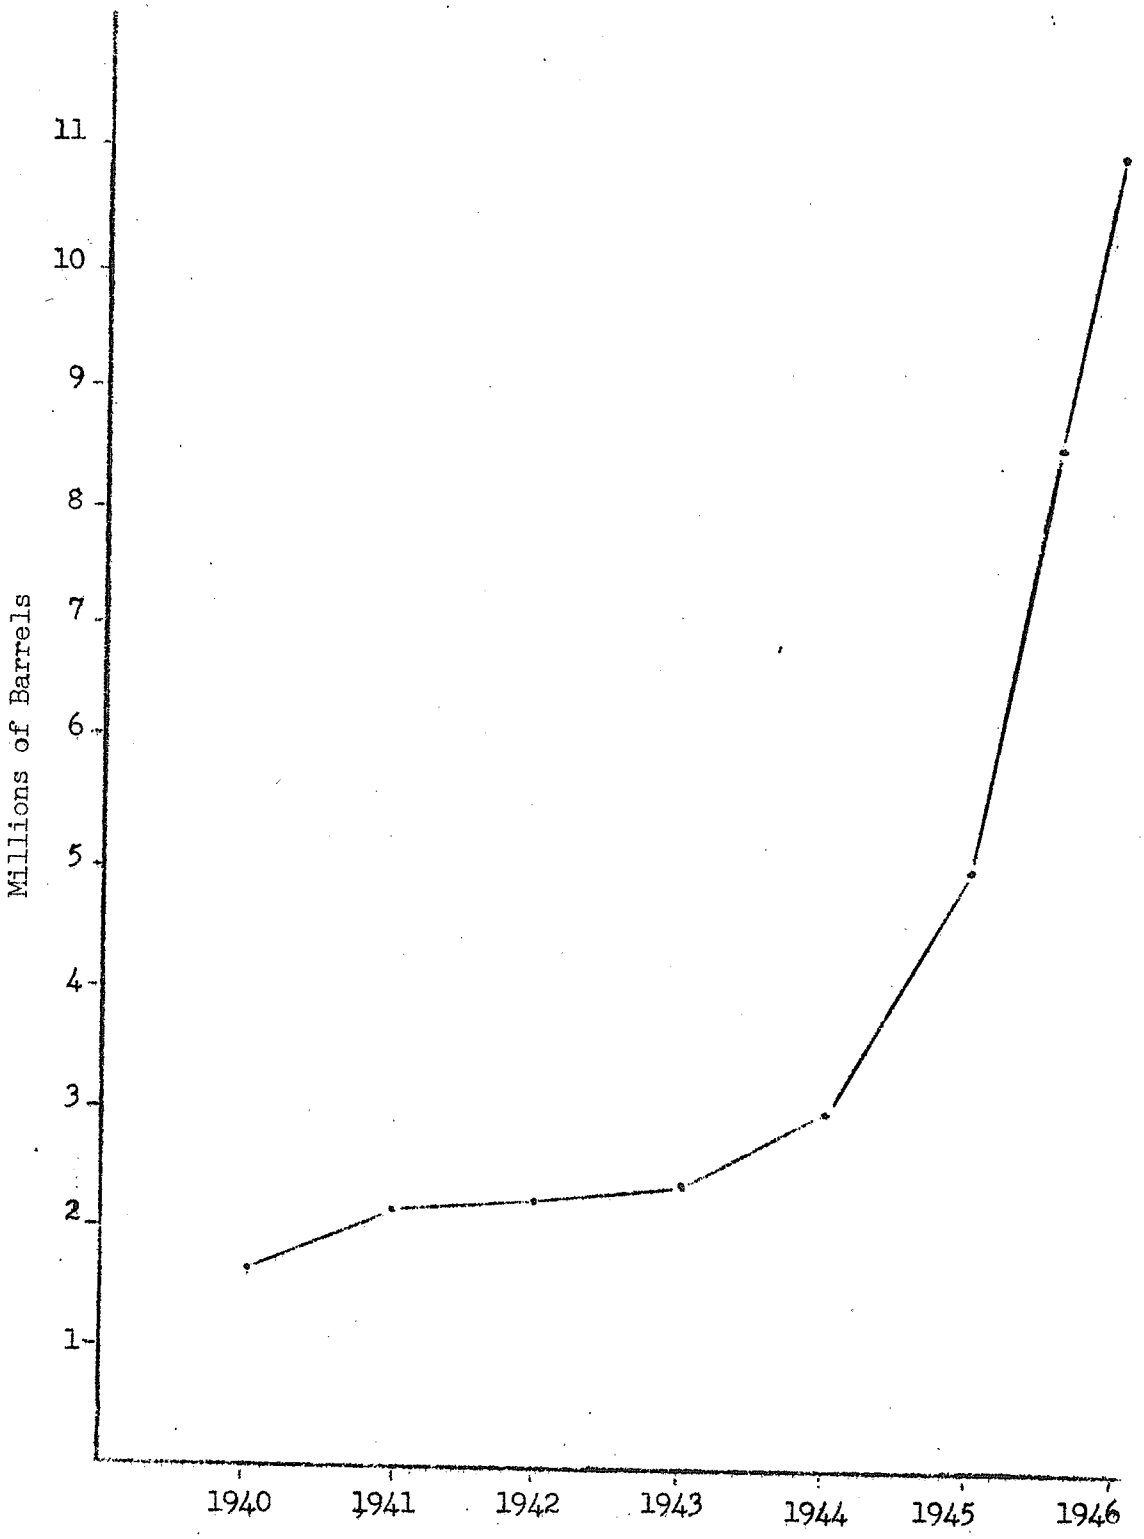
Kentucky	13	9,938,000
Montana	14	8,507,000
Colorado	15	4,862,000
Indiana	16	4,758,000
New York	17	4,572,000
Ohio	18	2,841,000
West Virginia	19	2,820,000
Nebraska	20	219,000
Miscellaneous		202,000
	Total	1,711,940,000

1 Oil and Gas Journal, January 26, 1946

Colorado's production ranked fifteenth among the states and represented .3 percent of total output for the year. This was a small proportion of the total; however, the expected output in 1946 will represent an increase sufficient to place Colorado next to Pennsylvania in oil production.

Furthermore, prospects are very bright for greatly expanded production in the years ahead. The state has rich oil reserves which as yet have been scarcely tapped. Table 15 gives estimates of proved oil reserves in the state on January first of each year since 1939.

It may be seen that during 1945 (between January 1, 1945 and January 1, 1946) proved oil reserves increased by 148,000,000 barrels, an amount almost three times greater than total proved oil reserves at any one previous time. The net increase for the year in terms of barrels of oil was fourth greatest among the states of the country, being exceeded only by Louisiana, Texas and California. On the basis of proved oil land the net increase in Colorado in 1945 was 12,800 acres -- second only to Texas.



Crude Oil Production in Colorado

1940 - 46 Inclusive

Table 15

Estimate of Proved Oil Reserves in Colorado on January 1, 1939-46[1]

(Barrels)

Beginning of Year	Total Proved Reserves	Net Increase for Year
1939	18,000,000	----
1940	20,000,000	2,000,000
1941	23,000,000	3,000,000
1942	23,000,000	----
1943	39,000,000	16,000,000
1944	45,000,000	6,000,000
1945	58,000,000	13,000,000
1946[2]	206,000,000	148,000,000

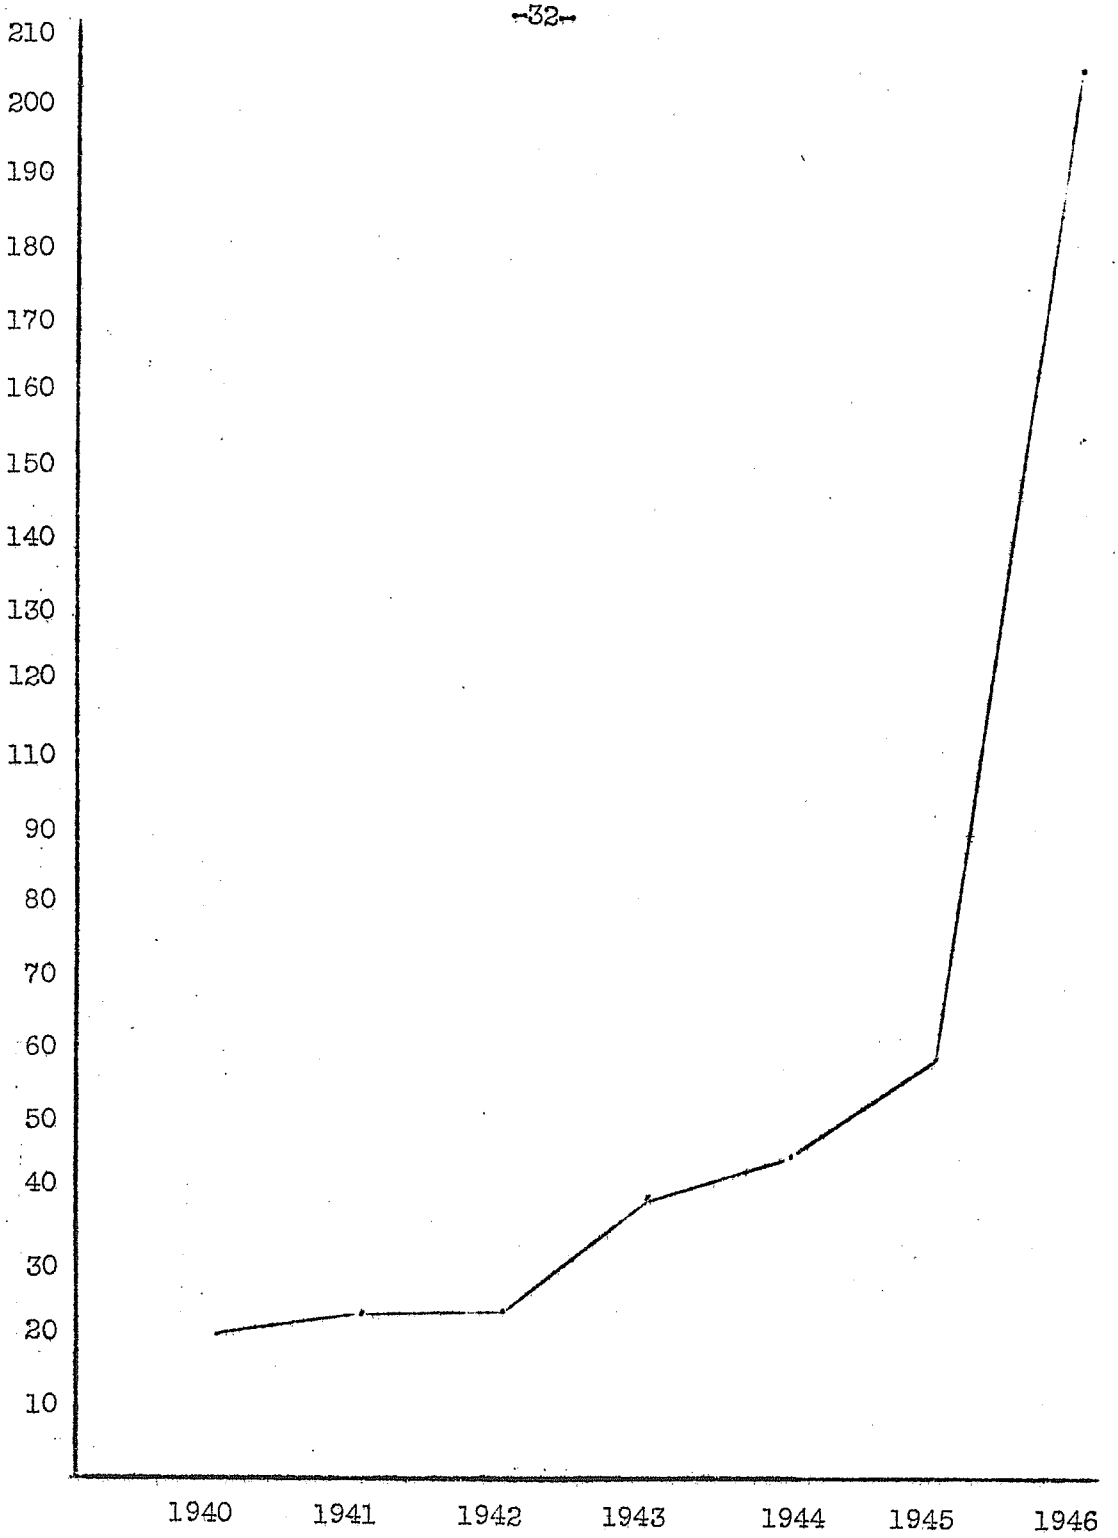
1 Minerals Year Book, 1944, Bureau of Mines
2 Oil and Gas Journal, January 26, 1946

On January 1, 1946 there were 240 producing wells in the state, 60 of them having been completed during the previous year. Eighty-three more wells were programmed for completion in 1946. Although, as previously stated, Colorado is not one of the greatest oil producing states, the daily output per well is very high. In 1945 the average was 55.5 barrels -- second highest of any state in the country. The average in Texas was only 19.8 and in California 35.9 barrels while the national daily average was only 11.1 barrels of oil per well.

Assuming a value of $1.10 per barrel of petroleum, the output in 1946 will have an estimated total value of about $12,000,000. Thus, oil is becoming one of the state's leading products.

The production and use of natural gas in Colorado for domestic and industrial purposes began on a small scale as early as 1893. However, the first major development occurred in 1923 when the Union Oil Company of California began producing and marketing natural gas from the Wellington dome in Larimer county. This gas was piped to Fort Collins and later to Cheyenne, Wyoming.

Today there are several natural gas producing areas in the state among them being fields located in Larimer, Las Animas, and Moffat counties. Gas from fields in the latter county is piped as far away as Salt Lake City. Natural gas has also been discovered in other areas but most of the wells have been shut in for lack of a gas market. Should pipe lines be constructed or other facilities for marketing be found, expanded production may occur in Garfield and Rio Blanco counties -- location of the rich Rangely field.



Proved Oil Reserves in Colorado

1940-46 Inclusive

Total production of natural gas during recent years is shown in Table 16. It may be seen that production in 1944 was about 6 billion cubic feet at an estimated total value at the wells of $220,000 and at the point of consumption of $1,389,000. At the beginning of the year (1944) there were twenty producing gas wells in the state while one additional well was drilled during each of the years 1944 and 1945. In addition to the natural gas obtained from gas wells there is some marketable production from oil wells.

Table 16

Natural Gas Production in Colorado, 1936-44[1]

Year	Production (M Cubic Feet)	Value at Wells	Value at Point of Consumption
1936	3,687,000	$121,000	$807,000
1937	3,186,000	105,000	673,000
1938	1,904,000	70,000	464,000
1939	2,015,000	78,000	467,000
1940	2,533,000	100,000	573,000
1941	3,256,000	121,000	714,000
1942	5,100,000	173,000	1,066,000
1943	6,148,000	226,000	1,425,000
1944	5,987,000	220,000[2]	1,389,000[2]

2 Estimated Value.

Some Possible Variations in a State Severance Tax — Estimates of Yield

It is difficult to estimate the amount of revenue which Colorado might be expected to collect from a severance tax. Naturally the amount would vary according to whether all natural resources are included or merely selected products. Other things being equal, the more comprehensive the coverage the more productive the tax. Also collections would vary according to particular rates applied. Then, too, the amount or value of production resulting from the severance of natural resources may fluctuate from year to year causing variations in tax collections.

Table 17 gives estimates of severance tax revenue which the state, under various conditions, might be expected to collect. Should there be a production tax of five percent on the gross value of all minerals (approximately the same rate as in Louisiana and Minnesota) the yield would be about $3,000,000. A rate similar to Oklahoma's of three percent would amount to about $1,800,000 annually. Should Colorado tax the production of minerals relatively as much as the average for 12 leading severance tax states, the yield would be approximately $1,636,000. On the other hand if certain selected products should be singled out

for severance taxation, as occurs in some states, the yield would be less. For example, a 10¢ per ton tax on coal would amount to about $760,000 annually; a 3¢ per pound rate on molybdenum about $700,000; and a 5 percent tax on oil and natural gas about $625,000 annually.

From the above estimates, regardless of how a tax might be applied, it may be seen that Colorado cannot hope to solve all her financial problems by levying a severance tax. Should collections amount to $3,000,000 annually (the highest estimate in Table 17) the figure would represent only about six percent of total state tax receipts. Nevertheless, the revenue would be important; furthermore, other objectives of a production tax such as equalizing tax burdens, promoting conservation of depleting resources, etc. may be significant considerations.

Table 17

Estimates of Revenue Expectations
From a Severance Tax in Colorado

Nature of Tax (Alternatives Applicable to:	Rate	Estimated Annual Revenue
All Minerals	5%[1]	$3,000,000[2]
" "	3%[3]	1,800,000[2]
Selected Products[4]	Average for 12 leading states	1,636,000[5]
Coal	10¢ per ton	760,000[6]
Molybdenum	3¢ per pound	708,000[7]
Oil and natural gas	Oil: 5¢ per barrel or 5% of value; Gas, 5% of value	625,000[8]

1 Approximate rate in Louisiana and Minnesota.
2 Based upon approximate annual average value of mineral production during past 20 years -- $60,000,000.
3 Rate in Oklahoma.
4 See Table 3.
5 Based upon value of mineral production in 1944.
6 Based upon average annual production during past 20 years.
7 Based upon production in 1944.
8 Based upon expected production in 1947 -- at least 12,000,000 barrels of oil, 6 billion cubic feet of gas. Production may be much greater.

Principles Involved In The Taxation of Minerals

A. Nature of Mineral Deposits Relative to Taxation[1]

Mineral resources have several distinguishing features which make

1 See "Taxation of Minerals in Colorado With Special Reference to Oil Shale Deposits", written by the author, published in Bulletin of the National Tax Association, April, 1945.

them essentially different from other forms of property and wealth.

In the first place, our minerals are used up in the process of exploitation. When taken out of the earth, they are gone forever, so far as those particular deposits are concerned. Thus, the minerals may be considered a kind of natural heritage of the state which should be safeguarded against too rapid exhaustion and waste. A heavy property tax often encourages rapid exploitation when principles of general welfare require careful conservation.

Moreover, from the viewpoint of the mine owner, the depleting resource presents a problem. Part of his capital is being returned each year along with his income. This complicates the calculation of mine valuation and of the determination of net income. Thus, a property tax whose assessments disregard mine depletion might tax deposits so heavily that incentive would be lacking for the ownership and development of even badly needed resources.

A second distinctive feature of mineral deposits is that satisfactory appraisal or valuation is often extremely difficult if not impossible. Property tax laws usually require assessors to value mines at such a price as the mine would sell at a fair, voluntary sale, for cash. But such properties are seldom sold. Therefore, the assessor must fall back upon other criteria for making appraisals. The proper application of these criteria usually necessitate the service of a trained and experienced mining engineer.[1] Not only does value of the resource depend upon future costs of extraction and the selling price of the mineral, but being underground, its value can be merely estimated relative to both quantity and quality of deposit. These difficulties apply especially to metal mines and oil wells. Because of this uncertainty relative to true value, the mine owner is usually given the benefit of the doubt and, as a consequence, property tax assessments are often very low as compared with those on other forms of real and personal tangible property.

A third characteristic of mineral deposits is that they are commonly located in sparsely populated areas. Even during periods of extensive development, the mining communities are normally much smaller than industrial and commercial centers of the same region. This situation becomes significant in those states using the property tax, particularly, as in Colorado, when assessments are made by local assessors and when revenues collected are retained largely by local units of government. These sparsely settled areas experience little difficulty in obtaining sufficient revenue to support local functions of government, even though mine assessments are low and mill levies nominal. Thus, mine owners are often able to induce local assessors to make low assessments in spite of state laws specifying full cash valuation. This, coupled with mill levies below the state average,

---

[1] Yet in Colorado the assessment of mines and oil wells is a responsibility of local assessors, most if not all of whom are inadequately trained for the task.

makes the tax system inequitable if comparisons are drawn between the mineral and non-mineral counties of the state.

In Colorado an example may be cited. In Lake County, location of valuable mines including the principal source of the world's molybdenum production, property assessments are undoubtedly extremely low relative to true values,[1] yet mill levies are the lowest among all of the counties of the state. The average levy in 1943 for Lake County was 16.37 mills as compared with 49.50 mills for Huerfano County, the highest in the state, and with an average for all counties of 33.9 mills.[2]

In addition to such tax inequality, an unequal geographic distribution of mineral resources (assuming retention of revenue by local units) promotes an unbalanced condition relative to support of governmental functions including education on the elementary and secondary levels. Some communities (the wealthy mineral areas with sparse populations) have more revenue than necessary while certain others may be virtually destitute.

B. Methods of Taxation -- (1) The Property Tax.

The various states usually apply the ad valorem or property tax to mineral resources within their borders. A notable exception is Louisiana which depends exclusively upon the severance tax and a series of business license taxes for necessary revenue from the extractive industries.

According to the property tax law in most American states, mineral deposits have been subject to taxation on the same basis as all other property. In other words, the general property or ad valorem tax has usually been applied to every kind of property, including minerals, with the avowed purpose of taxing all equally. Assessments are supposed to be made according to market value and a uniform mill levy within each tax jurisdiction is then applied to those valuations. The states of Colorado, Idaho, Montana, Nevada and Utah do not apply the property tax to metal mines upon a true ad valorem basis. Instead net revenue or a multiple of net is the assessment base except in Colorado which specifies either net or one-fourth of gross revenue whichever is greater.

The general property tax as applied to mines and oil wells in Colorado possesses many defects. However, the state should probably

---

1 See testimony presented in the tax dispute case of the Climax Molybdenum Company extending from the years 1939 to 1941. W. A. Roberts, State Taxation of Metallic Deposits, ch. 13.

2 These figures do not include a uniform state levy of 3.85 mills. Thirty-Second Annual Report, Colorado Tax Commission, 1943.

not abandon this method of taxation of mineral resources in order to substitute exclusively some other form of tax -- for example, the severance tax. Instead there should be an attempt to improve the property tax law and to strengthen its administration so that the tax will be more equitable relative to all property owners. As the writer intends to discuss in detail Colorado's general property tax in another study, further reference to this form of tax upon natural resources including minerals will be deferred until that time. However, it should be emphasized that sufficient evidence has already been obtained to indicate that under the present system of property taxation, as compared with most other forms of real estate, our mines and oil wells as a group are inadequately taxed.

(2) The Severance Tax.

As previously discussed, 25 states, with wide variations, apply severance taxes to the exploitation of natural resources. These taxes in all cases are levied in addition to other taxes (including the property tax); they are not substitutes for the property tax. A possible exception is Louisiana; however, in that jurisdiction a series of special license taxes are levied instead of the tax on an ad valorem basis.

In a number of states the severance tax measures are nothing more than regulatory or inspection fees. For example, the California tax on oil and gas is imposed for the purpose of covering the administrative costs of the conservation and inspection laws, while the Colorado tax on coal is merely an inspection fee for coal mines. On the other hand, the production taxes in Texas, Louisiana, Minnesota, and Oklahoma and to a lesser extent in a number of other states are important revenue measures.

C. Advantages of the Severance Tax

Before deciding whether or not Colorado should adopt a severance tax, the relative advantages and disadvantages of such a revenue measure should be considered. Let us first review the advantages.

One important aspect is that the severance or production tax has the advantage of simplicity. Whether based upon units of output or gross receipts, the amount of the tax is easily calculated -- being a determinable definite amount. In this respect the tax has an advantage over the property (ad valorem) tax upon mines. The latter being based upon market value, as previously discussed, is very difficult to determine and, consequently, administration is not simple. This point is not intended to be an argument against continuing the property tax upon mines and oil wells but merely to indicate that if a severance tax is also applied to the industry, tax administration would not become unduly complicated.

A second advantage of the production tax upon minerals (if it supplements the property tax) is that under the present arrangement mines and oil companies have probably not borne their proper share of the tax burden of the state. This is because the industry has been granted special favors in the matter of taxation. As previously discussed, producing metalliferous mines, are taxed upon the basis of 25 percent of gross or the net proceeds, whichever is greater. Non-producing mines are assessed at a rate not higher per acre than the lowest producing mine in the same location. Mines of coal, iron ore, asphaltum, quarries, and oil wells are assessed as other property. However, because of the difficulty of accurate assessment, the latter mineral resources are often greatly underassessed -- valuations being largely dependent upon self-assessment by the mine owners themselves and inclusions often being confined to the value of surface improvements.

Furthermore, for several years, Federal income tax favors (generous allowance for depletion) for mines and oil companies have been maintained in the law despite the repeated recommendations of the Treasury Department and numerous attacks of critics. The Congressional balance of power on this question is influenced by log-rolling factors much like those that appear in the tariff issue. In some cases taxpayers are still deducting depletion of mines after they have deducted the full cost of their investment. Therefore, one reason for adopting a severance tax might be in order better to equalize state and national tax burdens as between the various owners of real and personal property within the state.

A third advantage of a production tax upon the exploitation of natural resources is that it can be made to yield considerable revenue to pay for necessary functions of government. Of course the yield depends upon the products included under the tax and also the particular rates applied. Colorado's coal production tax of 4/10¢ per ton yielded only $33,000 in 1944, while a production tax of three percent of gross value upon all minerals would have yielded about $2,300,000 for the same year.

Another and rather important advantage of the severance tax is that it can be easily adapted to any particular conservation policy of the state or nation. By raising tax rates, production can be discouraged either because costs will rise, or if the tax is shifted, because the higher price will be a deterrent upon demand for the product. An opposite policy can induce more rapid exploitation of a mineral which currently may be urgently required. This advantage of the severance tax relative to conservation is in contrast to the ad valorem tax upon property (when heavy) which may operate in exactly the opposite direction from the one desired.

Another argument for the severance tax (as a supplement to a moderate property tax) is that it is fair to the owners and operators of mines and oil wells. If production is low or non-existent

then the severance tax correspondingly declines or disappears entirely. On the other hand, if output increases, for example, due to revival of mine activity, then the severance tax increases. Thus, a production tax is applied at the time and in amounts which are likely to correlate with ability of the mine and oil companies to pay such taxes.

Finally, one of the strongest arguments in favor of a severance tax is that our natural resources are the heritage of the state. Yet this heritage in the form of natural wealth and capital assets is depleted in the process of exploitation through production. The condition of gradual exhaustion is particularly significant regarding coal, petroleum, and natural gas but is also important relative to the other mineral resources even though these latter, such as iron ore, for example, may be used over and over again after being fabricated into tools or other articles. The natural heritage argument has least application to forests and fisheries provided these resources are exploited in such a way as to provide for a continuing "crop" rather than for ultimate exhaustion of the trees and fish.

The natural heritage argument as applied to our natural resources contends that the state should recover, through the application of a severance tax, at least a portion of its depleting wealth. In other words the state should share in the profits of such exploitation and should reinvest the revenue thus derived in so far as possible in something of a substantial and permanent character so that there will be some compensation for that which has been destroyed and consumed and which in no other way can be replaced.

This problem of our natural resources being a heritage of the state yet being depleted and perhaps finally exhausted becomes particularly significant when the mines and oil wells are owned and operated by absentee capital or when the raw products are exported directly from the state. Such conditions tend to keep the state in a backward economic status typical of colonial empires which are exploited by the mother country. Consequently, Colorado should be concerned about its oil, molybdenum and other resources which are being exploited by outside firms -- the products in their raw or semi-refined form being taken directly from the state. One compensating factor would be a production tax applied to the resources as they are severed from the soil.

D. Limitations of the Severance Tax

As a general rule any tax measure possesses at least some limitations or shortcomings and the severance tax is probably no exception.

First of all, it is frequently contended that the tax has an uncertain and unstable yield -- revenue fluctuating with variations in production from year to year. This uncertain yield places a hard-

ship upon local units depending upon the revenue for financing continuing functions of government. However, the state being larger than local governmental units and also receiving revenue from various sources would not experience as much difficulty if the severance tax yield fluctuated from year to year. Consequently this objection to the tax can be largely removed if, instead of local units, the state collects all revenue from the severance tax and then distributes it back to localities, for example, according to need. There is much to be said in favor of this policy even though the revenue system is based upon an ad valorem tax. The historical accident responsible for the location of mineral deposits is a poor justification for certain local units retaining all or most of the resulting tax revenue.

Furthermore, in reply to the charge that a mineral production tax has an unstable yield, it is argued by some that production policies particularly of the larger companies, are sufficiently stable to make the severance tax fully as dependable as the property tax. The argument is based upon the contention that the yield of the latter tax fluctuates with changes in amount of proved mineral reserves, increasing with new discoveries and decreasing as old ones become depleted.

A second objection to the severance tax is that neither volume of output nor gross revenue is an entirely satisfactory measure of ability to pay taxes. Two mines with the same volume of production may show very different rates of profit if one of the mines has a higher cost of operations or a lower grade of ore than the other. However, the tax is probably no more objectionable from this standpoint than the traditional property tax which may place equal tax loads upon two mines, one of which is being very profitably exploited while the other may be completely idle. Moreover, the severance tax may be justified in terms of some principle supplemental to the ability-to-pay doctrine, for example, the "natural heritage" principle.

Perhaps a genuine disadvantage of the severance tax is that it does not affect non-producing mines and mineral lands. Under the tax law the owners of such resources could keep their properties idle, merely holding for speculative profits, and as a consequence for years might pay no taxes even though ownership of the minerals represented considerable tax paying ability. However, most states levying taxes on production have largely removed this disadvantage by resorting to both the property and severance taxes, applying them in a complementary manner.

A common argument against the severance tax put forth by the mine and oil industries is that the tax discourages investment and consequently, "kills the goose that lays the golden eggs." The validity of this contention depends upon a number of factors. In the first place the <u>total</u> weight of taxes as compared with that upon alternative investments is an important consideration. In Colorado a severance tax to supplement the present moderate property tax upon mineral

resources would probably not represent an undue tax load as compared with other investments in the state, for example, agricultural property. Furthermore, the possibility is not likely of alternative investments in mines and oil wells in other states having lower taxes as most states possessing important mineral resources already levy severance taxes. Also there is a probability that the severance tax to a large degree is not borne by the mine and oil companies but is shifted to the users of mineral products.

Considering all factors, the evidence in Colorado appears to indicate that the adoption of a comprehensive severance tax at this time would be advantageous. A remaining consideration, however, is whether such a revenue measure would be legally considered to be an excise tax which would be subject to capture by the old age pension fund. Let us briefly review the probabilities relative to this problem.

Legal Status of Production Taxes

It is impossible to predict what the courts would decide relative to the legal interpretation of a Colorado severance tax should such a measure be enacted. Perhaps a decision would partly depend upon the wording of the law and the particular method of tax application. However, there is good reason for believing that the courts would decide the tax to be an excise levy, yet one not subject to seizure by the old age pension fund.

The precedent established in certain other states throws some light upon the question as to whether or not the severance tax is an excise. In 1923 the Supreme Court of Louisiana ruled that a three percent tax imposed upon oil and natural gas severed from the soil was not a property tax but an excise levy upon the privilege of severing natural resources from the soil.[1] The question at issue was whether or not the tax violated the equality and uniformity provisions of the state constitution; however, ruling that the tax was an excise the court contended there was no violation and the law stood. Upon appeal, the United Stated Supreme Court upheld the decision of the state tribunal.[2] On the other hand, two more recent court decisions indicate that a severance tax may be applied in such a manner as to be held to be a property tax. One of these was a Minnesota case in which the Supreme Court stated that a six percent tax upon royalties obtained from iron ore lands leased for mining was essentially a property tax upon the mineral lands.[3] It so happens that the state did not have a uniformity clause in its constitution and, consequently, the tax law was upheld. However, in Illinois (a state whose

1 Gulf Refining Co. vs. McFarland 154 La. 251 (1923). Courts have generally held that property but not excise taxes are subject to the limitations of equality and uniformity clauses.

2 264 U.S. 573 (1923)

3 Lake superior Consolidated Iron Mines vs. Lord, 271 U.S. 577 (1927)

constitution contains a clause requiring taxes to be equal and uniform) a tax imposed at the rate of three percent of the value on all oil produced was said to violate the constitution. Although the court did not directly specify that the tax was a levy upon property, it implied that the severance of oil could not in effect be separated from the valuation of the oil land. Thus the Illinois revenue measure, because of being sufficiently similar to a property tax, was declared unconstitutional.[1]

At first glance the Minnesota and Illinois decisions appear to reversals of the Louisiana case. However, upon closer examination it seems the courts have not been inconsistent. The laws in Minnesota and Illinois were drafted in such a manner that certain inclusions, for example, a provision that a property owner was ultimately liable for the production tax if unpaid by the mine operator, made the measures essentially property taxes. This has not been true regarding several other severance taxes (including Louisiana's) which have been tested in the courts.

Should Colorado adopt a severance tax, the law should probably be drafted in such a manner as to avoid the interpretation of being considered a property levy; otherwise, as the state's constitution contains a uniformity clause, the tax measure might encounter legal difficulty.

Another important legal question is whether or not revenue from a severance tax (or 85 percent thereof) would constitutionally fall within the catagory of the old age pension fund. The relevant parts of the old age pension amendment (Article XXIV, Section 2, paragraphs (a) and (b) are as follows:

> Sec. 2 Moneys allocated to fund -- There is hereby set aside, allocated and allotted to the old age pension fund sums and money as follows:
>
> (a) Beginning January 1, 1937, 85 percent of all net revenue accrued or accruing, received or receivable from any and all excise taxes now or hereafter levied upon sales at retail, or any other purchase transaction; together with 85 percent of the net revenue derived from any excise taxes now or hereafter levied upon the storage, use, or consumption of any commodity or product; together with 85 percent of all license fees imposed by the provisions of sections 1 to 36, both inclusive, of chapter 144 of Volume 4 of the 1935 Colorado Statutes Annotated, and amendments thereto; provided, however, that no part of the revenue derived from excise taxes now or hereafter levied, for highway purposes, upon gasoline or other motor fuel, shall be made a part of said old age pension fund.

(b) Beginning January 1, 1937, 85 percent of all net revenue accrued or accruing, received or receivable from taxes of whatever kind upon all malt, vinous, or spirituous liquor, both intoxicating and non-intoxicating, and license fees connected therewith.

A careful analysis of the above provisions leads one to the conclusion that not all kinds of excise taxes must be set aside for the pension fund. The intent of the wording in paragraph (a) (at least in a strict sense) seems to include under the fund only 85 percent of the net revenue from sales at retail -- undoubtedly referring to the two taxes currently in effect at the time, namely, the retail sales tax and the use tax. The last part of the paragraph specifically excludes all excise taxes levied for highway purposes upon gasoline or other motor fuel. Paragraph (b) pertaining to the revenue from liquor taxes appears to be much more inclusive.

The Colorado Supreme Court has been inclined to apply a strict rather than liberal interpretation to the old age pension fund amendment. In other words, the court has tended to limit the application of the pension fund to rather narrowly prescribed inclusions. This is an indication that the court would probably exclude from the fund a production tax upon the severing of natural resources. A few decisions of the court relating to the question may be cited.

The service tax cases are pertinent. Although in 1938, the service tax was considered by the court to be an excise rather than a property tax,[1] the tribunal decided that the revenue measure was not the kind of an excise falling within the category of the old age pension fund amendment.[2] Consequently, the service tax revenue (before the tax law was repealed) went into the general fund of the state rather than for pensions.

Another decision indicating the attitude of the court was rendered in the Denver cigarette tax case. In 1940 the court ruled that the pension fund could not claim taxes or license fees that have been imposed by a municipality or otherwise than by the usual legislative procedure of the state as a whole.[3]

Two liquor tax cases might also be cited. Generally the court has ruled the liquor fund provisions (paragraph b) to be rather comprehensive or all inclusive. In 1939 the Supreme Court decided that 85 percent of the liquor license fees collected by the city of Denver was to be turned over to the pension fund. The argument was based upon the contention that the amendment specifically provided for allocation of 85 percent of all taxes upon malt, vinous or spirituous liquor of whatever kind. Furthermore, the court held that the regulation of the sale of liquor was not exclusively a local matter but to some extent was a concern

1 Rinn vs. Bedford, State Treasurer, 102 Colo. 475
2 Conklin vs. Armstrong, State Treasurer, 106 Colo. 376 (1940)
3 State of Colorado et al vs. City and County of Denver et al, 106 Colo. 519

of the state as a whole.[1] A more restricted interpretation was rendered in 1944 at which time the court decided that a property tax levied by a county or municipality upon liquor could not be taken by the old age pension fund.[2]

It may be concluded with some reasonable assurance that Colorado can enact a severance tax measure which will not be ruled by the courts to be a property tax, thus avoiding possible legal difficulty because of the uniformity clause of the constitution. Also it may be assumed that the court, although ruling a severance tax to be an excise, will not likely decide that 85 percent of the revenue must go to the pension fund.[3]

THE COLORADO PROPERTY TAX

Summary and Conclusions

1. When Colorado became a state her new constitution required a system of general property taxation for state and local purposes which proved to be inequitable and from many standpoints impractical. Yet the provisions were so inflexible and constitutional revision was so difficult that it was not until 1911 (Tax Commission Act) and 1936 (amendment permitting income tax) that genuine tax reform was forthcoming. Even with these fundamental changes along with numerous other tax revisions over the years the property tax in Colorado still remains grievously defective.

2. As in most other states the property tax represents the principal source of revenue for state and local governmental purposes. In 1942 it yielded $43 million or 51.5 per cent of all tax revenue. This percentage was slightly more than the average for all states -- the latter being 47.5 per cent.

3. During recent years the relative emphasis placed upon the property tax as a source of revenue for the state government (as contrasted with local) has been declining. This downward trend is considered advantageous as the state can well depend largely upon such revenue sources as the income, sales, severance, inheritance and special business taxes, leaving the property tax principally for local units of government. In 1944 in Colorado the state government obtained 10.8 per cent of its revenue from the property tax. The average for all states was 4.6 per cent -- the range being from nothing in five states to 22 per cent in the state of North Dakota.

4. Expressed in dollars the yield of the property tax in Colorado has fluctuated widely, however, the general trend has been upward. Since 1913 this has been due to higher local mill levies rather than because of rising property assessments.

5. The law in Colorado specifies that all property, unless exempt, shall be assessed at full cash value. Yet conclusive evidence indicates that at present the average assessment ratio throughout the state is probably not more than 30 per cent of true value.

6. In 1946 total assessed valuation of property in the state amounted to about $1,259 million. This was actually $47 million less than total assessments in 1913. If current assessments are compared with those in the year 1929, the reduction has been $327 million, or 20.6 per cent. Exemption from the property tax of intangible wealth and motor vehicles accounts for only a small fraction of this loss on the assessment rolls.

7. While assessments have declined since 1913 actual property has expanded and greatly increased in value. Considering all available evidence and discounting the inflationary rises of the war years since 1940, we may conservatively conclude that all real and personal tangible

property in the state has increased in cash value at least 50 per cent since 1913. Moreover, there is good evidence to indicate that in the future, the values are not likely to decline below this level -- approximately the level of 1940 or 1941.

8. If assessments were approximately on a full valuation basis in 1913, in order for the same situation to prevail today (after correcting for postwar inflation and allowing for exemption of intangibles and motor vehicles) the total assessed valuation of real and personal tangible property would probably need to increase by at least $625 million. The tax commission to the limit of its ability, should attempt to place the property in the state upon this higher total appraised valuation basis. In some instances it would involve discovering property, taxable under the law, yet not listed on assessment rolls, either because of error, negligence or favoritism; in all instances it would involve placing valuations on a basis so that they would be at the level of full cash value. Such reform relative to assessments would merely be in accordance with the prescribed laws of the state. Moreover, full assessments do not cause higher general taxes; on the contrary, the average property owner would probably discover he has a lighter tax burden when all property is fully assessed than when it is only partially assessed.

9. But there are other advantages when the assessment objective is full cash value. One of these advantages is a much greater uniformity of original assessments. The use of a fractional basis tends to be indefinite in practice and inevitably leads to wide deviations.

10. A few illustrations of the lack of uniformity under the present system in Colorado are the following:

a. Assessed valuations of Colorado farms compared with United States Census values for 1940 indicates an average variation ranging from 145 per cent in one county down to 26 per cent of census values in another county.

b. Dry farm land in some eastern Colorado counties is being assessed at $4 or less per acre which is currently yielding up to $100 per acre in wheat for each crop year.

c. Based upon 1940 building costs, in 1944 a survey of 35 cities and towns made by the tax commission showed that the assessed valuation of urban residences varied from a high of 90 per cent to a low of 10 per cent of full value.

d. On the basis of actual sales data, there is often extreme variation <u>within</u> most, if not all of the counties relative to the assessment of real property. Surveys indicate that in most instances the larger homes and farms are under-assessed to a greater extent than the smaller properties. Thus, the property tax becomes grievously regressive.

e. In one-third of the counties of the state the average assessment of personal household goods is actually less than the $200 exemption permitted by law. Moreover, the assessment ratio of such personal property is relatively seven or eight times as high in some counties as in others.

f. As a group, mines and oil wells have always received special favors under Colorado's property tax system. In 1913 they were relatively under-assessed. Today they are favored to an even greater extent.

g. It is difficult to say whether or not public utilities assessed by the tax commission benefit from relatively lower assessments than other forms of property. Since 1921 the total assessed valuation placed upon utilities has held up better than upon most catagories of property, however, with the exception of railroads, utilities have enjoyed rather phenomenal expansion. For example, expressed as an average of assessed valuation of investment per kilowatt hour of production, assessments of electric light and power companies have declined from 7.8 cents in 1920 to 4.7 cents in 1945.

11. A number of special problems of property taxation in the state deserve particular mention. One of these is the problem of tax rate limits. The provision restricting current tax levies of the state and all local units of government to a level not exceeding 5 per cent in excess of the previous year appears to be as rigid an over-all limit as can practically be established. Perhaps this limit with the "safety valve" of appeal by local units to the tax commission, or if this fails, appeal to popular referendum, is a good one. Furthermore, the 5 per cent limit may be a genuine advantage, by stilling the fears of property owners who would otherwise oppose the state's return to a 100 per cent valuation basis for property. Such fears might arise from the belief that if tax valuations were drastically raised, governmental units would become extravagant because of receiving more revenue from the same mill levies. However, the 5 per cent limit is a safeguard against this possibility. Other specific mill levy limits restricting the state and certain classes of local units (notably the counties) appear to possess but dubious value.

12. A second special aspect of property taxation is the problem of collection and delinquency of taxes. Because of existing prosperous conditions throughout most of the state, current collections are excellent. This favorable situation would not be likely to continue, however, if another major depression occurs. Safeguards against a future period of property tax delinquency causing financial distress to school districts, local governmental units and state institutions would include: (1) placing less emphasis upon the property tax as a source of revenue, particularly for state purposes, by developing to a greater extent such revenue sources, for example, as the severance and income taxes; (2) relief extended to local units, especially school districts, by distribution of larger amounts of state aid; and (3) improvement of property assessments.

13. A third and rather serious problem is one caused by the state's constitutional and statutory provisions relating to tax exempt property. These exemptions may be classified as follows:

A. Required by Constitution

(1) $200 of personal property for each head of family
(2) Property owned by the state and its political subdivisions, including public libraries

B. Permitted by Constitution and authorized by law

(1) Property not owned or operated for a profit when employed solely for:

(a) Religious worship
(b) Schools
(c) Strictly charitable purposes
(d) Cemeteries

(2) Property employed in irrigation projects used solely by owners

C. Required by Constitution because of other taxes levied

(1) Motor vehicles
(2) Intangible property

D. Property owned by the federal government.

14. Although the provision for a personal property exemption of $200 per head of family which became part of the new constitution in 1876 was intended merely to safeguard the standard of living of families possessing the bare essentials of life, the exemption has proved to be a loophole through which millions of dollars worth of property has escaped taxation. This escape from taxation occurs principally in two ways, neither of which was intended by law. They are as follows:

A. The fill amount of the exemption has been applied against property assessed at a mere fraction of its value.

B. Although the exemption was intended to include only purely personal or household goods it has also been applied against agricultured and business personal property.

In 1945, in more than one-third of the counties of the state, personal exemptions exceeded the total assessed valuation of personal household goods. In another third of the counties, after deduction of exemptions, net personal property assessments were negligible. Assessors in all of these counties would probably show more net assessments on the tax rolls if the $200 personal exemption were eliminated and all household goods made tax exempt. However, this would not be the best solution of the problem. The principle behind the $200 exemption is probably sound if all personal property is included on the tax rolls and assessed at a figure even approaching full value. Furthermore, personal household

goods represent some taxpaying ability. To exempt all these goods would be to place an even heavier load upon real estate which in many cases is already paying relatively too much.

15. The exemption from taxation of state and municipal property is a customary arrangement found in most other states of the Union. Probably no useful purpose would be served by making state property taxable by local units. Likewise, the property of local governmental units, with the possible exception of publicly owned commercial enterprises, should not be subjected to taxation. Principal commercial enterprises are municipal light and power plants which are to be found in several communities and which produce about 10 per cent of the electric energy consumed in the state. No great hardship would be placed upon these plants if they paid taxes comparable to those paid by privately owned utilities; moreover, the total property tax load would become somewhat more equitably distributed. Furthermore, much unnecessary criticism directed against publicly owned utilities could in this manner be avoided.

16. The largest body of tax exempt property in the state is in the form of land and improvements owned by the federal government. During recent years the amount of this property has been increasing. By 1944 the government owned about 26 million acres or 38 per cent of the land area of the state. Moreover, there were extensive improvements on some of these lands including many government buildings. These holdings may appear to represent a vast amount of tax exempt property placing a burden upon owners of privately held property who must bear the entire cost of local government. However, upon closer examination it is found that several types of payments in lieu of taxes are annually contributed by the government. The average annual federal aid to Colorado excluding WPA and other emergency payments (1928-37) amounted to $5 million. This is considerably more than an ad valorem tax on federal property would yield if there were to be one. Nevertheless, the opportunistic basis for granting aid in lieu of taxes has caused much misunderstanding and dissatisfaction. In the future there should be a consistent and unified plan relative to such payments.

17. No appraisal has been made of the tax exempt property used for religious, educational and charitable purposes; for cemeteries and for irrigation propects. The justification for these exemptions is that meritorious functions are performed relieving the government of burdens which it would otherwise have to bear. However, the courts have followed an extremely liberal line when interpreting exemption provisions of the constitution and statutes. Consequently, these lenient decisions have permitted the escape from taxation of much property which probably should be taxed.

18. Responsibility for successful operation of the property tax resides in several county and state administrative bodies. A county assessor (elected in each county except in Denver County) is directly responsible for all original assessments except the assessment of public utilities. Within each county, the county commissioners serve as a board of equalization of assessments. On the state level, an appointed state tax commission has general supervision over county assessors, makes

original assessments of public utilities and recommends changes in assessments to the state board of equalization. An ex officio board of equalization possesses limited yet final authority over state-wide equalizations. Property tax collections are made by the various county treasurers.

19. Perhaps the weakest aspect of property tax administration in Colorado is the office of county assessor. Although in a number of counties assessors are trying courageously to do a good job and are succeeding surprisingly well, the general level of performance in most counties is woefully inadequate. However, appreciable improvement cannot be expected until several fundamental changes are made. In order to do a good job, the assessor and his deputies in addition to possessing other qualifications, must be highly trained individuals with a vast amount of technical information and experience. Existing conditions of selection, tenure and remuneration do not in most instances attract or retain such individuals.

20. Although salaries of assessors were raised in 1945, they are still inadequate. The range is from $4,600 in Denver to $1,000 in Hinsdale county -- the median salary being $2,400 per year. This $2,400 official is responsible for placing a valuation on some $10 million of property against which is placed a tax liability of hundreds of thousands of dollars. Private business would not likely place comparable responsibility upon the shoulders of a $2,400 employee. Moreover, the assessor is elected for a two-year term of office. This is not enough time for him to become sufficiently familiar with his duties to be really efficient. In practice the assessors in one-third of the state's 63 counties are normally turned out of office or else refuse to run for re-election after serving for only one, or at the most, two terms.

21. The dual and overlapping property tax administration retained by the state government is unsatisfactory. Years ago all other states except Missouri and Colorado got rid of the dual control over equalizations exercised by an appointed tax commission and an ex officio board of equalization. These two states have probably continued to retain their inefficient and generally unsatisfactory system because of a combination of inertia and inflexibilities in their state constitutions.

22. The 35-year record of "equalization" of assessments since 1911 indicates that the state board of equalization is more likely than the tax commission to be influenced by partisan politics. The board is apt to decide that the expedient course is to do nothing (10 of the years) or else to order assessment reductions (18 of the years). During the time from 1915 to 1930 those favored with reductions were the railroads and utilities; from 1931 to 1933 the favored ones were farmers. Only during the six-year period from 1934 to 1939 has the board apparently been able to resist the political expediency of either doing nothing or else of making tax reductions. Moreover, an ex officio board composed of individuals with numerous other duties has neither the time nor the facilities for doing an adequate job of equalization.

23. When evaluating the work of the state tax commission during its 35 years of existence since 1911, a number of factors must be taken into consideration. It had hardly begun to operate when its very life was threatened by proposed statutory changes and constitutional amendments. It has always operated on a budget insufficient to maintain an adequate staff of research and field workers. Also its authority over equalization of assessments among counties has been limited because of the fact that final decisions reside with the state board of equalization. Then, too, its work has not been easy. Colorado has many divergent economic and sectional interests which are difficult to reconcile.

24. Considering all aspects, there is no question but what the property tax system of the state has been strengthened and improved over the years by the tax commission because of its supervisory, assessment, and equalization functions. If the property tax is still unsatisfactory, the solution would not be to weaken the power of the commission but rather to strengthen its hand through bestowing additional authority supported by adequate appropriations. The various states of the union with most satisfactory property taxes are invariably states with considerable administrative centralization in a state tax commission or its equivalent.

Recommendations

1. In order to place assessments upon a full valuation basis, making them uniform among the various taxpayers and counties of the state, there is urgent need for a complete reappraisal of all taxable property. This work should be conducted by the tax commission with cooperation from the county assessors. So as to be completely fair, all counties should be placed upon the reappraisal basis at the same time. Consequently, the legislature should appropriate funds sufficient to permit completion of the reappraisal in a one-year or at most two-year period of time.

2. Sufficient appropriations should be made available to the tax commission so that county assessors can be provided continuous supervision and assistance. There is need for the preparation and distribution of assessor's manuals, for more field deputies and for such guidance as would be provided by periodic schools for assessors. The extra cost would pay big dividends in the form of more uniform and complete assessments.

3. There should be a constitutional amendment abolishing the ex officio state board of equalization. All authority now vested in the board should be transferred to the state tax commission.

4. The county assessor should be appointed instead of elected.

He and his office should serve under a merit system. Appointment of assessors might well be made by county commissioners from a list of eligible candidates approved by the state tax commission.

5. Should the state continue to elect the assessors (except Denver county) the term of office should definitely be lengthened to a minimum of four years.

6. The salary schedule for assessors and deputies should be increased. There was urgent need for such increase even before the development of high postwar living costs. Increases granted by the legislature in 1945 were not adequate.

7. There should be a reform relative to the $200 personal property exemption. The present system is far from satisfactory. Perhaps the solution is to retain the exemption but to apply it only against fully assessed household goods.

8. There should be a re-examination of the effect of tax exemptions due to religious, educational and charitable purposes; also tax exempt cemeteries and irrigation projects. An appraisal of the value of such property would be helpful. This appraisal could be made either by public officials or by some competent independent body. On the basis of incomplete information it appears that the statutory provisions relating to these exemptions should be made more stringent. Fortunately, the exemptions are not constitutionally mandatory.

THE COLORADO PROPERTY TAX

Fiscal Importance of the Property Tax

The general property tax has always been the principal source of public revenue in Colorado. This emphasis upon property taxation conforms to the general practice in most American states. For the nation as a whole until recent years, collections yielded more revenue than from all other state and local taxes combined. Even as late as in 1927 the property tax accounted for about 80 per cent of all state and local public revenue.[1] However, as the retail sales and income taxes have since gained in importance, the relative significance of the property tax has declined.

In Colorado, during the sixty year period from 1876 to 1936 the state and local units depended for revenue almost exclusively upon the general property tax. An indication of this dependence may be obtained by referring to the situation in 1932. According to the Census Bureau, in that year all Colorado taxes for state and local purposes yielded $54,408,000. Of this amount, $43,757,000 or 80.4 per cent came from the general property tax[2] -- this large percentage in spite of highway,

1 Jensen, Jens P., Property Taxation in the United States

2 Financial Statistics of State and Local Governments, 1932

inheritance and miscellaneous business taxes adopted principally during the two decades immediately preceding.

By 1942, in all states combined, the property tax supplied 47.5 per cent of tax revenue going to state and local governments. In that year the range among the states was from a high of 65.7 per cent in North Dakota to a low of 24.7 per cent in Delaware. Colorado was not far from midway in the list -- the property tax accounting for 51.5 per cent of total revenue as compared with an average of 47.5 per cent for all states.[3]

During the last 20 or 30 years in a number of states the property tax as a source of state revenue (as contrasted with local) has become relatively insignificant, disappearing entirely in at least five jurisdictions. The property tax revenue going to state governments expressed as percentage of all tax revenue claimed on the state level is shown in Table 1. In 1944 all states collected an average of only 4.6 per cent of their tax receipts in the form of the property tax. However, there was considerable variation among the individual states -- the range being from nothing in Delaware, Illinois, Oklahoma, Oregon,

Table 1

Property Tax Collections as percentage of Total State Tax Collections (Excluding Political Subdivisions), 1944

State	Percentage	State	Percentage
Delaware	0	Michigan	5.5

and Rhode Island to 22 per cent in North Dakota. The ratio for Colorado was 10.8 per cent, placing the state among those jurisdictions (eleven in number) still collecting 10 per cent or more of their revenue from the property tax.

However, the relative emphasis placed upon the property tax by the Colorado state government has been declining during recent years as seen in Table 2. In 1915, 12.7 per cent of all property tax revenue was taken by the state; the ratio increased to 14 per cent by 1920 but the trend has been downward since, declining to 9 per cent by 1945.

1 Annual Reports, Colorado Tax Commission

This downward trend in the relative amount of property taxes levied by the state is considered by most tax authorities to be advantageous. The state can well depend largely upon such revenue sources as the income, sales, severance, inheritance and special business taxes, leaving the property tax principally for counties, cities and school districts. Moreover, some authorities contend that by keeping the state property tax levies down to a relatively low level, local assessments are more likely to be uniform among the various counties -- thus contributing to equity in taxation. The basis for this contention is the theory that inequality among the county tax districts is principally due to competitive under-assessments -- the low assessments growing out of a desire upon the part of authorities in each county to keep their share of the state tax as low as possible.

The theory suggests that if the state were to discontinue completely the collection of property tax revenue, temptation for under-assessment between counties would be removed. Accordingly, at least five states have adopted such tax reform. However, the experience of these states relative to the property tax has been disappointing. Apparently the separation of revenue sources alone will not insure full and equal assessments of all property throughout the state. Perhaps other reasons more significant than the desire to escape state levies account for the low and unequal assessments on the county level.

Considering all factors the writer believes it desirable for Colorado to keep her state property tax levy down to the approximate level prevailing at present. In other words, in the future the state should not attempt to take more than about 9 or 10 per cent of all property tax receipts -- leaving the bulk of such revenue for the local units of government. Should additional revenue sources be found, for example, a severance tax or improved income tax, the state might well depend even less than at present upon the property tax. However, for the state to withdraw completely from the property tax field, as a number of jurisdictions have done, would probably not be advisable. By so doing, a measure of financial stability would be lost, as the property tax tends to yield a constant and stable stream of revenue. Moreover, the loss of this financial stability would not in itself be appreciably offset by improvements in local assessments.

The total yield of the property tax for all units of government in Coloradoby years since 1913 is shown in Table 3. From 1913 to 1929 the

Table 3

Taxes Levied, Colorado Property Tax for Years 1913 to 1946 Inclusive
(Dollars Expressed in Thousands)

Year	Anticipated Revenue	Year	Anticipated Revenue
1913	$18,032	1930	$49,207
1914	18,420	1931	44,864
1915	20,536	1932	39,998
1916	20,430	1933	36,793
1917	24,657	1934	36,813
1918	26,173	1935	36,962
1919	33,292	1936	38,139

trend of total revenue was steadily upward, rising from $18 million in the former year to over $49 million in the latter. Between 1929 and 1933 a drastic reduction occurred, anticipated collections falling to the level of $36.7 million by the latter year. Since 1933 the trend has again reversed itself, anticipated revenue for 1946 being about $50 million or approximately the same as in the former peak year of 1929.

As will be explained later, most of the increase in revenue since 1933 has come as a result of higher local mill levies rather than from rising property valuations as turned in by county assessors and the state tax commission. During the depression years property assessments were drastically reduced and those reductions have been only partially restored.[1]

Thus we find that by 1946, although property was being assessed at a much lower level, total tax collections were about the same as for the year 1929. Perhaps the most significant effect of the change has been that the state institutions, supported by a constant property mill levy, have suffered financially. Local units of government have recovered their lost revenue by raising local mill levies.

Early Development of the Property Tax

From 1876 to the Turn of the Century

When Colorado became a state in 1876 her new constitution provided for the adoption of a general property tax by authorizing the legislature to establish a uniform system of property taxation. All property, unless specifically exempted, was to be assessed at a just value. Original assessments were to be made by county assessors while equalization was possible on the county level by the county commissioners and on the state level by an ex officio board of equalization composed of the governor, state auditor, state treasurer, secretary of state and attorney general.

Specific property exemptions contained in the new constitution included the following: (1) $200 of personal property for each head of family, (2) ditches, canals and flumes used by the owners for irrigation, (3) mines and mining property for a period of ten years, (4) all real and personal property of the state, counties, cities, towns and other

municipal corporations and public libraries, and (5) property used solely for religious worship, for schools or for strictly charitable purposes, also to be exempt were cemeteries not used or held for private profit unless otherwise provided by law.

The constitution limited the state property tax to six mills on the dollar of assessed valuation with provisions for further reductions to four mills and then two mills when total state valuations reached $100 million and $300 million respectively. An amendment in 1892 repealed the latter provision and fixed the maximum rate for state purposes at four mills. The only exception allowed was to provide money to pay the expenses incurred on account of insurrection and invasion.[1]

Thus when Colorado became a state her constitution contained most of the customary provisions found in other state constitutions of that time relative to property taxation. The limiting features were intended to insure a system of equitable taxation without favoritism or discrimination to any special groups or classes.

However, the constitutional provisions committed the state to a system of general property taxation for state and local purposes which proved to be inequitable and from many standpoints impractical. Yet the provisions were so inflexible and constitutional revision was so difficult that it was not until 1911 (Tax Commission Act) and 1936 (amendment permitting income tax) that genuine tax reform was forthcoming.

Under the constitutional provisions of 1876 the legislature established by statutory means the procedure for initiating the property tax. County assessors elected for a term of two years were given the responsibility of determining the just valuation of all property, real and personal. These valuations were to be adjusted by a county board of equalization (county commissioners) and the differences between counties were to be equalized by the state board of equalization.

This administrative procedure was intended to insure assessment at full cash value of all property in each county of the state. However, in practice the procedure broke down. County assessors, always under pressure from property owners, began a competitive race with each other to under-assess property in order to reduce, in each case, the county's share of taxes paid to the state government. Because the same economic pressures and interests were present when equalization was attempted by the county commissioners, no correction of the inequality as between counties was achieved on this level.

Thus the state board of equalization was early confronted with the responsibility of attempting to force county assessors to make full-value assessments in order to obtain justice between the counties. Although

---

1 At present the maximum is still four mills for the ordinary operation of the state government and state institutions. However, in 1920 an amendment permitted the levying of one additional mill for erection of buildings for state educational institutions.

under the constitution the board was apparently vested with considerable power, its attempts were thwarted by the courts.

As early as 1876 the board detected property tax inequalities and changed assessments in such a manner that the sum total of all county assessments was greater after the equalization than before. The question of constitutionality was raised and in 1877 the court ruled that the board had no power to increase the aggregate valuation of the state. If it attempted to equalize by raising valuations in one county, it must make a corresponding reduction somewhere else.[1]

The board being composed of ex officio members, who were each busy with other duties anyway, decided that in view of the court's ruling nothing could be done. Consequently, nothing further was attempted relative to state equalization for over 20 years. Finally in 1899 the board made another effort to equalize values. This time it changed the assessment of certain classes of property in the various counties. Again objection was raised and an appeal made to the courts. The state supreme court affirmed its earlier decision and ruled this type of equalization to be likewise unconstitutional.[2]

Thus thoroughly discouraged in its efforts to equalize property valuations, the board adopted the following resolution:

> "Whereas every effort of the said Board of Equalization since its establishment has been invalidated by adjudication of the Supreme Court, therefore be it resolved, that in the judgment of this board the power of said board to equalize and adjust can only be made effective by constitutional amendment or by legislative enactment specifically designating its powers and directing the method of the performance thereof.[3]

After this formal declaration containing an appeal to the people, assessments grew steadily worse from the standpoint of equality among the various counties. Then, finally, several contributing factors induced the legislature to make a comprehensive property tax revision in 1902.

The Property Tax Law of 1902

The 1902 changes grew out of difficulties reaching a climax several years earlier. The depression of the 1890's put a severe strain upon the tax structure causing a shrinkage of revenue due to reduced valuations of property as well as because of tax delinquency. County assessors became reluctant to raise valuations even after several years of economic recovery. At the same time governmental functions were expanding and the need for revenue was increasing. As a consequence by 1898 the legislature

1 People vs. Lothrop, 3 Colorado 428 (1877)
2 People vs. Ames, 27 Colorado 346 (1900)
3 See Annual Report, Colorado Tax Commission, 1915, p.9.

found itself appropriating $472,555 in excess of tax receipts. Thus the lack of revenue for the biennium seriously crippled many of the state institutions and state functions.

Conditions became so bad that in 1900 Governor Thomas appointed a special revenue commission to study the problem and to make recommendations for tax reform. The commission's report led to the drafting and adoption of a new revenue bill in 1901. This new law amended the property tax by providing for, among other things, the appointment of a state board of assessors to supervise and administer tax assessments.

Through the efforts of the board total assessments in the state were increased from $216 million in 1900 to $460 million in 1901. Eighty-nine million dollars of this increase was assessed against the railroads. The latter corporations refused to pay their increased taxes and challenged the constitutionality of the new law. In December, 1901 the court ruled that the state board of assessors had no power under the state constitution, also contended that because of certain technicalities the law was invalid.

Governor Oram called a special session of the legislature in January, 1902 for the purpose of drafting tax legislation which might be approved by the courts. The general property tax revision of 1902 was the outcome. Many provisions of the law adopted at that time have remained unchanged.

In 1902 amendments attempted to strengthen the property tax by setting forth in detail a prescribed procedure of assessment of property and collection of taxes.[1] All properties of all kinds except specified exemptions were to be assessed annually at full, true cash value, by county assessors and their deputies; except that the properties of public utilities and railroads were to be assessed by the state board of equalization. The law gave detailed regulations for determining true cash value of property owned by individuals and corporations when no market or sale value information was available.

In order to guide and assist the county assessors and state board of equalization, all property was classified and carefully defined. Property was given the two-fold division of real estate and personal property. Real estate included lands, mines and improvements. Lands were segregated on the basis of whether they were grazing, agricultural or town lots. Mines were of two kinds -- those producing gold, silver, lead, copper or other precious minerals; and those producing iron, coal, asphaltum, quarries and lands containing other metals, minerals and earths. Improvements were defined as buildings, water rights, structures and fixtures erected upon or affixed to land.

Personal property was defined as everything subject to ownership not included within the term real estate. Such property was classified into tangible and intangible. Tangible personality included such property as animals, household goods, jewelry, vehicles, merchandise, etc. Intangible personality included rights, credits, franchises, special privileges and special advantages derivable under contract rights or in connection with the other property. The latter category was interpreted to include, among other items, bank deposits, money and credits, stock, bonds, notes

1 Revenue Act of 1902, approved March 22, 1902

and book accounts.

Heavy penalties were placed upon those found guilty of violating provisions of the law. Any officer neglecting or refusing to perform duties imposed in the act was to be fined not exceeding $5,000 and imprisoned not exceeding one year. Assessors were to forfeit $25 for each imperfect schedule they received and 20 per cent of their salary for failure to send abstract of assessments to the state auditor in due time. Also they were liable to a fine of $500 to $1,000 for neglect to compute and extend taxes, were to be punished as for perjury for wilfully omitting or undervaluing property, and could be removed from office by the governor for making erroneous assessments.

Corporations wilfully failing or refusing to make proper returns were to forfeit $100 per day for delays after June 1, failure to pay the tax could lead to forfeiture of the right to do business in the state, and failure to give information to the assessor or refusal to pay taxes would make a corporation liable to a fine of $1,000 and loss of its property through seizure and sale.

A taxpayer making an erroneous return was made liable to a fine of $1,000. Delinquent taxes were to bear interest at the rate of 1 per cent a month from March 1 to August 1, after which the rate was to be 15 per cent per annum.

There were also other prescribed penalties to insure enforcement of the law. These many drastic provisions applying to both tax administrators and taxpayers helped to increase for a time the effectiveness of the law but were futile from the point of view of obtaining really successful compliance. A tax system based upon faulty principles cannot be successful regardless of penalties imposed for noncompliance.

The first year after approval of the law (1903) total assessed valuation of property in the state was $333 million. This was considerably less than the $460 million valuation under the 1901 law which had been declared unconstitutional but more than the valuation of $216 million in 1900. From 1903 to 1912 total assessed valuation tended to increase slowly. By 1908 they were $375 million and by 1912, $422 million. Thus after 12 years time, valuations were still below those of the year 1901, in spite of drastic provisions in the law and even though actual wealth in the state had rapidly increased during the period.

The 1902 law had provided for an annual meeting of county assessors to be held at the Capitol for the purpose of discussing common problems attendant to the obtaining of assessments based upon full cash value for all property in the state. Yet the assessors in their annual meeting of 1908, realizing that there were widespread violations relative to property assessments, actually and openly agreed among themselves to assess in the future all property in the state at one-third cash value instead of full cash value as provided by law.

Writing in 1910, Blakey stated:

"As has been the case everywhere else, the general property tax in Colorado has degenerated into a tax on realty. The taxes on all

> other forms of property combined (if railroads are classed with realty) are an almost insignificant part of the total and of the real proportion of their actual worth. . . Mining property is highly favored by statute as well as by the assessors; manufacturing property is almost exempt from assessment and as long as communities and states desire such industries as they have in the past, there is apt to be no vital change in this respect, either as to manufactures or mines; merchandise, on account of its nature, is very inadequately assessed and the assessments of many kins of intangible property is a farce."[1]

Other states were also encountering serious difficulties with their property tax systems. Many began adopting a more centralized tax administrative procedure in an effort to correct some of the evils. This centralized administration usually took the form of establishing a state tax commission possessing considerable authority and responsibility over directing the work of local assessors relative to assessment procedure and equalization of property valuations. The tax commission was also usually given responsibility for direct assessment of public utilities and railroad properties in the state.

The county assessors in Colorado observing this development in other states and realizing that guidance and supervision on the state level was needed if uniformity of property assessment was ever to prevail, began advocating the adoption of a law establishing a state tax commission for Colorado. They urged that the commission if set up should possess powers comparable to those assumed by the state board of tax assessors under the ill-fated 1901 law which has fallen before the courts.

Beginning about 1910, a general reform movement swept the whole country and left its imprint in many states. The reform was supported by many labor, farmer and civic groups. Among other things, governmental reorganization, tax reform and protective labor legislation, were sponsored. In Colorado the cause of the county assessors became part of the general reform movement and, as a consequence, the 1911 state legislature passed a law creating a state tax commission.[2]

Since 1911 Under the State Tax Commission

With the establishment of a tax commission, the general property tax in Colorado became revitalized. In some respects this represented the beginning of a new era in property taxation. For a period of about 20 years (until the depression of the 30's) property assessments were fairly equitable, various economic groups appear to have assumed more nearly their fair share of the total tax load,[3] and public revenue was

---

1 Blakey, Roy G., Assessment of Property for Taxation in Colorado, 1910, Master's Theses, University of Colorado, p/84.

2 Bill was approved by the Governor, June 2, 1911.

3 One exception was the owners of intangible wealth. As most intangible property escaped assessment, these property owners paid very little, if any, state and local taxes.

usually sufficient to support necessary governmental functions.

During and since the depression the property tax has declined in relative importance and from some standpoints has become less equitable. However, the tax commission is still an extremely important agency in the whole tax program. In fact during recent years, as economic pressures have developed there has been more need than ever before for an aggressive commission possessing sufficient authority supported by adequate budgetary funds. Consequently, because of the vital role (actual or potential) of the tax commission, a brief discussion of its administrative record appears desirable.

The law of 1911 directed the governor and treasurer to appoint a tax commission composed of three members. Commissioners were to serve in office for six year terms and were eligible for reappointment. The annual salary of each fixed at $3,600.[1]

The powers and duties of the commission were (1) to supervise the work of county assessors, (2) to equalize assessments between the counties, and (3) to make original assessments of public utilities and other corporations having a continuity of business in two or more counties.

The first of these duties, that of supervision of local assessments, authorized the commission to exercise supervision over county assessors, county commissioners and all local tax officials, under penalty of forfeiture and removal from office, "to the end that all assessment of property, real, personal and mixed, be made relatively just and uniform and at its true and full cash value." It was charged with the duty of seeing that "all laws concerning the valuation and assessment of property and collection of taxes thereon are faithfully obeyed." The power to reassess individual properties was conferred in cases where, in the judgment of the commission, the property had not been assessed at its true and full cash value. In order to facilitate its work one or more members of the commission was required to visit at least one-half of the counties of the state annually, while every county was to be visited at least once every two years. Assessors could be summoned before the commission, and each year a meeting of all local assessors was to be held. The commission could prescribe forms and require reports from assessors.

Thus the powers and duties relative to supervision of local assessments as given to the tax commission appear to be very definite and extensive.

The second duty, that of equalization of assessments between counties, was limited by the constitutional provision that the state board of equalization should possess this function. There had been an attempt to abolish the board of equalization in 1912 but the proposed constitutional amendment had failed. Consequently, the legislature found it necessary to em-power the commission merely to make recommendations relative to equalization between counties -- the final decision to

1 Raised to $4,000 in 1943.

be made by the board of equalization. This dual control over equalization still exists and as will be explained later has frequently caused difficulty.

The third duty of the commission as embodied in law was to make original assessments of those properties formerly assessed by the state board of equalization. These properties included railroads, telegraph, telephone, and express companies, and sleeping-car and private-car lines. In addition the commission was empowered to make original assessments of all other public utilities. Other public utilities were defined as "such power companies, pipe-line companies, water companies and all other classes of companies, however owned or operated having a continuity of business in two or more counties of the state."

The tax commission was thus given the responsibility of determining the value of the utility as a whole and then of apportioning this value on an equitable basis among the counties served by the utility.

Several other duties were subsequently assigned to the commission by the legislature. Beginning in 1913 local tax authorities were required to obtain approval from the commission before they in turn could approve petitions for tax abatements, rebates and refunds. Also in 1913 the legislature placed upon the commission the responsibility of investigating and of approving or disapproving petitions of local taxing districts for permission to increase their tax levies beyond certain statutory limits.

Also the commission is required to prepare an annual report to be submitted to the governor, treasurer and legislature. This report contains extensive statistical material relating to property assessments and tax levies within the state.

Still another duty of the commission has been to recommend changes for the improvement of the tax system. This function was originally intended to be very important, however, too frequently in the past the commission has been forced to confine its limited time and energy relative to contacts with the legislature in fighting for its own appropriations rather than in sponsoring legislation to improve the tax system.

How successful has the commission been in fulfilling its primary duties? The newly created body was handicapped the first year because of delay in its appointment. Also, during the first year, very few changes were made in assessments because of the desire to place some limitation upon mill levies before drastically increasing valuations. Otherwise, it was feared the state and local units would find themselves with more revenue than they could economically spend.[1]

Accordingly, in 1913 the legislature amended the property tax law by limiting all tax-levying bodies, from the state government down to school districts, by providing that taxes for 1913 should not exceed those

1 First Annual Report, 1912, Colorado Tax Commission.

levied in 1912 by more than 15 per cent, while a maximum increase of 5 per cent over the preceding year was prescribed for each year subsequent to 1913.[1] This limitation upon governmental bodies is still operative throughout the state.[2]

By 1913 the commission decided that it should attempt to enforce the provisions of the law specifying that all assessments should be at full cash value. Consequently, rather drastic measures were taken which resulted in an increase of assessed valuation of all property in the state from $422,442,079 in 1912 to $1,306,647,430 in 1913 -- an increase of more than three fold.

It was only natural to expect that local authorities in many of the counties where assessments were forceably raised would register protests. During the first year assessments were increased by the commission in 58 counties and 24 of these protested before the board. The next year there was less opposition and it appeared as though the commission was soon going to obtain voluntary cooperation from all county assessors. However, in 1915, the authorities in Weld and Denver counties contending that they had been discriminated against, originated an initiated measure to abolish the tax commission -- the measure appearing on the November ballot.

Because of the issue which had been raised, the State Survey Committee representing the legislature, employed Professor R. M. Haig of Columbia University to make an investigation. During the summer Haig made a thorough study of conditions in the state including the work of the tax commission, and published a report in which the commission was completely exonerated. In fact, Haig's report was very complimentary relative to the board's accomplishments during its two years of existence in the face of many difficulties and much opposition.[3]

Relative to the issue, the election in November was close, the bill being defeated by a scant majority of 3,649 votes. However the tax commission now had a mandate from the people to continue to function. Nevertheless, since 1915 even though opposition subsided, the board has not entirely forgotten the time when it was forced to fight for its very existence -- it has never again been quite as energetic and aggressive in attempting to see that the assessment job is fully and adequately done among the counties of the state.

Members of the tax commission were given additional security in 1918 when they were placed under the protection of the new civil service system established by a constitutional amendment November, 1918. Since then members of the commission and their employees serve until they resign, or until they are removed for cause.

Another crisis occurred in 1929 when dissention developed among members of the tax commission. The chairman filed various charges

---

1 Chapter 137, Session Laws of 1913.

2 Supplementary levies are permitted if approved by the tax commission or by a referendum vote of the people.

3 Report of Survey Committee of State Affairs on Work of Tax Commission, published in Fifth Annual Report, 1916, Colorado Tax Commission.

against Mr. Link, a member since the board's creation and requested his dismissal. After various delays, including several court actions and counter actions, Mr. Link was successfully ousted leaving a vacancy which was filled by appointing Mr. Tucker, who had long served as secretary of the commission.[1] Since 1929 apparently there has been harmony among members of the board.

Perhaps further understanding and appreciation of the work of the tax commission can best be obtained by referring to the discussion which immediately follows of several special property tax problems. With reference to most of these problems the role of the tax commission cannot be disregarded. In discussing the problems, conditions prevailing at the present time are stressed.

However, before continuing further, this word of warning is appropriate. When evaluating the work of the tax commission during its 35 years of existence since 1911, a number of factors must be taken into consideration. It had hardly begun to operate when its very life was threatened by proposed statutory changes and constitutional amendments. It has always operated on a budget insufficient to maintain an adequate staff of field workers. Also its authority over equalization of assessments among counties has been limited because of the fact that final decisions reside with the state board of equalization. Then too, its work has not been easy. Colorado has many divergent economic and sectional interests which are difficult to reconcile.

1 Eighteenth Annual Report, 1929

The Problem of Local Assessments

The Colorado constitution provides that in each county there shall be an assessor elected by the people for a two-year term of office. Furthermore, it stipulates that the general assembly shall prescribe the duties of the assessor as well as the amount of his salary or other compensation.[1]

1 Colorado Constitution, Article XIV, section 8. An exception is the city and county of Denver; here all county officers may be either elected or appointed, depending upon provisions of the city charter (Article XX, section 3)

In accordance with the constitutional provisions, the general assembly has provided legislation relating to the office of county assessor. The statutes require that the assessor be a qualified voter in the county in which he serves, he must be elected at the biennial general election, serving for two years or until his successor takes office, he must be bonded and must subscribe an oath for the faithful performance of his duties. The assessor may employ deputies and assistants -- the number of deputies depending upon the number of assessment districts set up by the county commissioners -- and he decides the amount of salary for these employees subject to approval by the county commissioner. Should a disagreement arise relative to the number of deputies and assistants or to their salaries, the assessor may appeal to the state tax commission which has final authority.[1]

For the purpose of fixing the amount of compensation for assessors, the legislature classified the counties into various groups according to size, population and amount of work to be done by the county officers. The salaries thus specified in law remained unchanged for year. As time passed these salaries, inadequate in most counties even at first, became continuously less satisfactory from the standpoint of attracting competent candidates for office. Finally in 1945 some slight correction was made by increasing the amount of compensation going to assessors in most of the counties. The present salary schedule is shown in Table 4. It may be seen that the range is from $4,600 in Denver to $1,000 in Hinsdale county -- the median salary being $2,400 per year.

Table 4

Salaries of County Assessors in Colorado as Fixed by the State Legislature in 1945[2]

County	Annual Salary of Assessor
Class I (Denver)	$4,600
Class II, Group A (Pueblo, Weld, El Paso)	3,300
Group B (Boulder, Larimer, Mesa, Las Animas, Arapahoe, Jefferson)	3,100
Class III, Group A (Otero, Adams, Fremont, Logan, Morgan)	2,600
Group B (Delta, Huerfano, La Plata, Montrose, Rio Grande, Prowers, Yuma, Conejos, Garfield, Routt, Alamosa)	2,400

County	Annual Salary of Assessor
Class IV, Group A (Montezuma, Bent, Washington, Chaffee, Costilla, Kit Carson, Lake, Teller, Baca, Gunnison)	$2,400
Group B (Saguache, Lincoln, Elbert, Crowley, Eagle, Sedgwick, Moffat, Phillips)	2,250
Class V. (Archuleta, Clear Creek, San Miguel, Grand, Douglas, Park, Cheyenne, Rio Blanco, Kiowa, Custer, Curay)	2,100
Class VI, Group A (Dolores, Pitkin, Jackson, Summit, Gilpin, San Juan)	1,800
Group B (Mineral)	1,300
Group C (Hinsdale)	1,000

These salaries are still inadequate. In some respects the office of county assessor is the most important office in the county or state. The assessor has been given the authority and responsibility of exercising his own judgment and discretion relative to valuations of property involving the payment of millions of dollars of taxes. For example in 1945, the 63 county assessors made original assessments of property appraised at more than one billion dollars. This represented about 83 per cent of the total assessed property in the state while property owners thus assessed were called upon to pay taxes of almost $39 million. More specifically, in a county such as Yuma paying the median salary of $2,400, the assessor is responsible for placing a valuation on some $10 million of property against which is placed a tax liability of more than $300,000. Private business would not likely place comparable responsibility upon the shoulders of a $2,400 employee.

It is established principle that sucessful administration of our system of property taxation primarily depends upon sound original assessments. Where these occur, methods of review are of secondary consideration. Where they do not occur, review and equalization, although of vital importance, cannot be expected to remove all inequities of assessments.

Relative to the work of the county assessor, we must pay for a good job if we want a good job done. The office must provide sufficient compensation to attract and retain competent and well trained men. According to the National Association of Assessing Officers:

> "An assessor must be well-informed in many fields. He should know something about the law of property and should have a working knowledge of tax law. He ought to know enough about surveying to be able to use a tax map and to describe property

> accurately. If he is to appraise improvements effectively, he needs to know something about architecture and structural engineering. He should be aware of the principles of real estate management and sales practices, if he is to value urban land. He should have knowledge of soils and farming methods, if he is to appraise rural land. He should know something about market conditions, commercial practices and economics. Finally, he should be expert in public relations and should be able to organize a variety of work effectively."[1]

During recent years political parties in many of the counties have encountered great difficulty in securing candidates to run for office of assessor. After election the new incumbent, often poorly prepared for his duties, soon finds alternative opportunities for employment which are much more attractive. Thus after a period of two years he is not likely to want a second or perhaps third term.

An exception is to be found in a number of counties where assessors have made the work a life career, the electors retaining them in office over a considerable number of years. Some of these experienced assessors, especially in a few of the larger counties, are doing a remarkably good job and are staying in office in spite of relatively low salaries.

Table 5 indicates the number of changes made in the assessor's office for the various counties during the last 30 years. It may be seen that at the top of the list are five counties (Alamosa, Boulder, Clear Creek, El Paso and Rio Blanco), each of which had but two individuals serving as assessor. On the other hadn, the other extreme is Costilla county which had nine different assessors. The median county changed assessors five times during the 30 year period. In other words, the average assessor s served a total of six years in office, having been elected to three two-year terms. This record appears to be better than that found in many states. However, in Colorado the record is far from enviable, particularly in more than one-third of the counties -- those changing assessors every two or four years.

Table 6 gives the number of years of service as county assessor of present incumbents. As the date taken (October 1, 1946) is just before a general election, all incumbents have served at least two years. However, there are 16 assessors who have served no more than two years. An additional nine have served only four years, while a total of 48 have been in office for 10 years or less. On the other hadn, it may be observed that six assessors have had 20 years or more of assessing experience.

It does not necessarily follow that assessors staying in office for the longest periods of time make the best assessments. However, a continuous turnover of assessors and deputies every two or four years is definitely not conducive to competency and good performance in office.

This leads to the discussion of another problem relative to local assessors in Colorado. The elective term of two years is too short a period.[1] The victorious candidate scarely finds himself in office until he must begin worrying about the next election. At least two years are needed for an assessor to lear even the rudiments of his job -- during the second two years he may begin to be competent. If county assessors are to be elected, the term of office should be for a minimum of four years.

However, many tax authorities rather convincingly argue that local assessors should be appointed rather than elected. For example, when discussing the elective system Jenks points out;

> "The fundamental defect of our assessing system lies in the inefficiency of the local assessor. Dominated by the influence of his neighbors who elected him, swayed by prejudices or favoritism, he carelessly, or intentionally, omits from the

1 Nevertheless, two years is still the prevailing term in a large number of states. About 40 per cent of the primary assessment districts of the United States select their assessors for two-year terms, 30 per cent for four-year terms, 20 per cent for one-year terms, and the remaining 10 per cent for terms of three, five, six or an indefinite number of years. See Selection, Tenure and Compensation of Assessors, 1940, Nat'l. Ass'n. of Assessing Officers, Chicago

> tax list many persons and much property which should be listed; his valuations are not measured by the same standard and are not fair nor equitable as between persons assessed. At every point the system, if such it can be called, is more or less defective. In the first instance, the assessor is subjected to local pressure in the making of his valuations. He hopes to live at peace with his neighbors and, generally, desires to be reelected; and his method of assessment, as a consequence, follows the line of least resistance... as the years go by, the assessor continues in office and a local system of assessment is developed which is more or less satisfactory to the people who give the matter no attention, feeling that they are assessed on a minimum basis. The assessment thus made is copied from year to year and the injustices and inequalities thereon existent are perpetuated."[1]

Although such conditions among the various states have been well known for years and in spite of arguments brought forth in favor of the appointment of assessors, in some 40 odd states the people continue to elect their local assessors.[2] Is this merely because of inertia and perhaps stumbling blocks to be found in the state constitution? Is this merely because of inertia and perhaps stumbling blocks to be found in the state constitution? Undoubtedly these factors are important, but probably there are other reasons also. Let us briefly review the arguments for and against the elective system as contrasted with the appointive system for selecting assessors.

The claimed advantages of electing local assessors are several -- the arguments presented often taking various forms. As most proposals for the appointment of assessors provide for selection by an administrative body on the state level, some arguments are directed against this state centralization. For example, in the first place it is frequently pointed out that local government has the largest financial stake in property taxes. Thus, it is desirable that the responsibility for the administration of these taxes should rest with the governmental unit principally dependent upon the proceeds.

Second, it is claimed that a local assessor is apt to have a more thorough knowledge of conditions affecting the value of property in his jurisdiction. This greater familiarity with local conditions makes possible better assessments.

Third, is the argument that the convenience of taxpayers is apt to be better served by a local assessor, elected by the people; that taxpayers will find it easier to call at the assessor's office to discuss

---

1 Jenks, Aldro, "Professionalization of Assessors", Bulletin of the National Tax Association, February 1944, p. 152.

2 In 1940 about 97 per cent of all town, village, borough, and township districts, 87 per cent of all county districts, and 33 per cent of all city districts throughout the country had systems under which assessors were elected. See Selection, Tenure and Compensation of Assessors, 1940, National Association of Assessing Officers.

factors affecting value which are essential policy matters.

Fourth, the local assessment unit, independent from a large state organization which it is alleged, is likely to be unwieldy, can act more quickly in adjusting assessments to rapidly changing values or in providing prompt relief if property has been erroneously valued. A corollary of this argument is that a state organization tends to become bureaucratic, arbitrary in making decisions, and less responsive to public needs, particularly when officials are appointed rather than elected to office.

Fifth, is the argument that appointed assessors are not necessarily removed from the influence of partisan politics -- that appointments may be in accordance with a spoils system rather than selection based upon competence; or, if appointments are made through examination under a merit or civil service system, there is no assurance that the most competent individuals will be selected. Moreover, regardless of possible inefficiency the assessor may be retained in office indefinitely.

Contrasted with these arguments are those put forth by the advocates of a system based upon the appointment of assessors. First, it is pointed out that although local governments may be the major beneficiaries of the property tax, there is no reason why they should suffer financially if assessors are to be appointed by a state body. On the contrary, in those states which have adopted a more unified assessment procedure, the experience has been that local communities, because of better assessments, have received increased proceeds from the property tax.

Second, in reply to the claim that a locally elected assessor is more likely to be familiar with the nature of property to be assessed in his county, it is argued that much of the property in a locality is highly specialized or is owned by utilities and other corporations doing business in more than one county. Consequently, assessments by a local assessor are often very difficult if not impossible. Furthermore, it is argued that if the specialized properties including utilities are assessed a unit by a state body while the remaining property is assessed by an elected county assessor (the arrangement in Colorado), there will not be equality of either procedure or results as between the two assessing bodies. Colorado's experience indicates that this claim is well founded. Local assessors argue that local property is bearing a tax burden disproportionately heavy as compared with that paid by the corporations assessed by the state tax commission. On the other hand, the commission argues that actual conditions are exactly opposite. Regardless of which group is correct in its analysis, if a unified system were in operation throughout the state, greater equality would be likely to prevail as between different types of property.

Third, taxpayers frequently exert undue unfluence upon an elected county assessor. During election years this influence is especially apt to interfere with the assessor's ability to make impartial and equal assessments, at least if he wishes to be retained in office. The principal inequity resulting from such taxpayers' pressure is that the

more influential people owning the largest properties are likely to be the ones most favored with low assessments. Thus, the property tax tends to become badly regressive. This argument against elected tax officials is ably presented in the quotation by Jenks included above.

Fourth, it is argued that although appointed tax officials may not always be selected from among the most competent individuals available, with proper safeguards, the chances of getting satisfactory assessors are better than if they are to be elected. This may partly be due to the fact that the greater security of tenure which usually comes with an appointive office is likely to attract individuals who are better fitted for office.

Fifth, it is pointed out by those who favor the appointment of assessors that many of the arguments put forth by opponents are extraneous if assessors are selected by local officials, for example, in a city and county like Denver by the city council, or perhaps in other counties by the county commissioners. It is further argued that although such a method would not be as satisfactory as a more unified state system, should fear of state centralization be an insurmountable obstacle to tax reform, a system of locally appointed tax officials would be superior to a system of locally elected ones.[1]

Because of the importance of the issue of local vs. state control relative to the property tax, we shall quote from Jens P. Jensen, perhaps the outstanding authority on property taxation in the United States.

Professor Jensen says;

> "It would hardly be possible to over-emphasize the prevailing characteristic of excessive decentralization in the assessment. The administration of the general property tax contrasts sharply with that of the income tax, and of other taxes except the poll tax and a few local license taxes. The assessment is essentially a function of determining values uniformly for the entire state. It ought to be a state function, the assessment officials ought to be as free from local pressure of taxpayers as are the administrators of the federal and state income taxes. That this is not the condition is chargeable chiefly to the fetish of home rule. Perhaps the home rule doctrine is, in certain phases, based upon a genuine desire for local self-government. But underlying the insistence upon local assessment is a feeling that the local assessor is not merely necessary in order to prevent differentially high local valuations but also useful for the purpose of obtaining differentially low local valuations. The mechanism of this competitive undervaluation could be removed by centralizing the assessment."[2]

---

1 A good discussion of many of these arguments as well as additional ones may be found in an article by Dixwell L. Pierce entitled, "Advantages and Disadvantages of the County Assessor System," Proceedings of National Tax Association, 1941, pp. 276-86

2 Property Taxation in the United States, 1931, p. 359

The procedure to be followed relative to local assessment of property in this state is prescribed in detail in the Colorado statutes. This procedure by chronological steps is as follows:[3]

1. On or before March 1, the assessor shall mail to each non-resident owner of property in the county a tax schedule, setting forth a description of the real property assessed to him the previous year. These schedules, containing any necessary corrections because of changes in ownership, must be returned to the assessor before the first of May.

2. On March 1, or as soon thereafter as practicable, the assessor is required to deliver a form of tax schedule to every inhabitant of his county. If these forms are not filled out at the time of the assessor's visit, they are left with the property owner who is required under oath to set forth specifically upon the schedule all real and personal property owned by him. The property owner shall return the completed schedule before the first of May.

3. On the basis of property listed upon the tax schedule, the assessor shall determine a valuation for tax purposes. Such valuation is supposed to be according to full cash value of the property.

4. March 1 is the date for attachment of tax liens on all property subject to taxation in the state.

5. If property is brought into the state after March 1, the owner should at once file a schedule with the assessor of the county in which the property is located.

6. Before July 1, the assessor must notify all taxpayers whose property he has assessed at a valuation other than that given in the original schedule. If the taxpayers object to changes they must be given an opportunity for a hearing.

7. Between the third Monday in July and the twenty-eighth day of July, the county board of equalization (county commissioners) holds meetings for the purpose of reviewing any complaints from taxpayers who wish to appeal decisions of the assessor. The county board, in order to achieve greater equalization, has the power to change any assessments during this period.

8. On or before August 1, the assessor, having determined the value of each item on the various schedules (reflecting any changes which the county commissioners may have made) prepares in duplicate an abstract of his assessment

---

3 Colorado Statutes Annotated, 1935, and Cumulative Supplement, 1945, Chapter 142.

roll. One copy, together with a sworn statement that the abstract complies with all provisions of the law, is forwarded to the state tax commission.

9. On or before the second Monday in September, the state tax commission meets and examines the abstracts of assessment rolls to determine whether property has been assessed at its full value, and makes its recommendations to the state board of equalization.

10. On the third Monday in September the state board of equalization meets and must complete its work before the fourth Monday in September. It examines the abstracts or assessment rolls as submitted by the state tax commission, and after making such changes as it is authorized and may wish to make, approval is given -- the assessments then becoming official.

11. On or before October 1, the assessor must certify to the clerk of each town within the county and to the county superintendent of schools the total value of assessable property in the towns and school districts respectively. Before October 16, the local officials in each town and school district must certify to the proper county authorities its mill levy to be applied for the taxable year.

12. As soon as practicable after the taxes are levied and not later than January 1, the county assessor is required to extend upon the assessment rolls the taxes levied by all taxing units and attach his warrant. The tax list and warrant is delivered to the county treasurer for collection, the warrant being a command to the treasurer to collect the said taxes.

It may be seen from this description of the local assessment procedure that the assessor's work is rather involved and requires a period of time extending over most of the year. Prior to 1943, the period elapsing between the first and last assessment steps was even longer, however, in that year, the legislature shortened the period by about two months.

One part of the assessment procedure, the most important phase of all, tends to break down in actual practice. According to law, property owners are held responsible (subject to heavy penalty for violation) for listing <u>all</u> of their property, both real and personal, upon the tax schedule. In other words, the law intends that there shall be self-assessment by the property-owner himself, that is, to the extent of listing all items -- the assessor is to place valuations upon them.

The county assessors, however, are unable to depend upon this cooperation from taxpayers. Penalties are not enforced against property owners who do not comply with provisions of the law, perhaps because violations are so prevalent. If the assessor or his deputy does not find the property owner at home, the tax form is left; if the schedule

is never filled out and returned, an assessment is made at the discretion of the assessor -- usually the same amount as for the preceding year.

Actually, whether the property owner is found at home or not, assessments vary but little from year to year. Probably because of difficulties involved, particularly due to limitations of time and staff, but sometimes also because of inertia or the desire not to antagonize property owners, assessment figures are usually merely copied from the tax roll of the previous year. Most county assessors find it impractical or inexpedient to make general reappraisals of property oftener than five, ten, or even twenty years.

Considering the general breakdown of this important phase of assessment, therefore, it is not surprising that a great deal of property in the state is never listed upon tax schedules; neither is it surprising that the property actually listed for any particular year is appraised for tax purposes at a figure having little relationship to true cash value.

Figures in Table 7 indicate the variation among Colorado counties relative to assessment of farm property. Assessed valuations are expressed as percentages of United States Census values for the year 1940. Although census valuations are not necessarily more accurate than the valuations for tax purposes, the procedure used by the Bureau of the Census in uniform among all counties. Therefore, the percentage figures shown in the table are considered significant.

The counties are listed in order according to relative assessment levels. It may be seen that the percentage range is from a high of 145 per cent in Kiowa county to a low of 26 per cent in Jackson county. Average for the state was 62 per cent. In other words, for the state as a whole, assessed valuation of farms amounted to a little less than two-thirds of the value placed upon farms by the Bureau of the Census. Assessors of five counties (top of list) showed valuations exceeding census figures, while assessors in 15 counties (at the bottom) showed valuations of less than half the corresponding ones made by the census.

Table 7

Assessed Valuation of Colorado Farms Compared with Census Value, by Counties, 1940[1]

Rank	County	United States Census Valuation	Assessed Valuation	Percentage
1	Kiowa	$ 2,486,112	$ 3,615,278	145.4

1 Both valuations include agricultural and grazing lands, improvements, farm machinery and implements; neither includes the value of farm animals.

Source: Bureau of the Census, April, 1940; also, Annual Report, Colorado Tax Commission, 1940.

The question might appropriately be asked, is there any justification for farms in a county such as Rio Grande for example, to be assessed at 35 per cent of census value, for those in Alamosa at 58 per cent, those in Crowley at 100 per cent and those in Kiowa county at 145 per cent? These figures do not necessarily indicate that the farms in any county are assessed at more than full market value as required by law, but they do indicate a very inequitable condition throughout the state due to lack of equality of property assessments. Undoubtedly within many of the counties one would find as great inequality among farms of various property owners as apparently exists among the counties themselves.

In 1944 the state tax commission reported that it had completed a survey of approximately 35 cities and towns in which field men appraised 700 residences, using 1940 building costs as a basis. The properties were selected at random in the various cities and towns and when the valuations thus obtained were compared with the assessed valuations it was found that the assessments varied from as low as 10 per cent to as high as 90 per cent of the appraised value.[1] Thus it appears that urban

1 Annual Report 1944, Colorado Tax Commission, p. 4

real estate is probably assessed as unequally throughout the state as farm property.

However, the assessment of personal property is undoubtedly least satisfactory of all. This phase of assessment will be discussed in another section of our study dealing with personal property exemptions. It will be seen that in fully one-third of the counties the average assessment of personal household property is actually less than the $200 exemption permitted by law. Also it will be seen that the assessment ratio of such personal property is relatively seven or eight times as high in some counties as in others.

Currently (1946-47) the tax commission is conducting a survey throughout various counties of the state for the purpose of determining the extent to which local assessors are undervaluing real property. An attempt is being made not only to discover the extent of inequality of assessments within a county but also to determine the average inequalities prevailing among the counties. Actual real estate sales data as indicated in the county clerk's office are compared to assessed valuations placed upon these same properties by the county assessor. As the survey is not complete, the commission has not yet released data by named counties. However, figures were given to the writer for three counties which we shall call X, Y, and Z. There is reason to believe that conditions prevailing in these counties are fairly typical of those to be found in the other 60 counties of the state.

The data supplied by the commission are shown in Table 8. It may be seen that on the basis of property transactions between July 1, 1945 and July 1, 1946, the average level of assessed valuations was 27 per cent in County X, 32 per cent in County Y, and 35 per cent in County Z. On the basis of these figures as well as data being tabulated for other counties, the commission estimates that real property throughout the state is not being assessed by county assessors at a higher average level than 25 or 30 per cent of full cash value.

Another and perhaps even more significant part of Table 8 refers to the assessment ration of property classified as farm and urban, by counties. The figures for urban real estate include all transactions of real property made during the year in the largest city or town of the county.[1] Those for farm property include all transactions made throughout the county during the period. The table indicates that great inequality exists within the counties relative to the assessment of property. The same general pattern of inequality prevails in each of the three counties and for both farm and city property. For example, on the basis of the sample check, in County X, 3 per cent of the farms are assessed at more than 60 per cent of full value, 3 per cent on a 50 to 60 per cent basis, 21 per cent on a 40 to 50 per cent basis, 28 per cent on a 30 to 40 per cent basis, 28 per cent on a basis of 20 to 30

1 It should be pointed out that the commission's investigations are not confined to a study of these cities.

Table 8

Ratio of Assessed Value to Sales Value of Real Estate in Three Colorado Counties[1] (1946)

Average assessment ration (farm and city):
County X = 27.31% (206 transfers of property)
County Y = 31.99% (262 transfers of property)
County Z = 35.25% (57 transfers of property)

Real Estate by Kind	Ratio of assessment to sales value					
	Over 60%	50-60	40-50	30-40	20-30	Under 20%
	(Number of properties in each category expressed as percentage of total)					
County X						
Farm	3	3	21	28	28	17
Urban	4	4	12	20	33	27
County Y						
Farm	8	5	13	32	29	13
Urban	14	6	13	26	25	16
County Z						
Farm	8	11	8	34	31	8
Urban	-	--	--	--	--	--

1 Based upon transfers of real estate taken from records of county clerk's office and verified by revenue stamps from July 1, 1945 to July 1, 1946. Assessed values are for the year 1946.

Source: Figures were supplied by the State Tax Commission.

per cent and finally, 17 per cent of farms are assessed at less than 20 per cent of full value. The discrepancy in county X of urban property is even greater -- 4 per cent of city homes being assessed above 60 per cent of cash value and 27 per cent being assessed below 20 per cent of value. Counties Y, and Z show similar inequalities for both farm and urban property, although the assessment ratios average somewhat higher than in county X.

Such inequalities of assessment within a county are particularly bad because of the resulting inequity of tax load distribution as between particular property owners. For example, if two farms each having a cash value of $10,000 are assessed unequally -- the first being assessed at 60 per cent and the second at 20 per cent of cash value, the owner of the first farm would have a tax load three times as heavy as the owner of the second. Assuming the tax levy to be 40 mills, the taxes would be $240 and $80 respectively, or a discrepancy of $160. This degree of inequity (when two farms of equal value are involved) is bad enough, but when farms or city property having different true values

are compared with each other relative to assessments, the inequity often is well nigh intolerable, the reason being that large and valuable properties (whose owners have superior tax paying ability) tend to be the ones which are most underassessed. Thus the property tax in effect becomes grievously regressive.

The best correction for these inequalities as well as others described in this section is to see that good original assessments are made by county assessors. Although the state tax commission, through guidance of assessors and through equalization functions, can play a significant role in attempting to achieve this objective, it is also vital that competent local assessors and deputies be selected in the first place.

By way of conclusion it may be stated that a preponderance of evidence seems to indicate that local assessors should be appointed rather than elected. They should serve fairly long terms in office. If the state and local governments have a satisfactory merit system, the assessor should be placed under the system and retained in office until retirement or until removed for cause. In the absence of a good merit system, assessors might well be appointed by county commissioners for a term of not less than four years from a list of eligible applicants examined and approved by the state tax commission. The latter arrangement would perhaps remove many of the objections of those who fear complete centralization in a state body. Finally, regardless of the system of selection or retention in office, assessors should be paid adequate salaries -- compensation commensurate with their duties and responsibilities. There is every reason to believe the salary schedule operative in Colorado is still too low.

If these suggested changes were adopted in the state, there is no question but that local assessments would be appreciably improved, resulting in much greater equality and equity in taxation and at the same time bringing in additional revenue to state and local governments.

However, in order to avoid some inequalities which would still persist, it is desirable to maintain a system of supervision and equalization by a state administrative body. This phase of property taxation will be discussed in the next section.

State Supervision of Local Assessments

When the state tax commission was established in 1911 it was given rather extensive authority relative to the supervision of property tax assessment work undertaken by county assessors and boards of county commissioners.[1] In a state such as Colorado where local tax authorities are elected for two-year terms of office, where the normal turnover in office appears to be nearly one-third of the county as-

sessors at every election, where the local assessment function is divided among 63 county units containing diverse kinds of property, the task of accomplishing effective state supervision is particularly difficult yet at the same time vitally important. How well are the supervisory functions being accomplished by Colorado's state tax commission?

Tax Forms and Schedules

One supervisory function is the preparation of suitable forms for use in listing property on the tax schedule. The items included should be changed from time to time to include or emphasize new kinds of property, or to drop obsolete items no longer important. Because over the years there is a constant and often rapid change in the nature and variety of property, especially personal property, it is important that the tax form be constantly revised. If an item is not on the blank, demanding the assessor's attention, it is not likely to be listed at all, and the continuance of obsolete items on the list is expensive, as they crowd out more important items. In addition to the preparation of a general schedule to be used by most taxpayers, there should also be schedules made available for use by the specialized owners of property in business. Moreover, the various appropriate tax schedules should be standardized as much as possible for all counties in the state.

> Writing in 1930 Jensen stated: "Considerable confusion exists in the preparation of the tax schedules, the blanks on which the taxpayers are to enter their taxable property, and it cannot be doubted that the results are detrimental to the assessment....The statute creating the Colorado tax commission assigns the duty of preparing all necessary forms, but provides nothing as to when or how they shall be printed. From a comparison of tax schedules in use it would appear that no central authority has standardized the general schedule. Although the tax commission has exerted its influence toward making the schedules uniform, they are yet very diversified as to size, form, arrangement, items listed and affidavits or oaths required. It would appear that the general schedule blanks are designed to serve for all classes of taxpayers, whether individual, or corporations, banks or merchants, etc., with or without supplementary schedules. Not one of the blanks examined provides for the appraisal of exempt property....The list of items of taxable property is not uniform nor is the list uniformly arranged."[2]

---

1 For enumeration of specific powers see previous section on early development of the property tax.

2 Jensen, Jens P., Survey of Colorado State Tax System, 1930, p. 87

Since the time when Jensen wrote, certain improvements have been made in the schedules relative to kinds of forms in use as well as standardization of personal property items included on the schedules. It has been suggested that the effectiveness of supervision by the tax commission could be further enhanced if the legislature were to provide, at state expense, for printing of all necessary tax forms so that the commission might then distribute such approved blanks to the 63 county assessors as may be required.

An Assessors' Manual

Tax commissions in a number of states have extended valuable assistance to local assessors by preparing assessors' and property appraisers' manuals. Such manuals when carefully and comprehensively prepared can give to the county assessor and his deputies a great deal of technical and theoretical information needed for assessing all like and similar property. The manual can serve as a guide for systematic and orderly procedure for making tax appraisals more uniform throughout the entire state.

In discussing the advantages of an assessors' manual, a local tax assessor in Wisconsin (a state whose tax commission has been unusually successful) points out:

> "The fundamental requirement of an assessment roll is that it distributes equitably the burden of taxes, and to do this the human equation must be eliminated as much as possible. For the individuality of the assessor and his varying judgment, there must be substituted a system of mechanical precision (the assessor's manual), and supplemented by individual judgment only when necessitated by unusual conditions."[1]

One of the most recently prepared property appraisal manuals was published by the Illinois tax commission in 1943. It contains forms, instructions, procedures and guides for the valuation of land, the estimation of reproduction cost of improvements, the determination of allowances for depreciation and obsolescence, and the establishment of the fair value of improved and unimproved properties for assessment purposes. The manual should prove to be very helpful in overcoming many inequalities of assessment which have long prevailed in that state.

Although the preparation of a good tax manual requires the assistance of specialists and technicians together with a certain amount of field work, the time and money expended in the effort, bear rich dividends in the form of more accurate and uniform assessments. Several years ago the Colorado tax commission distributed to the county assessors a manual containing helpful appraisal instructions. However, much of

---

1 Herman, R. C., "Aid to Local Assessors From the Viewpoint of a Local Assessor," Proceedings of the National Tax Association, 1941, p. 76

the information is now out of date. Consequently, the commission might well consider the preparation of a new and comprehensive appraisal guide for use by the local assessors. Undoubtedly the commission would gladly undertake such a task if the necessary funds were to be supplied by the legislature.

Assessors' Schools

Another form of aid given by some state tax commissions to local assesssors is direct instruction provided in assessors' schools. The most common arrangement for these schools is to have a joint sponsorship by the tax commission and perhaps the state municipal league or the state university. The school usually is conducted annually and lasts for two or three days or sometimes for as long as one or two weeks.

The school is intended especially to train newly elected or appointed assessors and deputies regarding the technical phases of their duties, for which many, if not most have had no previous training. The older assessors also are benefitted from attending these schools by the exchange of views and experiences as well as by receiving up-to-date information relative to property appraisals, assessment procedures, etc.

It is to be hoped that in the future, an arrangement can be made in Colorado for conducting annual assessors' schools. Such arrangement is especially desirable as long as the people of the state, through elections, select assessors who usually possess no particular qualifications for the highly technical work which they are required to undertake-- the elections being conducted every two years.

Annual Meeting of Assessors and Commissioners' Visits to Assessors

Beginning in 1902 in the state, county assessors were required by law to meet at the Capitol the first Tuesday in August, to discuss and report matters in their counties concerning taxation. They were directed also to turn over to the state auditor their tax abstracts, showing the value placed by them on each class of property in their respective counties. Upon delivery of this abstract to the auditor, each assessor was to be paid the sum of $50 and railroad fare required in attending the meeting.

The newly appointed tax commission reported in 1912 that the annual meetings of assessors were not accomplishing the objectives as intended by law.[1] The commission pointed out that the legislature had intended for abstracts of assessment to be completed before the assessors' meeting so that valuations could be compared in order to facilitate a general discussion for the purpose of improving assessments the subsequent year. Apparently, however, assessors at the annual meetings were merely guessing as to what their abstracts would

1 First Annual Report, Colorado Tax Commission, pp. 15-16

ultimately show when finally completed some 30 days later. Moreover, because of the lack of direction, general discussions were not proving fruitful from the viewpoint of improving subsequent assessments.

Consequently, upon recommendation of the tax commission the legislature made changes in 1913. Each assessor was to complete his abstract of assessment and transmit one copy with oath of authenticity to the tax commission before the first of September.[1] The time of the assessors' meeting was to be at the call of the governor or tax commission and assessors were to be paid actual expenses incurred in attending meetings.[2]

Writing in 1916 with reference to assessors' meetings, Haig stated,

> "Four conferences have been held since (1913) and under the guidance of the commission they have developed into a very important part of the assessment machinery. The meetings are held during the winter, before the assessment work for the year is begun, and are excellent practical training schools for the newly elected officials. Committees are appointed to assist in crystalizing the judgment of the assessors on average values and assessment methods, and much information of value to the commission is thus presented. Papers are read by those assessors who have had unusual success in various parts of the work and discussion is freely indulged in.....The annual meeting has undoubtedly had a great influence in stimulating the interest of the assessors in the problems of taxation and every effort should be made to develop its usefulness still further."[3]

The time of holding the meetings was delayed in both 1917 and 1918 because funds were not appropriated soon enough by the legislature. In 1919 the appropriation bill was too late to permit a meeting at all. Likewise in the years 1930, 1934, and 1936 no annual meeting was held because of the lack of funds to pay expenses of the assessors. Since 1938 the legislature has habitually neglected (or refused) to make appropriations for the meetings which are actually required by law. Consequently, the sessions which have been held recently have been attended only by those assessors or deputies whose counties were willing to pay travel and other expenses.

Thus, during recent years an unfriendly legislature has interfered with the important work of the tax commission relative to the annual

3 Haig, R. M., The Work of the Colorado Tax Commission, published in Annual Report, 1916, Colorado Tax Commission, p. 50.

instruction of assessors, etc. by refusing to appropriate funds. Newly elected assessors are particularly in need of special instruction before they begin the complicated and technical task of making assessments. This instruction can most economically be given through an annual general conference.

In the future, the state should again assume its proper responsibility by adequately financing the annual meetings of assessors. Should it continue to shirk this responsibility, it becomes even more important than indicated in the previous section for the tax commission (with its limited funds) and perhaps the municipal league or the state university to cooperate in sponsoring an annual school or conference for the purpose of training and instructing county assessors.

It should be pointed out in this section of our study that during most years in the past the tax commission has conducted district meetings in various parts of the state at which time contacts have been possible between the commission and assessors.

Also, at least once every two years, in accordance with provisions of the law, members of the commission attempt to visit each assessor in his home county. However, sufficient time and funds have not always been available to permit making all of the prescribed visits. Furthermore, the visits made must of necessity be relatively short at each assessor's office. Consequently, not much more can be attempted in these calls than the development of an esprit de corps between the commission and assessor. If the assessor requires much assistance relative to various appraisal problems, the commission's field deputies must be sent out to extend this aid.

Field Deputies

A vital aspect of state supervision over local assessment as conducted by the tax commission is carried on through the services of field deputies or investigators. Under ideal conditions these deputies -- trained and well qualified appraisers of property in general as well as of various specialized kinds, assisted by competent auditors -- cannot only assist the commission relative to equalization functions but can also aid local assessors whenever such assistance is needed and requested.

In Colorado the commission has always been handicapped because of the lack of appropriations sufficient to employ enough field deputies. The first field work was provided for in 1915 when the legislature permitted the hiring of one investigator and one clerk, each to be paid an annual salary of $1200. The commission complained that the compensation was so inadequate, competent investigators could not be retained. It reported that, "It is absurd assessors of third-class counties, who work usually much less than the full year, and who have deputies,

should get double the salary of an investigator for the state commission."[1]

The response of the legislature in 1917 was to provide for two investigators at salaries of $1500 each. Thus, the situation was improved but little. However, the next year in spite of financial difficulties the commission was able to report,

> "During the year 1918 an investigator worked for three months with the assessor of Denver County on merchandise alone, and assisted in increasing the value of this item from $27,619,730 to $42,528,630.
>
> "The two investigators specialized on merchandise in most of the other counties, and helped the assessors to bring the total assessment from $55,139,900 to $79,846,131 in 1918.
>
> "An investigator was placed in Phillips county for about six weeks, and as the result of what was practically a re-assessment, the local values were increased from $6,449,746 in 1917 to $14,104,328 for 1918."[2]

An attack upon the commission in 1925 by several special groups of the state, who even tried to induce the legislature to abolish the commission, succeeded to the extent of inducing Governor Morley to veto that part of the commission's appropriation bill providing for a secretary and two field deputies. Confronted with this emergency the commission accepted financial aid during the next two years from 62 of the 63 counties of the state who voluntarily appropriated funds to pay the salaries of the secretary and deputies.[3] This action on the part of the counties is of special significance in that it was initiated by the county assessors' association--clearly indicating the attitude of county assessors toward the tax commission and its field deputies relative to assistance which had been obtained in the past and which was desired for the future.

During recent years the commission has regularly reported that its staff has been inadequate to permit accommodating all of the requests made for assistance by the county assessors. For example, in 1936 it was pointed out that,

> "At the present time, and for a number of years, we have attempted to comply with the law in assisting assessors to check valuations in their respective counties, make appraisals, and confer with county officials, with only two men available for this purpose. We believe that if we were allowed one additional investigator, thousands of dollars

1 Fifth Annual Report, 1916, Colorado Tax Commission, p. 16
2 Seventh Annual Report, 1918, pp. 4-5
3 This money was returned to the counties in 1927 by a legislature and governor more friendly toward the commission.

> in taxes on property now escaping taxation would be forthcoming, that a better equalization of assessments would result, and we would be in a position to comply with hundreds of requests received annually from county assessors for assistance in assessing property at a uniform basis.
>
> The commission is very much in need of an accountant whose duty it would be to examine annual reports and schedules filed by public utility corporations, in order to enable the commission to make intelligent assessments on these properties. When not engaged in this work this man would be available to all county assessors in assisting in the work of proper assessments on corporations and merchants. Our investigations show that thousands of dollars in valuation are escaping taxation on stocks of merchandise for the reason that the assessor is not qualified to properly examine inventories and financial statements, and in numerous cases inventories are not filed with the county assessor as required by law."[1]

In 1938 the commission reiterated its need for additional field workers asking for two additional investigators and an accountant or auditor. The 1939 legislature accommodated to the extent of providing for the employment of an accountant at a salary of $2100 per year. By this time the salary of the two investigators permitted in the budget had been increased to the level of $1800 annually -- an amount still far too low considering the highly specialized and technical services required.

In 1945 the commission was employing four full-time investigators and appraisers including one trained accountant, but a reduction that year of one-third in the biennial budget for maintenance seriously handicapped operations. Consequently, requests from county assessors for assistance far exceed the ability of the commission to comply. Moreover, there is great need throughout the state for a complete reappraisal of all real estate and improvements to the end that property be assessed more equitably and at a figure more nearly approaching full value. County assessors, acting independently, cannot effectively accomplish this reassessment. Consequently, the commission has several times but to no avail requested enough appropriations to make the reappraisals. Finally in 1945, it recommended an alternative procedure -- that the commission should merely supervise the reappraisal work which would be undertaken by each county assessor and his deputies, the expense being cared for through a special county mill levy in each case.[2] It still remains to be seen whether or not this suggestion will bear fruit.

---

1 Twenty-fifth Annual Report, 1936, p. 9.
2 Thirty-fourth Annual Report, 1945, p. 4.

However, the writer believes that the supervisory tasks of the state tax commission including the field work of investigators, appraisers and accountants are sufficiently important to the people of the state as a whole to justify demanding that the legislature assume its proper responsibility by appropriating all necessary funds. Counties should not be expected to bear the expense. Moreover, unless forced to do so, the counties whose assessments are most out of line are the ones least likely to appropriate voluntarily the necessary funds for making reappraisals.

Review of Tax Rebates

Still another supervisory function exercised by the tax commission is the passing upon petitions from county commissioners requesting rebates and refunds for individual taxpayers. Previous to 1914, rebates of taxes were made by county commissioners, the power to reduce the amount any taxpayer needed to pay being entirely in the hands of the local authorities. The justification for making such reductions was in order to permit correction for assessment or tax levy errors such as double assessment and clerical mistakes.

However, the power residing in the county commissioners to rectify technical errors of assessment and levy gave opportunity to dissatisfied property owners to bring pressure upon the commissioners for tax reductions even though there would be no justifiable reason. Thus when the time came for paying taxes (long after the legal period for equalization functions) favored taxpayers might obtain assessment reductions regardless of the level of valuations previously fixed by the assessor. Such rebates often not only increased the inequality as between individual taxpayers, but undermined the morale of tax assessors who tended to become careless in the work of fixing valuations. Under this system of rebates, in the year 1911 $376,309 in taxes were rebated in the various counties.[1]

In order to curb the unlimited power possessed by county commissioners to grant alleged favors to taxpayers, the legislature amended the property tax law in 1913. The new amendment provided that "no abatement, rebate or refund of taxes shall be allowed by the county commissioners unless a hearing shall be had thereon and a notice of such hearing and an opportunity to be present being first given to the assessor and no abatement, rebate or refund of taxes shall be allowed by the board of county commissioners if the application is disapproved by the Colorado Tax Commission."[2]

Thus, since 1913 the tax commission receives all petitions for tax rebates and must give approval before the refund can be granted

1 Annual Report, 1914, State Tax Commission, p. 8.
2 Chapter 134, section 5, Session Laws of 1913.

by the county commissioners. During the first year after the new arrangement went into operation, the commission approved rebates amounting to about $80,000 -- compared with $376,309 of rebates granted in 1911 under the old system.

The record of rebates approved by the tax commission by five-year periods since 1914 is given in Table 9. It may be seen that the trend was upward in number of petitions granted until the period 1930-34; since then the trend has been down. Relative to the total amount of taxes involved in the petitions, there was a trend upward until the period 1925-29; since then there has been no apparent trend in either direction. The annual average for the 31 years has been 1,485 petitions approved amounting to $171,209 of rebated taxes.

Most petitions requested by county commissioners in the various counties have always been granted by the tax commission -- some of them perhaps not being justified. However, the present arrangement in undoubtedly a great improvement over the old system. The provision for greater publicity, a hearing and the need for approval by the tax com-

Table 9

Petitions for Abatement, Rebate and Refund of Taxes Granted by the State Tax Commission by Five-Year Periods, 1915 to 1945 Inclusive

Source: Annual Reports, State Tax Commission

mission are strong deterrents upon the county commissioners when they may be tempted to grant undeserved favors to property owners relative to tax rebates. Furthermore, the power to pass upon petitions is considered by the commission to be essential to preserve the fruits of equalization. Without it a disgruntled local board might rebate the entire increase placed upon their county by the tax commission and state board of equalization.

The Problem of Equalization

Equalization is a necessary function relative to property assessments because experience indicates that original assessments are frequently defective. Moreover, a principal purpose of the function is to insure a uniform assessment ratio, at least within given categories of property to be taxed throughout the equalization district -- usually the county or state. Effective equalization includes the power to initiate changes in assessments -- either raising or lowering, the power to require listing of omitted property in the interest of the public treasury and of taxpayers generally, and finally, the power to act as a board of appeals to settle disputes between taxpayers and the assessors or lower boards of review.

As the property tax evolved during the Nineteenth Century, most American states developed systems of equalization on both the local and state levels. Colorado's constitution, adopted in 1876, as previously discussed, provided for county and state equalization.

County Equalization

In Colorado, as in most other states, equalization begins on the county level -- the county commissioners acting in the capacity of an equalization board. However, in actual practice these county boards in most instances confine their efforts to the hearing of appeals made by taxpayers who consider their assessments to be too high as fixed by county assessors. Consequently, the "equalization" made on the county level is in the form of reducing assessments of those complainants who appear to have valid claims. Almost never are assessments raised on any particular property or class of property.

The function of serving as a tax appeals body is an important one and perhaps this work is all that should be expected from the county board. Being an ex officio body, not especially experienced in tax administration, it is not well qualified to pass upon assessments in general as made by the tax assessor. Moreover, the board's equalization work is definitely handicapped by a lack of time, as all hearings and decisions rendered must be made each tax year between the third Monday and the twenty-eighth day in July.

State Equalization

The shortcomings of equalization on the county level have increased the need for effective state equalization. However, because of defective legislation and crippling court decisions, practically no state equalization was possible until the Tax Commission Act of 1911. Even then it was not clear as to the extent of authority over equalization possessed by the county commissioners, the state tax commission and the state board of equalization. Consequently, a proposed constitutional amendment to clarify the lines of authority was submitted by the legislature to the people in the November election of 1912. The proposal if adopted would have abolished the

board of equalization by centralizing all ultimate authority in the state tax commission. However, the proposal failed to carry in the election.

Through cooperative action by the tax commission and state board of equalization, assessments were raised in many counties during both 1913 and 1914 -- the changes being sanctioned by the court. The equalization was declared constitutional because the courts ruled that increased assessments had really been made by the tax commission when it determined the changes necessary in the valuation of each county to secure assessment at full cash value.[1] Thus, the court interpreted the action of the commission as part of the assessment procedure rather than an equalization function. The argument presented in the case was to the effect that the board of equalization still possessed the sole authority of making equalizations but that the constitution limited this authority by denying it the power to raise aggregate assessments for the state as a whole.

Thus, the Pitcher case of 1913, in effect, appeared to give sufficient power to the tax commission to make equalizations. However, there were those who feared this authority would be inadequate should a disagreement arise with the state board of equalization. Consequently, another constitutional amendment was attempted in 1914. This time the proposal did not provide for abolishing the state board of equalization; on the contrary, the board's power would be strengthened.

In the November general election the amendment was adopted by the people, thus becoming part of the constitution. Its provisions are as follows:

> "There shall be a Board of Equalization for the State, consisting of the Governor, State Auditor, State Treasurer, Secretary of State, and Attorney General. The duty of the said Board of Equalization shall be to adjust, equalize, raise or lower the valuation of real and personal property of the several counties of the State, and the valuation of any item or items of the various classess of such property.
>
> "There shall be in each county of this State a County Board of Equalization, consisting of the Board of County Commissioners of said County. The duty of the County Board of Equalization shall be to adjust, equalize, raise or lower the valuation of real and personal property within their respective counties, subject to revision, change and amendment by the State Board of Equalization. The State Board of Equalization and the County Board of Equalization shall equalize to the end that all taxable property in the State shall be assessed at its full cash value and also perform such other duties as may be prescribed by law; provided, however, that the State Board of Equalization shall have no power of original assessment."[2]

---

1 Colorado Tax Commission vs. Pitcher, 56 Colo. 343 (1913)
2 Article X, section 15, Colorado Constitution

This amendment of 1914 was probably intended to bestow unlimited ultimate equalization power upon the state board of equalization. However, because of the provision that the board shll have no power of original assessment, the courts have ruled that it cannot examine the valuation of an individual taxpayer's property, but must confine its attention to the equalization of valuations among aggregates and general classes of property.[1]

The practical effect of the decisions by the court has been to limit the power of the state board by increasing the power of the tax commission. Thus, today the tax commission appears to possess the primary authority over equalization, being directed by law to make its recommendations to the board of equalization, which in turn must certify all assessments before they are official. Moreover, relative to this certification of assessments, should the board wish to make changes, such modifications must be confined to broad categories of property.

However, enven though the tax commission appears to possess superior equalization power, the ex officio state board has retained sufficient authority to make of Colorado's equalization procedure a dual system of control. How effective is this dual control? In other words, how successfully have the two bodies achieved the objective of maintaining uniform assessments throughout the state upon a 100 per cent valuation basis? Before directly answering this question, let us examine the individual record of the state board of equalization.

State Board of Equalization

Table 10 shows changes in assessments made by the state board during the 34 year period since the tax commission was established. It may be seen that in 10 separate years no changes whatsoever were made in the assessed valuations as recommended by the tax commission. For the 24 years when changes were ordered, 18 resulted in net reductions while six resulted in net increases of total assessed valuation of property in the state. During the entire period reductions exceeded increases to the extent of more than $200 million.

Let us examine somewhat more closely the particular decreases and increases ordered by the board. Until the year 1931 all changes were in the form of net reductions except for the year 1923 when there was a slight net increase. During this period (1912-1930) almost all of the reductions benefitted railroads and utilities. Reporting in 1926 the state tax commission stated:

---

1 Board of County Commissioners vs. Union Pacific RR. Co. 89 Colo. 110; McGinnis vs. Denver Land Co., 90 Colo. 72

> "It is interesting to note that, in fourteen years, the board has lowered this commission's valuations on public utilities, railroads, and other like corporations, approximately $30,667,810. This translated into taxes, means a loss to the state, counties, municipalities and school districts of nearly $1,000,000. In all that time not a single increase in valuations has been made or ordered. And, with one exception, all its reductions have been given to corporate property. In other words, its equalization has been 100 per cent downward and confined to corporations."[1]

Beginning with the drastic reduction ordered by the board of equalization in 1931 and continuing through 1933 with total net reductions amounting to approximately $250 million for the three-year period, principal benefits were extended to agriculture. Due to rulings by the board, about 30 per cent horizontal reductions occurred in the value of agricultural lands and improvements while from five to ten per cent horizontal reductions were made in the value of city residential property and automobiles.

During the unprecedented period from 1935 to 1939 when the board of equalization made increases in five of the years, totaling almost $88 million, the additional assessments were placed upon railroads and utilities. This action represented a complete reversal of the attitude of the state board toward these corporations during the previous two decades.

What conclusions may be reached relative to the 34 year period of "equalization" of assessments by the state board? The evidence indicates rather strongly that the board is more likely than the tax commission to be influenced by partisan considerations. Judging from the record the board is apt to decide that the expedient course is no action (10 of the years), or else to order assessment reductions (18 of the years). The assessment reductions in most cases appear to represent favoritism shown special economic groups after these groups have exerted considerable pressure. During the time from 1915 to 1930 those favored with reductions were the railroads and utilities; from 1931 to 1933 the favored ones were farmers. Only during the six-year period from 1934 to 1939 (administrations of Edwin C. Johnson, Teller Ammons and the first year of Ralph L. Carr) has the board been able to resist the political expediency of either doing nothing or else of making tax reductions. Therefore, it may be concluded that in Colorado as elsewhere an ex officio board composed of elected officials is too likely to be swayed by political

---

1 Fifteenth Annual Report, Colorado Tax Commission, p. 8. There appears to be an error in this quoted statement. Although the general conclusion is valid, the board of equalization did make some small increases during the years from 1917 to 1923 inclusive -- the change in 1923 resulting in a small net increase (Table 10).

CHANGES IN ASSESSED VALUATION MADE BY THE STATE BOARD OF EQUALIZATION 1912 - 1946

expediency and the pressure of special groups rather than the larger interests of the state as a whole.

Moreover, the state board of equalization is inefficient and ill adapted to the function of equalization. In the words of Jensen:

> "The board is ex officio, and it is not to be presumed that the members, elected for other purposes, have any fitness for the work of equalization, which involves considerable technical skill and knowledge. The change in personnel must be frequent, so that little skill and experience can be accumulated from one year to another. The board sits for less than two weeks, and unless it has a permanent staff to accumulate and organize information, it can have little or no basis of fact for its work. Having little or at least an inadequate factual basis for its rulings, it becomes the easy victim, even if it is not so inclined, to aggressive groups making extravagant claims of excessive or inadequate assessments, on the property of themselves or others, respectively."[1]

Another disadvantage of having a board of equalization in addition to a tax commission is that the dual control contributes to waste in time and effort of the assessment agencies. Several weeks longer is required for the completion of all steps in assessment before collection of the tax can begin. This delay contributes to the problem of collection as there is greater chance that the taxpayer or the property or both will have disappeared from the county or even the state. Moreover, wasted effort occurs because of duplication of work as between the board and commission. Each administrative body attempts to have at its command all necessary data for making decisions. Frequently the same individuals must twice present identical facts -- once before the commission and again before the board.

But perhaps one of the principal drawbacks of a dual control of equalization is that neither body can assume full responsibility. This divided jurisdiction makes it easy for each group to blame the other for errors of omission or commission. All the while both suffer because of the loss of confidence and respect from the public.

Years ago all other states except Missouri and Colorado got rid of the dual control over equalization exercised by an appointed tax commission and an ex officio board of equalization. These two states have apparently continued to retain their inefficient and generally unsatisfactory system because of inflexibilities in the state constitution. The people of Colorado should amend their constitution, placing all ultimate powers of equalization in the tax commission and abolishing the state board of equalization.

1 Jensen, Jens P., Colorado State Tax System, 1930, p. 92

Equalization by the Tax Commission

Let us now turn our attention more directly to the role of the state tax commission relative to equalization functions. It is well to keep in mind the fact that the legislature has endowed the commission with specific responsibility for maintaining assessments throughout the state at full cash value. Chapter 142, section 157 of Colorado Statutes specifies, in part:

> "It shall be the duty of the commission, and it shall have and exercise power and authority:
>
> "First -- To have general supervision over the administration of and to enforce all laws for assessment, levying and collection of taxes.....to the end that all assessment of property real, personal, and mixed, be made relatively just and uniform and at its true and full cash value.....
>
> "Sixth -- Whenever in the judgment of the tax commission, property in any county or municipal subdivision thereof has not been assessed at its true and full cash value the commission may make a reappraisement of the property therein, to the end that all classes of property in such taxing district shall be assessed in compliance with the law....
>
> "Seventh -- The commission may raise or lower the assessed value of any real or personal property, first giving notice to the owner or owners thereof.....[1]

Thus, it may be seen that the legislature in establishing the tax commission intended for it to exercise full supervision over the assessment of all property to the end that it be assessed at full cash value. The courts have generally protected this authority possessed by the commission.[2]

In a practical sense the above enumerated power in the tax commission is an equalization power. Whether or not the state board of equalization approves all assessments as turned in by county assessors and recommended by the tax commission, it is the duty of the commission to see that all assessments submitted for approval are just, equal and at full cash value. If such is not the case, the commission is not fulfilling its duties as specified by law.

We shall now briefly examine the general results of the supervision and equalization functions as exercised by the commission. Relative to this examination it is well to keep in mind the fact that since 1940 the

2 Denver vs. Pitcher, 54 Colorado 203; Goldsmith vs. Standard Chem. Co., 23 F. (2nd) 313

commission has apparently had no interference from the state board of equalization -- all assessment recommendations having been approved as submitted.[1]

Table 11 gives the total assessed valuation of all property in the state for each year since the tax commission was established in 1912. It may be seen that the new commission increased valuations from $422 million in 1912 to $1,306 million in 1913. This action was taken in order to place the property of the state upon a full valuation basis as prior valuations had been admittedly upon a basis of one-third full value.

Table 11

Total Assessed Valuation of all Property in Colorado, by Years, 1912-1946 Inclusive

Year	Valuation	Year	Valuation
1912	$ 422,442,079*	1930	$1,586,462,903

Source: Annual Reports, Colorado Tax Commission

Subsequent to 1913 the trend in valuations was slightly upward until 1929 when the figure reached $1,587 million. After 1929 total assessments declined until 1935, by which time they had dropped to a low of $1,088 million. Since then the trend has again reversed itself. However, during

1 See Table 10

the last 10 year period since 1935 the increases from year to year have been slight. By 1946 total assessed valuation of property in the state amounted to about $1,259 million. Thus, after 33 years time, total assessments were actually more than $47 million less than at the beginning of the period in 1913. This represented a decline in assessments of 3.6 per cent. If current assessments (1946) are compared with those in the year 1929, the reduction has been $327 million, or 20.6 per cent!

It should be pointed out that a partial explanation of the relatively low total valuations since 1936 is that intangible wealth and motor vehicles have no longer been included under the general property tax. However, this is only a partial explanation in that all intangible wealth included on the assessment rolls for the year 1935 amounted to less than $43 million while the assessed valuation of motor vehicles accounted for an estimated $20 million more. Both combined ($63 million) is only 19 per cent of the reduction in assessments since 1929. Moreover, if the $63 million were added to the present total for the state (1946), assessed valuation would still be about the same as for the year 1913!

Considerable evidence can be presented to show that the level of actual wealth in the state has not been stationary or declining but on the contrary has been expanding during the last 33 years. Table 12 shows that the state's population increased from 799,024 individuals in 1910 to 1,123,269 in 1940. This represented a 40 per cent increase for the 30 years -- a period of time approximately coinciding with that under consideration (1913-1946).

It is reasonable to assume that a 40 per cent growth of population in Colorado -- an economically underdeveloped state in the Rocky Mountain region -- would signify an important increase in total property values.

Moreover, as shown in Table 13, the value of manufactured goods produced in the state increased from $136 million in 1914 to $221 million in 1939 -- a 62 per cent gain. If figures were available for 1946 they would indicate an even greater growth of manufacturing for the entire period. The value of mineral products increased from $54 million in 1913 to $79 million in 1944 -- a 47 per cent increase. Harvested agricultural crops for the state increased from a value of $50 million in 1910 to $62 million in 1940 -- an increase of 23 per cent for the 30 year period. If values are combined for the three classes of products the increase for the years indicated in the table was 50 per cent.

Table 13

Value of Output, Three Leading Industries in Colorado for Selected Years[1]

Another evidence of expansion of wealth and income in the state is the growth of deposits in Colorado banks. Comparable figures are not available for the years before 1916; however, for the period since then, by five-year intervals, they are shown in Table 14. It may be seen that total deposits increased from $228 million in 1916 to $415 million by 1941 -- an increase of 82 per cent for the 25 year period. If 1943

is considered, the increase was 215.6 per cent. However, because the year 1943 was in a war period of credit expansion, the figure for deposits in 1941 is perhaps more truly indicative of the long term trend.

Table 14

Perhaps one additional evidence of the growth of wealth and income in the state will be sufficient. Although figures are not available giving the total income for Colorado, there is evidence that the income has increased roughly in proportion to the growth of national income. For example, income payments to individuals in Colorado compared with those for the country as a whole for selected years since 1929 (Table 15) indicate a close relationship between the two. In 1929 payments to Colorado residents represented

Table 15

Income Payments to Individuals
United States and Colorado for Selected Years
(Dollars expressed in millions)

Year	United States	Colorado	Colorado As Percentage of U.S.
1929	$ 82,617	$ 634	.77
1933	46,273	359	.78
1939	70,601	564	.80
1941	92,269	695	.75
1943	138,101	1,104	.80

Source: Bureau of Foreign and Domestic Commerce, Department of Commerce.

.77 per cent of total payments for the United States; during the subsequent years of 1933, 1939, 1941, and 1943 the ratios were .78, .80, .75 and .80 per cent respectively. Thus, there appears to be a very stable relationship between changes in national and state income -- at least for the years indicated. To the extent that deviations occured for the period between 1929 and 1943, the tendency was for Colorado to receive relatively more of the total national income payments. Thus we may conclude that increases in national income have been reflected in similar or even greater increases in income in Colorado.

Table 16 shows the growth of national income for selected years since 1913. The table indicates that national income being at a level of about $35 billion in 1913, rose to $69 billion by 1920, was approximately the same in 1930, declined during the depression being $55 billion in 1935, rose to $77 billion by 1940, and has increased sharply since rising to a level of $160 billion in 1944. During the period from 1913 to 1940 the national income more than doubled and by 1944 the increase was over four fold. Assuming that the high income of the war years can not be maintained, but that average prices and total income may drop back approximately to the 1940 level, there would still be a total annual income exceeding that in 1913 by more than 100 per cent.

Table 16

National Income in the United States
for Selected Years, 1913 to 1944 Inclusive
(millions of dollars)

Year	National Income	Year	National Income
1913	$35,580	1940	$77,574

Hauser, P. M. and Leonard, W. R., Government Statistics for Business Use, 1946, p. 23, for remaining years. (Although two different sources are used, figures for the entire period are considered comparable.)

As previously indicated there is evidence that the rate of growth of income in Colorado has corresponded rather closely with that for the country as a whole. Assuming this to be true, the inevitable conclusion would be

that property values have also materially increased in the state.[1]

Considering all available evidence and discounting the inflationary rises of the war years since 1940, the writer believes that on the basis of a conservative estimate we may safely conclude that all real and personal tangible property in the state has increased in cash value at least 50 per cent since 1913. Moreover, there is good evidence to indicate that in the future, the values are not likely to decline below this level -- approximately the level of 1940 or 1941.

Yet despite the estimated increase of a least 50 per cent in actual value since 1913 (disregarding all increases during World War II) the total assessed valuation of all property in the state (1946) is actually at a lower level than 33 years ago, at the beginning of the period. If assessments were approximately on a full valuation basis of 1913, in order for the same situation to prevail today (discounting the war inflation and allowing for exemption of intangibles and motor vehicles) the total assessed valuation of real and personal tangible property would probably need to increase by at least $625 million.

The state tax commission, to the limit of its ability, should attempt to place the property in the state upon this higher total appraised valuation basis. In some instances it would involve discovering property, taxable under the law, yet not listed on assessment rolls either because of error, negligence or favoritism; in all instances it would involve placing valuations on a basis so that they would be at the level of full cash value. Such reform relative to assessments would merely be in accordance with the prescribed laws of the state and achieving this goal (under the law) is specifically a responsibility of the tax commission. Moreover, full assessments do not cause higher general taxes; on the contrary, the average property owner would probably discover he has a lighter tax burden when all property is full assessed than when it is only partially assessed. The commission has frequently pointed out that in Colorado throughout the years since 1930 as assessments have shrunken, mill levies have increased enough to more than make up the difference. If all taxable property were listed and fully assessed, mill levies could drop back to a relatively low level.

But other advantages are forthcoming when property is assessed at full cash value. When 100 per cent assessment is the objective, original valuations are more likely to be uniform. The use of a fractional basis tends to be indefinite in practice and inevitably leads to wide deviations. According to Allen, under such a fractional system, "Instead of determing the actual value of a piece of property as accurately as possible and then

---

1 In the final analysis the principal basis for the value of property is its income earning capacity. Therefore, if total income is greater, we must expect the value of property to increase also, although not necessarily proportionately.

applying the prevailing assessment ratio, assessors often set down a lump-sum figure which they believe to be in line with similar properties without regard to whether the assessment represents the proper percentage of full value."[1] Allen concludes that this inevitably results in numerous errors which are magnified in terms of the actual value of the property erroneously assessed. On the other hand, full assessments promote uniformity, not only as pertains to locally assessed property within a county but also the general level of assessments as between counties. Moreover, a 100 per cent valuation contributes to greater uniformity as between property, on the one hand, assessed locally in the 63 counties and, on the other hand, the assessment of public utilities by the tax commission.

Another advantage of full assessment is that the taxpayer has a better basis for comparing the valuation placed upon his property with that upon the property of his neighbor or of anyone else. Fractional assessments confuse the taxpayer and often give him a false impression of liberality in tax treatment. Not knowing what assessment ration is being used he is likely to refrain from objecting to a particular valuation in spite of suspecting that his property is being appraised relatively too high. He realizes that even though there is discrimination against his property it would be difficult to prove and if a complaint is lodged the assessor can easily justify raising the assessment still higher from the standpoint of law. Therefore, assessments upon the basis of full, cash value are really in the interest of the taxpayers themselves because then the assessed value of any property may readily be compared with that of any other.

A corollary advantage is that full assessments reduce the regressive aspects of the property tax. Almost invariably when property is assessed at a fraction of full value the larger properties tend to be underassessed to a greater extent than are the smaller ones. Thus, property owners with the lowest incomes and the least property pay more than their proportional share of property taxes. This regressive feature due to fractional assessments has frequently been pointed out by tax authorities in other states as well as in Colorado. The problem may be illustrated by citing an example, which, in effect occurs all too frequently. Suppose two homes in the same tax district have full cash values of $3,000 and $12,000 respectively. If the assessor vaguely knows that property in the state is being usually assessed on a level somewhere between 30 per cent and 60 per cent of full value, attempting to keep his valuation approximately in line with those in other counties, he is likely (perhaps unconsciously) to discriminate against the $3,000 home. One reason for this discrimination may be that the true value of the smaller property is more readily determinable. In addition, the assessor may not wish valuations to go below a certain minimum for any

1 Allen, H. Kenneth, "Full-Value Assessment Program in Illinois", Bulletin of the National Tax Association, January, 1946, pp. 117-119.

home, regardless of value. Thus, he assesses the smaller property at perhaps $2,000, thinking all the while that surely the householder can afford to pay a tax on such a low total valuation. However, with reference to the larger property, partly because of uncertainty relative to true value and partly because most any fractional valuation may appear relatively large to the assessor or deputy who probably lives in a modest cottage himself, the $12,000 home may be assessed at perhaps $5,000. The practical effect of these two valuations is for the small home to be assessed on a 66 per cent basis and the large one on a basis of about 42 per cent. Thus, the tax is regressive, favoring the larger property. Assuming the tax levy for the particular district to be 50 mills, the favoritism amounts to a saving of $150 in taxes (based upon an undervaluation to the extent of $3,000) as compared with the amount of tax paid by the owner of the $3,000 home. In other words, the owner of the large home should pay a tax of $400 instead of $250 in order for the tax to be proportional with the $100 tax paid by the owner of the small home.

Finally, an advantage of full assessment is that the various local governments -- whether county, municipality or school district -- receive equal treatment with reference to tax rate limitations imposed by the constitution or legislature. On the other hand, under a system of fractional assessments, the maximum mill-levy provisions are much more restrictive in tax districts with low assessment ratios than they are in those with high ratios. Thus, by increasing assessment ratios, the application of tax-rate limits can be avoided or at least postponed.

One aspect of the problem of equalization of assessments throughout the state relates to the broad categories of property as indicated in Table 17. In order for the property tax to be equitable, valuations should be applied to these categories in such a manner that each bears its proper share of the total tax load. If original assessments do not result in accomplishing such uniformity, valuations should be equalized by the tax commission.

It may be seen from the table that assessment abstracts as returned by the county assessors and corrected by the tax commission for the representative years 1913, 1921, 1935, and 1945 show a rather wide variation as among individual items. For example, the valuation of land and improvements has fluctuated, going from 24.71 per cent of total property values in 1913 up to 34.84 per cent in 1921 and then down to 21.42 per cent by 1945. This category of property is principally in the form of agricultural and grazing lands and improvements. There is little or no evidence to support the justification for such wide relative variations of assessments. It is true that during the first world war the market value of agricultural land advanced somewhat more sharply than of property generally; however, by 1921 these extreme values had declined again.

The actual situation is probably that farm property was relatively over-assessed in 1921. This over-assessment continued for a number of years until the depression period of the thirties when the agricultural

bloc induced the state board of equalization to slash farm valuations. As a consequence, there was probably an over-adjustment leaving agriculture in a relatively favored position -- at least in comparison with some other classes of property in the state. This appears to be true especially since the development of agricultural prosperity during and after the second world war.

One illustration will be given to indicate the present favored position of at least certain kinds of agriculture relative to property assessments. In Baca county, one of the dry-farming counties of eastern Colorado, assessment of agricultural and grazing land by five-year intervals since 1930 is shown in Table 18. It may be seen that during the period, 2,950 acres of irrigation land was reclassified so that all land was considered either dry farm or grazing. By 1935 the dry farm and grazing lands were being assessed on a basis little more than half the level of valuations in 1930 -- the general average dropping from $5,24 to $2.80 per acre. Since 1935 some increase in assessed values has occurred but the increase has been slight -- by 1945 the average assessment being only $2.90 per acre.

Table 18

Abstract of Assessment of Agricultural and Grazing Lands in Baca County, Selected Years since 1930[1]

	Irrigated Land		Dry Farm Land		Grazing Land		Total Agri. Lands	
Year	Assessment	Av. per Acre	Assessment	Av. per Acre	Assessment	Av. per Acre	Assessment	Av. per Acre
1930	$36,875	$12.50	$6,050,280	$6.25	$1,941,230	$3.45	$8,028,385	$5.24

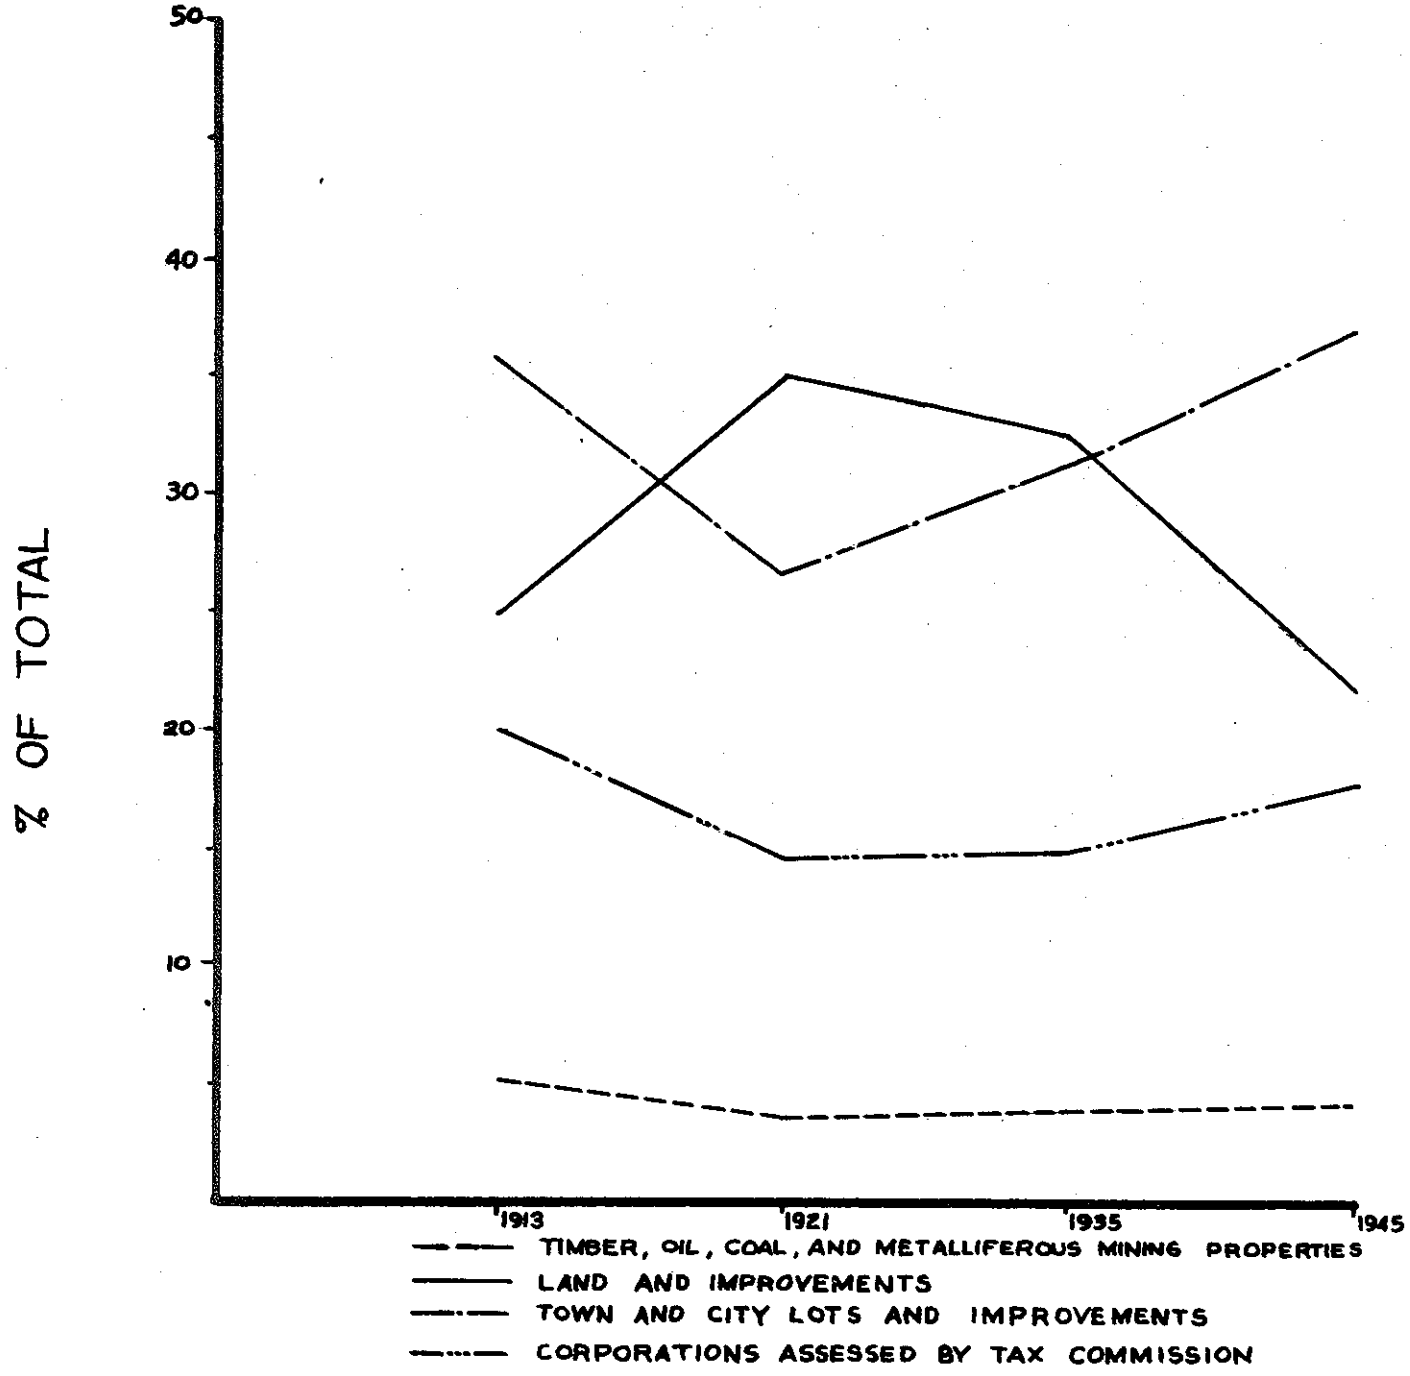
Source: Reports for years indicated, Colorado Tax Commission

Undoubtedly a reduction in valuations in Baca county as well as in other dry farm counties of eastern Colorado was justified during the first half of the period under consideration. Drought conditions caused several crop failures in a row and we began to consider the area a dust bowl. However, the farmers were taught scientific methods of water and soil conservation relative to dry farming, while since about 1937 the annual precipitation has been more favorable for crops. As a consequence, during recent years the farmers have been among the most prosperous of any in the nation. For example, Baca county is now raising about one-third of the world's supply of broom corn. In 1946 the harvest was about 23 million pounds which sold for 15 cents per pound. Farmers of the county are



ASSESSMENT OF SEVERAL LEADING CATEGORIES
OF PROPERTIES IN COLORADO

raising wheat which yields up to $100 per acre for each crop year on land still assessed at about $4 per acre. In 1946 the wheat crop of Baca county amounted to 1,700,000 bushels which sold at about $1.85 per bushel. In addition, the farmers of the county produced during the year $1,260,000 worth of cattle, $150,000 worth of sheep and $75,000 worth of hogs.[1]

Thus, convincing evidence indicates that dry farm lands of eastern Colorado typified by Baca county are now being assessed on a level representing a mere token of actual value. Moreover, agricultural authorities believe that the present high levels of production are likely to continue, that due to scientific methods of cultivation, never again will the farmers of the area need to fear a return of the dust bowl. Although assessed valuations or irrigated farms in other parts of the state never dropped quite as far relatively as those upon the dry farms during the decade of the thirties, both production and land sale figures indicate that current assessed valuation are relatively low upon these lands also.

Two other categories of property listed in Table 17 are metalliferous mining properties and timber, oil and coal properties. Together these represent the assessment of the mineral wealth of the state.[2] On a comparative basis these mineral resources have always been favored under the property tax. In 1913 when metalliferous mines accounted for 3.52 per cent and timber, oil and coal mines 1.57 per cent of total assessments, they were relatively under assessed; by 1945 when the ratios were 2.04 per cent and 1.82 per cent respectively, they were still in a privileged position relative to most other property in the state.

One basis for estimating the trend of assessments over the years is to compare the assessed valuation of all mineral lands and improvements with the value of mineral production. Such a comparison for selected years since 1915 is shown in Table 19. It may be seen that the assessed valuation represented almost 90 per cent of value of output in 1915. The ratio subsequently fluctuated rising to 100 per cent in 1930 and then declined thereafter, falling to 64 per cent by 1944. The average ratio for the years shown in the table was 78.4 per cent. Thus, if we assume that mineral property was relatively underassessed at the beginning of the period, since 1930 it has been favored to an even greater extent.[3] If valuations in 1944 were equal to the average for the period they would be at the level of about $62,000,000 or at least $11,000,000 more than the actual valuations for the year.

---

1 Rocky Mountain News, October 17, 1946.

2 Although timber property is included in the table, the value of privately owned timber in the state is so relatively small that for our purpose the item may be disregarded.

3 The writer realizes that the value of mineral production is not in all cases a good index of what the level of property tax should be; however, as the whole industry is considered in our discussion, the figures are undoubtedly significant.

Table 19

Assessed Valuation of Colorado Mineral Lands and Improvements Compared with the Value of Mineral Production for Selected Years

Year	Assessed Valuation[1]	Value of Mineral Production[2]	Percentage
1915	$57,413,617	64,295,119	89.2
1920	57,529,745	76,037,896	75.6

		Average	78.4

1 Annual Reports, Colorado Tax Commission
2 Minerals Year Book, Bureau of Mines
3 Estimated by writer from figures not entirely segregated by tax commission.

There appears to be sufficient evidence to indicate that a general reappraisal of all mineral wealth of the state would be highly desirable. Moreover, the problem should not be considered as one confined to attempts at improving assessments as the law relating to taxation of minerals is also defective. However, should the state adopt a comprehensive severance tax, the inadequacy of the mineral property tax would probably be largely overcome. For a more complete discussion of the taxation of mineral resources the reader is referred to the report in this series on severance taxation.

The catagories of town and city lots and improvements, livestock and merchandise as shown in Table 17 have probably been more satisfactorily assessed since 1913 than most other categories of property. During many of the years field men of the tax commission have assisted county assessors with the appraisal, especially of urban residential property and merchandise. Moreover, during the depression years after 1930 the assessed valuation of these properties was reduced relatively little by the state board of equalization.

The item in Table 17 called "manufacture" had not been interpreted uniformly by county assessors. Moreover, the nature of property included in the category has changed to some extent during the period since 1913. Consequently, a comparison of the relative levels of assessment of capital employed in manufacturing is difficult. However, some discussion of this important industry as it relates to property assessment appears desirable.

In 1912 the newly appointed tax commission was particularly concerned regarding the prevailingly low property valuations in manufacturing industries. During the period between 1903 and 1912 valuation of manufacturing

property had remained practically stationary, the amount in the former year having been $3,487,122 and in the latter, $3,507,675. Yet during this same period sixteen new sugar factories, costing approximately one million dollars each, had been erected in Colorado while according to the United States Census, capital invested in manufacturing in the state increased from $107,664,000 in 1904 to 162,688,000 in 1909.[1]

Through vigorous efforts of the commission, valuations in the state for manufacturing property increased to $13,575,571 in 1914 and by 1921 had climbed to $41,037,122. As seen by the accompanying table (Table 20) in the latter year the industry included 1,491 establishments whose manufactured products had a total value of more than $221 million. Expressed as a percentage of value of products, assessed valuation of the industry amounted to 18.5 per cent.

2 Bureau of the Census
3 Reports of Colorado Tax Commission

Since 1921 the trend of valuations placed upon manufactures by county assessors has been downward even though the industry itself has not declined. Of course there was a temporary setback during the depression of the 1930's, but by 1939 the value of manufactured products in the state almost exactly equaled the value of products in 1921. Furthermore, the industry was apparently more prosperous as the cost of labor, raw materials and power was considerably less by 1939. Yet between 1921 and 1939 assessed valuations

1 First Annual Report, 1912.

dropped from $41,037,122 to $23,749,670. While assessments in the former year amounted to 2.60 per cent of all property valuations in the state, by 1939 they had declined to 2.13 per cent. Expressed in terms of value of manufactured products the decline of assessed valuations was from 18.5 to 10.7 per cent.

Although since 1939 the tremendous war expansion of manufacturing caused valuations to increase to the level of $33,576,905 by 1945, there is evidence to indicate that the industry is still being assessed at only a fraction of the true value of invested capital. If the item labeled manufacture were interpreted more uniformily by the various county assessors, conclusions relating to assessments of the industry could be more decisive.

The classification of property in Table 17 labeled "miscellaneous less exemptions" refers principally to personal household property less personal exemptions of $200 per head of family. The assessment of this category of property is discussed in some detail in the section of our study on tax-exempt property. In that section it will be noted that such property is probably less adequately assessed than any other class of property in the state. A vast amount of household goods is never listed on assessment rolls, much of that listed is greatly under-appraised, and the $200 personal exemption is often too liberally applied. Moreover, making the inequity of these violations particularly bad is the fact that wide variation prevails among the 63 counties of the state relative to the assessment defects.

One of the most difficult comparisons relating to the question of assessment equalization among the broad classes of property is a comparison of the assessed valuations of corporations (assessed by the tax commission) with the valuation of all other property (assessed by the county assessors). Table 17 indicates that the proportion of total valuation assessed against the corporations has fluctuated considerably -- the percentage declining from a high of 19.22 in 1913 to a low of 14.35 in 1921. After the latter year the trend was slightly upward reaching 14.76 by 1935 then climbing to 17.45 per cent by 1945. Figures recently released by the Department of Revenue indicate a minor change for the year 1946 -- the ratio declining to 17.11 per cent. Thus, if a comparison is made directly between the years 1913[1] and 1946 we find that the percentage of assessments borne by the public utility corporations has experienced a net reduction of 2.81 per cent.

Before deciding whether or not this reduction of assessments (both in the aggregate and relatively) against the public utilities since 1913 has been justified, it is necessary first to determine whether or not these corporations have been expanding more slowly than all other property in the state relative to actual value. Although available data cannot be

1 It was 1913 when the tax commission first raised all valuations to the 100 per cent basis.

considered conclusive evidence there is reason to believe that the true value of utilities has not declined on a relative basis since 1913, but on the contrary has actually expanded considerably faster than the over-all growth of wealth in the state.

Although comparable data are not available for the period prior to 1920, Table 21 gives figures showing the trend in production of electric energy in the state for the subsequent years. Throughout the 26-year period from 1920 to 1945 there was a constantly accelerating rate of growth in production except for a short interval during the early years of depression following 1930. Total production increased from 397 million kilowatt hours in 1920 to over 1.1 billion kilowatt hours in 1945. This represented an expansion for the period of almost three fold. Thus, it may be concluded that at least relative to the electric public utility field there was undoubtedly considerable growth of total plant investment for the various companies producing and selling electric energy. Moreover, although the relationship between electric production and plant investment is not always directly proportional, there is a tendency for operating net income, and consequently, the value of utility assets, to increase as the volume of production increases.

Table 21

Total Production of Electric Energy for Public Use Compared with Assessed Valuation of all Electric Light and Power Companies in Colorado, Selected Years Since 1920

Assessed Valuation increase (26 year-period = 70.9%

1 U. S. Geological Survey for years prior to 1934; Federal Power Commission for years since.

2 Reports of Colorado Tax Commission. As the Reports prior to 1939 do not give a composite figure for electric companies, tabulations for the earlier years were made by the writer. Rural electric companies are included in all tabulations.

Table 21 also gives a comparison between total production of electric energy for public use and assessed valuation of all electric light and power companies. It may be seen that expressed as an average of assessed valuation per kilowatt hour of production, assessments have declined from 7.8 cents in 1920 to 4.7 cents in 1945. In other words, although production increased 184.3 per cent during the period, assessed valuations increased only 70.0 per cent. In order for the same ratio to prevail in 1945 as in 1920, total assessments for the industry should have been $88 million instead of the actual $52.7 million. However, there is insufficient evidence to indicate whether or not the same ratio should prevail if relative tax burdens for all property owners in the state are to be maintained. One consideration is whether or not tax-exempt municipally owned electric plants were producing and distributing a larger proportion of electric energy at the end than at the beginning of the period. However, this aspect of the problem can probably be disregarded, as privately owned utilities are now producing about 90 per cent of all electric energy in the state. Although exact figures are not available for the earlier years, there is reason to believe the ratio was not very much different in 1920.

Conclusive evidence has been presented in this study to indicate that a state wide reappraisal of all tangible property in Colorado is urgently needed. Moreover, the tax commission has long recognized this need and has repeatedly requested the legislature, to no avail, for sufficient appropriations to permit the conducting of these reappraisals. Colorado's need is similar to that which was present in Utah several years ago. The procedure followed there relative to the reappraisal of all buildings in the state is described by L. L. Wilson as follows:

> "Soon after the tax commission was organized, a survey revealed the existence in Utah of all those evils to which the property tax system everywhere is heir. Under-assessment, over-assessment and non-assessment were rife, and for many reasons. Inequities existed as between counties and between classes of

property. But the greatest inequities -- and the most serious to the taxpayers concerned -- were found as between property in the same county, and in the same class. Obviously, to cure such evils the original assessment must be made uniform.

"The first step taken by the Utah commission to correct this situation, so far as it applied to buildings, was to set up a valuation engineering division, which spent some time in formulating scientific schedules, adapted to Utah conditions, for the valuation of the various types of structures. The division also prepared a reappraisal card for use in the field, on which could be recorded all data necessary for an accurate valuation of each building, together with an outline plan and a photograph.

"After agreement had been reached with county taxing officials, a representative from the county assessor's office and one from the engineering division of the tax commission, equipped with camera, tapeline, and reappraisal cards, visited each building in a county. Interior and exterior examinations were made, measurements taken and data recorded. With this field work completed, it was possible to calculate, first, uniform reconstruction costs; then present values of each building, after allowances for depreciation, obsolescence and other factors, affecting marketability. Lastly the cards were filed in the office of the county assessor, where they were available for public inspection.

"Usually a public hearing also was held at which the purposes and the procedure of the revaluation were explained, protests were received, and decisions announced and discussed. Public interest was encouraging; reaction finally was good, though at first, in a few instances, threatening and even truculent. Not infrequently opposition and criticism melted away when groups of cards, showing photographs of comparable structures, revealed emphatically the inequities in former assessments and the much greater uniformity attained by revaluation."[1]

A number of other states including Illinois have made significant progress toward state wide reappraisal of property during recent years. Illinois' efforts in attempting to obtain full-value assessments are particularly notable. Should Colorado decide to reform her assessment procedure in order to provide more complete and equal appraisals of property in the several counties, the experience in such states as Utah and Illinois can be drawn upon for assistance.

---

1. L. L. Lamont, "Statewide Reappraisal of Buildings in Utah for Assessment Purposes," Bulletin of the National Tax Association, October 1945, pp. 4-5

The Problem of Tax Exempt Property

There is a large proportion of property, both real and personal, in Colorado which is wholly or partially exempt from taxation under the property tax system. As previously discussed, the constitution adopted in 1876 permitted and in some cases required certain classes of exemptions. These included (1) $200 of personal property for each head of family, (2) property of the state and its political subdivisions, and (3) certain property employed in a manner other than for the purpose of earning a profit for the individual owners -- namely, property used solely for religious worship, for schools, for strictly charitable purposes, and also cemeteries and irrigation projects not operated for private profit. Later constitutional amendments exempted all intangible property and motor vehicles from the property tax. Also because of the established principle of intergovernmental immunities, federal property is not subject to taxation by state and local units.

These constitutional tax exemption provisions have been implemented by statutory law, by administrative practice and by court decisions. They are sufficiently significant to justify a brief discussion.

The Personal Property Exemption for Heads of Families

The provision for a personal property exemption of $200 for each head of family[1] was undoubtedly placed in the constitution in order to safeguard the standard of living of those families in the lowest income groups -- those on a subsistence level who would be forced to sacrifice some of the bare necessities of life if their scant personal effects were subjected to taxation. However, for the sake of uniformity and ease of administration a blanket provision was inserted, permitting each head of family, regardless of the amount of personal property, to claim an exemption up to a maximum of $200.

The constitutional provision was not intended to provide a loophole through which millions of dollars of property would escape without paying a cent of property tax even when the owners possess considerable taxpaying ability. In other words the exemption was intended to include only $200 of personal property when all such property is fully assessed at true market value. Also the exemption was intended to apply only to purely personal or household tangible property such as household furniture, washing machines, clocks, silverware, clothes, etc. It was not intended to be applied against the present broad interpretation of personal property which includes all movables whether in the home, factory, or business.

Nevertheless, in practice in Colorado the $200 exemption provision has been flagrantly violated by most every county assessor since adoption of the constitution in 1876. Perhaps the most inequitable aspect of this refusal to follow the requirements of the law and constitution is that there is no uniformity of violation by the county assessors.

---

1 Article 10, Paragraph 3, Colorado Constitution.

In some counties most personal property escapes assessment entirely while the few items to be found on the tax rolls are assessed at a mere fraction of true value. This situation almost invariably means that total exemptions exceed the assessed value of all personal property -- a preposterous state of affairs. Then to make matters worse, the assessor finding the value of personal property for individuals to be less than the $200 personal exemption, deducts the "excess" from the value of farm or business personality which may be owned by the individual.

These violations carried on in some counties to the extent described, become particularly unfair to property owners in other counties where assessors may be attempting, more adequately, to enforce the law. Furthermore, even within the very counties where property owners appear to be most favored with low assessments, there are likely to be the greatest discrepancies as between particular individuals, relative to the assessment of personal and real property.

Studies indicate that if personal household property were fully assessed, the assessment value should correlate closely with the value of the dwelling in which the property is located. Consequently, a comparison of actual personal property assessments with the census value of dwelling units is an excellent index with which to compare the various counties of the state. Such comparisons are shown in Table 22. Figures are for 1940, the most recent year since the last housing census.[1] Column (d) gives the average assessed value per dwelling unit of personal household property. It may be seen that the range among the counties is from a high of $273 in Denver to a low of $35 in Huerfano -- $150 being an average for the state as a whole. As it is unfair to make direct comparisons between counties whose residents differ widely relative to actual income and wealth, the figures are expressed in column (e) as percentages of the average census value per dwelling unit for each county.

The counties are listed in the table according to their relative standing as shown in column (e). It should be kept in mind that the percentage figures for the various counties are shown in this column can now be compared directly with each other -- a correction having been made for variations among the counties in wealth and income. Therefore, these percentages should indicate in a very real sense the success, or more likely the lack of success, of assessors in placing personal household property on the assessment rolls.

---

1 Even though the valuation placed upon housing units by the Bureau of Census may not be completely accurate, the same criteria for judging values were used in each county; consequently, comparisons in Table 22 are valid and significant.

2 Ibid.

3 Includes musical instruments, radios, clocks and watches, jewelry and silverware, household furniture. See Annual Report, 1940, Colorado Tax Commission.

4 Assuming same average as for the neighboring county of Archuleta, census figure not given.

According to the table, Pitkin county rated highest in the state with a ratio of 20.7 per cent. In other words, in this county the average assessed valuation of personal household property was 20.7 per cent of the average census value of dwelling units. On the other hand, Bent County rated lowest with a ratio of only 2.8 per cent. Average for the state was 6.4 per cent indicating that assessments were considerably lower than they should be for the state as a whole. Generally it is safe to say that personal household property is worth about 10 per cent of the real estate value (including both building and ground) where the personal property is located. Judged by this standard, and disregarding the fact that the value of land is not considered in our table (column b), only 10 counties in the state were adequately assessing their household goods -- those as shown in Column (e) with ratios of 10.0 per cent or more.[1]

Our immediate concern in this section is the effect of the $200 exemption upon personal property assessments. The figures in Table 22 (Column c) do not take into consideration this effect as they represent assessment amounts before deduction for exemptions. The table is merely intended to show the inadequate and unequal assessment of personal property among the counties.

However, figures for 1945 assessments compiled by the tax commission (Table 23) show some of the effects of the personal tax exemption. The counties are segregated into six groups in the state according to common economic characteristics. Although the classification is not a perfect one, it has some value in facilitating a direct comparison among the counties. For example, the three counties largely urban -- containing the three largest cities in the state -- are in one group, the eleven counties, each with middle-sized cities and considerable areas of productive irrigation lands, are in another group, etc.

Within each group the counties are listed according to relative rank. Those counties with the highest relative amounts left after deduction for personal exemptions are listed first. For example, Denver is first in her group because exemptions amount to only 42.5 per cent of the assessed value of household goods, while Pueblo county is last in the group because her ratio is 78.8 per cent.

Among the other groups of the state an even greater variation exists regarding the effects of deduction for personal exemptions. In group II the range is from a low of 62.0 per cent in Boulder county to a high of

---

1 The writer realizes that some county assessors have made courageous efforts to improve assessments of personal property. Various devices have been used to standardize practices and to serve as guides for deputy assessors. One example is the "Room-Unit-System" for assessment of household goods prepared by the assessor in El Paso county. Other similar plans have been adopted by assessors in a few other counties.

Table 23

Assessment of Personal Household Property Compared with Personal Exemptions, by Counties, 1945

Rank	County	Assessment of Household Goods	Average Assessment per Family	Personal Exemptions	Net Assessments	Per cent Exemptions to Total Assessment

Source: Figures obtained from Colorado Tax Commission

104.9 per cent in Las Animas county; group III ranges from 73.3 per cent in Sedgwick county to 196.8 per cent in Washington county; group V, from 68 per cent in Grand county to 129.3 per cent in Costilla county; and finally group VI, from 56.2 per cent in Clear Creek county to 133.2 per cent in Hinsdale county. There is little equity in a property tax system permitting such a wide variation among counties with similar industries, whose resident property owners are to be found upon similar economic levels.

In more than one-third of the counties of the state, personal exemptions exceed the total assessed valuation of personal household property. Assessors in these counties would actually show more net assessments on the tax rolls if the $200 personal property exemption were eliminated and all household goods were made tax exempt. In another third of the counties, total net personal property assessments are so negligible that considering the cost of administration and the subterfuge of the system, conditions in these counties also would be improved if the personal exemption were removed and household goods made tax exempt.

The writer believes, however, that this would not be the best solution of the problem. In the first place, removal of the $200 personal property exemption would require a constitutional amendment which would be virtually impossible to obtain. Secondly, the principle behind the exemption is probably sound if personal property is assessed at a figure even approaching full value. Finally, personal household property owned by most families represents at least some taxpaying ability. To exempt it all would place an even heavier burden upon real estate which in many cases is already paying relatively too much.

From the standpoint of sound tax principles, the correction would be to obtain a much more complete listing of personal property upon tax rolls with assessment on a valuation basis corresponding more closely to full value. The state tax commission has sufficient authority over county assessors to enforce this.

An aggressive commission supported by sufficient budgetary funds to maintain an adequate staff of field workers could succeed in obtaining millions of dollars of additional personal property upon the tax rolls. The small extra cost would be repaid many times over in additional revenue; moreover, as a consequence, there could be a lighter tax load upon much of the real property of the state.

Even though budgetary funds are inadequate, the present tax commission has sufficient information regarding assessments among various counties to bring about a great improvement. Perhaps the present commission needs more of the aggressive character of the original commission appointed some 30 years ago. However, it would be much easier for the tax body to act if it had an aroused public behind it to support measures taken relative to tax reform. The writer believes members of the commission would welcome such an aroused public.

Property of State and Local Units

The Colorado constitution exempts from taxation all real and personal property of the state, counties, cities, towns and other municipal corporations and public libraries. These provisions were placed in the original constitution adopted in 1876. Subsequent legislation has been guided by this exemption principle. The arrangement for exclusion from taxation of inter-governmental properties conforms to general practice in other states of the Union.

Probably no useful purpose would be accomplished by making state property taxable by local units; likewise, the property of local governmental units should not be taxed by the state government. A possible exception, as referred to later, is governmental property used in commercial enterprises.

Because of concentrations of state property in particular areas of the state, especially when these holdings narrow the tax base of local units and perhaps also require more expenditures for local services, the state might consider the advisability of extending certain payments in lieu of taxes. Such a policy if adopted, would conform to the fiscal policy of the national government relative to its holdings of certain real property.

The valuation placed upon all property owned by the state of Colorado (both departments and institutions) for June 30, 1944 was nearly $370 million as shown in Table 24. It may be seen that real property (land, buildings and improvements, water and mineral rights) was the largest item amounting to a total valuation of about $325 million; while personal property (the remaining items in the table) had a valuation of almost $44 million. The figures are probably in excess of a true market value and undoubtedly are very much greater than a tax assessed value would be if assessments were comparable with those on private property in the state.

Estimates are not available to indicate the value of all property owned by local governmental units in Colorado. However, this information would probably serve no useful purpose from the standpoint of property taxation. Yet there is one category of property owned by several Colorado municipalities which might be subjected to state and county taxation -- namely, property used in commercial enterprise.

The principal form of such commercial enterprise is the municipally owned utility producing electric light and power. In 1942, 10.5 per cent of the electric energy produced in the state came from these city owned utilities. No great hardship would be placed upon these plants if they paid taxes comparable to those paid by privately owned utilities. In fact, much unnecessary criticism directed against them could in this manner be avoided. Furthermore, the total property tax load would become somewhat more equitabley distributed.

Federally Owned Property in the State

The largest body of tax exempt property in Colorado is in the form of land and improvements owned by the federal government. In most cases this property is fully exempt from taxation by state and local units.

During recent years there has been a rather pronounced increase in the amount of real estate removed from tax rolls because of expansion of federal ownership. This development, together with inability for other reasons of the property tax to satisfy local revenue needs, has caused considerable concern in the minds of some people relative to the trend. It is contended, and sometimes with justification, that federal acquisition of property may create difficult local financial problems due to contraction of the local tax base. Moreover, in some instances federal properties make necessary the expansion of local governmental services.

The amount of land in Colorado owned by the national government has increased from 22,119,158 acres in 1937 to 25,492,803 acres in 1944. This increase has been to a large extent because of the acquisition of tracts of land for conservation and development purposes as well as for reservations, cantonments, airfields and other defense and war facilities attendant to World War II.

By 1944, the 25,492,803 acres of land owned by the federal government represented 38 per cent of the total land area of the state (table 25). On the basis of percentage of federal land to total land, Colorado ranked ninth among the states of the Union. In other words, eight states (all

western) had relatively greater areas under national ownership. Largest areas on both an aggregate and relative basis were to be found in the 11 western states. Aside from these states only South Dakota and New Hampshire contained areas in excess of 10 per cent owned by the federal government.

Table 25

Principal States Containing Federally Owned Lands, 1944[1]

Rank	State	Federal Land (Acres)	Federal Land as Percentage of Area of State
1	Nevada	61,378,360	87
2	Arizona	53,363,273	73
3	Utah	37,898,177	72
4	Idaho	33,730,114	64

1 States with 5 per cent or less not listed.

Table 26 shows the amount of federal land holdings in Colorado classified by administrative agencies. It may be seen that the largest tracts are forest lands (13,674,492 acres) administered by the Department of Agriculture and grazing lands (7,678,944 acres) administered by the Department of Interior. These two combined represent almost 84 per cent of the total area owned by the national government.

Other fairly large tracts are administered by the Bureau of Reclamation, the Office of Indian Affairs, the General Land Office, the Soil Conservation Service, National Park Service, and the War Department.

These extensive holdings by the national government -- 38 per cent of the land area of the state, toghether with improvements thereon -- appear to represent a vast amount of tax-exempt property placing a burden upon the owners of privately held property who must bear the entire cost of local government. However, such an interpretation is inadequate and in particular cases completely erroneous.

Although most federal property is not taxable by state and local governments, various payments in lieu of taxes have been authorized by Congress. In general, all types of payments may be classified into three categories.[1]

First and most important are payments made to state or local governments in the form of a stated percentage of gross or net revenues from the use of land, with or without stipulation of the purposes for which the funds may be used by the recipient. These payments apply principally to the public domain but also in special cases to certain acquired lands.

The types of benefit to state or local units in Colorado in this first category are shown in Table 27. The principal revenue sources in recent years have been forest and grazing lands and mineral resources. In addition to the percentage payments as indicated in the table, the national government allocates considerable revenue for maintenance and improvement of the public domain. For example, 10 per cent of the total collections from forest acreages is devoted to road and trail construction within the forests; 25 per cent of receipts under the Taylor Grazing Act, when appropriated by Congress, may be expended for construction, purchase and maintenance of range improvements; while various amounts received by the United States Reclamation Bureau from mineral royalties and bonuses are spent in the state on reclamation projects.

A second general type of payment from the federal government (of minor importance in most states, including Colorado) is revenue allocated by administrative agencies, by agreement, to local units in lieu of taxes when certain resettlement and federal housing projects have been undertaken requiring expensive local services.

Finally, a third type of payment (also of minor importance in Colorado) is the payment of ad valorem taxes by federal lending agencies. These levies have been permitted by Congress and are upon real estate acquired in most cases for forclosure in connection with lending and collection operations.

Table 27

Federal Contributions Based Upon a Specified Per Cent of Revenues from Public Lands

Lands or Resources Affected	Nature of Payment	Recipient and Purpose if Specified
Forest resources	25% of receipts	Counties for roads and schools
Conservation and land utilization projects	25% of net revenue	Counties for roads and schools.

Figures are not available showing payments to Colorado (the three categories) because of the ownership of federal real estate. However, Table 28 gives average annual payments (1928-37) for all purposes including relief expenditures. This average amount was $11,928,000. If relief and other emergency expenditures are excluded the average annual payment to the state was $4,982,000.

Table 28 also shows an estimate of the fair market value of real property owned by the federal government in Colorado ($100,203,912)[1] and indicates the amount of local property taxes ($1,885,525) which the government would pay if such property were assessed and taxed by local units. The latter figure is particularly significant when compared with the amount of federal aid going to Colorado for the benefit of state and local units of government. Apparently an amount of assistance is given

1 This estimate was made for the year 1937 for all states by "a special committee on the study of Federal ownership of real estate and of its bearing on state and local taxation" appointed by President Roosevelt. Its report was submitted in 1939. A more recent and perhaps more comprehensive estimate of the value of federal property in Colorado is contained in the Colorado Year Book, 1943-44. Its estimate is $7,056,442,531, or $1,171,129,830 excluding cash assets in the Denver mint. This figure is obviously determined on some basis other than fair market value. For example, federal coal lands alone are valued at $722,450,000! See page 472.

Table 28

Estimated Value of Federally Owned Real Estate in Colorado (1937)
Compared with Federal Aid to Colorado

Area of federal land in Colorado (1937)	22,119,158 Acres
Cost of federal land and improvements	$46,772,913
Estimated fair market value of federal real estate	100,203,912
Estimated property tax yield if applied to federal real estate	$1,885,525*
Average annual federal aid to Colorado (1928-37)	$11,928,000
Annual federal aid as percentage of fair market value of federal real estate	11.9 per cent
Average annual federal aid to Colorado (1928-37), excluding all WPA and other emergency payments	$4,982,000
Annual federal aid (excluding WPA, etc.) as percentage of fair market value of Federal real estate	5.0 per cent

* Based upon local mill levies.

several times greater than if payments were confined to ad valorem taxes on federally owned property. The average federal aid (1926-37) related to the value of federal property was 11.9 per cent.

If relief expenditures are excluded, the ratio becomes 5.0 per cent. Even this smaller percentage is considerably more than the average total property tax rate (state, county, municipal and school) of 3.6 per cent levied against private property in Colorado in 1937. Furthermore, private property was probably assessed at not more than 50 per cent of true value while the appraisal of federal property was upon a 100 per cent basis.

Thus, even though most federal property is completely tax exempt, payments in lieu of taxes added to other federal aids would amount to a much greater sum than the yield of a tax on federal property should there be one. Therefore, in a sense, federal real estate in Colorado is more than paying its way.

This does not necessarily mean however, that the fiscal relationship between federal and local governments growing out of the ownership of federal properties is always satisfactory. We believe that in the future a much better solution of the general problem would be achieved if the principles were adopted as formulated by the Treasury Department's Committee on Intergovernmental Fiscal Relations. These principles, summarized by the writer are as follows:[1]

1 Senate Document No. 69, 78th Congress, 1st Session, June 23, 1943, pp. 24-26.

1. There should be a Federal-State Fiscal authority to serve as a clearing house and administrative agency for all payments in lieu of taxes. It is desirable to develop a consistent and intelligible policy in this field.

2. Some recognition should be given to the benefit bestowed on a community by the location of a federal function. If there is resulting benefit, the amount of federal payments might be governed accordingly.

3. Property that has long been owned by the Government, and new properties of the same class should ordinarily be exempt with no compensation from federal funds. The affairs of all concerned have long since been adjusted to the exemption status. No useful purpose would be served, for instance, by subjecting the United States post office property and general administrative buildings to local taxes. The extensive holdings of public domain have never been taxed and probably should also be placed in this category, although revenue-sharing devices of long standing are in operation and will probably have to be retained.

4. Where services are sold by governmental agencies on a commercial basis and in competition with similar private activities, as in the power projects, the property should ordinarily be valued by the federal government and subjected to local taxes.

5. Other federal property that is ordinarily utilized by or designed for sale to private individuals, such as farm and resettlement properties or additional Indian lands, should pay the equivalent of levies on similar privately owned property.

6. Property acquired for conservation purposes (such as sub-marginal and cut-over forest lands) might well pay a low, flat, average rate on value as of the time of acquisition. This would constitute a minimum guaranty, pending larger local receipts which later could be paid from a distribution of revenue when the property becomes revenue producing. The percentage of revenue shared would resemble a severance tax.

7. Although in the main, full local services should be supplied the federal property and its residents, if the Government is obliged to supply its own facilities and perhaps even to extend them to local residents, there should be adjustment accordingly of the payment to local units.

Other Tax Exempt Property

The Colorado constitution provides that "Property, real and personal, that is used solely and exclusively for religious worship, for schools, or for strictly charitable purposes, also cemeteries, not used or held for private or corporate profit, shall be exempt from taxation unless otherwise

provided by general law."[1]

It may be noted that the exemption is in the nature of a privilege conferred by the sovereign which may be limited, modified or abolished by the legislature. This right of the legislature to decide the extent to which the exemption privilege shall be bestowed was affirmed in the case of Horton vs. Colorado Springs Masonic Building Society[2] and re-affirmed in McGlone vs. First Baptist Church.[3]

However, the legislature has followed the wording of the constitution very closely when enacting laws pertaining to exemptions for religious, educational and charitable purposes. The existing law was passes by the legislature in 1908.[4] It extended the concept of exempt property used for religious worship by including the value of rectories to a maximum of $3,000.[5]

Among the states of the Union there are two distinct lines of authority on the construction of tax exempt constitutional and statutory provisions; one line construing them strictly, the other giving them a liberal construction. The Colorado courts have consistently followed the liberal interpretation. This has been a matter of concern to tax authorities because of the apparent escape under immunity of tax exemption of much property which rightfully should be taxed.

For example, until the law was amended to specifically deny the practice, the courts held that premises occupied solely for a private school although conducted for profit, were tax exempt.[6] In 1921 the legislature changed the law to read: "Section 2. The following classes of property shall be exempt from general taxation, to wit: ..... Third. Grounds with the buildings thereon, if said buildings are used exclusively for schools, other than schools held or conducted for private or corporate profit."[7]

The 1933 legislature further clarified its intent relative to a tax exempt school by defining such school as "an educational institution requiring daily attendance, having a curriculum comparable to a grade, grammar school, junior high, high school or college or any combination thereof and having an enrollment of at least forty students and charging a tuition fee."[8]

Another example of the liberal interpretation of the court relative to tax exempt property involved a building owned by a corporation organized by several Masonic societies in Colorado Springs. The societies

8 Chapter 158, Session Laws of Colorado, 1933.

used the building primarily for charitable purposes but operated a stand for the sale, to those privileged to be there, of cigars, tobacco, and other wares; as well as a reading room for the use of members of the different Masonic bodies and gave dances and dinners in a room devoted to the purpose, where non-members were admitted and an admission fee was charged. A majority of the Court ruled that the land and building were entirely exempt from taxation.[1]

Justice Teller writing a dissenting opinion vigorously attacked the opinion of the majority contending that "clearly, this building is not used solely and exclusively for strictly charitable purposes, and ought not, therefore, to be exempt." He further argued that "The basis of the exemption of charitable institutions is that the state does not lose thereby, since they assume a burden which the state must otherwise bear....How can it be said that the use of so much of this property as is in effect a club-room for the use of lodge members -- with no necessary connection with the general work of the order, -- relieves the state of any burden?....if the court's reasoning be sound, a golf course connected with the building....or a picture show, the receipts of which are devoted in part to lodge purposes, should likewise be exempt....The result of this consideration is that we have exempted a property from taxation on the mere possibility that it may be a source of income to an institution which has, without much reason, been termed a charitable institution."

Since 1918 when the ruling was made in the Colorado Springs Masonic case a majority of the court has consistently taken a liberal viewpoint relative to such fraternal organizations as the Masonic Lodge.

In 1932 the court ruled that property of a corporation not for profit and which is used in connection with the promotion of physical culture and mental qualities of its members and others who may comply with its rules, was exempt from general taxation.[2]

One further example may be cited to indicate the judicial attitude toward tax exempt property. In 1935 the court held that the requirements of the constitution and statutes concerning exemption from taxation of property of religious, charitable and educational institutions are met if there has been work done on the lots and "there is a bona fide continuous intention on the part of such organizations that their real property, and buildings to be by them constructed thereon, are to be devoted exclusively to religious, charitable or educational purposes.[3]

Justice Holland, dissenting, stated that in his view the opinion of the majority "announces in effect the doctrine that all real estate owned by a religious corporation is exempt from taxation."

---

1 Horton vs. Colorado Springs Masonic Building Society, 64 Colorado 529 (1918)
2 Denver Turnverein v. McGlone, 91 Colorado 473 (1932)
3 McGlone vs. First Baptist Church of Denver, 97 Colorado 427. (1935).

Because of the very liberal attitude taken by the Colorado courts relative to exemptions of property owned and operated for educational, religious and charitable purposes, considerable property, not originally intended to be so favored, undoubtedly escapes taxation. Writing in 1918, the state tax commission urged, "Property subject to exemption from taxation should be more clearly defined. Our state courts have construed the subject of exemption so liberally that there has been stricken from the tax rolls millions of dollars' worth of property that is at least partially used commercially."[1] The sole justification for such exemptions is that meritorious functions are performed relieving the government of burdens which it would otherwise have to bear. However, the definitions of religious, charitable and educational purposes have been so broadened and so loosely interpreted that it is questionable if in many instances the justification is present of "relieving the government of burdens which it would otherwise have to bear."

The argument that the exempt property is held and operated for purposes other than a profit is scarcely valid in that much other taxable property including homes and household goods would fall into the same category.

Another class of property exempt from taxation, as permitted by the constitution, and authorized by law is property used for irrigation projects. The present law was enacted in 1921 and provides that "Ditches, canals, and flumes owned and used by individuals or corporations for irrigating land owned by such individuals or corporations, or the individual members thereof, shall not be separately taxed so long as they shall be owned and used exclusively for such purposes."[2]

There appears to be no valid justification for favoring this particular kind of cooperative ownership of property as contrasted with real and personal property of other cooperatives such as marketing and consumer organizations not operating for a profit. However, if the value of the irrigated land, made possible because of the irrigation project, is sufficiently assessed, probably no great injustice is done, as the value of the project is reflected in increased value of the land.

Still another property exemption permitted by the constitution and authorized by law is "cemeteries not held or conducted for private or corporate profit."[3] This provision appears not to violate the principle of equity in taxation. However, it is necessary for tax assessors to be diligent in seeing that only those cemeteries of a public or cooperative nature are made tax exempt.

Two categories of property have recently been added to the list of tax exemptions under the general property tax. These are motor vehicles and intangible personal property.

---

1 Seventh Annual Report, 1918, p. 9.
2 Chapter 200, Session Laws of Colorado, 1921.
3 Ibid.

The reason for the motor vehicle exemption was in order to provide for a specific ownership tax in lieu of the property tax, to be collected at the time license fees are paid.[1] This new method of taxing motor vehicles has been an improvement over the old in preventing evasion; however, the new tax rates appear to be unusually light as compared with those in most states. More will be said regarding this tax in another report.

Since the beginning of property taxation in Colorado intangible personal property had largely escaped taxation. In spite of constitutional and statutory provisions to the contrary most county assessors found it inadvisable or impossible to place a very large proportion of intangibles such as stocks, bonds, money and credits, notes, bank deposits, and book accounts on the assessment rolls. As early as 1912 tax authorities began recommending a change in the system by proposing that intangibles be made exempt from property taxation if the income from intangibles could be included under an income tax. Finally, in 1936 this arrangement was made possible by a constitutional amendment[2] and the following year an exemption provision was made part of the new income tax law.[3]

The degree of success in taxing the income from intangible property in lieu of all property taxes is discussed in another section.

The law in Colorado specifies that county assessors shall assess all tax exempt property placing the valuations on the assessment rolls even though no taxes are to be collected.[4] No appraisals have ever been made, however, and consequently, none of the property is listed by the assessors. Apparently their efforts have been confined to the difficult task of finding and assessing property which is subject to taxation.

There probably should be an appraisal of tax exempt property in the state -- particularly that property exempt for religious, educational and charitable purposes, and tax exempt irrigation projects and cemeteries. This appraisal could be made either by public officials or by some competent independent body. If we had an estimate of the value of such tax exempt property classified by kind and by uses it would be much easier to decide the effect of liberal and often lenient rulings of the court relative to the problem. After obtaining this information it also would be easier to agree upon changes in the system of tax exemption if amendment seemed advisable. A revision, although perhaps politically difficult, would not encounter many legal problems as the tax exemptions causing the greatest concern are statutory and not constitutional.[5]

Tax Rates and Tax Rate Limits

Tax Rates

The property tax rate is customarily expressed as a particular mill levy per dollar of assessed valuation. For example, the rate in 1945 for state purposes was 3.50 mills. This means that property owners were required to pay taxes to the state government equivalent to 3.50 mills for each dollar of assessed valuation of their property. The rate can also be expressed as a percentage, in which case the 3.50 mills would become .35 per cent -- a 10 mill levy would be 1 per cent.

Actually, in Colorado as in most other states, the property owner does not pay any property tax directly to the state government. There is local collection by the county treasurer, who in turn, forwards the state's share to the state treasurer. In order to facilitate collection, particular mill levies of each layer of government (state, county, city or town, and school district) are added together and the total levy thus obtained is applied against the property located within the governmental units concerned. Thus actual collection of the total tax is made by the county treasurer.

If all property were uniformly assessed among the various taxing districts and if valuations were relatively equal from one year to another, a comparison of mill levies for the purpose of determining relative tax burdens would be more significant. However, as we have already seen, property assessments are not uniform throughout the state, nor have they been made in a uniform manner over the years in the past. Nevertheless, with this limitation in mind let us briefly review the past and current tax rates which have been levied by the state and local units.

Table 29 gives the total mill levy for state purposes by years since 1912. It may be seen that considerable fluctuation in rates has occurred. For example, the levy was drastically reduced in 1913 (1.30 mills) as compared with the previous year (4.05 mills), the reason being that in 1913 assessed valuations were tripled by the new tax commission. Actual taxes levied and collected in dollars remained relatively constant. After 1913 the mill levy gradually increased until by 1922 it was 4.48. However, there was a reduction the next year, thereafter the rate remaining about the same (fluctuating around 3.50 mills) until 1937. The beginning of a 10 year building program for state institutions caused an increase in that year, the levy rising to 4.50 mills. Since then the trend has been down, declining to 3.42 mills by 1946.

Throughout the years the effective state rate has remained remarkably constant; it has always represented a relatively small proportion of the total levy made by all governmental units (state and local): and always the state levy has remained well below the maximum rate permitted under the constitution.

Table 29

State Mill Levy and Average Total Mill Levy, All Governmental Units in Colorado, by Years 1912 - 1946 Inclusive

Year	State only	Average for all units[1]	Year	State only	Average for all units[1]
1912	4.05	39.8	1930	3.59	31.0
1913	1.30	13.8	1931	3.49	31.2
1914	1.39	14.1	1932	3.49	31.2
1915	2.10	16.4	1933	3.40	33.5

Table 30 shows the allocation of the 3.50 mill levy in 1945 according to various state functions. During recent years (including 1945) the state general fund has received no revenue from the property tax -- all levies being earmarked for special functions or funds. A discussion of the levies for these special purposes would lead to a discussion of governmental expenditures -- a topic beyond the scope of our present study.

Table 30

Mill Levy for State, Classified by Major Functions, 1945

Function	Mill Levy	Anticipated Revenue
Educational Institutions	1.58741	$ 1,934,764
Eleemosynary Institutions	.40844	497,814
Building Program	.81314	991.070
Interest and Debt Retirement	.35768	435,947
Police Pensions	.20000	243,764
State Military	.07000	85,317
Stock Inspection	.03333	40,623
State Fair Tax	.03000	36,565
Total (state purposes)	3.50000	$ 4,265,864

Source: Annual Report, 1945, Colorado Tax Commission

In addition to the figures indicating mill levies since 1912 for state purposes only, Table 29 also shows average total levies by years for all governmental units (state and local) within Colorado. The total levy sharply declined after 1912, dropping from an average of 39.8 to an average of 13.8 mills. However, since then the rate has gradually but steadily increased until by 1945 it was almost back to the level of 1912 -- 38.7 mills as compared with the former 39.8 mills.

Considerable variation occurs throughout the various counties relative to property tax rates. In Table 31 the counties are listed in order according to total assessed valuation -- the larger and more wealthy counties being listed first. It may be seen that in 1945 the county mill levy varied from a low of 4.16 in Baca county to a high of 24.32 mills in Hinsdale county. The average for all counties was 9.2 mills. It is significant that the smaller and poorer counties at the bottom, with one or two exceptions, had the highest mill levies. Thus the 14 counties with total valuations below $4 million had an average mill levy of 14.42 or 56 per cent above the average for all counties in the state. It may be concluded that these counties particularly, and to a lesser extent some of the other smaller ones, possess insufficient population and resources for efficient and economical operation of county government.

The same table also shows the average total mill levy (state, county, city or town, and school district) for each county. These figures represent the average tax rates which property owners are called upon to pay in the various counties. Here the range is from a low of 22.5 mills in Park county to a high of 50.66 mills in Huerfano county -- the average for the state being 38.72 mills. Because the smaller and poorer counties have fewer cities and also because they provide less adequately for schools, the combined total levy for all purposes in these poorer counties tends to be at or below the average level for the state.

An interesting comparison is shown in Table 32 which gives the total mill levy in the 25 largest cities and towns of the state. Although property assessments are not uniform among all of these cities and, consequently, conclusions relative to tax rates must be qualified, the wide variation among the cities has some significance. For example, the city of Longmont in Boulder county in 1945 had a total mill levy of only 39.36 as compared with 67.17 mills in Walsenburg, Huerfano county, a city of about the same size. Although evidence indicates that property in Boulder county is assessed at more nearly the full value than in Huerfano county, the entire difference in mill levies as between the two cities cannot be explained in assessments. Another explanation of the tax rate differences could be in terms of the governmental services and educational facilities offered in the two communities. However, the level of these services in Longmont is probably higher than in Walsenburg. Consequently, some other cause must be found to explain the wide variation in rates as between the two cities. By examining the table, other interesting comparisons among different cities can be made.

Tax Rate Limits

Rate limits relative to the property tax found in the Colorado Constitution are confined to restrictions upon the state government. As previously discussed, the original constitution provided for a sliding scale of limitations, maximum rates at a particular time depending upon total assessed valuations. However, an amendment in 1892 fixed the maximum rate for state purposes at four mills. Another amendment in 1920 permitted the levying of one additional mill for erection of buildings for state educational institutions. Thus, present restrictions limit the total tax rate on property for all state purposes to a maximum of five mills on each dollar of valuation.[1] One exception to this limitation has been ruled by the courts. The legislature may levy any rate required to finance the cost of suppressing an insurrection.[2]

Tax levy limits imposed upon political subdivisions of the state are all statutory rather than constitutional. The scope of this study permits merely a brief summary of these statutory limits.

I. Counties. The maximum county levy to defray ordinary expenses including support of the poor and contingencies is limited according to

1 Colorado Constitution, Article 10, section 11
2 In re State Board of Equalization, 24 Colorado 446.

a detailed classification established by the legislature. The range is from a maximum of six mills in counties having an assessed valuation of $1 million or less to a maximum of one mill in counties having a valuation of $400 million or more.[1] In addition, a number of special provisions in the law permitting maximum levies for specific purposes may be mentioned as follows:[2]

1. Judgments against county, 15 mills.
2. Outstanding warrants, 3 mills.
3. Additional levy for unpaid warrants, 5 mills.
4. Mothers' Compensation, 1/8 of 1 mill.
5. Bonds and interest, amount of levy sufficient to equal 10 per cent of bonds issued.
6. To promote immigration through advertising, etc, 1/5 of 1 mill.
7. County or union high school, 4 mills.
8. Control and eradication of rodents, amount of levy not to exceed a yield of $20,000 annually.
9. Postwar improvements, 1 mill.
10. Road purposes, 10 mills.

II. School Districts. No general maximum levies apply specifically to school districts except for third class districts which are limited to 20 mills.[3] All classes of districts are permitted to levy taxes sufficient to pay interest and principal of maturing bonds. A maximum levy of .1 mill is permitted for the purchase of library books.[4] As previously mentioned, counties may not levy more than four mills for union high schools.

III. Cities and towns. No maximum limits are prescribed by general state law specifically for cities and towns of Colorado. Thus, the municipalities are largely free from such restrictions relative to tax levies. Cities over 100,000 population are specifically permitted to levy a maximum of 1/4 of one mill and 1/10 of one mill for firemen's and policemen's pension funds respectively.[5] In all cities, tax levies for public libraries are not to exceed one mill per dollar of assessed valuation. Also levies for current operation are limited in a number of home rule cities through provisions contained in their own charters.

IV. The five per cent limit. The most significant property tax restriction relative to rates in Colorado is the 5 per cent limit. Unless exceptions are permitted by law, the provision restricts the state and all political subdivisions to a tax levy which will yield for a current year no more revenue than 5 per cent in excess of the preceding year.[6]

2. Ibid, Chapters 33, 45, 143; also Supplement, 1945, Chapter 33.
3. Chapter 146, par. 32.
4. Chapter 146, par. 194.
5. Chapter 163, par. 451, 499.
6. Colorado Statutes Annotated, 1935, Chapter 142, par. 39.

Levies made to provide for the payment of bonds and interest are exempt from the limitation. Also exempt are levies up to a maximum of one mill for any county, city or town postwar improvement.[1]

In any taxing district, except the state, if officials believe the maximum levy permitted by law will not produce sufficient revenue for the current year, an appeal may be made to the state tax commission for the privilege of increasing the maximum levy. If, after investigation, the commission is of the opinion that the request is justified, an additional levy not exceeding five mills may be granted. Should the commission fail to grant the request, or should the excess levy of five mills be insufficient, the question may be submitted to the voters of the taxing district. If three-fourths of the voters at a general or special election favor the increased levy it can be made.[2]

Table 33 shows the number of petitions for selected years which have been submitted to the tax commission by the various classes of local governmental units. Because of the more rigid limits placed upon county governments, a larger proportion of the counties than of other local units usually request increases. In fact, each year since 1935, every county in the state has found it necessary to present petitions for increased levies. Also a great many school districts annually esperience difficulty in levying sufficient taxes to cover budget needs, and, consequently, request permission to make additional levies. It may be observed that the number of petitions tends to fluctuate throughout the years according to general economic conditions -- the number rising during inflation years and falling in times of depression. For example, note the contrast in number of petitions submitted in the years 1920 and 1921.

Table 33

Petitions to Tax Commission for Increased Levies, Selected Years Since 1915

Year	Counties	Cities and Towns	School Districts	Total
1915	28	35	344	399
1920	40	66	762	868

1945	63	27	394	484

Source: Reports, Colorado Tax Commission

1 Chapter 45, par. 237-40.
2 Chapter 142, par. 41.

From time to time the tax commission has questioned the advisability of requiring tax districts under existing arrangements to submit petitions for increased levies. For example, in 1926 it reported, "With the small force available to the commission, its action in these applications are necessarily more or less perfunctory, as it is impossible for us to examine into the needs of these taxing districts as contemplated by the statutes."[1] Again in 1928 it stated, "It is perfectly obvious that this commission has no facilities for making the examinations contemplated...and, unless the examinations are properly made, there is always danger of excess levies which frequently cause many complications and clouds on titles that last for years and sometimes indefinitely."[2]

Although facilities of the commission are limited for examing petitions, as long as rigid mill levy restrictions are operative, some flexibility appears desirable to take care of hardship cases. Perhaps the commission is as well prepared to provide this flexibility as any other agency. Moreover, since 1934 local units have been required to file with the commission copies of their budgets. This has greatly facilitated the effectiveness of the commission's work.

During the years following 1931 when assessed valuations were drastically reduced, most of the petitions going to the commission were from local units which were facing insolvency. Without mill levy increases the governmental functions of these units would have been seriously crippled. Thus for a number of years most all of the requests were granted by the commission.

In fact, over the years, since 1914 the commission has usually approved most of the applications for increased tax levies. Lacking information, there has been a tendency to give to the local unit "the benefit of the doubt," the request being granted. In many instances if the application is turned down, the issue is submitted to the people of the district who usually approve the tax increase.

This raises the question as to whether or not tax limitation provisions can ever be very effective. Apparently some elasticity is required or, at least in special hardship cases, the evils resulting may be much more serious than the ones which the law is intended to avoid. However, the loophole permitted by the flexibility provisions may largely nullify the effects of any limitation.

Relative to the problem, we might briefly examine the experience with the tax limits imposed in other states. All but about 10 states have imposed various kinds of property tax rate limits -- some restrictions being constitutional and some statutory. As a general rule the restrictions are either by fixing maximum tax levies relative to assessed valuation or else by limiting the tax to a certain per cent of the last levy. Until the depression period beginning in 1930, the limits in most states were too high to affect the ordinary operation of the property tax, either from the viewpoint of protecting property, or of embarrassing

1 Annual Report, 1926, p. 5
2 Annual Report, 1928, p. 6

local finances.

However, in the early thirties a number of states began adopting much stricter property tax limits. Among these was Ohio, whose restrictions became probably the most drastic of any state. An overall limit was established of 10 mills for all purposes except financing of indebtedness incurred prior to January, 1934. The only possibility of exceeding this 10 mill limit in any particular case was through a popular referendum. Since adoption of these severe restrictions, the experience in Ohio has been far from satisfactory. Conditions have developed there which bear out the earlier findings of a New York special joint committee on local property tax limits which concluded:

> "(1) Tax limits do not limit. Cities with tax limits spend as much and raise as much by taxation as cities without tax limits. The tax limit may serve to curtail expenditures for one or two years, but as soon as the restraint is felt an amendment is secured which encourages expansion since the tendency is to levy the full amount permitted whether it is necessary or not; (2) Tax limitation encourages unsound bonding; (3) Tax limitations should never apply to debt service; (4) In a democracy there is no way of blocking a genuine popular demand for increased governmental service through an arbitrary limitation upon the tax levy; (5) The only effective method of securing a restriction of tax levies without hampering municipal services, encouraging unsound bonding and promoting periodic expansion and extravagance, lies along the lines of centering full responsibility upon a single elected official through (a) the establishment of a comprehensive and binding budget system, (b) the enactment of a complete bonding act which will prevent unsound bonding and (c) the wide distribution among the electorals of the direct tax burden."[1]

In the opinion of the writer the various limits placed upon property tax rates in Colorado, as elsewhere, are largely ineffectual. Perhaps occasionally a school district or more likely a county may continuously forego some expenditure because of restrictions which cannot be circumvented, but this is probably the exception, rather than the rule. On the other hand, experience in other states indicates that it would not be wise for Colorado to attempt to strengthen the restrictions by reducing tax limits or by making them less elastic. The present arrangement of presenting applications to the tax commission for additional tax levies (up to five mills) by local units appears to be working fairly well.

Moreover, the limitation restricting current tax levies to a level not exceeding 5 per cent in excess of the previous year appears to be as rigid an over-all limit as can practically be established. Perhaps this limit with the "safety valve" of appeal to the tax commission, or if this fails, appeal to popular referendum, is a good one. Furthermore, the 5 per cent limit may be a genuine advantage, by stilling the fears of

---

1 Quoted by Jensen, Jens P., Colorado State Tax System, 1930, p. 199.

property owners who would otherwise oppose the state's return to a 100 per cent valuation basis for property. Such fears might arise from the belief that if tax valuations were drastically raised, governmental units would become extravagant because of receiving more revenue from the same mill levies. However, the 5 per cent limit would be a safeguard against this possibility.

Collection and Delinquency

As in most other states, the legal arrangements in Colorado are rather complex for enforcing collection of the property tax. These complexities have developed through the years because of an attempt, on the one hand, to improve collections, yet on the other hand, a desire to extend proper protection to the owners of delinquent property.

A very general and simplified description of the procedure in Colorado for collection of the tax would necessarily include a discussion of certain steps as follows:[1]

1. A tax lien (for current taxes) attaches to all property, real and personal, not exempt by law, on the first day of March of each year. The tax lien remains perpetual on the property until taxes are paid.[2]

2. Taxes are due and payable on or before the 30th day of April, the year following assessment. If paid in installments, the first half is due not later than the last day in February; the second half, not later than July 31.

3. Although notices are mailed to the last known address of property owner, a personal demand of taxes is not necessary. Each person subject to taxation is legally obligated to pay to the county treasurer the amount of taxes due.

4. During August a list is compiled of the names of owners of personal property whose taxes have become delinquent. This list with addresses of owners indicating the amounts of delinquent taxes plus interest and penalties is published during the month of September in a newspaper of the county.

5. Any time after the first day of December, the State Department of Revenue may require a remittant county treasurer to enter suit in court for judgments against personal property in order to collect delinquent taxes levied the previous year. After obtaining such judgment a public sale is held to recover an amount equal to the delinquent taxes plus interest and penalties.

---

1 Chapter 142, Colorado Statutes Annotated, 1935, and 1945 Cumulative Supplement.

2 Burton vs. Denver, 99 Colorado 207.

6. After taxes become delinquent upon real property (after August 1) property owners are notified by mail. The notice is also published over a period of four weeks in a paper of the county, announcing a sale at public auction of the property concerned.

7. On or before the second Monday in December all tax delinquent real property is sold at auction under tax certificates of purchase. Any lands remaining because of inadequate bids are taken by the county which in turn receives certificates of purchase.

8. Certificates of purchase held by the county may be sold by the county commissioners at any time or in any manner in which they may see fit, except if taxes due for any one property owner are im excess of $10,000, the Tax Commission must give approval and notice of sale must be published in a local paper.

9. Three years after sale, a tax deed may be issued to the holder of a certificate of purchase (either private individual or county).

10. The owner has five years thereafter in which to redeem his property.[1] In effect, he enjoys the privilege of redemption for eight years after sale.

11. If redemption occurs during the first three years (before tax deed is issued) the owner pays the amount for which property was sold and certain costs and penalties, together with interest at the rate of 2/3 of 1 per cent per month.

12. If redemption occurs after the tax deed has been issued (during the subsequent five year period) the owner pays to the holder of the tax deed an amount equal to the purchase price plus the current value of any improvements which may have been made, plus all back taxes paid with interest at the rate of 12 per cent, plus other costs and penalties including an abstract if one was obtained and cost of treasurer's deed.

13. The holder of a tax deed (private person or county) may enter suit (subject to legal limitations) to quiet the title, thus obtaining a marketable title.

This brief review of the law relative to the collection of taxes and disposal of delinquent property, when taxes remain unpaid, indicates a procedure probably no more involved than necessary if all interest parties are to be protected. During recent years the collection procedure has been improved. Consequently, the system at present, although not perfect in Colorado, is more satisfactory than that found in a majority of the

---

1 Except that a minor, insane person or idiot may enter suit to redeem at any time if within one year after such disability is removed.

states.

A record of actual collections for selected years since 1930 is shown in Table 34. These collections expressed as percentages of taxes levied were calculated at the end of the fiscal year after unpaid taxes had been delinquent, in each case, for a period of 11 months. Ultimately, a somewhat larger percentage of taxes is always collected due to sale of delinquent property, collection of interest and penalties, etc. The figures in the table show a wide variation by years. For example, only 84 per cent of the taxes levied in the depression year of 1932 were collected by June 30, 1934; while 99.4 per cent of the 1944 taxes were collected after a corresponding period had elapsed. This improvement has been due partly to a strengthening of the tax collection procedure, but

Table 34

Tax Collections Expressed as Percentages of Taxes Levied, State of Colorado for Selected Years, 1930 to 1944[1]

perhaps mainly to an improvement in the economic welfare of the people of the state. During prosperous years, collections are always better than during years of depression.

The record of collections by counties for the year 1932 contrasted with 1944 is shown in Table 35. In the former year the range was from a low of 38.7 per cent in Costilla county to a high of 97.0 per cent collections in Jackson county. Fifteen counties collected less than two-thirds of the taxes levied, while 38 counties collected less than 80 per cent.

Such heavy tax delinquency was due to a number of factors. Faulty assessments, placing excessive tax burdens upon some properties as compared with others; an over-emphasis upon the property tax, particularly for local governmental purposes; insufficient state aid to the poorer school districts which were attempting to maintain minimum standards; and the general economic depression, more severe in some counties than others, for example, the dry farm acreas of Eastern Colorado -- all were contributing factors. After a time, the heavy delinquency caused such

an accumulation of interest and other penalties for many property owners that the payment of back and current taxes became impossible.

As a consequence, many local governmental units, including school districts, found themselves financially insolvent. Even after reducing standars and cutting of governmental services far beyound that which was in the public interest, expenditures often exceeded revenue. Many school, town and county warrants were issued for salaries, etc. which could not be paid because of insufficient funds. Financial distress was also experienced by the state institutions which were depending upon a property mill levy for sources of revenue.

In 1935 an effort was made to rehabilitate delinquent property owners who were unable to pay the accumulation of taxes, interest, and penalties. The legislature amended the revenue act, permitting back taxes, (those delinquent prior to August 1, 1934) to be paid without interest or other penalty. In order to benefit from this waiver of interest and penalty costs, back taxes had to be paid prior to December 31, 1935.[1] Such an arrangement for relieving delinquent property owners was perhpas warranted because of the critical aspects of the period. However, should this inducement for property owners to pay back taxes be extended repeatedly, it would defeat its own purpose. In the long run, more taxes than otherwise would probably become delinquent.

Table 35 indicates that collections of 1944 taxes were excellent in most counties of the state. Twelve counties actually collected 100 per cent or more of the taxes levied. The explanation for collection in a few cases being more than 100 per cent is that assessment rolls were changed perhaps slightly during the year, or else county treasurers through error reported some interest and penalties along with taxes. According to the table, only four counties experienced what might be considered poor collections. They were Hinsdale with a percentage of 61.9, San Juan with 66.6, Gilpin with 72.0 and Clear Creek with 80.2 per cent collections. The next lowest percentage was 88.2 for Teller county, while average collection for the state as a whole was the remarkable figure of 99.4 per cent.

By way of conclusion it may be stated that the administrative procedure for collection of the property tax as established by law is at present fairly satisfactory. However, actual collections could be improved in some counties through a more careful selection of administrative officers. Moreover, greater uniformity of assessment of property would be conducive to a more complete collection of taxes in all counties. An increase of state aid would also be helpful by relieving part of the local property tax burden. Such state aid provides relief in two ways. First, through a program of equalization according to need, the aid relieves poorer districts of the state which otherwise would be forced to adopt excessive mill levies upon property within their areas. Secondly, if the state obtains revenue for distribution to local units from sources other than the property tax, for example, the income, inheritance, or severance tax, the property tax tends to be lightened in all districts receiving any aid. In either case, such assistance is helpful in maintaining good tax collections, particularly during periods of economic distress.

THE COLORADO PROPERTY TAX

Summary and Conclusions

1. When Colorado became a state her new constitution required a system of general property taxation for state and local purposes which proved to be inequitable and from many standpoints impractical. Yet the provisions were so inflexible and constitutional revision was so difficult that it was not until 1911 (Tax Commission Act) and 1936 (amendment permitting income tax) that genuine tax reform was forthcoming. Even with these fundamental changes along with numerous other tax revisions over the years the property tax in Colorado still remains grievously defective.

2. As in most other states the property tax represents the principal source of revenue for state and local governmental purposes. In 1942 it yielded $43 million or 51.5 per cent of all tax revenue. This percentage was slightly more than the average for all states -- the latter being 47.5 per cent.

3. During recent years the relative emphasis placed upon the property tax as a source of revenue for the state government (as contrasted with local) has been declining. This downward trend is considered advantageous as the state can well depend largely upon such revenue sources as the income, sales, severance, inheritance and special business taxes, leaving the property tax principally for local units of government. In 1944 in Colorado the state government obtained 10.8 per cent of its revenue from the property tax. The average for all states was 4.6 per cent -- the range being from nothing in five states to 22 per cent in the state of North Dakota.

4. Expressed in dollars the yield of the property tax in Colorado has fluctuated widely, however, the general trend has been upward. Since 1913 this has been due to higher local mill levies rather than because of rising property assessments.

5. The law in Colorado specifies that all property, unless exempt, shall be assessed at full cash value. Yet conclusive evidence indicates that at present the average assessment ratio throughout the state is probably not more than 30 per cent of true value.

6. In 1946 total assessed valuation of property in the state amounted to about $1,259 million. This was actually $47 million less than total assessments in 1913. If current assessments are compared with those in the year 1929, the reduction has been $327 million, or 20.6 per cent. Exemption from the property tax of intangible wealth and motor vehicles accounts for only a small fraction of this loss on the assessment rolls.

7. While assessments have declined since 1913 actual property has expanded and greatly increased in value. Considering all available evidence and discounting the inflationary rises of the war years since 1940, we may conservatively conclude that all real and personal tangible

property in the state has increased in cash value at least 50 per cent since 1913. Moreover, there is good evidence to indicate that in the future, the values are not likely to decline below this level -- approximately the level of 1940 or 1941.

8. If assessments were approximately on a full valuation basis in 1913, in order for the same situation to prevail today (after correcting for postwar inflation and allowing for exemption of intangibles and motor vehicles) the total assessed valuation of real and personal tangible property would probably need to increase by at least $625 million. The tax commission to the limit of its ability, should attempt to place the property in the state upon this higher total appraised valuation basis. In some instances it would involve discovering property, taxable under the law, yet not listed on assessment rolls, either because of error, negligence or favoritism; in all instances it would involve placing valuations on a basis so that they would be at the level of full cash value. Such reform relative to assessments would merely be in accordance with the prescribed laws of the state. Moreover, full assessments do not cause higher general taxes; on the contrary, the average property owner would probably discover he has a lighter tax burden when all property is fully assessed than when it is only partially assessed.

9. But there are other advantages when the assessment objective is full cash value. One of these advantages is a much greater uniformity of original assessments. The use of a fractional basis tends to be indefinite in practice and inevitably leads to wide deviations.

10. A few illustrations of the lack of uniformity under the present system in Colorado are the following:

a. Assessed valuations of Colorado farms compared with United States Census values for 1940 indicates an average variation ranging from 145 per cent in one county down to 26 per cent of census values in another county.

b. Dry farm land in some eastern Colorado counties is being assessed at $4 or less per acre which is currently yielding up to $100 per acre in wheat for each crop year.

c. Based upon 1940 building costs, in 1944 a survey of 35 cities and towns made by the tax commission showed that the assessed valuation of urban residences varied from a high of 90 per cent to a low of 10 per cent of full value.

d. On the basis of actual sales data, there is often extreme variation <u>within</u> most, if not all of the counties relative to the assessment of real property. Surveys indicate that in most instances the larger homes and farms are under-assessed to a greater extent than the smaller properties. Thus, the property tax becomes grievously regressive.

e. In one-third of the counties of the state the average assessment of personal household goods is actually less than the $200 exemption permitted by law. Moreover, the assessment ratio of such personal property is relatively seven or eight times as high in some counties as in others.

f. As a group, mines and oil wells have always received special favors under Colorado's property tax system. In 1913 they were relatively under-assessed. Today they are favored to an even greater extent.

g. It is difficult to say whether or not public utilities assessed by the tax commission benefit from relatively lower assessments than other forms of property. Since 1921 the total assessed valuation placed upon utilities has held up better than upon most catagories of property, however, with the exception of railroads, utilities have enjoyed rather phenomenal expansion. For example, expressed as an average of assessed valuation of investment per kilowatt hour of production, assessments of electric light and power companies have declined from 7.8 cents in 1920 to 4.7 cents in 1945.

11. A number of special problems of property taxation in the state deserve particular mention. One of these is the problem of tax rate limits. The provision restricting current tax levies of the state and all local units of government to a level not exceeding 5 per cent in excess of the previous year appears to be as rigid an over-all limit as can practically be established. Perhaps this limit with the "safety valve" of appeal by local units to the tax commission, or if this fails, appeal to popular referendum, is a good one. Furthermore, the 5 per cent limit may be a genuine advantage, by stilling the fears of property owners who would otherwise oppose the state's return to a 100 per cent valuation basis for property. Such fears might arise from the belief that if tax valuations were drastically raised, governmental units would become extravagant because of receiving more revenue from the same mill levies. However, the 5 per cent limit is a safeguard against this possibility. Other specific mill levy limits restricting the state and certain classes of local units (notably the counties) appear to possess but dubious value.

12. A second special aspect of property taxation is the problem of collection and delinquency of taxes. Because of existing prosperous conditions throughout most of the state, current collections are excellent. This favorable situation would not be likely to continue, however, if another major depression occurs. Safeguards against a future period of property tax delinquency causing financial distress to school districts, local governmental units and state institutions would include: (1) placing less emphasis upon the property tax as a source of revenue, particularly for state purposes, by developing to a greater extent such revenue sources, for example, as the severance and income taxes; (2) relief extended to local units, especially school districts, by distribution of larger amounts of state aid; and (3) improvement of property assessments.

13. A third and rather serious problem is one caused by the state's constitutional and statutory provisions relating to tax exempt property. These exemptions may be classified as follows:

A. Required by Constitution

(1) $200 of personal property for each head of family
(2) Property owned by the state and its political subdivisions, including public libraries

B. Permitted by Constitution and authorized by law

(1) Property not owned or operated for a profit when employed solely for:

(a) Religious worship
(b) Schools
(c) Strictly charitable purposes
(d) Cemeteries

(2) Property employed in irrigation projects used solely by owners

C. Required by Constitution because of other taxes levied

(1) Motor vehicles
(2) Intangible property

D. Property owned by the federal government.

14. Although the provision for a personal property exemption of $200 per head of family which became part of the new constitution in 1876 was intended merely to safeguard the standard of living of families possessing the bare essentials of life, the exemption has proved to be a loophole through which millions of dollars worth of property has escaped taxation. This escape from taxation occurs principally in two ways, neither of which was intended by law. They are as follows:

A. The fill amount of the exemption has been applied against property assessed at a mere fraction of its value.

B. Although the exemption was intended to include only purely personal or household goods it has also been applied against agricultured and business personal property.

In 1945, in more than one-third of the counties of the state, personal exemptions exceeded the total assessed valuation of personal household goods. In another third of the counties, after deduction of exemptions, net personal property assessments were negligible. Assessors in all of these counties would probably show more net assessments on the tax rolls if the $200 personal exemption were eliminated and all household goods made tax exempt. However, this would not be the best solution of the problem. The principle behind the $200 exemption is probably sound if all personal property is included on the tax rolls and assessed at a figure even approaching full value. Furthermore, personal household

goods represent some taxpaying ability. To exempt all these goods would be to place an even heavier load upon real estate which in many cases is already paying relatively too much.

15. The exemption from taxation of state and municipal property is a customary arrangement found in most other states of the Union. Probably no useful purpose would be served by making state property taxable by local units. Likewise, the property of local governmental units, with the possible exception of publicly owned commercial enterprises, should not be subjected to taxation. Principal commercial enterprises are municipal light and power plants which are to be found in several communities and which produce about 10 per cent of the electric energy consumed in the state. No great hardship would be placed upon these plants if they paid taxes comparable to those paid by privately owned utilities; moreover, the total property tax load would become somewhat more equitably distributed. Furthermore, much unnecessary criticism directed against publicly owned utilities could in this manner be avoided.

16. The largest body of tax exempt property in the state is in the form of land and improvements owned by the federal government. During recent years the amount of this property has been increasing. By 1944 the government owned about 26 million acres or 38 per cent of the land area of the state. Moreover, there were extensive improvements on some of these lands including many government buildings. These holdings may appear to represent a vast amount of tax exempt property placing a burden upon owners of privately held property who must bear the entire cost of local government. However, upon closer examination it is found that several types of payments in lieu of taxes are annually contributed by the government. The average annual federal aid to Colorado excluding WPA and other emergency payments (1928-37) amounted to $5 million. This is considerably more than an ad valorem tax on federal property would yield if there were to be one. Nevertheless, the opportunistic basis for granting aid in lieu of taxes has caused much misunderstanding and dissatisfaction. In the future there should be a consistent and unified plan relative to such payments.

17. No appraisal has been made of the tax exempt property used for religious, educational and charitable purposes; for cemeteries and for irrigation propects. The justification for these exemptions is that meritorious functions are performed relieving the government of burdens which it would otherwise have to bear. However, the courts have followed an extremely liberal line when interpreting exemption provisions of the constitution and statutes. Consequently, these lenient decisions have permitted the escape from taxation of much property which probably should be taxed.

18. Responsibility for successful operation of the property tax resides in several county and state administrative bodies. A county assessor (elected in each county except in Denver County) is directly responsible for all original assessments except the assessment of public utilities. Within each county, the county commissioners serve as a board of equalization of assessments. On the state level, an appointed state tax commission has general supervision over county assessors, makes

original assessments of public utilities and recommends changes in assessments to the state board of equalization. An ex officio board of equalization possesses limited yet final authority over state-wide equalizations. Property tax collections are made by the various county treasurers.

19. Perhaps the weakest aspect of property tax administration in Colorado is the office of county assessor. Although in a number of counties assessors are trying courageously to do a good job and are succeeding surprisingly well, the general level of performance in most counties is woefully inadequate. However, appreciable improvement cannot be expected until several fundamental changes are made. In order to do a good job, the assessor and his deputies in addition to possessing other qualifications, must be highly trained individuals with a vast amount of technical information and experience. Existing conditions of selection, tenure and remuneration do not in most instances attract or retain such individuals.

20. Although salaries of assessors were raised in 1945, they are still inadequate. The range is from $4,600 in Denver to $1,000 in Hinsdale county -- the median salary being $2,400 per year. This $2,400 official is responsible for placing a valuation on some $10 million of property against which is placed a tax liability of hundreds of thousands of dollars. Private business would not likely place comparable responsibility upon the shoulders of a $2,400 employee. Moreover, the assessor is elected for a two-year term of office. This is not enough time for him to become sufficiently familiar with his duties to be really efficient. In practice the assessors in one-third of the state's 63 counties are normally turned out of office or else refuse to run for re-election after serving for only one, or at the most, two terms.

21. The dual and overlapping property tax administration retained by the state government is unsatisfactory. Years ago all other states except Missouri and Colorado got rid of the dual control over equalizations exercised by an appointed tax commission and an ex officio board of equalization. These two states have probably continued to retain their inefficient and generally unsatisfactory system because of a combination of inertia and inflexibilities in their state constitutions.

22. The 35-year record of "equalization" of assessments since 1911 indicates that the state board of equalization is more likely than the tax commission to be influenced by partisan politics. The board is apt to decide that the expedient course is to do nothing (10 of the years) or else to order assessment reductions (18 of the years). During the time from 1915 to 1930 those favored with reductions were the railroads and utilities; from 1931 to 1933 the favored ones were farmers. Only during the six-year period from 1934 to 1939 has the board apparently been able to resist the political expediency of either doing nothing or else of making tax reductions. Moreover, an ex officio board composed of individuals with numerous other duties has neither the time nor the facilities for doing an adequate job of equalization.

23. When evaluating the work of the state tax commission during its 35 years of existence since 1911, a number of factors must be taken into consideration. It had hardly begun to operate when its very life was threatened by proposed statutory changes and constitutional amendments. It has always operated on a budget insufficient to maintain an adequate staff of research and field workers. Also its authority over equalization of assessments among counties has been limited because of the fact that final decisions reside with the state board of equalization. Then, too, its work has not been easy. Colorado has many divergent economic and sectional interests which are difficult to reconcile.

24. Considering all aspects, there is no question but what the property tax system of the state has been strengthened and improved over the years by the tax commission because of its supervisory, assessment, and equalization functions. If the property tax is still unsatisfactory, the solution would not be to weaken the power of the commission but rather to strengthen its hand through bestowing additional authority supported by adequate appropriations. The various states of the union with most satisfactory property taxes are invariably states with considerable administrative centralization in a state tax commission or its equivalent.

Recommendations

1. In order to place assessments upon a full valuation basis, making them uniform among the various taxpayers and counties of the state, there is urgent need for a complete reappraisal of all taxable property. This work should be conducted by the tax commission with cooperation from the county assessors. So as to be completely fair, all counties should be placed upon the reappraisal basis at the same time. Consequently, the legislature should appropriate funds sufficient to permit completion of the reappraisal in a one-year or at most two-year period of time.

2. Sufficient appropriations should be made available to the tax commission so that county assessors can be provided continuous supervision and assistance. There is need for the preparation and distribution of assessor's manuals, for more field deputies and for such guidance as would be provided by periodic schools for assessors. The extra cost would pay big dividends in the form of more uniform and complete assessments.

3. There should be a constitutional amendment abolishing the ex officio state board of equalization. All authority now vested in the board should be transferred to the state tax commission.

4. The county assessor should be appointed instead of elected.

He and his office should serve under a merit system. Appointment of assessors might well be made by county commissioners from a list of eligible candidates approved by the state tax commission.

5. Should the state continue to elect the assessors (except Denver county) the term of office should definitely be lengthened to a minimum of four years.

6. The salary schedule for assessors and deputies should be increased. There was urgent need for such increase even before the development of high postwar living costs. Increases granted by the legislature in 1945 were not adequate.

7. There should be a reform relative to the $200 personal property exemption. The present system is far from satisfactory. Perhaps the solution is to retain the exemption but to apply it only against fully assessed household goods.

8. There should be a re-examination of the effect of tax exemptions due to religious, educational and charitable purposes; also tax exempt cemeteries and irrigation projects. An appraisal of the value of such property would be helpful. This appraisal could be made either by public officials or by some competent independent body. On the basis of incomplete information it appears that the statutory provisions relating to these exemptions should be made more stringent. Fortunately, the exemptions are not constitutionally mandatory.

THE COLORADO PROPERTY TAX

Fiscal Importance of the Property Tax

The general property tax has always been the principal source of public revenue in Colorado. This emphasis upon property taxation conforms to the general practice in most American states. For the nation as a whole until recent years, collections yielded more revenue than from all other state and local taxes combined. Even as late as in 1927 the property tax accounted for about 80 per cent of all state and local public revenue.[1] However, as the retail sales and income taxes have since gained in importance, the relative significance of the property tax has declined.

In Colorado, during the sixty year period from 1876 to 1936 the state and local units depended for revenue almost exclusively upon the general property tax. An indication of this dependence may be obtained by referring to the situation in 1932. According to the Census Bureau, in that year all Colorado taxes for state and local purposes yielded $54,408,000. Of this amount, $43,757,000 or 80.4 per cent came from the general property tax[2] -- this large percentage in spite of highway,

1 Jensen, Jens P., Property Taxation in the United States

2 Financial Statistics of State and Local Governments, 1932

inheritance and miscellaneous business taxes adopted principally during the two decades immediately preceding.

By 1942, in all states combined, the property tax supplied 47.5 per cent of tax revenue going to state and local governments. In that year the range among the states was from a high of 65.7 per cent in North Dakota to a low of 24.7 per cent in Delaware. Colorado was not far from midway in the list -- the property tax accounting for 51.5 per cent of total revenue as compared with an average of 47.5 per cent for all states.[3]

During the last 20 or 30 years in a number of states the property tax as a source of state revenue (as contrasted with local) has become relatively insignificant, disappearing entirely in at least five jurisdictions. The property tax revenue going to state governments expressed as percentage of all tax revenue claimed on the state level is shown in Table 1. In 1944 all states collected an average of only 4.6 per cent of their tax receipts in the form of the property tax. However, there was considerable variation among the individual states -- the range being from nothing in Delaware, Illinois, Oklahoma, Oregon,

Table 1

Property Tax Collections as percentage of Total State Tax Collections (Excluding Political Subdivisions), 1944

State	Percentage	State	Percentage
Delaware	0	Michigan	5.5
Illinois	0	Kansas	5.7
Oklahoma	0	New Hampshire	6.2

and Rhode Island to 22 per cent in North Dakota. The ratio for Colorado was 10.8 per cent, placing the state among those jurisdictions (eleven in number) still collecting 10 per cent or more of their revenue from the property tax.

However, the relative emphasis placed upon the property tax by the Colorado state government has been declining during recent years as seen in Table 2. In 1915, 12.7 per cent of all property tax revenue was taken by the state; the ratio increased to 14 per cent by 1920 but the trend has been downward since, declining to 9 per cent by 1945.

1 Annual Reports, Colorado Tax Commission

This downward trend in the relative amount of property taxes levied by the state is considered by most tax authorities to be advantageous. The state can well depend largely upon such revenue sources as the income, sales, severance, inheritance and special business taxes, leaving the property tax principally for counties, cities and school districts. Moreover, some authorities contend that by keeping the state property tax levies down to a relatively low level, local assessments are more likely to be uniform among the various counties -- thus contributing to equity in taxation. The basis for this contention is the theory that inequality among the county tax districts is principally due to competitive under-assessments -- the low assessments growing out of a desire upon the part of authorities in each county to keep their share of the state tax as low as possible.

The theory suggests that if the state were to discontinue completely the collection of property tax revenue, temptation for under-assessment between counties would be removed. Accordingly, at least five states have adopted such tax reform. However, the experience of these states relative to the property tax has been disappointing. Apparently the separation of revenue sources alone will not insure full and equal assessments of all property throughout the state. Perhaps other reasons more significant than the desire to escape state levies account for the low and unequal assessments on the county level.

Considering all factors the writer believes it desirable for Colorado to keep her state property tax levy down to the approximate level prevailing at present. In other words, in the future the state should not attempt to take more than about 9 or 10 per cent of all property tax receipts -- leaving the bulk of such revenue for the local units of government. Should additional revenue sources be found, for example, a severance tax or improved income tax, the state might well depend even less than at present upon the property tax. However, for the state to withdraw completely from the property tax field, as a number of jurisdictions have done, would probably not be advisable. By so doing, a measure of financial stability would be lost, as the property tax tends to yield a constant and stable stream of revenue. Moreover, the loss of this financial stability would not in itself be appreciably offset by improvements in local assessments.

The total yield of the property tax for all units of government in Coloradoby years since 1913 is shown in Table 3. From 1913 to 1929 the

Table 3

Taxes Levied, Colorado Property Tax for Years 1913 to 1946 Inclusive
(Dollars Expressed in Thousands)

Year	Anticipated Revenue	Year	Anticipated Revenue
1913	$18,032	1930	$49,207
1914	18,420	1931	44,864
1915	20,536	1932	39,998
1916	20,430	1933	36,793
1917	24,657	1934	36,813

1929	49,665	1946	50,000[1]

1 Estimated
Source: Annual Reports, Colorado Tax Commission

trend of total revenue was steadily upward, rising from $18 million in the former year to over $49 million in the latter. Between 1929 and 1933 a drastic reduction occurred, anticipated collections falling to the level of $36.7 million by the latter year. Since 1933 the trend has again reversed itself, anticipated revenue for 1946 being about $50 million or approximately the same as in the former peak year of 1929.

As will be explained later, most of the increase in revenue since 1933 has come as a result of higher local mill levies rather than from rising property valuations as turned in by county assessors and the state tax commission. During the depression years property assessments were drastically reduced and those reductions have been only partially restored.[1]

Thus we find that by 1946, although property was being assessed at a much lower level, total tax collections were about the same as for the year 1929. Perhaps the most significant effect of the change has been that the state institutions, supported by a constant property mill levy, have suffered financially. Local units of government have recovered their lost revenue by raising local mill levies.

Early Development of the Property Tax

From 1876 to the Turn of the Century

When Colorado became a state in 1876 her new constitution provided for the adoption of a general property tax by authorizing the legislature to establish a uniform system of property taxation. All property, unless specifically exempted, was to be assessed at a just value. Original assessments were to be made by county assessors while equalization was possible on the county level by the county commissioners and on the state level by an ex officio board of equalization composed of the governor, state auditor, state treasurer, secretary of state and attorney general.

Specific property exemptions contained in the new constitution included the following: (1) $200 of personal property for each head of family, (2) ditches, canals and flumes used by the owners for irrigation, (3) mines and mining property for a period of ten years, (4) all real and personal property of the state, counties, cities, towns and other

municipal corporations and public libraries, and (5) property used solely for religious worship, for schools or for strictly charitable purposes, also to be exempt were cemeteries not used or held for private profit unless otherwise provided by law.

The constitution limited the state property tax to six mills on the dollar of assessed valuation with provisions for further reductions to four mills and then two mills when total state valuations reached $100 million and $300 million respectively. An amendment in 1892 repealed the latter provision and fixed the maximum rate for state purposes at four mills. The only exception allowed was to provide money to pay the expenses incurred on account of insurrection and invasion.[1]

Thus when Colorado became a state her constitution contained most of the customary provisions found in other state constitutions of that time relative to property taxation. The limiting features were intended to insure a system of equitable taxation without favoritism or discrimination to any special groups or classes.

However, the constitutional provisions committed the state to a system of general property taxation for state and local purposes which proved to be inequitable and from many standpoints impractical. Yet the provisions were so inflexible and constitutional revision was so difficult that it was not until 1911 (Tax Commission Act) and 1936 (amendment permitting income tax) that genuine tax reform was forthcoming.

Under the constitutional provisions of 1876 the legislature established by statutory means the procedure for initiating the property tax. County assessors elected for a term of two years were given the responsibility of determining the just valuation of all property, real and personal. These valuations were to be adjusted by a county board of equalization (county commissioners) and the differences between counties were to be equalized by the state board of equalization.

This administrative procedure was intended to insure assessment at full cash value of all property in each county of the state. However, in practice the procedure broke down. County assessors, always under pressure from property owners, began a competitive race with each other to under-assess property in order to reduce, in each case, the county's share of taxes paid to the state government. Because the same economic pressures and interests were present when equalization was attempted by the county commissioners, no correction of the inequality as between counties was achieved on this level.

Thus the state board of equalization was early confronted with the responsibility of attempting to force county assessors to make full-value assessments in order to obtain justice between the counties. Although

---

1 At present the maximum is still four mills for the ordinary operation of the state government and state institutions. However, in 1920 an amendment permitted the levying of one additional mill for erection of buildings for state educational institutions.

under the constitution the board was apparently vested with considerable power, its attempts were thwarted by the courts.

As early as 1876 the board detected property tax inequalities and changed assessments in such a manner that the sum total of all county assessments was greater after the equalization than before. The question of constitutionality was raised and in 1877 the court ruled that the board had no power to increase the aggregate valuation of the state. If it attempted to equalize by raising valuations in one county, it must make a corresponding reduction somewhere else.[1]

The board being composed of ex officio members, who were each busy with other duties anyway, decided that in view of the court's ruling nothing could be done. Consequently, nothing further was attempted relative to state equalization for over 20 years. Finally in 1899 the board made another effort to equalize values. This time it changed the assessment of certain classes of property in the various counties. Again objection was raised and an appeal made to the courts. The state supreme court affirmed its earlier decision and ruled this type of equalization to be likewise unconstitutional.[2]

Thus thoroughly discouraged in its efforts to equalize property valuations, the board adopted the following resolution:

> "Whereas every effort of the said Board of Equalization since its establishment has been invalidated by adjudication of the Supreme Court, therefore be it resolved, that in the judgment of this board the power of said board to equalize and adjust can only be made effective by constitutional amendment or by legislative enactment specifically designating its powers and directing the method of the performance thereof.[3]

After this formal declaration containing an appeal to the people, assessments grew steadily worse from the standpoint of equality among the various counties. Then, finally, several contributing factors induced the legislature to make a comprehensive property tax revision in 1902.

The Property Tax Law of 1902

The 1902 changes grew out of difficulties reaching a climax several years earlier. The depression of the 1890's put a severe strain upon the tax structure causing a shrinkage of revenue due to reduced valuations of property as well as because of tax delinquency. County assessors became reluctant to raise valuations even after several years of economic recovery. At the same time governmental functions were expanding and the need for revenue was increasing. As a consequence by 1898 the legislature

1 People vs. Lothrop, 3 Colorado 428 (1877)
2 People vs. Ames, 27 Colorado 346 (1900)
3 See Annual Report, Colorado Tax Commission, 1915, p.9.

found itself appropriating $472,555 in excess of tax receipts. Thus the lack of revenue for the biennium seriously crippled many of the state institutions and state functions.

Conditions became so bad that in 1900 Governor Thomas appointed a special revenue commission to study the problem and to make recommendations for tax reform. The commission's report led to the drafting and adoption of a new revenue bill in 1901. This new law amended the property tax by providing for, among other things, the appointment of a state board of assessors to supervise and administer tax assessments.

Through the efforts of the board total assessments in the state were increased from $216 million in 1900 to $460 million in 1901. Eighty-nine million dollars of this increase was assessed against the railroads. The latter corporations refused to pay their increased taxes and challenged the constitutionality of the new law. In December, 1901 the court ruled that the state board of assessors had no power under the state constitution, also contended that because of certain technicalities the law was invalid.

Governor Oram called a special session of the legislature in January, 1902 for the purpose of drafting tax legislation which might be approved by the courts. The general property tax revision of 1902 was the outcome. Many provisions of the law adopted at that time have remained unchanged.

In 1902 amendments attempted to strengthen the property tax by setting forth in detail a prescribed procedure of assessment of property and collection of taxes.[1] All properties of all kinds except specified exemptions were to be assessed annually at full, true cash value, by county assessors and their deputies; except that the properties of public utilities and railroads were to be assessed by the state board of equalization. The law gave detailed regulations for determining true cash value of property owned by individuals and corporations when no market or sale value information was available.

In order to guide and assist the county assessors and state board of equalization, all property was classified and carefully defined. Property was given the two-fold division of real estate and personal property. Real estate included lands, mines and improvements. Lands were segregated on the basis of whether they were grazing, agricultural or town lots. Mines were of two kinds -- those producing gold, silver, lead, copper or other precious minerals; and those producing iron, coal, asphaltum, quarries and lands containing other metals, minerals and earths. Improvements were defined as buildings, water rights, structures and fixtures erected upon or affixed to land.

Personal property was defined as everything subject to ownership not included within the term real estate. Such property was classified into tangible and intangible. Tangible personality included such property as animals, household goods, jewelry, vehicles, merchandise, etc. Intangible personality included rights, credits, franchises, special privileges and special advantages derivable under contract rights or in connection with the other property. The latter category was interpreted to include, among other items, bank deposits, money and credits, stock, bonds, notes

1 Revenue Act of 1902, approved March 22, 1902

and book accounts.

Heavy penalties were placed upon those found guilty of violating provisions of the law. Any officer neglecting or refusing to perform duties imposed in the act was to be fined not exceeding $5,000 and imprisoned not exceeding one year. Assessors were to forfeit $25 for each imperfect schedule they received and 20 per cent of their salary for failure to send abstract of assessments to the state auditor in due time. Also they were liable to a fine of $500 to $1,000 for neglect to compute and extend taxes, were to be punished as for perjury for wilfully omitting or undervaluing property, and could be removed from office by the governor for making erroneous assessments.

Corporations wilfully failing or refusing to make proper returns were to forfeit $100 per day for delays after June 1, failure to pay the tax could lead to forfeiture of the right to do business in the state, and failure to give information to the assessor or refusal to pay taxes would make a corporation liable to a fine of $1,000 and loss of its property through seizure and sale.

A taxpayer making an erroneous return was made liable to a fine of $1,000. Delinquent taxes were to bear interest at the rate of 1 per cent a month from March 1 to August 1, after which the rate was to be 15 per cent per annum.

There were also other prescribed penalties to insure enforcement of the law. These many drastic provisions applying to both tax administrators and taxpayers helped to increase for a time the effectiveness of the law but were futile from the point of view of obtaining really successful compliance. A tax system based upon faulty principles cannot be successful regardless of penalties imposed for noncompliance.

The first year after approval of the law (1903) total assessed valuation of property in the state was $333 million. This was considerably less than the $460 million valuation under the 1901 law which had been declared unconstitutional but more than the valuation of $216 million in 1900. From 1903 to 1912 total assessed valuation tended to increase slowly. By 1908 they were $375 million and by 1912, $422 million. Thus after 12 years time, valuations were still below those of the year 1901, in spite of drastic provisions in the law and even though actual wealth in the state had rapidly increased during the period.

The 1902 law had provided for an annual meeting of county assessors to be held at the Capitol for the purpose of discussing common problems attendant to the obtaining of assessments based upon full cash value for all property in the state. Yet the assessors in their annual meeting of 1908, realizing that there were widespread violations relative to property assessments, actually and openly agreed among themselves to assess in the future all property in the state at one-third cash value instead of full cash value as provided by law.

Writing in 1910, Blakey stated:

"As has been the case everywhere else, the general property tax in Colorado has degenerated into a tax on realty. The taxes on all

> other forms of property combined (if railroads are classed with realty) are an almost insignificant part of the total and of the real proportion of their actual worth. . . Mining property is highly favored by statute as well as by the assessors; manufacturing property is almost exempt from assessment and as long as communities and states desire such industries as they have in the past, there is apt to be no vital change in this respect, either as to manufactures or mines; merchandise, on account of its nature, is very inadequately assessed and the assessments of many kins of intangible property is a farce."[1]

Other states were also encountering serious difficulties with their property tax systems. Many began adopting a more centralized tax administrative procedure in an effort to correct some of the evils. This centralized administration usually took the form of establishing a state tax commission possessing considerable authority and responsibility over directing the work of local assessors relative to assessment procedure and equalization of property valuations. The tax commission was also usually given responsibility for direct assessment of public utilities and railroad properties in the state.

The county assessors in Colorado observing this development in other states and realizing that guidance and supervision on the state level was needed if uniformity of property assessment was ever to prevail, began advocating the adoption of a law establishing a state tax commission for Colorado. They urged that the commission if set up should possess powers comparable to those assumed by the state board of tax assessors under the ill-fated 1901 law which has fallen before the courts.

Beginning about 1910, a general reform movement swept the whole country and left its imprint in many states. The reform was supported by many labor, farmer and civic groups. Among other things, governmental reorganization, tax reform and protective labor legislation, were sponsored. In Colorado the cause of the county assessors became part of the general reform movement and, as a consequence, the 1911 state legislature passed a law creating a state tax commission.[2]

Since 1911 Under the State Tax Commission

With the establishment of a tax commission, the general property tax in Colorado became revitalized. In some respects this represented the beginning of a new era in property taxation. For a period of about 20 years (until the depression of the 30's) property assessments were fairly equitable, various economic groups appear to have assumed more nearly their fair share of the total tax load,[3] and public revenue was

---

1 Blakey, Roy G., Assessment of Property for Taxation in Colorado, 1910, Master's Theses, University of Colorado, p/84.

2 Bill was approved by the Governor, June 2, 1911.

3 One exception was the owners of intangible wealth. As most intangible property escaped assessment, these property owners paid very little, if any, state and local taxes.

usually sufficient to support necessary governmental functions.

During and since the depression the property tax has declined in relative importance and from some standpoints has become less equitable. However, the tax commission is still an extremely important agency in the whole tax program. In fact during recent years, as economic pressures have developed there has been more need than ever before for an aggressive commission possessing sufficient authority supported by adequate budgetary funds. Consequently, because of the vital role (actual or potential) of the tax commission, a brief discussion of its administrative record appears desirable.

The law of 1911 directed the governor and treasurer to appoint a tax commission composed of three members. Commissioners were to serve in office for six year terms and were eligible for reappointment. The annual salary of each fixed at $3,600.[1]

The powers and duties of the commission were (1) to supervise the work of county assessors, (2) to equalize assessments between the counties, and (3) to make original assessments of public utilities and other corporations having a continuity of business in two or more counties.

The first of these duties, that of supervision of local assessments, authorized the commission to exercise supervision over county assessors, county commissioners and all local tax officials, under penalty of forfeiture and removal from office, "to the end that all assessment of property, real, personal and mixed, be made relatively just and uniform and at its true and full cash value." It was charged with the duty of seeing that "all laws concerning the valuation and assessment of property and collection of taxes thereon are faithfully obeyed." The power to reassess individual properties was conferred in cases where, in the judgment of the commission, the property had not been assessed at its true and full cash value. In order to facilitate its work one or more members of the commission was required to visit at least one-half of the counties of the state annually, while every county was to be visited at least once every two years. Assessors could be summoned before the commission, and each year a meeting of all local assessors was to be held. The commission could prescribe forms and require reports from assessors.

Thus the powers and duties relative to supervision of local assessments as given to the tax commission appear to be very definite and extensive.

The second duty, that of equalization of assessments between counties, was limited by the constitutional provision that the state board of equalization should possess this function. There had been an attempt to abolish the board of equalization in 1912 but the proposed constitutional amendment had failed. Consequently, the legislature found it necessary to em-power the commission merely to make recommendations relative to equalization between counties -- the final decision to

1 Raised to $4,000 in 1943.

be made by the board of equalization. This dual control over equalization still exists and as will be explained later has frequently caused difficulty.

The third duty of the commission as embodied in law was to make original assessments of those properties formerly assessed by the state board of equalization. These properties included railroads, telegraph, telephone, and express companies, and sleeping-car and private-car lines. In addition the commission was empowered to make original assessments of all other public utilities. Other public utilities were defined as "such power companies, pipe-line companies, water companies and all other classes of companies, however owned or operated having a continuity of business in two or more counties of the state."

The tax commission was thus given the responsibility of determining the value of the utility as a whole and then of apportioning this value on an equitable basis among the counties served by the utility.

Several other duties were subsequently assigned to the commission by the legislature. Beginning in 1913 local tax authorities were required to obtain approval from the commission before they in turn could approve petitions for tax abatements, rebates and refunds. Also in 1913 the legislature placed upon the commission the responsibility of investigating and of approving or disapproving petitions of local taxing districts for permission to increase their tax levies beyond certain statutory limits.

Also the commission is required to prepare an annual report to be submitted to the governor, treasurer and legislature. This report contains extensive statistical material relating to property assessments and tax levies within the state.

Still another duty of the commission has been to recommend changes for the improvement of the tax system. This function was originally intended to be very important, however, too frequently in the past the commission has been forced to confine its limited time and energy relative to contacts with the legislature in fighting for its own appropriations rather than in sponsoring legislation to improve the tax system.

How successful has the commission been in fulfilling its primary duties? The newly created body was handicapped the first year because of delay in its appointment. Also, during the first year, very few changes were made in assessments because of the desire to place some limitation upon mill levies before drastically increasing valuations. Otherwise, it was feared the state and local units would find themselves with more revenue than they could economically spend.[1]

Accordingly, in 1913 the legislature amended the property tax law by limiting all tax-levying bodies, from the state government down to school districts, by providing that taxes for 1913 should not exceed those

1 First Annual Report, 1912, Colorado Tax Commission.

levied in 1912 by more than 15 per cent, while a maximum increase of 5 per cent over the preceding year was prescribed for each year subsequent to 1913.[1] This limitation upon governmental bodies is still operative throughout the state.[2]

By 1913 the commission decided that it should attempt to enforce the provisions of the law specifying that all assessments should be at full cash value. Consequently, rather drastic measures were taken which resulted in an increase of assessed valuation of all property in the state from $422,442,079 in 1912 to $1,306,647,430 in 1913 -- an increase of more than three fold.

It was only natural to expect that local authorities in many of the counties where assessments were forceably raised would register protests. During the first year assessments were increased by the commission in 58 counties and 24 of these protested before the board. The next year there was less opposition and it appeared as though the commission was soon going to obtain voluntary cooperation from all county assessors. However, in 1915, the authorities in Weld and Denver counties contending that they had been discriminated against, originated an initiated measure to abolish the tax commission -- the measure appearing on the November ballot.

Because of the issue which had been raised, the State Survey Committee representing the legislature, employed Professor R. M. Haig of Columbia University to make an investigation. During the summer Haig made a thorough study of conditions in the state including the work of the tax commission, and published a report in which the commission was completely exonerated. In fact, Haig's report was very complimentary relative to the board's accomplishments during its two years of existence in the face of many difficulties and much opposition.[3]

Relative to the issue, the election in November was close, the bill being defeated by a scant majority of 3,649 votes. However the tax commission now had a mandate from the people to continue to function. Nevertheless, since 1915 even though opposition subsided, the board has not entirely forgotten the time when it was forced to fight for its very existence -- it has never again been quite as energetic and aggressive in attempting to see that the assessment job is fully and adequately done among the counties of the state.

Members of the tax commission were given additional security in 1918 when they were placed under the protection of the new civil service system established by a constitutional amendment November, 1918. Since then members of the commission and their employees serve until they resign, or until they are removed for cause.

Another crisis occurred in 1929 when dissention developed among members of the tax commission. The chairman filed various charges

---

1 Chapter 137, Session Laws of 1913.

2 Supplementary levies are permitted if approved by the tax commission or by a referendum vote of the people.

3 Report of Survey Committee of State Affairs on Work of Tax Commission, published in Fifth Annual Report, 1916, Colorado Tax Commission.

against Mr. Link, a member since the board's creation and requested his dismissal. After various delays, including several court actions and counter actions, Mr. Link was successfully ousted leaving a vacancy which was filled by appointing Mr. Tucker, who had long served as secretary of the commission.[1] Since 1929 apparently there has been harmony among members of the board.

Perhaps further understanding and appreciation of the work of the tax commission can best be obtained by referring to the discussion which immediately follows of several special property tax problems. With reference to most of these problems the role of the tax commission cannot be disregarded. In discussing the problems, conditions prevailing at the present time are stressed.

However, before continuing further, this word of warning is appropriate. When evaluating the work of the tax commission during its 35 years of existence since 1911, a number of factors must be taken into consideration. It had hardly begun to operate when its very life was threatened by proposed statutory changes and constitutional amendments. It has always operated on a budget insufficient to maintain an adequate staff of field workers. Also its authority over equalization of assessments among counties has been limited because of the fact that final decisions reside with the state board of equalization. Then too, its work has not been easy. Colorado has many divergent economic and sectional interests which are difficult to reconcile.

1 Eighteenth Annual Report, 1929

The Problem of Local Assessments

The Colorado constitution provides that in each county there shall be an assessor elected by the people for a two-year term of office. Furthermore, it stipulates that the general assembly shall prescribe the duties of the assessor as well as the amount of his salary or other compensation.[1]

1 Colorado Constitution, Article XIV, section 8. An exception is the city and county of Denver; here all county officers may be either elected or appointed, depending upon provisions of the city charter (Article XX, section 3)

In accordance with the constitutional provisions, the general assembly has provided legislation relating to the office of county assessor. The statutes require that the assessor be a qualified voter in the county in which he serves, he must be elected at the biennial general election, serving for two years or until his successor takes office, he must be bonded and must subscribe an oath for the faithful performance of his duties. The assessor may employ deputies and assistants -- the number of deputies depending upon the number of assessment districts set up by the county commissioners -- and he decides the amount of salary for these employees subject to approval by the county commissioner. Should a disagreement arise relative to the number of deputies and assistants or to their salaries, the assessor may appeal to the state tax commission which has final authority.[1]

For the purpose of fixing the amount of compensation for assessors, the legislature classified the counties into various groups according to size, population and amount of work to be done by the county officers. The salaries thus specified in law remained unchanged for year. As time passed these salaries, inadequate in most counties even at first, became continuously less satisfactory from the standpoint of attracting competent candidates for office. Finally in 1945 some slight correction was made by increasing the amount of compensation going to assessors in most of the counties. The present salary schedule is shown in Table 4. It may be seen that the range is from $4,600 in Denver to $1,000 in Hinsdale county -- the median salary being $2,400 per year.

Table 4

Salaries of County Assessors in Colorado as Fixed by the State Legislature in 1945[2]

County	Annual Salary of Assessor
Class I (Denver)	$4,600
Class II, Group A (Pueblo, Weld, El Paso)	3,300
Group B (Boulder, Larimer, Mesa, Las Animas, Arapahoe, Jefferson)	3,100
Class III, Group A (Otero, Adams, Fremont, Logan, Morgan)	2,600
Group B (Delta, Huerfano, La Plata, Montrose, Rio Grande, Prowers, Yuma, Conejos, Garfield, Routt, Alamosa)	2,400

1 Colorado Statutes Annotated, 1935, Chapter 45, subdivision 6.
2 Colorado Statutes Annotated, 1935, Cumulative Supplement, 1945, Chaper 66, section 58. Law approved April 2, 1945

County	Annual Salary of Assessor
Class IV, Group A (Montezuma, Bent, Washington, Chaffee, Costilla, Kit Carson, Lake, Teller, Baca, Gunnison)	$2,400
Group B (Saguache, Lincoln, Elbert, Crowley, Eagle, Sedgwick, Moffat, Phillips)	2,250
Class V. (Archuleta, Clear Creek, San Miguel, Grand, Douglas, Park, Cheyenne, Rio Blanco, Kiowa, Custer, Curay)	2,100
Class VI, Group A (Dolores, Pitkin, Jackson, Summit, Gilpin, San Juan)	1,800
Group B (Mineral)	1,300
Group C (Hinsdale)	1,000

These salaries are still inadequate. In some respects the office of county assessor is the most important office in the county or state. The assessor has been given the authority and responsibility of exercising his own judgment and discretion relative to valuations of property involving the payment of millions of dollars of taxes. For example in 1945, the 63 county assessors made original assessments of property appraised at more than one billion dollars. This represented about 83 per cent of the total assessed property in the state while property owners thus assessed were called upon to pay taxes of almost $39 million. More specifically, in a county such as Yuma paying the median salary of $2,400, the assessor is responsible for placing a valuation on some $10 million of property against which is placed a tax liability of more than $300,000. Private business would not likely place comparable responsibility upon the shoulders of a $2,400 employee.

It is established principle that sucessful administration of our system of property taxation primarily depends upon sound original assessments. Where these occur, methods of review are of secondary consideration. Where they do not occur, review and equalization, although of vital importance, cannot be expected to remove all inequities of assessments.

Relative to the work of the county assessor, we must pay for a good job if we want a good job done. The office must provide sufficient compensation to attract and retain competent and well trained men. According to the National Association of Assessing Officers:

> "An assessor must be well-informed in many fields. He should know something about the law of property and should have a working knowledge of tax law. He ought to know enough about surveying to be able to use a tax map and to describe property

> accurately. If he is to appraise improvements effectively, he needs to know something about architecture and structural engineering. He should be aware of the principles of real estate management and sales practices, if he is to value urban land. He should have knowledge of soils and farming methods, if he is to appraise rural land. He should know something about market conditions, commercial practices and economics. Finally, he should be expert in public relations and should be able to organize a variety of work effectively."[1]

During recent years political parties in many of the counties have encountered great difficulty in securing candidates to run for office of assessor. After election the new incumbent, often poorly prepared for his duties, soon finds alternative opportunities for employment which are much more attractive. Thus after a period of two years he is not likely to want a second or perhaps third term.

An exception is to be found in a number of counties where assessors have made the work a life career, the electors retaining them in office over a considerable number of years. Some of these experienced assessors, especially in a few of the larger counties, are doing a remarkably good job and are staying in office in spite of relatively low salaries.

Table 5 indicates the number of changes made in the assessor's office for the various counties during the last 30 years. It may be seen that at the top of the list are five counties (Alamosa, Boulder, Clear Creek, El Paso and Rio Blanco), each of which had but two individuals serving as assessor. On the other hadn, the other extreme is Costilla county which had nine different assessors. The median county changed assessors five times during the 30 year period. In other words, the average assessor s served a total of six years in office, having been elected to three two-year terms. This record appears to be better than that found in many states. However, in Colorado the record is far from enviable, particularly in more than one-third of the counties -- those changing assessors every two or four years.

Table 6 gives the number of years of service as county assessor of present incumbents. As the date taken (October 1, 1946) is just before a general election, all incumbents have served at least two years. However, there are 16 assessors who have served no more than two years. An additional nine have served only four years, while a total of 48 have been in office for 10 years or less. On the other hadn, it may be observed that six assessors have had 20 years or more of assessing experience.

It does not necessarily follow that assessors staying in office for the longest periods of time make the best assessments. However, a continuous turnover of assessors and deputies every two or four years is definitely not conducive to competency and good performance in office.

This leads to the discussion of another problem relative to local assessors in Colorado. The elective term of two years is too short a period.[1] The victorious candidate scarely finds himself in office until he must begin worrying about the next election. At least two years are needed for an assessor to lear even the rudiments of his job -- during the second two years he may begin to be competent. If county assessors are to be elected, the term of office should be for a minimum of four years.

However, many tax authorities rather convincingly argue that local assessors should be appointed rather than elected. For example, when discussing the elective system Jenks points out;

> "The fundamental defect of our assessing system lies in the inefficiency of the local assessor. Dominated by the influence of his neighbors who elected him, swayed by prejudices or favoritism, he carelessly, or intentionally, omits from the

1 Nevertheless, two years is still the prevailing term in a large number of states. About 40 per cent of the primary assessment districts of the United States select their assessors for two-year terms, 30 per cent for four-year terms, 20 per cent for one-year terms, and the remaining 10 per cent for terms of three, five, six or an indefinite number of years. See Selection, Tenure and Compensation of Assessors, 1940, Nat'l. Ass'n. of Assessing Officers, Chicago

> tax list many persons and much property which should be listed; his valuations are not measured by the same standard and are not fair nor equitable as between persons assessed. At every point the system, if such it can be called, is more or less defective. In the first instance, the assessor is subjected to local pressure in the making of his valuations. He hopes to live at peace with his neighbors and, generally, desires to be reelected; and his method of assessment, as a consequence, follows the line of least resistance... as the years go by, the assessor continues in office and a local system of assessment is developed which is more or less satisfactory to the people who give the matter no attention, feeling that they are assessed on a minimum basis. The assessment thus made is copied from year to year and the injustices and inequalities thereon existent are perpetuated."[1]

Although such conditions among the various states have been well known for years and in spite of arguments brought forth in favor of the appointment of assessors, in some 40 odd states the people continue to elect their local assessors.[2] Is this merely because of inertia and perhaps stumbling blocks to be found in the state constitution? Is this merely because of inertia and perhaps stumbling blocks to be found in the state constitution? Undoubtedly these factors are important, but probably there are other reasons also. Let us briefly review the arguments for and against the elective system as contrasted with the appointive system for selecting assessors.

The claimed advantages of electing local assessors are several -- the arguments presented often taking various forms. As most proposals for the appointment of assessors provide for selection by an administrative body on the state level, some arguments are directed against this state centralization. For example, in the first place it is frequently pointed out that local government has the largest financial stake in property taxes. Thus, it is desirable that the responsibility for the administration of these taxes should rest with the governmental unit principally dependent upon the proceeds.

Second, it is claimed that a local assessor is apt to have a more thorough knowledge of conditions affecting the value of property in his jurisdiction. This greater familiarity with local conditions makes possible better assessments.

Third, is the argument that the convenience of taxpayers is apt to be better served by a local assessor, elected by the people; that taxpayers will find it easier to call at the assessor's office to discuss

---

1 Jenks, Aldro, "Professionalization of Assessors", Bulletin of the National Tax Association, February 1944, p. 152.

2 In 1940 about 97 per cent of all town, village, borough, and township districts, 87 per cent of all county districts, and 33 per cent of all city districts throughout the country had systems under which assessors were elected. See Selection, Tenure and Compensation of Assessors, 1940, National Association of Assessing Officers.

factors affecting value which are essential policy matters.

Fourth, the local assessment unit, independent from a large state organization which it is alleged, is likely to be unwieldy, can act more quickly in adjusting assessments to rapidly changing values or in providing prompt relief if property has been erroneously valued. A corollary of this argument is that a state organization tends to become bureaucratic, arbitrary in making decisions, and less responsive to public needs, particularly when officials are appointed rather than elected to office.

Fifth, is the argument that appointed assessors are not necessarily removed from the influence of partisan politics -- that appointments may be in accordance with a spoils system rather than selection based upon competence; or, if appointments are made through examination under a merit or civil service system, there is no assurance that the most competent individuals will be selected. Moreover, regardless of possible inefficiency the assessor may be retained in office indefinitely.

Contrasted with these arguments are those put forth by the advocates of a system based upon the appointment of assessors. First, it is pointed out that although local governments may be the major beneficiaries of the property tax, there is no reason why they should suffer financially if assessors are to be appointed by a state body. On the contrary, in those states which have adopted a more unified assessment procedure, the experience has been that local communities, because of better assessments, have received increased proceeds from the property tax.

Second, in reply to the claim that a locally elected assessor is more likely to be familiar with the nature of property to be assessed in his county, it is argued that much of the property in a locality is highly specialized or is owned by utilities and other corporations doing business in more than one county. Consequently, assessments by a local assessor are often very difficult if not impossible. Furthermore, it is argued that if the specialized properties including utilities are assessed a unit by a state body while the remaining property is assessed by an elected county assessor (the arrangement in Colorado), there will not be equality of either procedure or results as between the two assessing bodies. Colorado's experience indicates that this claim is well founded. Local assessors argue that local property is bearing a tax burden disproportionately heavy as compared with that paid by the corporations assessed by the state tax commission. On the other hand, the commission argues that actual conditions are exactly opposite. Regardless of which group is correct in its analysis, if a unified system were in operation throughout the state, greater equality would be likely to prevail as between different types of property.

Third, taxpayers frequently exert undue unfluence upon an elected county assessor. During election years this influence is especially apt to interfere with the assessor's ability to make impartial and equal assessments, at least if he wishes to be retained in office. The principal inequity resulting from such taxpayers' pressure is that the

more influential people owning the largest properties are likely to be the ones most favored with low assessments. Thus, the property tax tends to become badly regressive. This argument against elected tax officials is ably presented in the quotation by Jenks included above.

Fourth, it is argued that although appointed tax officials may not always be selected from among the most competent individuals available, with proper safeguards, the chances of getting satisfactory assessors are better than if they are to be elected. This may partly be due to the fact that the greater security of tenure which usually comes with an appointive office is likely to attract individuals who are better fitted for office.

Fifth, it is pointed out by those who favor the appointment of assessors that many of the arguments put forth by opponents are extraneous if assessors are selected by local officials, for example, in a city and county like Denver by the city council, or perhaps in other counties by the county commissioners. It is further argued that although such a method would not be as satisfactory as a more unified state system, should fear of state centralization be an insurmountable obstacle to tax reform, a system of locally appointed tax officials would be superior to a system of locally elected ones.[1]

Because of the importance of the issue of local vs. state control relative to the property tax, we shall quote from Jens P. Jensen, perhaps the outstanding authority on property taxation in the United States.

Professor Jensen says;

> "It would hardly be possible to over-emphasize the prevailing characteristic of excessive decentralization in the assessment. The administration of the general property tax contrasts sharply with that of the income tax, and of other taxes except the poll tax and a few local license taxes. The assessment is essentially a function of determining values uniformly for the entire state. It ought to be a state function, the assessment officials ought to be as free from local pressure of taxpayers as are the administrators of the federal and state income taxes. That this is not the condition is chargeable chiefly to the fetish of home rule. Perhaps the home rule doctrine is, in certain phases, based upon a genuine desire for local self-government. But underlying the insistence upon local assessment is a feeling that the local assessor is not merely necessary in order to prevent differentially high local valuations but also useful for the purpose of obtaining differentially low local valuations. The mechanism of this competitive undervaluation could be removed by centralizing the assessment."[2]

---

1 A good discussion of many of these arguments as well as additional ones may be found in an article by Dixwell L. Pierce entitled, "Advantages and Disadvantages of the County Assessor System," Proceedings of National Tax Association, 1941, pp. 276-86

2 Property Taxation in the United States, 1931, p. 359

The procedure to be followed relative to local assessment of property in this state is prescribed in detail in the Colorado statutes. This procedure by chronological steps is as follows:[3]

1. On or before March 1, the assessor shall mail to each non-resident owner of property in the county a tax schedule, setting forth a description of the real property assessed to him the previous year. These schedules, containing any necessary corrections because of changes in ownership, must be returned to the assessor before the first of May.

2. On March 1, or as soon thereafter as practicable, the assessor is required to deliver a form of tax schedule to every inhabitant of his county. If these forms are not filled out at the time of the assessor's visit, they are left with the property owner who is required under oath to set forth specifically upon the schedule all real and personal property owned by him. The property owner shall return the completed schedule before the first of May.

3. On the basis of property listed upon the tax schedule, the assessor shall determine a valuation for tax purposes. Such valuation is supposed to be according to full cash value of the property.

4. March 1 is the date for attachment of tax liens on all property subject to taxation in the state.

5. If property is brought into the state after March 1, the owner should at once file a schedule with the assessor of the county in which the property is located.

6. Before July 1, the assessor must notify all taxpayers whose property he has assessed at a valuation other than that given in the original schedule. If the taxpayers object to changes they must be given an opportunity for a hearing.

7. Between the third Monday in July and the twenty-eighth day of July, the county board of equalization (county commissioners) holds meetings for the purpose of reviewing any complaints from taxpayers who wish to appeal decisions of the assessor. The county board, in order to achieve greater equalization, has the power to change any assessments during this period.

8. On or before August 1, the assessor, having determined the value of each item on the various schedules (reflecting any changes which the county commissioners may have made) prepares in duplicate an abstract of his assessment

---

3 Colorado Statutes Annotated, 1935, and Cumulative Supplement, 1945, Chapter 142.

roll. One copy, together with a sworn statement that the abstract complies with all provisions of the law, is forwarded to the state tax commission.

9. On or before the second Monday in September, the state tax commission meets and examines the abstracts of assessment rolls to determine whether property has been assessed at its full value, and makes its recommendations to the state board of equalization.

10. On the third Monday in September the state board of equalization meets and must complete its work before the fourth Monday in September. It examines the abstracts or assessment rolls as submitted by the state tax commission, and after making such changes as it is authorized and may wish to make, approval is given -- the assessments then becoming official.

11. On or before October 1, the assessor must certify to the clerk of each town within the county and to the county superintendent of schools the total value of assessable property in the towns and school districts respectively. Before October 16, the local officials in each town and school district must certify to the proper county authorities its mill levy to be applied for the taxable year.

12. As soon as practicable after the taxes are levied and not later than January 1, the county assessor is required to extend upon the assessment rolls the taxes levied by all taxing units and attach his warrant. The tax list and warrant is delivered to the county treasurer for collection, the warrant being a command to the treasurer to collect the said taxes.

It may be seen from this description of the local assessment procedure that the assessor's work is rather involved and requires a period of time extending over most of the year. Prior to 1943, the period elapsing between the first and last assessment steps was even longer, however, in that year, the legislature shortened the period by about two months.

One part of the assessment procedure, the most important phase of all, tends to break down in actual practice. According to law, property owners are held responsible (subject to heavy penalty for violation) for listing <u>all</u> of their property, both real and personal, upon the tax schedule. In other words, the law intends that there shall be self-assessment by the property-owner himself, that is, to the extent of listing all items -- the assessor is to place valuations upon them.

The county assessors, however, are unable to depend upon this cooperation from taxpayers. Penalties are not enforced against property owners who do not comply with provisions of the law, perhaps because violations are so prevalent. If the assessor or his deputy does not find the property owner at home, the tax form is left; if the schedule

is never filled out and returned, an assessment is made at the discretion of the assessor -- usually the same amount as for the preceding year.

Actually, whether the property owner is found at home or not, assessments vary but little from year to year. Probably because of difficulties involved, particularly due to limitations of time and staff, but sometimes also because of inertia or the desire not to antagonize property owners, assessment figures are usually merely copied from the tax roll of the previous year. Most county assessors find it impractical or inexpedient to make general reappraisals of property oftener than five, ten, or even twenty years.

Considering the general breakdown of this important phase of assessment, therefore, it is not surprising that a great deal of property in the state is never listed upon tax schedules; neither is it surprising that the property actually listed for any particular year is appraised for tax purposes at a figure having little relationship to true cash value.

Figures in Table 7 indicate the variation among Colorado counties relative to assessment of farm property. Assessed valuations are expressed as percentages of United States Census values for the year 1940. Although census valuations are not necessarily more accurate than the valuations for tax purposes, the procedure used by the Bureau of the Census in uniform among all counties. Therefore, the percentage figures shown in the table are considered significant.

The counties are listed in order according to relative assessment levels. It may be seen that the percentage range is from a high of 145 per cent in Kiowa county to a low of 26 per cent in Jackson county. Average for the state was 62 per cent. In other words, for the state as a whole, assessed valuation of farms amounted to a little less than two-thirds of the value placed upon farms by the Bureau of the Census. Assessors of five counties (top of list) showed valuations exceeding census figures, while assessors in 15 counties (at the bottom) showed valuations of less than half the corresponding ones made by the census.

1 Both valuations include agricultural and grazing lands, improvements, farm machinery and implements; neither includes the value of farm animals.

Source: Bureau of the Census, April, 1940; also, Annual Report, Colorado Tax Commission, 1940.

The question might appropriately be asked, is there any justification for farms in a county such as Rio Grande for example, to be assessed at 35 per cent of census value, for those in Alamosa at 58 per cent, those in Crowley at 100 per cent and those in Kiowa county at 145 per cent? These figures do not necessarily indicate that the farms in any county are assessed at more than full market value as required by law, but they do indicate a very inequitable condition throughout the state due to lack of equality of property assessments. Undoubtedly within many of the counties one would find as great inequality among farms of various property owners as apparently exists among the counties themselves.

In 1944 the state tax commission reported that it had completed a survey of approximately 35 cities and towns in which field men appraised 700 residences, using 1940 building costs as a basis. The properties were selected at random in the various cities and towns and when the valuations thus obtained were compared with the assessed valuations it was found that the assessments varied from as low as 10 per cent to as high as 90 per cent of the appraised value.[1] Thus it appears that urban

1 Annual Report 1944, Colorado Tax Commission, p. 4

real estate is probably assessed as unequally throughout the state as farm property.

However, the assessment of personal property is undoubtedly least satisfactory of all. This phase of assessment will be discussed in another section of our study dealing with personal property exemptions. It will be seen that in fully one-third of the counties the average assessment of personal household property is actually less than the $200 exemption permitted by law. Also it will be seen that the assessment ratio of such personal property is relatively seven or eight times as high in some counties as in others.

Currently (1946-47) the tax commission is conducting a survey throughout various counties of the state for the purpose of determining the extent to which local assessors are undervaluing real property. An attempt is being made not only to discover the extent of inequality of assessments within a county but also to determine the average inequalities prevailing among the counties. Actual real estate sales data as indicated in the county clerk's office are compared to assessed valuations placed upon these same properties by the county assessor. As the survey is not complete, the commission has not yet released data by named counties. However, figures were given to the writer for three counties which we shall call X, Y, and Z. There is reason to believe that conditions prevailing in these counties are fairly typical of those to be found in the other 60 counties of the state.

The data supplied by the commission are shown in Table 8. It may be seen that on the basis of property transactions between July 1, 1945 and July 1, 1946, the average level of assessed valuations was 27 per cent in County X, 32 per cent in County Y, and 35 per cent in County Z. On the basis of these figures as well as data being tabulated for other counties, the commission estimates that real property throughout the state is not being assessed by county assessors at a higher average level than 25 or 30 per cent of full cash value.

Another and perhaps even more significant part of Table 8 refers to the assessment ration of property classified as farm and urban, by counties. The figures for urban real estate include all transactions of real property made during the year in the largest city or town of the county.[1] Those for farm property include all transactions made throughout the county during the period. The table indicates that great inequality exists within the counties relative to the assessment of property. The same general pattern of inequality prevails in each of the three counties and for both farm and city property. For example, on the basis of the sample check, in County X, 3 per cent of the farms are assessed at more than 60 per cent of full value, 3 per cent on a 50 to 60 per cent basis, 21 per cent on a 40 to 50 per cent basis, 28 per cent on a 30 to 40 per cent basis, 28 per cent on a basis of 20 to 30

1 It should be pointed out that the commission's investigations are not confined to a study of these cities.

Table 8

Ratio of Assessed Value to Sales Value of Real Estate in Three Colorado Counties[1] (1946)

Average assessment ration (farm and city):
County X = 27.31% (206 transfers of property)
County Y = 31.99% (262 transfers of property)
County Z = 35.25% (57 transfers of property)

Real Estate by Kind	Ratio of assessment to sales value					
	Over 60%	50-60	40-50	30-40	20-30	Under 20%
	(Number of properties in each category expressed as percentage of total)					
County X						
Farm	3	3	21	28	28	17
Urban	4	4	12	20	33	27
County Y						
Farm	8	5	13	32	29	13
Urban	14	6	13	26	25	16
County Z						
Farm	8	11	8	34	31	8
Urban	-	--	--	--	--	--

per cent and finally, 17 per cent of farms are assessed at less than 20 per cent of full value. The discrepancy in county X of urban property is even greater -- 4 per cent of city homes being assessed above 60 per cent of cash value and 27 per cent being assessed below 20 per cent of value. Counties Y, and Z show similar inequalities for both farm and urban property, although the assessment ratios average somewhat higher than in county X.

Such inequalities of assessment within a county are particularly bad because of the resulting inequity of tax load distribution as between particular property owners. For example, if two farms each having a cash value of $10,000 are assessed unequally -- the first being assessed at 60 per cent and the second at 20 per cent of cash value, the owner of the first farm would have a tax load three times as heavy as the owner of the second. Assuming the tax levy to be 40 mills, the taxes would be $240 and $80 respectively, or a discrepancy of $160. This degree of inequity (when two farms of equal value are involved) is bad enough, but when farms or city property having different true values

are compared with each other relative to assessments, the inequity often is well nigh intolerable, the reason being that large and valuable properties (whose owners have superior tax paying ability) tend to be the ones which are most underassessed. Thus the property tax in effect becomes grievously regressive.

The best correction for these inequalities as well as others described in this section is to see that good original assessments are made by county assessors. Although the state tax commission, through guidance of assessors and through equalization functions, can play a significant role in attempting to achieve this objective, it is also vital that competent local assessors and deputies be selected in the first place.

By way of conclusion it may be stated that a preponderance of evidence seems to indicate that local assessors should be appointed rather than elected. They should serve fairly long terms in office. If the state and local governments have a satisfactory merit system, the assessor should be placed under the system and retained in office until retirement or until removed for cause. In the absence of a good merit system, assessors might well be appointed by county commissioners for a term of not less than four years from a list of eligible applicants examined and approved by the state tax commission. The latter arrangement would perhaps remove many of the objections of those who fear complete centralization in a state body. Finally, regardless of the system of selection or retention in office, assessors should be paid adequate salaries -- compensation commensurate with their duties and responsibilities. There is every reason to believe the salary schedule operative in Colorado is still too low.

If these suggested changes were adopted in the state, there is no question but that local assessments would be appreciably improved, resulting in much greater equality and equity in taxation and at the same time bringing in additional revenue to state and local governments.

However, in order to avoid some inequalities which would still persist, it is desirable to maintain a system of supervision and equalization by a state administrative body. This phase of property taxation will be discussed in the next section.

State Supervision of Local Assessments

When the state tax commission was established in 1911 it was given rather extensive authority relative to the supervision of property tax assessment work undertaken by county assessors and boards of county commissioners.[1] In a state such as Colorado where local tax authorities are elected for two-year terms of office, where the normal turnover in office appears to be nearly one-third of the county as-

sessors at every election, where the local assessment function is divided among 63 county units containing diverse kinds of property, the task of accomplishing effective state supervision is particularly difficult yet at the same time vitally important. How well are the supervisory functions being accomplished by Colorado's state tax commission?

Tax Forms and Schedules

One supervisory function is the preparation of suitable forms for use in listing property on the tax schedule. The items included should be changed from time to time to include or emphasize new kinds of property, or to drop obsolete items no longer important. Because over the years there is a constant and often rapid change in the nature and variety of property, especially personal property, it is important that the tax form be constantly revised. If an item is not on the blank, demanding the assessor's attention, it is not likely to be listed at all, and the continuance of obsolete items on the list is expensive, as they crowd out more important items. In addition to the preparation of a general schedule to be used by most taxpayers, there should also be schedules made available for use by the specialized owners of property in business. Moreover, the various appropriate tax schedules should be standardized as much as possible for all counties in the state.

> Writing in 1930 Jensen stated: "Considerable confusion exists in the preparation of the tax schedules, the blanks on which the taxpayers are to enter their taxable property, and it cannot be doubted that the results are detrimental to the assessment....The statute creating the Colorado tax commission assigns the duty of preparing all necessary forms, but provides nothing as to when or how they shall be printed. From a comparison of tax schedules in use it would appear that no central authority has standardized the general schedule. Although the tax commission has exerted its influence toward making the schedules uniform, they are yet very diversified as to size, form, arrangement, items listed and affidavits or oaths required. It would appear that the general schedule blanks are designed to serve for all classes of taxpayers, whether individual, or corporations, banks or merchants, etc., with or without supplementary schedules. Not one of the blanks examined provides for the appraisal of exempt property....The list of items of taxable property is not uniform nor is the list uniformly arranged."[2]

---

1 For enumeration of specific powers see previous section on early development of the property tax.

2 Jensen, Jens P., Survey of Colorado State Tax System, 1930, p. 87

Since the time when Jensen wrote, certain improvements have been made in the schedules relative to kinds of forms in use as well as standardization of personal property items included on the schedules. It has been suggested that the effectiveness of supervision by the tax commission could be further enhanced if the legislature were to provide, at state expense, for printing of all necessary tax forms so that the commission might then distribute such approved blanks to the 63 county assessors as may be required.

An Assessors' Manual

Tax commissions in a number of states have extended valuable assistance to local assessors by preparing assessors' and property appraisers' manuals. Such manuals when carefully and comprehensively prepared can give to the county assessor and his deputies a great deal of technical and theoretical information needed for assessing all like and similar property. The manual can serve as a guide for systematic and orderly procedure for making tax appraisals more uniform throughout the entire state.

In discussing the advantages of an assessors' manual, a local tax assessor in Wisconsin (a state whose tax commission has been unusually successful) points out:

> "The fundamental requirement of an assessment roll is that it distributes equitably the burden of taxes, and to do this the human equation must be eliminated as much as possible. For the individuality of the assessor and his varying judgment, there must be substituted a system of mechanical precision (the assessor's manual), and supplemented by individual judgment only when necessitated by unusual conditions."[1]

One of the most recently prepared property appraisal manuals was published by the Illinois tax commission in 1943. It contains forms, instructions, procedures and guides for the valuation of land, the estimation of reproduction cost of improvements, the determination of allowances for depreciation and obsolescence, and the establishment of the fair value of improved and unimproved properties for assessment purposes. The manual should prove to be very helpful in overcoming many inequalities of assessment which have long prevailed in that state.

Although the preparation of a good tax manual requires the assistance of specialists and technicians together with a certain amount of field work, the time and money expended in the effort, bear rich dividends in the form of more accurate and uniform assessments. Several years ago the Colorado tax commission distributed to the county assessors a manual containing helpful appraisal instructions. However, much of

---

1 Herman, R. C., "Aid to Local Assessors From the Viewpoint of a Local Assessor," Proceedings of the National Tax Association, 1941, p. 76

the information is now out of date. Consequently, the commission might well consider the preparation of a new and comprehensive appraisal guide for use by the local assessors. Undoubtedly the commission would gladly undertake such a task if the necessary funds were to be supplied by the legislature.

Assessors' Schools

Another form of aid given by some state tax commissions to local assesssors is direct instruction provided in assessors' schools. The most common arrangement for these schools is to have a joint sponsorship by the tax commission and perhaps the state municipal league or the state university. The school usually is conducted annually and lasts for two or three days or sometimes for as long as one or two weeks.

The school is intended especially to train newly elected or appointed assessors and deputies regarding the technical phases of their duties, for which many, if not most have had no previous training. The older assessors also are benefitted from attending these schools by the exchange of views and experiences as well as by receiving up-to-date information relative to property appraisals, assessment procedures, etc.

It is to be hoped that in the future, an arrangement can be made in Colorado for conducting annual assessors' schools. Such arrangement is especially desirable as long as the people of the state, through elections, select assessors who usually possess no particular qualifications for the highly technical work which they are required to undertake-- the elections being conducted every two years.

Annual Meeting of Assessors and Commissioners' Visits to Assessors

Beginning in 1902 in the state, county assessors were required by law to meet at the Capitol the first Tuesday in August, to discuss and report matters in their counties concerning taxation. They were directed also to turn over to the state auditor their tax abstracts, showing the value placed by them on each class of property in their respective counties. Upon delivery of this abstract to the auditor, each assessor was to be paid the sum of $50 and railroad fare required in attending the meeting.

The newly appointed tax commission reported in 1912 that the annual meetings of assessors were not accomplishing the objectives as intended by law.[1] The commission pointed out that the legislature had intended for abstracts of assessment to be completed before the assessors' meeting so that valuations could be compared in order to facilitate a general discussion for the purpose of improving assessments the subsequent year. Apparently, however, assessors at the annual meetings were merely guessing as to what their abstracts would

1 First Annual Report, Colorado Tax Commission, pp. 15-16

ultimately show when finally completed some 30 days later. Moreover, because of the lack of direction, general discussions were not proving fruitful from the viewpoint of improving subsequent assessments.

Consequently, upon recommendation of the tax commission the legislature made changes in 1913. Each assessor was to complete his abstract of assessment and transmit one copy with oath of authenticity to the tax commission before the first of September.[1] The time of the assessors' meeting was to be at the call of the governor or tax commission and assessors were to be paid actual expenses incurred in attending meetings.[2]

Writing in 1916 with reference to assessors' meetings, Haig stated,

> "Four conferences have been held since (1913) and under the guidance of the commission they have developed into a very important part of the assessment machinery. The meetings are held during the winter, before the assessment work for the year is begun, and are excellent practical training schools for the newly elected officials. Committees are appointed to assist in crystalizing the judgment of the assessors on average values and assessment methods, and much information of value to the commission is thus presented. Papers are read by those assessors who have had unusual success in various parts of the work and discussion is freely indulged in.....The annual meeting has undoubtedly had a great influence in stimulating the interest of the assessors in the problems of taxation and every effort should be made to develop its usefulness still further."[3]

The time of holding the meetings was delayed in both 1917 and 1918 because funds were not appropriated soon enough by the legislature. In 1919 the appropriation bill was too late to permit a meeting at all. Likewise in the years 1930, 1934, and 1936 no annual meeting was held because of the lack of funds to pay expenses of the assessors. Since 1938 the legislature has habitually neglected (or refused) to make appropriations for the meetings which are actually required by law. Consequently, the sessions which have been held recently have been attended only by those assessors or deputies whose counties were willing to pay travel and other expenses.

Thus, during recent years an unfriendly legislature has interfered with the important work of the tax commission relative to the annual

3 Haig, R. M., The Work of the Colorado Tax Commission, published in Annual Report, 1916, Colorado Tax Commission, p. 50.

instruction of assessors, etc. by refusing to appropriate funds. Newly elected assessors are particularly in need of special instruction before they begin the complicated and technical task of making assessments. This instruction can most economically be given through an annual general conference.

In the future, the state should again assume its proper responsibility by adequately financing the annual meetings of assessors. Should it continue to shirk this responsibility, it becomes even more important than indicated in the previous section for the tax commission (with its limited funds) and perhaps the municipal league or the state university to cooperate in sponsoring an annual school or conference for the purpose of training and instructing county assessors.

It should be pointed out in this section of our study that during most years in the past the tax commission has conducted district meetings in various parts of the state at which time contacts have been possible between the commission and assessors.

Also, at least once every two years, in accordance with provisions of the law, members of the commission attempt to visit each assessor in his home county. However, sufficient time and funds have not always been available to permit making all of the prescribed visits. Furthermore, the visits made must of necessity be relatively short at each assessor's office. Consequently, not much more can be attempted in these calls than the development of an esprit de corps between the commission and assessor. If the assessor requires much assistance relative to various appraisal problems, the commission's field deputies must be sent out to extend this aid.

Field Deputies

A vital aspect of state supervision over local assessment as conducted by the tax commission is carried on through the services of field deputies or investigators. Under ideal conditions these deputies -- trained and well qualified appraisers of property in general as well as of various specialized kinds, assisted by competent auditors -- cannot only assist the commission relative to equalization functions but can also aid local assessors whenever such assistance is needed and requested.

In Colorado the commission has always been handicapped because of the lack of appropriations sufficient to employ enough field deputies. The first field work was provided for in 1915 when the legislature permitted the hiring of one investigator and one clerk, each to be paid an annual salary of $1200. The commission complained that the compensation was so inadequate, competent investigators could not be retained. It reported that, "It is absurd assessors of third-class counties, who work usually much less than the full year, and who have deputies,

should get double the salary of an investigator for the state commission."[1]

The response of the legislature in 1917 was to provide for two investigators at salaries of $1500 each. Thus, the situation was improved but little. However, the next year in spite of financial difficulties the commission was able to report,

> "During the year 1918 an investigator worked for three months with the assessor of Denver County on merchandise alone, and assisted in increasing the value of this item from $27,619,730 to $42,528,630.
>
> "The two investigators specialized on merchandise in most of the other counties, and helped the assessors to bring the total assessment from $55,139,900 to $79,846,131 in 1918.
>
> "An investigator was placed in Phillips county for about six weeks, and as the result of what was practically a re-assessment, the local values were increased from $6,449,746 in 1917 to $14,104,328 for 1918."[2]

An attack upon the commission in 1925 by several special groups of the state, who even tried to induce the legislature to abolish the commission, succeeded to the extent of inducing Governor Morley to veto that part of the commission's appropriation bill providing for a secretary and two field deputies. Confronted with this emergency the commission accepted financial aid during the next two years from 62 of the 63 counties of the state who voluntarily appropriated funds to pay the salaries of the secretary and deputies.[3] This action on the part of the counties is of special significance in that it was initiated by the county assessors' association--clearly indicating the attitude of county assessors toward the tax commission and its field deputies relative to assistance which had been obtained in the past and which was desired for the future.

During recent years the commission has regularly reported that its staff has been inadequate to permit accommodating all of the requests made for assistance by the county assessors. For example, in 1936 it was pointed out that,

> "At the present time, and for a number of years, we have attempted to comply with the law in assisting assessors to check valuations in their respective counties, make appraisals, and confer with county officials, with only two men available for this purpose. We believe that if we were allowed one additional investigator, thousands of dollars

1 Fifth Annual Report, 1916, Colorado Tax Commission, p. 16
2 Seventh Annual Report, 1918, pp. 4-5
3 This money was returned to the counties in 1927 by a legislature and governor more friendly toward the commission.

> in taxes on property now escaping taxation would be forthcoming, that a better equalization of assessments would result, and we would be in a position to comply with hundreds of requests received annually from county assessors for assistance in assessing property at a uniform basis.
>
> The commission is very much in need of an accountant whose duty it would be to examine annual reports and schedules filed by public utility corporations, in order to enable the commission to make intelligent assessments on these properties. When not engaged in this work this man would be available to all county assessors in assisting in the work of proper assessments on corporations and merchants. Our investigations show that thousands of dollars in valuation are escaping taxation on stocks of merchandise for the reason that the assessor is not qualified to properly examine inventories and financial statements, and in numerous cases inventories are not filed with the county assessor as required by law."[1]

In 1938 the commission reiterated its need for additional field workers asking for two additional investigators and an accountant or auditor. The 1939 legislature accommodated to the extent of providing for the employment of an accountant at a salary of $2100 per year. By this time the salary of the two investigators permitted in the budget had been increased to the level of $1800 annually -- an amount still far too low considering the highly specialized and technical services required.

In 1945 the commission was employing four full-time investigators and appraisers including one trained accountant, but a reduction that year of one-third in the biennial budget for maintenance seriously handicapped operations. Consequently, requests from county assessors for assistance far exceed the ability of the commission to comply. Moreover, there is great need throughout the state for a complete reappraisal of all real estate and improvements to the end that property be assessed more equitably and at a figure more nearly approaching full value. County assessors, acting independently, cannot effectively accomplish this reassessment. Consequently, the commission has several times but to no avail requested enough appropriations to make the reappraisals. Finally in 1945, it recommended an alternative procedure -- that the commission should merely supervise the reappraisal work which would be undertaken by each county assessor and his deputies, the expense being cared for through a special county mill levy in each case.[2] It still remains to be seen whether or not this suggestion will bear fruit.

---

1 Twenty-fifth Annual Report, 1936, p. 9.
2 Thirty-fourth Annual Report, 1945, p. 4.

However, the writer believes that the supervisory tasks of the state tax commission including the field work of investigators, appraisers and accountants are sufficiently important to the people of the state as a whole to justify demanding that the legislature assume its proper responsibility by appropriating all necessary funds. Counties should not be expected to bear the expense. Moreover, unless forced to do so, the counties whose assessments are most out of line are the ones least likely to appropriate voluntarily the necessary funds for making reappraisals.

Review of Tax Rebates

Still another supervisory function exercised by the tax commission is the passing upon petitions from county commissioners requesting rebates and refunds for individual taxpayers. Previous to 1914, rebates of taxes were made by county commissioners, the power to reduce the amount any taxpayer needed to pay being entirely in the hands of the local authorities. The justification for making such reductions was in order to permit correction for assessment or tax levy errors such as double assessment and clerical mistakes.

However, the power residing in the county commissioners to rectify technical errors of assessment and levy gave opportunity to dissatisfied property owners to bring pressure upon the commissioners for tax reductions even though there would be no justifiable reason. Thus when the time came for paying taxes (long after the legal period for equalization functions) favored taxpayers might obtain assessment reductions regardless of the level of valuations previously fixed by the assessor. Such rebates often not only increased the inequality as between individual taxpayers, but undermined the morale of tax assessors who tended to become careless in the work of fixing valuations. Under this system of rebates, in the year 1911 $376,309 in taxes were rebated in the various counties.[1]

In order to curb the unlimited power possessed by county commissioners to grant alleged favors to taxpayers, the legislature amended the property tax law in 1913. The new amendment provided that "no abatement, rebate or refund of taxes shall be allowed by the county commissioners unless a hearing shall be had thereon and a notice of such hearing and an opportunity to be present being first given to the assessor and no abatement, rebate or refund of taxes shall be allowed by the board of county commissioners if the application is disapproved by the Colorado Tax Commission."[2]

Thus, since 1913 the tax commission receives all petitions for tax rebates and must give approval before the refund can be granted

1 Annual Report, 1914, State Tax Commission, p. 8.
2 Chapter 134, section 5, Session Laws of 1913.

by the county commissioners. During the first year after the new arrangement went into operation, the commission approved rebates amounting to about $80,000 -- compared with $376,309 of rebates granted in 1911 under the old system.

The record of rebates approved by the tax commission by five-year periods since 1914 is given in Table 9. It may be seen that the trend was upward in number of petitions granted until the period 1930-34; since then the trend has been down. Relative to the total amount of taxes involved in the petitions, there was a trend upward until the period 1925-29; since then there has been no apparent trend in either direction. The annual average for the 31 years has been 1,485 petitions approved amounting to $171,209 of rebated taxes.

Most petitions requested by county commissioners in the various counties have always been granted by the tax commission -- some of them perhaps not being justified. However, the present arrangement in undoubtedly a great improvement over the old system. The provision for greater publicity, a hearing and the need for approval by the tax com-

Table 9

Petitions for Abatement, Rebate and Refund of Taxes Granted by the State Tax Commission by Five-Year Periods, 1915 to 1945 Inclusive

	Petitions Approved	
Period	Number	Amount

mission are strong deterrents upon the county commissioners when they may be tempted to grant undeserved favors to property owners relative to tax rebates. Furthermore, the power to pass upon petitions is considered by the commission to be essential to preserve the fruits of equalization. Without it a disgruntled local board might rebate the entire increase placed upon their county by the tax commission and state board of equalization.

The Problem of Equalization

Equalization is a necessary function relative to property assessments because experience indicates that original assessments are frequently defective. Moreover, a principal purpose of the function is to insure a uniform assessment ratio, at least within given categories of property to be taxed throughout the equalization district -- usually the county or state. Effective equalization includes the power to initiate changes in assessments -- either raising or lowering, the power to require listing of omitted property in the interest of the public treasury and of taxpayers generally, and finally, the power to act as a board of appeals to settle disputes between taxpayers and the assessors or lower boards of review.

As the property tax evolved during the Nineteenth Century, most American states developed systems of equalization on both the local and state levels. Colorado's constitution, adopted in 1876, as previously discussed, provided for county and state equalization.

County Equalization

In Colorado, as in most other states, equalization begins on the county level -- the county commissioners acting in the capacity of an equalization board. However, in actual practice these county boards in most instances confine their efforts to the hearing of appeals made by taxpayers who consider their assessments to be too high as fixed by county assessors. Consequently, the "equalization" made on the county level is in the form of reducing assessments of those complainants who appear to have valid claims. Almost never are assessments raised on any particular property or class of property.

The function of serving as a tax appeals body is an important one and perhaps this work is all that should be expected from the county board. Being an ex officio body, not especially experienced in tax administration, it is not well qualified to pass upon assessments in general as made by the tax assessor. Moreover, the board's equalization work is definitely handicapped by a lack of time, as all hearings and decisions rendered must be made each tax year between the third Monday and the twenty-eighth day in July.

State Equalization

The shortcomings of equalization on the county level have increased the need for effective state equalization. However, because of defective legislation and crippling court decisions, practically no state equalization was possible until the Tax Commission Act of 1911. Even then it was not clear as to the extent of authority over equalization possessed by the county commissioners, the state tax commission and the state board of equalization. Consequently, a proposed constitutional amendment to clarify the lines of authority was submitted by the legislature to the people in the November election of 1912. The proposal if adopted would have abolished the

board of equalization by centralizing all ultimate authority in the state tax commission. However, the proposal failed to carry in the election.

Through cooperative action by the tax commission and state board of equalization, assessments were raised in many counties during both 1913 and 1914 -- the changes being sanctioned by the court. The equalization was declared constitutional because the courts ruled that increased assessments had really been made by the tax commission when it determined the changes necessary in the valuation of each county to secure assessment at full cash value.[1] Thus, the court interpreted the action of the commission as part of the assessment procedure rather than an equalization function. The argument presented in the case was to the effect that the board of equalization still possessed the sole authority of making equalizations but that the constitution limited this authority by denying it the power to raise aggregate assessments for the state as a whole.

Thus, the Pitcher case of 1913, in effect, appeared to give sufficient power to the tax commission to make equalizations. However, there were those who feared this authority would be inadequate should a disagreement arise with the state board of equalization. Consequently, another constitutional amendment was attempted in 1914. This time the proposal did not provide for abolishing the state board of equalization; on the contrary, the board's power would be strengthened.

In the November general election the amendment was adopted by the people, thus becoming part of the constitution. Its provisions are as follows:

> "There shall be a Board of Equalization for the State, consisting of the Governor, State Auditor, State Treasurer, Secretary of State, and Attorney General. The duty of the said Board of Equalization shall be to adjust, equalize, raise or lower the valuation of real and personal property of the several counties of the State, and the valuation of any item or items of the various classess of such property.
>
> "There shall be in each county of this State a County Board of Equalization, consisting of the Board of County Commissioners of said County. The duty of the County Board of Equalization shall be to adjust, equalize, raise or lower the valuation of real and personal property within their respective counties, subject to revision, change and amendment by the State Board of Equalization. The State Board of Equalization and the County Board of Equalization shall equalize to the end that all taxable property in the State shall be assessed at its full cash value and also perform such other duties as may be prescribed by law; provided, however, that the State Board of Equalization shall have no power of original assessment."[2]

---

1 Colorado Tax Commission vs. Pitcher, 56 Colo. 343 (1913)
2 Article X, section 15, Colorado Constitution

This amendment of 1914 was probably intended to bestow unlimited ultimate equalization power upon the state board of equalization. However, because of the provision that the board shll have no power of original assessment, the courts have ruled that it cannot examine the valuation of an individual taxpayer's property, but must confine its attention to the equalization of valuations among aggregates and general classes of property.[1]

The practical effect of the decisions by the court has been to limit the power of the state board by increasing the power of the tax commission. Thus, today the tax commission appears to possess the primary authority over equalization, being directed by law to make its recommendations to the board of equalization, which in turn must certify all assessments before they are official. Moreover, relative to this certification of assessments, should the board wish to make changes, such modifications must be confined to broad categories of property.

However, enven though the tax commission appears to possess superior equalization power, the ex officio state board has retained sufficient authority to make of Colorado's equalization procedure a dual system of control. How effective is this dual control? In other words, how successfully have the two bodies achieved the objective of maintaining uniform assessments throughout the state upon a 100 per cent valuation basis? Before directly answering this question, let us examine the individual record of the state board of equalization.

State Board of Equalization

Table 10 shows changes in assessments made by the state board during the 34 year period since the tax commission was established. It may be seen that in 10 separate years no changes whatsoever were made in the assessed valuations as recommended by the tax commission. For the 24 years when changes were ordered, 18 resulted in net reductions while six resulted in net increases of total assessed valuation of property in the state. During the entire period reductions exceeded increases to the extent of more than $200 million.

Let us examine somewhat more closely the particular decreases and increases ordered by the board. Until the year 1931 all changes were in the form of net reductions except for the year 1923 when there was a slight net increase. During this period (1912-1930) almost all of the reductions benefitted railroads and utilities. Reporting in 1926 the state tax commission stated:

---

1 Board of County Commissioners vs. Union Pacific RR. Co. 89 Colo. 110; McGinnis vs. Denver Land Co., 90 Colo. 72

> "It is interesting to note that, in fourteen years, the board has lowered this commission's valuations on public utilities, railroads, and other like corporations, approximately $30,667,810. This translated into taxes, means a loss to the state, counties, municipalities and school districts of nearly $1,000,000. In all that time not a single increase in valuations has been made or ordered. And, with one exception, all its reductions have been given to corporate property. In other words, its equalization has been 100 per cent downward and confined to corporations."[1]

Beginning with the drastic reduction ordered by the board of equalization in 1931 and continuing through 1933 with total net reductions amounting to approximately $250 million for the three-year period, principal benefits were extended to agriculture. Due to rulings by the board, about 30 per cent horizontal reductions occurred in the value of agricultural lands and improvements while from five to ten per cent horizontal reductions were made in the value of city residential property and automobiles.

During the unprecedented period from 1935 to 1939 when the board of equalization made increases in five of the years, totaling almost $88 million, the additional assessments were placed upon railroads and utilities. This action represented a complete reversal of the attitude of the state board toward these corporations during the previous two decades.

What conclusions may be reached relative to the 34 year period of "equalization" of assessments by the state board? The evidence indicates rather strongly that the board is more likely than the tax commission to be influenced by partisan considerations. Judging from the record the board is apt to decide that the expedient course is no action (10 of the years), or else to order assessment reductions (18 of the years). The assessment reductions in most cases appear to represent favoritism shown special economic groups after these groups have exerted considerable pressure. During the time from 1915 to 1930 those favored with reductions were the railroads and utilities; from 1931 to 1933 the favored ones were farmers. Only during the six-year period from 1934 to 1939 (administrations of Edwin C. Johnson, Teller Ammons and the first year of Ralph L. Carr) has the board been able to resist the political expediency of either doing nothing or else of making tax reductions. Therefore, it may be concluded that in Colorado as elsewhere an ex officio board composed of elected officials is too likely to be swayed by political

---

1 Fifteenth Annual Report, Colorado Tax Commission, p. 8. There appears to be an error in this quoted statement. Although the general conclusion is valid, the board of equalization did make some small increases during the years from 1917 to 1923 inclusive -- the change in 1923 resulting in a small net increase (Table 10).

CHANGES IN ASSESSED VALUATION MADE BY THE STATE BOARD OF EQUALIZATION 1912 - 1946

expediency and the pressure of special groups rather than the larger interests of the state as a whole.

Moreover, the state board of equalization is inefficient and ill adapted to the function of equalization. In the words of Jensen:

> "The board is ex officio, and it is not to be presumed that the members, elected for other purposes, have any fitness for the work of equalization, which involves considerable technical skill and knowledge. The change in personnel must be frequent, so that little skill and experience can be accumulated from one year to another. The board sits for less than two weeks, and unless it has a permanent staff to accumulate and organize information, it can have little or no basis of fact for its work. Having little or at least an inadequate factual basis for its rulings, it becomes the easy victim, even if it is not so inclined, to aggressive groups making extravagant claims of excessive or inadequate assessments, on the property of themselves or others, respectively."[1]

Another disadvantage of having a board of equalization in addition to a tax commission is that the dual control contributes to waste in time and effort of the assessment agencies. Several weeks longer is required for the completion of all steps in assessment before collection of the tax can begin. This delay contributes to the problem of collection as there is greater chance that the taxpayer or the property or both will have disappeared from the county or even the state. Moreover, wasted effort occurs because of duplication of work as between the board and commission. Each administrative body attempts to have at its command all necessary data for making decisions. Frequently the same individuals must twice present identical facts -- once before the commission and again before the board.

But perhaps one of the principal drawbacks of a dual control of equalization is that neither body can assume full responsibility. This divided jurisdiction makes it easy for each group to blame the other for errors of omission or commission. All the while both suffer because of the loss of confidence and respect from the public.

Years ago all other states except Missouri and Colorado got rid of the dual control over equalization exercised by an appointed tax commission and an ex officio board of equalization. These two states have apparently continued to retain their inefficient and generally unsatisfactory system because of inflexibilities in the state constitution. The people of Colorado should amend their constitution, placing all ultimate powers of equalization in the tax commission and abolishing the state board of equalization.

1 Jensen, Jens P., Colorado State Tax System, 1930, p. 92

Equalization by the Tax Commission

Let us now turn our attention more directly to the role of the state tax commission relative to equalization functions. It is well to keep in mind the fact that the legislature has endowed the commission with specific responsibility for maintaining assessments throughout the state at full cash value. Chapter 142, section 157 of Colorado Statutes specifies, in part:

> "It shall be the duty of the commission, and it shall have and exercise power and authority:
>
> "First -- To have general supervision over the administration of and to enforce all laws for assessment, levying and collection of taxes.....to the end that all assessment of property real, personal, and mixed, be made relatively just and uniform and at its true and full cash value.....
>
> "Sixth -- Whenever in the judgment of the tax commission, property in any county or municipal subdivision thereof has not been assessed at its true and full cash value the commission may make a reappraisement of the property therein, to the end that all classes of property in such taxing district shall be assessed in compliance with the law....
>
> "Seventh -- The commission may raise or lower the assessed value of any real or personal property, first giving notice to the owner or owners thereof.....[1]

Thus, it may be seen that the legislature in establishing the tax commission intended for it to exercise full supervision over the assessment of all property to the end that it be assessed at full cash value. The courts have generally protected this authority possessed by the commission.[2]

In a practical sense the above enumerated power in the tax commission is an equalization power. Whether or not the state board of equalization approves all assessments as turned in by county assessors and recommended by the tax commission, it is the duty of the commission to see that all assessments submitted for approval are just, equal and at full cash value. If such is not the case, the commission is not fulfilling its duties as specified by law.

We shall now briefly examine the general results of the supervision and equalization functions as exercised by the commission. Relative to this examination it is well to keep in mind the fact that since 1940 the

2 Denver vs. Pitcher, 54 Colorado 203; Goldsmith vs. Standard Chem. Co., 23 F. (2nd) 313

commission has apparently had no interference from the state board of equalization -- all assessment recommendations having been approved as submitted.[1]

Table 11 gives the total assessed valuation of all property in the state for each year since the tax commission was established in 1912. It may be seen that the new commission increased valuations from $422 million in 1912 to $1,306 million in 1913. This action was taken in order to place the property of the state upon a full valuation basis as prior valuations had been admittedly upon a basis of one-third full value.

Table 11

Total Assessed Valuation of all Property in Colorado, by Years, 1912-1946 Inclusive

Source: Annual Reports, Colorado Tax Commission

Subsequent to 1913 the trend in valuations was slightly upward until 1929 when the figure reached $1,587 million. After 1929 total assessments declined until 1935, by which time they had dropped to a low of $1,088 million. Since then the trend has again reversed itself. However, during

1 See Table 10

the last 10 year period since 1935 the increases from year to year have been slight. By 1946 total assessed valuation of property in the state amounted to about $1,259 million. Thus, after 33 years time, total assessments were actually more than $47 million less than at the beginning of the period in 1913. This represented a decline in assessments of 3.6 per cent. If current assessments (1946) are compared with those in the year 1929, the reduction has been $327 million, or 20.6 per cent!

It should be pointed out that a partial explanation of the relatively low total valuations since 1936 is that intangible wealth and motor vehicles have no longer been included under the general property tax. However, this is only a partial explanation in that all intangible wealth included on the assessment rolls for the year 1935 amounted to less than $43 million while the assessed valuation of motor vehicles accounted for an estimated $20 million more. Both combined ($63 million) is only 19 per cent of the reduction in assessments since 1929. Moreover, if the $63 million were added to the present total for the state (1946), assessed valuation would still be about the same as for the year 1913!

Considerable evidence can be presented to show that the level of actual wealth in the state has not been stationary or declining but on the contrary has been expanding during the last 33 years. Table 12 shows that the state's population increased from 799,024 individuals in 1910 to 1,123,269 in 1940. This represented a 40 per cent increase for the 30 years -- a period of time approximately coinciding with that under consideration (1913-1946).

It is reasonable to assume that a 40 per cent growth of population in Colorado -- an economically underdeveloped state in the Rocky Mountain region -- would signify an important increase in total property values.

Moreover, as shown in Table 13, the value of manufactured goods produced in the state increased from $136 million in 1914 to $221 million in 1939 -- a 62 per cent gain. If figures were available for 1946 they would indicate an even greater growth of manufacturing for the entire period. The value of mineral products increased from $54 million in 1913 to $79 million in 1944 -- a 47 per cent increase. Harvested agricultural crops for the state increased from a value of $50 million in 1910 to $62 million in 1940 -- an increase of 23 per cent for the 30 year period. If values are combined for the three classes of products the increase for the years indicated in the table was 50 per cent.

Table 13

Value of Output, Three Leading Industries in Colorado for Selected Years[1]

Another evidence of expansion of wealth and income in the state is the growth of deposits in Colorado banks. Comparable figures are not available for the years before 1916; however, for the period since then, by five-year intervals, they are shown in Table 14. It may be seen that total deposits increased from $228 million in 1916 to $415 million by 1941 -- an increase of 82 per cent for the 25 year period. If 1943

is considered, the increase was 215.6 per cent. However, because the year 1943 was in a war period of credit expansion, the figure for deposits in 1941 is perhaps more truly indicative of the long term trend.

Table 14

Perhaps one additional evidence of the growth of wealth and income in the state will be sufficient. Although figures are not available giving the total income for Colorado, there is evidence that the income has increased roughly in proportion to the growth of national income. For example, income payments to individuals in Colorado compared with those for the country as a whole for selected years since 1929 (Table 15) indicate a close relationship between the two. In 1929 payments to Colorado residents represented

Table 15

Income Payments to Individuals
United States and Colorado for Selected Years
(Dollars expressed in millions)

Year	United States	Colorado	Colorado As Percentage of U.S.
1929	$ 82,617	$ 634	.77
1933	46,273	359	.78
1939	70,601	564	.80
1941	92,269	695	.75
1943	138,101	1,104	.80

Source: Bureau of Foreign and Domestic Commerce, Department of Commerce.

.77 per cent of total payments for the United States; during the subsequent years of 1933, 1939, 1941, and 1943 the ratios were .78, .80, .75 and .80 per cent respectively. Thus, there appears to be a very stable relationship between changes in national and state income -- at least for the years indicated. To the extent that deviations occured for the period between 1929 and 1943, the tendency was for Colorado to receive relatively more of the total national income payments. Thus we may conclude that increases in national income have been reflected in similar or even greater increases in income in Colorado.

Table 16 shows the growth of national income for selected years since 1913. The table indicates that national income being at a level of about $35 billion in 1913, rose to $69 billion by 1920, was approximately the same in 1930, declined during the depression being $55 billion in 1935, rose to $77 billion by 1940, and has increased sharply since rising to a level of $160 billion in 1944. During the period from 1913 to 1940 the national income more than doubled and by 1944 the increase was over four fold. Assuming that the high income of the war years can not be maintained, but that average prices and total income may drop back approximately to the 1940 level, there would still be a total annual income exceeding that in 1913 by more than 100 per cent.

Table 16

National Income in the United States
for Selected Years, 1913 to 1944 Inclusive

Hauser, P. M. and Leonard, W. R., Government Statistics for Business Use, 1946, p. 23, for remaining years. (Although two different sources are used, figures for the entire period are considered comparable.)

As previously indicated there is evidence that the rate of growth of income in Colorado has corresponded rather closely with that for the country as a whole. Assuming this to be true, the inevitable conclusion would be

that property values have also materially increased in the state.[1]

Considering all available evidence and discounting the inflationary rises of the war years since 1940, the writer believes that on the basis of a conservative estimate we may safely conclude that all real and personal tangible property in the state has increased in cash value at least 50 per cent since 1913. Moreover, there is good evidence to indicate that in the future, the values are not likely to decline below this level -- approximately the level of 1940 or 1941.

Yet despite the estimated increase of a least 50 per cent in actual value since 1913 (disregarding all increases during World War II) the total assessed valuation of all property in the state (1946) is actually at a lower level than 33 years ago, at the beginning of the period. If assessments were approximately on a full valuation basis of 1913, in order for the same situation to prevail today (discounting the war inflation and allowing for exemption of intangibles and motor vehicles) the total assessed valuation of real and personal tangible property would probably need to increase by at least $625 million.

The state tax commission, to the limit of its ability, should attempt to place the property in the state upon this higher total appraised valuation basis. In some instances it would involve discovering property, taxable under the law, yet not listed on assessment rolls either because of error, negligence or favoritism; in all instances it would involve placing valuations on a basis so that they would be at the level of full cash value. Such reform relative to assessments would merely be in accordance with the prescribed laws of the state and achieving this goal (under the law) is specifically a responsibility of the tax commission. Moreover, full assessments do not cause higher general taxes; on the contrary, the average property owner would probably discover he has a lighter tax burden when all property is full assessed than when it is only partially assessed. The commission has frequently pointed out that in Colorado throughout the years since 1930 as assessments have shrunken, mill levies have increased enough to more than make up the difference. If all taxable property were listed and fully assessed, mill levies could drop back to a relatively low level.

But other advantages are forthcoming when property is assessed at full cash value. When 100 per cent assessment is the objective, original valuations are more likely to be uniform. The use of a fractional basis tends to be indefinite in practice and inevitably leads to wide deviations. According to Allen, under such a fractional system, "Instead of determing the actual value of a piece of property as accurately as possible and then

---

1 In the final analysis the principal basis for the value of property is its income earning capacity. Therefore, if total income is greater, we must expect the value of property to increase also, although not necessarily proportionately.

applying the prevailing assessment ratio, assessors often set down a lump-sum figure which they believe to be in line with similar properties without regard to whether the assessment represents the proper percentage of full value."[1] Allen concludes that this inevitably results in numerous errors which are magnified in terms of the actual value of the property erroneously assessed. On the other hand, full assessments promote uniformity, not only as pertains to locally assessed property within a county but also the general level of assessments as between counties. Moreover, a 100 per cent valuation contributes to greater uniformity as between property, on the one hand, assessed locally in the 63 counties and, on the other hand, the assessment of public utilities by the tax commission.

Another advantage of full assessment is that the taxpayer has a better basis for comparing the valuation placed upon his property with that upon the property of his neighbor or of anyone else. Fractional assessments confuse the taxpayer and often give him a false impression of liberality in tax treatment. Not knowing what assessment ration is being used he is likely to refrain from objecting to a particular valuation in spite of suspecting that his property is being appraised relatively too high. He realizes that even though there is discrimination against his property it would be difficult to prove and if a complaint is lodged the assessor can easily justify raising the assessment still higher from the standpoint of law. Therefore, assessments upon the basis of full, cash value are really in the interest of the taxpayers themselves because then the assessed value of any property may readily be compared with that of any other.

A corollary advantage is that full assessments reduce the regressive aspects of the property tax. Almost invariably when property is assessed at a fraction of full value the larger properties tend to be underassessed to a greater extent than are the smaller ones. Thus, property owners with the lowest incomes and the least property pay more than their proportional share of property taxes. This regressive feature due to fractional assessments has frequently been pointed out by tax authorities in other states as well as in Colorado. The problem may be illustrated by citing an example, which, in effect occurs all too frequently. Suppose two homes in the same tax district have full cash values of $3,000 and $12,000 respectively. If the assessor vaguely knows that property in the state is being usually assessed on a level somewhere between 30 per cent and 60 per cent of full value, attempting to keep his valuation approximately in line with those in other counties, he is likely (perhaps unconsciously) to discriminate against the $3,000 home. One reason for this discrimination may be that the true value of the smaller property is more readily determinable. In addition, the assessor may not wish valuations to go below a certain minimum for any

1 Allen, H. Kenneth, "Full-Value Assessment Program in Illinois", Bulletin of the National Tax Association, January, 1946, pp. 117-119.

home, regardless of value. Thus, he assesses the smaller property at perhaps $2,000, thinking all the while that surely the householder can afford to pay a tax on such a low total valuation. However, with reference to the larger property, partly because of uncertainty relative to true value and partly because most any fractional valuation may appear relatively large to the assessor or deputy who probably lives in a modest cottage himself, the $12,000 home may be assessed at perhaps $5,000. The practical effect of these two valuations is for the small home to be assessed on a 66 per cent basis and the large one on a basis of about 42 per cent. Thus, the tax is regressive, favoring the larger property. Assuming the tax levy for the particular district to be 50 mills, the favoritism amounts to a saving of $150 in taxes (based upon an undervaluation to the extent of $3,000) as compared with the amount of tax paid by the owner of the $3,000 home. In other words, the owner of the large home should pay a tax of $400 instead of $250 in order for the tax to be proportional with the $100 tax paid by the owner of the small home.

Finally, an advantage of full assessment is that the various local governments -- whether county, municipality or school district -- receive equal treatment with reference to tax rate limitations imposed by the constitution or legislature. On the other hand, under a system of fractional assessments, the maximum mill-levy provisions are much more restrictive in tax districts with low assessment ratios than they are in those with high ratios. Thus, by increasing assessment ratios, the application of tax-rate limits can be avoided or at least postponed.

One aspect of the problem of equalization of assessments throughout the state relates to the broad categories of property as indicated in Table 17. In order for the property tax to be equitable, valuations should be applied to these categories in such a manner that each bears its proper share of the total tax load. If original assessments do not result in accomplishing such uniformity, valuations should be equalized by the tax commission.

It may be seen from the table that assessment abstracts as returned by the county assessors and corrected by the tax commission for the representative years 1913, 1921, 1935, and 1945 show a rather wide variation as among individual items. For example, the valuation of land and improvements has fluctuated, going from 24.71 per cent of total property values in 1913 up to 34.84 per cent in 1921 and then down to 21.42 per cent by 1945. This category of property is principally in the form of agricultural and grazing lands and improvements. There is little or no evidence to support the justification for such wide relative variations of assessments. It is true that during the first world war the market value of agricultural land advanced somewhat more sharply than of property generally; however, by 1921 these extreme values had declined again.

The actual situation is probably that farm property was relatively over-assessed in 1921. This over-assessment continued for a number of years until the depression period of the thirties when the agricultural

bloc induced the state board of equalization to slash farm valuations. As a consequence, there was probably an over-adjustment leaving agriculture in a relatively favored position -- at least in comparison with some other classes of property in the state. This appears to be true especially since the development of agricultural prosperity during and after the second world war.

One illustration will be given to indicate the present favored position of at least certain kinds of agriculture relative to property assessments. In Baca county, one of the dry-farming counties of eastern Colorado, assessment of agricultural and grazing land by five-year intervals since 1930 is shown in Table 18. It may be seen that during the period, 2,950 acres of irrigation land was reclassified so that all land was considered either dry farm or grazing. By 1935 the dry farm and grazing lands were being assessed on a basis little more than half the level of valuations in 1930 -- the general average dropping from $5,24 to $2.80 per acre. Since 1935 some increase in assessed values has occurred but the increase has been slight -- by 1945 the average assessment being only $2.90 per acre.

Table 18

Abstract of Assessment of Agricultural and Grazing Lands in Baca County, Selected Years since 1930[1]

	Irrigated Land		Dry Farm Land		Grazing Land		Total Agri. Lands	
Year	Assessment	Av. per Acre	Assessment	Av. per Acre	Assessment	Av. per Acre	Assessment	Av. per Acre
1930	$36,875	$12.50	$6,050,280	$6.25	$1,941,230	$3.45	$8,028,385	$5.24

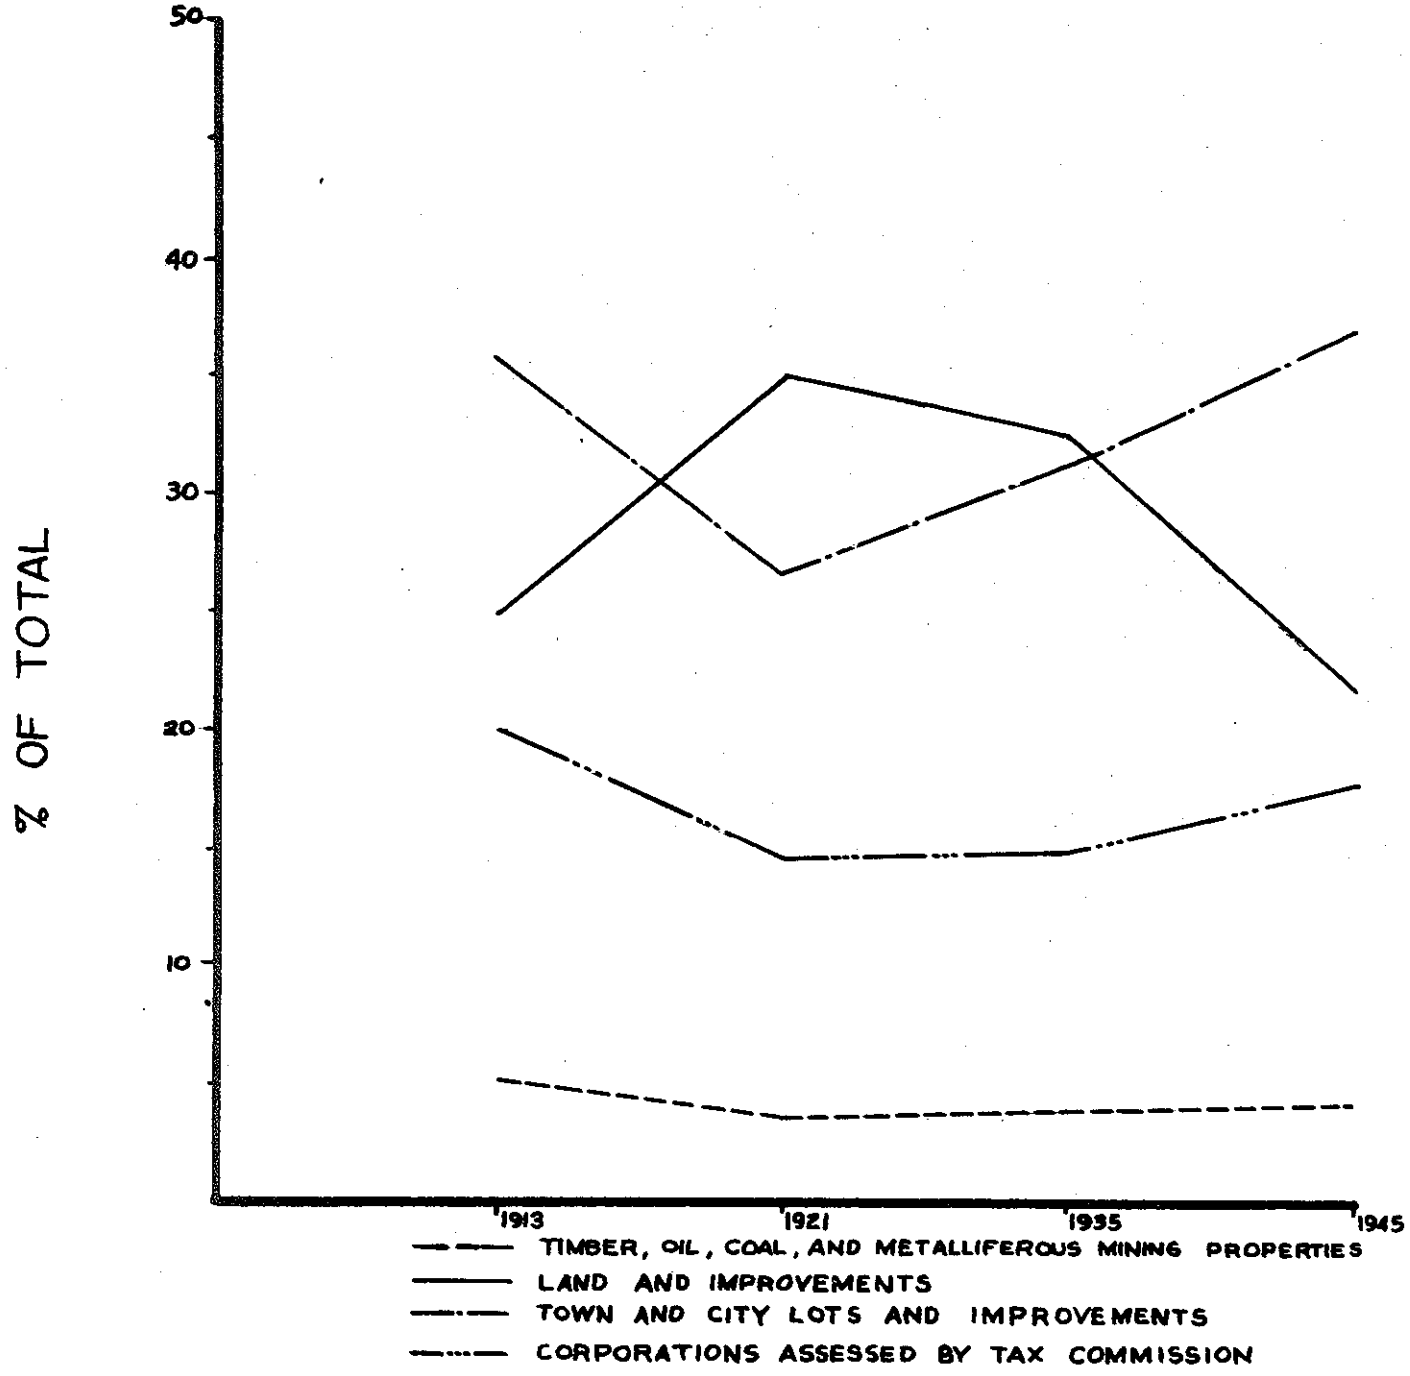
Source: Reports for years indicated, Colorado Tax Commission

Undoubtedly a reduction in valuations in Baca county as well as in other dry farm counties of eastern Colorado was justified during the first half of the period under consideration. Drought conditions caused several crop failures in a row and we began to consider the area a dust bowl. However, the farmers were taught scientific methods of water and soil conservation relative to dry farming, while since about 1937 the annual precipitation has been more favorable for crops. As a consequence, during recent years the farmers have been among the most prosperous of any in the nation. For example, Baca county is now raising about one-third of the world's supply of broom corn. In 1946 the harvest was about 23 million pounds which sold for 15 cents per pound. Farmers of the county are



ASSESSMENT OF SEVERAL LEADING CATEGORIES
OF PROPERTIES IN COLORADO

raising wheat which yields up to $100 per acre for each crop year on land still assessed at about $4 per acre. In 1946 the wheat crop of Baca county amounted to 1,700,000 bushels which sold at about $1.85 per bushel. In addition, the farmers of the county produced during the year $1,260,000 worth of cattle, $150,000 worth of sheep and $75,000 worth of hogs.[1]

Thus, convincing evidence indicates that dry farm lands of eastern Colorado typified by Baca county are now being assessed on a level representing a mere token of actual value. Moreover, agricultural authorities believe that the present high levels of production are likely to continue, that due to scientific methods of cultivation, never again will the farmers of the area need to fear a return of the dust bowl. Although assessed valuations or irrigated farms in other parts of the state never dropped quite as far relatively as those upon the dry farms during the decade of the thirties, both production and land sale figures indicate that current assessed valuation are relatively low upon these lands also.

Two other categories of property listed in Table 17 are metalliferous mining properties and timber, oil and coal properties. Together these represent the assessment of the mineral wealth of the state.[2] On a comparative basis these mineral resources have always been favored under the property tax. In 1913 when metalliferous mines accounted for 3.52 per cent and timber, oil and coal mines 1.57 per cent of total assessments, they were relatively under assessed; by 1945 when the ratios were 2.04 per cent and 1.82 per cent respectively, they were still in a privileged position relative to most other property in the state.

One basis for estimating the trend of assessments over the years is to compare the assessed valuation of all mineral lands and improvements with the value of mineral production. Such a comparison for selected years since 1915 is shown in Table 19. It may be seen that the assessed valuation represented almost 90 per cent of value of output in 1915. The ratio subsequently fluctuated rising to 100 per cent in 1930 and then declined thereafter, falling to 64 per cent by 1944. The average ratio for the years shown in the table was 78.4 per cent. Thus, if we assume that mineral property was relatively underassessed at the beginning of the period, since 1930 it has been favored to an even greater extent.[3] If valuations in 1944 were equal to the average for the period they would be at the level of about $62,000,000 or at least $11,000,000 more than the actual valuations for the year.

---

1 Rocky Mountain News, October 17, 1946.

2 Although timber property is included in the table, the value of privately owned timber in the state is so relatively small that for our purpose the item may be disregarded.

3 The writer realizes that the value of mineral production is not in all cases a good index of what the level of property tax should be; however, as the whole industry is considered in our discussion, the figures are undoubtedly significant.

Table 19

Assessed Valuation of Colorado Mineral Lands and Improvements Compared with the Value of Mineral Production for Selected Years

Year	Assessed Valuation[1]	Value of Mineral Production[2]	Percentage
1915	$57,413,617	64,295,119	89.2
1920	57,529,745	76,037,896	75.6

		Average	78.4

1 Annual Reports, Colorado Tax Commission
2 Minerals Year Book, Bureau of Mines
3 Estimated by writer from figures not entirely segregated by tax commission.

There appears to be sufficient evidence to indicate that a general reappraisal of all mineral wealth of the state would be highly desirable. Moreover, the problem should not be considered as one confined to attempts at improving assessments as the law relating to taxation of minerals is also defective. However, should the state adopt a comprehensive severance tax, the inadequacy of the mineral property tax would probably be largely overcome. For a more complete discussion of the taxation of mineral resources the reader is referred to the report in this series on severance taxation.

The catagories of town and city lots and improvements, livestock and merchandise as shown in Table 17 have probably been more satisfactorily assessed since 1913 than most other categories of property. During many of the years field men of the tax commission have assisted county assessors with the appraisal, especially of urban residential property and merchandise. Moreover, during the depression years after 1930 the assessed valuation of these properties was reduced relatively little by the state board of equalization.

The item in Table 17 called "manufacture" had not been interpreted uniformly by county assessors. Moreover, the nature of property included in the category has changed to some extent during the period since 1913. Consequently, a comparison of the relative levels of assessment of capital employed in manufacturing is difficult. However, some discussion of this important industry as it relates to property assessment appears desirable.

In 1912 the newly appointed tax commission was particularly concerned regarding the prevailingly low property valuations in manufacturing industries. During the period between 1903 and 1912 valuation of manufacturing

property had remained practically stationary, the amount in the former year having been $3,487,122 and in the latter, $3,507,675. Yet during this same period sixteen new sugar factories, costing approximately one million dollars each, had been erected in Colorado while according to the United States Census, capital invested in manufacturing in the state increased from $107,664,000 in 1904 to 162,688,000 in 1909.[1]

Through vigorous efforts of the commission, valuations in the state for manufacturing property increased to $13,575,571 in 1914 and by 1921 had climbed to $41,037,122. As seen by the accompanying table (Table 20) in the latter year the industry included 1,491 establishments whose manufactured products had a total value of more than $221 million. Expressed as a percentage of value of products, assessed valuation of the industry amounted to 18.5 per cent.

2 Bureau of the Census
3 Reports of Colorado Tax Commission

Since 1921 the trend of valuations placed upon manufactures by county assessors has been downward even though the industry itself has not declined. Of course there was a temporary setback during the depression of the 1930's, but by 1939 the value of manufactured products in the state almost exactly equaled the value of products in 1921. Furthermore, the industry was apparently more prosperous as the cost of labor, raw materials and power was considerably less by 1939. Yet between 1921 and 1939 assessed valuations

1 First Annual Report, 1912.

dropped from $41,037,122 to $23,749,670. While assessments in the former year amounted to 2.60 per cent of all property valuations in the state, by 1939 they had declined to 2.13 per cent. Expressed in terms of value of manufactured products the decline of assessed valuations was from 18.5 to 10.7 per cent.

Although since 1939 the tremendous war expansion of manufacturing caused valuations to increase to the level of $33,576,905 by 1945, there is evidence to indicate that the industry is still being assessed at only a fraction of the true value of invested capital. If the item labeled manufacture were interpreted more uniformily by the various county assessors, conclusions relating to assessments of the industry could be more decisive.

The classification of property in Table 17 labeled "miscellaneous less exemptions" refers principally to personal household property less personal exemptions of $200 per head of family. The assessment of this category of property is discussed in some detail in the section of our study on tax-exempt property. In that section it will be noted that such property is probably less adequately assessed than any other class of property in the state. A vast amount of household goods is never listed on assessment rolls, much of that listed is greatly under-appraised, and the $200 personal exemption is often too liberally applied. Moreover, making the inequity of these violations particularly bad is the fact that wide variation prevails among the 63 counties of the state relative to the assessment defects.

One of the most difficult comparisons relating to the question of assessment equalization among the broad classes of property is a comparison of the assessed valuations of corporations (assessed by the tax commission) with the valuation of all other property (assessed by the county assessors). Table 17 indicates that the proportion of total valuation assessed against the corporations has fluctuated considerably -- the percentage declining from a high of 19.22 in 1913 to a low of 14.35 in 1921. After the latter year the trend was slightly upward reaching 14.76 by 1935 then climbing to 17.45 per cent by 1945. Figures recently released by the Department of Revenue indicate a minor change for the year 1946 -- the ratio declining to 17.11 per cent. Thus, if a comparison is made directly between the years 1913[1] and 1946 we find that the percentage of assessments borne by the public utility corporations has experienced a net reduction of 2.81 per cent.

Before deciding whether or not this reduction of assessments (both in the aggregate and relatively) against the public utilities since 1913 has been justified, it is necessary first to determine whether or not these corporations have been expanding more slowly than all other property in the state relative to actual value. Although available data cannot be

1 It was 1913 when the tax commission first raised all valuations to the 100 per cent basis.

considered conclusive evidence there is reason to believe that the true value of utilities has not declined on a relative basis since 1913, but on the contrary has actually expanded considerably faster than the over-all growth of wealth in the state.

Although comparable data are not available for the period prior to 1920, Table 21 gives figures showing the trend in production of electric energy in the state for the subsequent years. Throughout the 26-year period from 1920 to 1945 there was a constantly accelerating rate of growth in production except for a short interval during the early years of depression following 1930. Total production increased from 397 million kilowatt hours in 1920 to over 1.1 billion kilowatt hours in 1945. This represented an expansion for the period of almost three fold. Thus, it may be concluded that at least relative to the electric public utility field there was undoubtedly considerable growth of total plant investment for the various companies producing and selling electric energy. Moreover, although the relationship between electric production and plant investment is not always directly proportional, there is a tendency for operating net income, and consequently, the value of utility assets, to increase as the volume of production increases.

Table 21

Total Production of Electric Energy for Public Use Compared with Assessed Valuation of all Electric Light and Power Companies in Colorado, Selected Years Since 1920

Year	Kilowatt Hours Production[1] (Thousands)	Assessed Valuation[2]	Average Assessed Valuation per Kilowatt Hour Prod.
1920	397,000	$30,844,410	7.8¢

Production increase (26 year-period = 184.3%
Assessed Valuation increase (26 year-period = 70.9%

1 U. S. Geological Survey for years prior to 1934; Federal Power Commission for years since.

2 Reports of Colorado Tax Commission. As the Reports prior to 1939 do not give a composite figure for electric companies, tabulations for the earlier years were made by the writer. Rural electric companies are included in all tabulations.

Table 21 also gives a comparison between total production of electric energy for public use and assessed valuation of all electric light and power companies. It may be seen that expressed as an average of assessed valuation per kilowatt hour of production, assessments have declined from 7.8 cents in 1920 to 4.7 cents in 1945. In other words, although production increased 184.3 per cent during the period, assessed valuations increased only 70.0 per cent. In order for the same ratio to prevail in 1945 as in 1920, total assessments for the industry should have been $88 million instead of the actual $52.7 million. However, there is insufficient evidence to indicate whether or not the same ratio should prevail if relative tax burdens for all property owners in the state are to be maintained. One consideration is whether or not tax-exempt municipally owned electric plants were producing and distributing a larger proportion of electric energy at the end than at the beginning of the period. However, this aspect of the problem can probably be disregarded, as privately owned utilities are now producing about 90 per cent of all electric energy in the state. Although exact figures are not available for the earlier years, there is reason to believe the ratio was not very much different in 1920.

Conclusive evidence has been presented in this study to indicate that a state wide reappraisal of all tangible property in Colorado is urgently needed. Moreover, the tax commission has long recognized this need and has repeatedly requested the legislature, to no avail, for sufficient appropriations to permit the conducting of these reappraisals. Colorado's need is similar to that which was present in Utah several years ago. The procedure followed there relative to the reappraisal of all buildings in the state is described by L. L. Wilson as follows:

> "Soon after the tax commission was organized, a survey revealed the existence in Utah of all those evils to which the property tax system everywhere is heir. Under-assessment, over-assessment and non-assessment were rife, and for many reasons. Inequities existed as between counties and between classes of

property. But the greatest inequities -- and the most serious to the taxpayers concerned -- were found as between property in the same county, and in the same class. Obviously, to cure such evils the original assessment must be made uniform.

"The first step taken by the Utah commission to correct this situation, so far as it applied to buildings, was to set up a valuation engineering division, which spent some time in formulating scientific schedules, adapted to Utah conditions, for the valuation of the various types of structures. The division also prepared a reappraisal card for use in the field, on which could be recorded all data necessary for an accurate valuation of each building, together with an outline plan and a photograph.

"After agreement had been reached with county taxing officials, a representative from the county assessor's office and one from the engineering division of the tax commission, equipped with camera, tapeline, and reappraisal cards, visited each building in a county. Interior and exterior examinations were made, measurements taken and data recorded. With this field work completed, it was possible to calculate, first, uniform reconstruction costs; then present values of each building, after allowances for depreciation, obsolescence and other factors, affecting marketability. Lastly the cards were filed in the office of the county assessor, where they were available for public inspection.

"Usually a public hearing also was held at which the purposes and the procedure of the revaluation were explained, protests were received, and decisions announced and discussed. Public interest was encouraging; reaction finally was good, though at first, in a few instances, threatening and even truculent. Not infrequently opposition and criticism melted away when groups of cards, showing photographs of comparable structures, revealed emphatically the inequities in former assessments and the much greater uniformity attained by revaluation."[1]

A number of other states including Illinois have made significant progress toward state wide reappraisal of property during recent years. Illinois' efforts in attempting to obtain full-value assessments are particularly notable. Should Colorado decide to reform her assessment procedure in order to provide more complete and equal appraisals of property in the several counties, the experience in such states as Utah and Illinois can be drawn upon for assistance.

---

1. L. L. Lamont, "Statewide Reappraisal of Buildings in Utah for Assessment Purposes," Bulletin of the National Tax Association, October 1945, pp. 4-5

The Problem of Tax Exempt Property

There is a large proportion of property, both real and personal, in Colorado which is wholly or partially exempt from taxation under the property tax system. As previously discussed, the constitution adopted in 1876 permitted and in some cases required certain classes of exemptions. These included (1) $200 of personal property for each head of family, (2) property of the state and its political subdivisions, and (3) certain property employed in a manner other than for the purpose of earning a profit for the individual owners -- namely, property used solely for religious worship, for schools, for strictly charitable purposes, and also cemeteries and irrigation projects not operated for private profit. Later constitutional amendments exempted all intangible property and motor vehicles from the property tax. Also because of the established principle of intergovernmental immunities, federal property is not subject to taxation by state and local units.

These constitutional tax exemption provisions have been implemented by statutory law, by administrative practice and by court decisions. They are sufficiently significant to justify a brief discussion.

The Personal Property Exemption for Heads of Families

The provision for a personal property exemption of $200 for each head of family[1] was undoubtedly placed in the constitution in order to safeguard the standard of living of those families in the lowest income groups -- those on a subsistence level who would be forced to sacrifice some of the bare necessities of life if their scant personal effects were subjected to taxation. However, for the sake of uniformity and ease of administration a blanket provision was inserted, permitting each head of family, regardless of the amount of personal property, to claim an exemption up to a maximum of $200.

The constitutional provision was not intended to provide a loophole through which millions of dollars of property would escape without paying a cent of property tax even when the owners possess considerable taxpaying ability. In other words the exemption was intended to include only $200 of personal property when all such property is fully assessed at true market value. Also the exemption was intended to apply only to purely personal or household tangible property such as household furniture, washing machines, clocks, silverware, clothes, etc. It was not intended to be applied against the present broad interpretation of personal property which includes all movables whether in the home, factory, or business.

Nevertheless, in practice in Colorado the $200 exemption provision has been flagrantly violated by most every county assessor since adoption of the constitution in 1876. Perhaps the most inequitable aspect of this refusal to follow the requirements of the law and constitution is that there is no uniformity of violation by the county assessors.

---

1 Article 10, Paragraph 3, Colorado Constitution.

In some counties most personal property escapes assessment entirely while the few items to be found on the tax rolls are assessed at a mere fraction of true value. This situation almost invariably means that total exemptions exceed the assessed value of all personal property -- a preposterous state of affairs. Then to make matters worse, the assessor finding the value of personal property for individuals to be less than the $200 personal exemption, deducts the "excess" from the value of farm or business personality which may be owned by the individual.

These violations carried on in some counties to the extent described, become particularly unfair to property owners in other counties where assessors may be attempting, more adequately, to enforce the law. Furthermore, even within the very counties where property owners appear to be most favored with low assessments, there are likely to be the greatest discrepancies as between particular individuals, relative to the assessment of personal and real property.

Studies indicate that if personal household property were fully assessed, the assessment value should correlate closely with the value of the dwelling in which the property is located. Consequently, a comparison of actual personal property assessments with the census value of dwelling units is an excellent index with which to compare the various counties of the state. Such comparisons are shown in Table 22. Figures are for 1940, the most recent year since the last housing census.[1] Column (d) gives the average assessed value per dwelling unit of personal household property. It may be seen that the range among the counties is from a high of $273 in Denver to a low of $35 in Huerfano -- $150 being an average for the state as a whole. As it is unfair to make direct comparisons between counties whose residents differ widely relative to actual income and wealth, the figures are expressed in column (e) as percentages of the average census value per dwelling unit for each county.

The counties are listed in the table according to their relative standing as shown in column (e). It should be kept in mind that the percentage figures for the various counties are shown in this column can now be compared directly with each other -- a correction having been made for variations among the counties in wealth and income. Therefore, these percentages should indicate in a very real sense the success, or more likely the lack of success, of assessors in placing personal household property on the assessment rolls.

---

1 Even though the valuation placed upon housing units by the Bureau of Census may not be completely accurate, the same criteria for judging values were used in each county; consequently, comparisons in Table 22 are valid and significant.

4 Assuming same average as for the neighboring county of Archuleta, census figure not given.

According to the table, Pitkin county rated highest in the state with a ratio of 20.7 per cent. In other words, in this county the average assessed valuation of personal household property was 20.7 per cent of the average census value of dwelling units. On the other hand, Bent County rated lowest with a ratio of only 2.8 per cent. Average for the state was 6.4 per cent indicating that assessments were considerably lower than they should be for the state as a whole. Generally it is safe to say that personal household property is worth about 10 per cent of the real estate value (including both building and ground) where the personal property is located. Judged by this standard, and disregarding the fact that the value of land is not considered in our table (column b), only 10 counties in the state were adequately assessing their household goods -- those as shown in Column (e) with ratios of 10.0 per cent or more.[1]

Our immediate concern in this section is the effect of the $200 exemption upon personal property assessments. The figures in Table 22 (Column c) do not take into consideration this effect as they represent assessment amounts before deduction for exemptions. The table is merely intended to show the inadequate and unequal assessment of personal property among the counties.

However, figures for 1945 assessments compiled by the tax commission (Table 23) show some of the effects of the personal tax exemption. The counties are segregated into six groups in the state according to common economic characteristics. Although the classification is not a perfect one, it has some value in facilitating a direct comparison among the counties. For example, the three counties largely urban -- containing the three largest cities in the state -- are in one group, the eleven counties, each with middle-sized cities and considerable areas of productive irrigation lands, are in another group, etc.

Within each group the counties are listed according to relative rank. Those counties with the highest relative amounts left after deduction for personal exemptions are listed first. For example, Denver is first in her group because exemptions amount to only 42.5 per cent of the assessed value of household goods, while Pueblo county is last in the group because her ratio is 78.8 per cent.

Among the other groups of the state an even greater variation exists regarding the effects of deduction for personal exemptions. In group II the range is from a low of 62.0 per cent in Boulder county to a high of

---

1 The writer realizes that some county assessors have made courageous efforts to improve assessments of personal property. Various devices have been used to standardize practices and to serve as guides for deputy assessors. One example is the "Room-Unit-System" for assessment of household goods prepared by the assessor in El Paso county. Other similar plans have been adopted by assessors in a few other counties.

Table 23

Source: Figures obtained from Colorado Tax Commission

104.9 per cent in Las Animas county; group III ranges from 73.3 per cent in Sedgwick county to 196.8 per cent in Washington county; group V, from 68 per cent in Grand county to 129.3 per cent in Costilla county; and finally group VI, from 56.2 per cent in Clear Creek county to 133.2 per cent in Hinsdale county. There is little equity in a property tax system permitting such a wide variation among counties with similar industries, whose resident property owners are to be found upon similar economic levels.

In more than one-third of the counties of the state, personal exemptions exceed the total assessed valuation of personal household property. Assessors in these counties would actually show more net assessments on the tax rolls if the $200 personal property exemption were eliminated and all household goods were made tax exempt. In another third of the counties, total net personal property assessments are so negligible that considering the cost of administration and the subterfuge of the system, conditions in these counties also would be improved if the personal exemption were removed and household goods made tax exempt.

The writer believes, however, that this would not be the best solution of the problem. In the first place, removal of the $200 personal property exemption would require a constitutional amendment which would be virtually impossible to obtain. Secondly, the principle behind the exemption is probably sound if personal property is assessed at a figure even approaching full value. Finally, personal household property owned by most families represents at least some taxpaying ability. To exempt it all would place an even heavier burden upon real estate which in many cases is already paying relatively too much.

From the standpoint of sound tax principles, the correction would be to obtain a much more complete listing of personal property upon tax rolls with assessment on a valuation basis corresponding more closely to full value. The state tax commission has sufficient authority over county assessors to enforce this.

An aggressive commission supported by sufficient budgetary funds to maintain an adequate staff of field workers could succeed in obtaining millions of dollars of additional personal property upon the tax rolls. The small extra cost would be repaid many times over in additional revenue; moreover, as a consequence, there could be a lighter tax load upon much of the real property of the state.

Even though budgetary funds are inadequate, the present tax commission has sufficient information regarding assessments among various counties to bring about a great improvement. Perhaps the present commission needs more of the aggressive character of the original commission appointed some 30 years ago. However, it would be much easier for the tax body to act if it had an aroused public behind it to support measures taken relative to tax reform. The writer believes members of the commission would welcome such an aroused public.

Property of State and Local Units

The Colorado constitution exempts from taxation all real and personal property of the state, counties, cities, towns and other municipal corporations and public libraries. These provisions were placed in the original constitution adopted in 1876. Subsequent legislation has been guided by this exemption principle. The arrangement for exclusion from taxation of inter-governmental properties conforms to general practice in other states of the Union.

Probably no useful purpose would be accomplished by making state property taxable by local units; likewise, the property of local governmental units should not be taxed by the state government. A possible exception, as referred to later, is governmental property used in commercial enterprises.

Because of concentrations of state property in particular areas of the state, especially when these holdings narrow the tax base of local units and perhaps also require more expenditures for local services, the state might consider the advisability of extending certain payments in lieu of taxes. Such a policy if adopted, would conform to the fiscal policy of the national government relative to its holdings of certain real property.

The valuation placed upon all property owned by the state of Colorado (both departments and institutions) for June 30, 1944 was nearly $370 million as shown in Table 24. It may be seen that real property (land, buildings and improvements, water and mineral rights) was the largest item amounting to a total valuation of about $325 million; while personal property (the remaining items in the table) had a valuation of almost $44 million. The figures are probably in excess of a true market value and undoubtedly are very much greater than a tax assessed value would be if assessments were comparable with those on private property in the state.

Estimates are not available to indicate the value of all property owned by local governmental units in Colorado. However, this information would probably serve no useful purpose from the standpoint of property taxation. Yet there is one category of property owned by several Colorado municipalities which might be subjected to state and county taxation -- namely, property used in commercial enterprise.

The principal form of such commercial enterprise is the municipally owned utility producing electric light and power. In 1942, 10.5 per cent of the electric energy produced in the state came from these city owned utilities. No great hardship would be placed upon these plants if they paid taxes comparable to those paid by privately owned utilities. In fact, much unnecessary criticism directed against them could in this manner be avoided. Furthermore, the total property tax load would become somewhat more equitabley distributed.

Federally Owned Property in the State

The largest body of tax exempt property in Colorado is in the form of land and improvements owned by the federal government. In most cases this property is fully exempt from taxation by state and local units.

During recent years there has been a rather pronounced increase in the amount of real estate removed from tax rolls because of expansion of federal ownership. This development, together with inability for other reasons of the property tax to satisfy local revenue needs, has caused considerable concern in the minds of some people relative to the trend. It is contended, and sometimes with justification, that federal acquisition of property may create difficult local financial problems due to contraction of the local tax base. Moreover, in some instances federal properties make necessary the expansion of local governmental services.

The amount of land in Colorado owned by the national government has increased from 22,119,158 acres in 1937 to 25,492,803 acres in 1944. This increase has been to a large extent because of the acquisition of tracts of land for conservation and development purposes as well as for reservations, cantonments, airfields and other defense and war facilities attendant to World War II.

By 1944, the 25,492,803 acres of land owned by the federal government represented 38 per cent of the total land area of the state (table 25). On the basis of percentage of federal land to total land, Colorado ranked ninth among the states of the Union. In other words, eight states (all

western) had relatively greater areas under national ownership. Largest areas on both an aggregate and relative basis were to be found in the 11 western states. Aside from these states only South Dakota and New Hampshire contained areas in excess of 10 per cent owned by the federal government.

1 States with 5 per cent or less not listed.

Table 26 shows the amount of federal land holdings in Colorado classified by administrative agencies. It may be seen that the largest tracts are forest lands (13,674,492 acres) administered by the Department of Agriculture and grazing lands (7,678,944 acres) administered by the Department of Interior. These two combined represent almost 84 per cent of the total area owned by the national government.

Other fairly large tracts are administered by the Bureau of Reclamation, the Office of Indian Affairs, the General Land Office, the Soil Conservation Service, National Park Service, and the War Department.

These extensive holdings by the national government -- 38 per cent of the land area of the state, toghether with improvements thereon -- appear to represent a vast amount of tax-exempt property placing a burden upon the owners of privately held property who must bear the entire cost of local government. However, such an interpretation is inadequate and in particular cases completely erroneous.

Although most federal property is not taxable by state and local governments, various payments in lieu of taxes have been authorized by Congress. In general, all types of payments may be classified into three categories.[1]

First and most important are payments made to state or local governments in the form of a stated percentage of gross or net revenues from the use of land, with or without stipulation of the purposes for which the funds may be used by the recipient. These payments apply principally to the public domain but also in special cases to certain acquired lands.

The types of benefit to state or local units in Colorado in this first category are shown in Table 27. The principal revenue sources in recent years have been forest and grazing lands and mineral resources. In addition to the percentage payments as indicated in the table, the national government allocates considerable revenue for maintenance and improvement of the public domain. For example, 10 per cent of the total collections from forest acreages is devoted to road and trail construction within the forests; 25 per cent of receipts under the Taylor Grazing Act, when appropriated by Congress, may be expended for construction, purchase and maintenance of range improvements; while various amounts received by the United States Reclamation Bureau from mineral royalties and bonuses are spent in the state on reclamation projects.

A second general type of payment from the federal government (of minor importance in most states, including Colorado) is revenue allocated by administrative agencies, by agreement, to local units in lieu of taxes when certain resettlement and federal housing projects have been undertaken requiring expensive local services.

Finally, a third type of payment (also of minor importance in Colorado) is the payment of ad valorem taxes by federal lending agencies. These levies have been permitted by Congress and are upon real estate acquired in most cases for forclosure in connection with lending and collection operations.

Table 27

Federal Contributions Based Upon a Specified Per Cent of Revenues from Public Lands

Lands or Resources Affected	Nature of Payment	Recipient and Purpose if Specified
Forest resources	25% of receipts	Counties for roads and schools
Conservation and land utilization projects	25% of net revenue	Counties for roads and schools.

Figures are not available showing payments to Colorado (the three categories) because of the ownership of federal real estate. However, Table 28 gives average annual payments (1928-37) for all purposes including relief expenditures. This average amount was $11,928,000. If relief and other emergency expenditures are excluded the average annual payment to the state was $4,982,000.

Table 28 also shows an estimate of the fair market value of real property owned by the federal government in Colorado ($100,203,912)[1] and indicates the amount of local property taxes ($1,885,525) which the government would pay if such property were assessed and taxed by local units. The latter figure is particularly significant when compared with the amount of federal aid going to Colorado for the benefit of state and local units of government. Apparently an amount of assistance is given

1 This estimate was made for the year 1937 for all states by "a special committee on the study of Federal ownership of real estate and of its bearing on state and local taxation" appointed by President Roosevelt. Its report was submitted in 1939. A more recent and perhaps more comprehensive estimate of the value of federal property in Colorado is contained in the Colorado Year Book, 1943-44. Its estimate is $7,056,442,531, or $1,171,129,830 excluding cash assets in the Denver mint. This figure is obviously determined on some basis other than fair market value. For example, federal coal lands alone are valued at $722,450,000! See page 472.

Table 28

Estimated Value of Federally Owned Real Estate in Colorado (1937)
Compared with Federal Aid to Colorado

Area of federal land in Colorado (1937)	22,119,158 Acres
Cost of federal land and improvements	$46,772,913
Estimated fair market value of federal real estate	100,203,912
Estimated property tax yield if applied to federal real estate	$1,885,525*
Average annual federal aid to Colorado (1928-37)	$11,928,000
Annual federal aid as percentage of fair market value of federal real estate	11.9 per cent
Average annual federal aid to Colorado (1928-37), excluding all WPA and other emergency payments	$4,982,000
Annual federal aid (excluding WPA, etc.) as percentage of fair market value of Federal real estate	5.0 per cent

* Based upon local mill levies.

Source: Senate Document No. 130, 78th Congress, 1st Session, November 18, 1943, p. 27.

several times greater than if payments were confined to ad valorem taxes on federally owned property. The average federal aid (1926-37) related to the value of federal property was 11.9 per cent.

If relief expenditures are excluded, the ratio becomes 5.0 per cent. Even this smaller percentage is considerably more than the average total property tax rate (state, county, municipal and school) of 3.6 per cent levied against private property in Colorado in 1937. Furthermore, private property was probably assessed at not more than 50 per cent of true value while the appraisal of federal property was upon a 100 per cent basis.

Thus, even though most federal property is completely tax exempt, payments in lieu of taxes added to other federal aids would amount to a much greater sum than the yield of a tax on federal property should there be one. Therefore, in a sense, federal real estate in Colorado is more than paying its way.

This does not necessarily mean however, that the fiscal relationship between federal and local governments growing out of the ownership of federal properties is always satisfactory. We believe that in the future a much better solution of the general problem would be achieved if the principles were adopted as formulated by the Treasury Department's Committee on Intergovernmental Fiscal Relations. These principles, summarized by the writer are as follows:[1]

1 Senate Document No. 69, 78th Congress, 1st Session, June 23, 1943, pp. 24-26.

1. There should be a Federal-State Fiscal authority to serve as a clearing house and administrative agency for all payments in lieu of taxes. It is desirable to develop a consistent and intelligible policy in this field.

2. Some recognition should be given to the benefit bestowed on a community by the location of a federal function. If there is resulting benefit, the amount of federal payments might be governed accordingly.

3. Property that has long been owned by the Government, and new properties of the same class should ordinarily be exempt with no compensation from federal funds. The affairs of all concerned have long since been adjusted to the exemption status. No useful purpose would be served, for instance, by subjecting the United States post office property and general administrative buildings to local taxes. The extensive holdings of public domain have never been taxed and probably should also be placed in this category, although revenue-sharing devices of long standing are in operation and will probably have to be retained.

4. Where services are sold by governmental agencies on a commercial basis and in competition with similar private activities, as in the power projects, the property should ordinarily be valued by the federal government and subjected to local taxes.

5. Other federal property that is ordinarily utilized by or designed for sale to private individuals, such as farm and resettlement properties or additional Indian lands, should pay the equivalent of levies on similar privately owned property.

6. Property acquired for conservation purposes (such as sub-marginal and cut-over forest lands) might well pay a low, flat, average rate on value as of the time of acquisition. This would constitute a minimum guaranty, pending larger local receipts which later could be paid from a distribution of revenue when the property becomes revenue producing. The percentage of revenue shared would resemble a severance tax.

7. Although in the main, full local services should be supplied the federal property and its residents, if the Government is obliged to supply its own facilities and perhaps even to extend them to local residents, there should be adjustment accordingly of the payment to local units.

Other Tax Exempt Property

The Colorado constitution provides that "Property, real and personal, that is used solely and exclusively for religious worship, for schools, or for strictly charitable purposes, also cemeteries, not used or held for private or corporate profit, shall be exempt from taxation unless otherwise

provided by general law."[1]

It may be noted that the exemption is in the nature of a privilege conferred by the sovereign which may be limited, modified or abolished by the legislature. This right of the legislature to decide the extent to which the exemption privilege shall be bestowed was affirmed in the case of Horton vs. Colorado Springs Masonic Building Society[2] and re-affirmed in McGlone vs. First Baptist Church.[3]

However, the legislature has followed the wording of the constitution very closely when enacting laws pertaining to exemptions for religious, educational and charitable purposes. The existing law was passes by the legislature in 1908.[4] It extended the concept of exempt property used for religious worship by including the value of rectories to a maximum of $3,000.[5]

Among the states of the Union there are two distinct lines of authority on the construction of tax exempt constitutional and statutory provisions; one line construing them strictly, the other giving them a liberal construction. The Colorado courts have consistently followed the liberal interpretation. This has been a matter of concern to tax authorities because of the apparent escape under immunity of tax exemption of much property which rightfully should be taxed.

For example, until the law was amended to specifically deny the practice, the courts held that premises occupied solely for a private school although conducted for profit, were tax exempt.[6] In 1921 the legislature changed the law to read: "Section 2. The following classes of property shall be exempt from general taxation, to wit: ..... Third. Grounds with the buildings thereon, if said buildings are used exclusively for schools, other than schools held or conducted for private or corporate profit."[7]

The 1933 legislature further clarified its intent relative to a tax exempt school by defining such school as "an educational institution requiring daily attendance, having a curriculum comparable to a grade, grammar school, junior high, high school or college or any combination thereof and having an enrollment of at least forty students and charging a tuition fee."[8]

Another example of the liberal interpretation of the court relative to tax exempt property involved a building owned by a corporation organized by several Masonic societies in Colorado Springs. The societies

8 Chapter 158, Session Laws of Colorado, 1933.

used the building primarily for charitable purposes but operated a stand for the sale, to those privileged to be there, of cigars, tobacco, and other wares; as well as a reading room for the use of members of the different Masonic bodies and gave dances and dinners in a room devoted to the purpose, where non-members were admitted and an admission fee was charged. A majority of the Court ruled that the land and building were entirely exempt from taxation.[1]

Justice Teller writing a dissenting opinion vigorously attacked the opinion of the majority contending that "clearly, this building is not used solely and exclusively for strictly charitable purposes, and ought not, therefore, to be exempt." He further argued that "The basis of the exemption of charitable institutions is that the state does not lose thereby, since they assume a burden which the state must otherwise bear....How can it be said that the use of so much of this property as is in effect a club-room for the use of lodge members -- with no necessary connection with the general work of the order, -- relieves the state of any burden?....if the court's reasoning be sound, a golf course connected with the building....or a picture show, the receipts of which are devoted in part to lodge purposes, should likewise be exempt....The result of this consideration is that we have exempted a property from taxation on the mere possibility that it may be a source of income to an institution which has, without much reason, been termed a charitable institution."

Since 1918 when the ruling was made in the Colorado Springs Masonic case a majority of the court has consistently taken a liberal viewpoint relative to such fraternal organizations as the Masonic Lodge.

In 1932 the court ruled that property of a corporation not for profit and which is used in connection with the promotion of physical culture and mental qualities of its members and others who may comply with its rules, was exempt from general taxation.[2]

One further example may be cited to indicate the judicial attitude toward tax exempt property. In 1935 the court held that the requirements of the constitution and statutes concerning exemption from taxation of property of religious, charitable and educational institutions are met if there has been work done on the lots and "there is a bona fide continuous intention on the part of such organizations that their real property, and buildings to be by them constructed thereon, are to be devoted exclusively to religious, charitable or educational purposes.[3]

Justice Holland, dissenting, stated that in his view the opinion of the majority "announces in effect the doctrine that all real estate owned by a religious corporation is exempt from taxation."

---

1 Horton vs. Colorado Springs Masonic Building Society, 64 Colorado 529 (1918)
2 Denver Turnverein v. McGlone, 91 Colorado 473 (1932)
3 McGlone vs. First Baptist Church of Denver, 97 Colorado 427. (1935).

Because of the very liberal attitude taken by the Colorado courts relative to exemptions of property owned and operated for educational, religious and charitable purposes, considerable property, not originally intended to be so favored, undoubtedly escapes taxation. Writing in 1918, the state tax commission urged, "Property subject to exemption from taxation should be more clearly defined. Our state courts have construed the subject of exemption so liberally that there has been stricken from the tax rolls millions of dollars' worth of property that is at least partially used commercially."[1] The sole justification for such exemptions is that meritorious functions are performed relieving the government of burdens which it would otherwise have to bear. However, the definitions of religious, charitable and educational purposes have been so broadened and so loosely interpreted that it is questionable if in many instances the justification is present of "relieving the government of burdens which it would otherwise have to bear."

The argument that the exempt property is held and operated for purposes other than a profit is scarcely valid in that much other taxable property including homes and household goods would fall into the same category.

Another class of property exempt from taxation, as permitted by the constitution, and authorized by law is property used for irrigation projects. The present law was enacted in 1921 and provides that "Ditches, canals, and flumes owned and used by individuals or corporations for irrigating land owned by such individuals or corporations, or the individual members thereof, shall not be separately taxed so long as they shall be owned and used exclusively for such purposes."[2]

There appears to be no valid justification for favoring this particular kind of cooperative ownership of property as contrasted with real and personal property of other cooperatives such as marketing and consumer organizations not operating for a profit. However, if the value of the irrigated land, made possible because of the irrigation project, is sufficiently assessed, probably no great injustice is done, as the value of the project is reflected in increased value of the land.

Still another property exemption permitted by the constitution and authorized by law is "cemeteries not held or conducted for private or corporate profit."[3] This provision appears not to violate the principle of equity in taxation. However, it is necessary for tax assessors to be diligent in seeing that only those cemeteries of a public or cooperative nature are made tax exempt.

Two categories of property have recently been added to the list of tax exemptions under the general property tax. These are motor vehicles and intangible personal property.

---

1 Seventh Annual Report, 1918, p. 9.
2 Chapter 200, Session Laws of Colorado, 1921.
3 Ibid.

The reason for the motor vehicle exemption was in order to provide for a specific ownership tax in lieu of the property tax, to be collected at the time license fees are paid.[1] This new method of taxing motor vehicles has been an improvement over the old in preventing evasion; however, the new tax rates appear to be unusually light as compared with those in most states. More will be said regarding this tax in another report.

Since the beginning of property taxation in Colorado intangible personal property had largely escaped taxation. In spite of constitutional and statutory provisions to the contrary most county assessors found it inadvisable or impossible to place a very large proportion of intangibles such as stocks, bonds, money and credits, notes, bank deposits, and book accounts on the assessment rolls. As early as 1912 tax authorities began recommending a change in the system by proposing that intangibles be made exempt from property taxation if the income from intangibles could be included under an income tax. Finally, in 1936 this arrangement was made possible by a constitutional amendment[2] and the following year an exemption provision was made part of the new income tax law.[3]

The degree of success in taxing the income from intangible property in lieu of all property taxes is discussed in another section.

The law in Colorado specifies that county assessors shall assess all tax exempt property placing the valuations on the assessment rolls even though no taxes are to be collected.[4] No appraisals have ever been made, however, and consequently, none of the property is listed by the assessors. Apparently their efforts have been confined to the difficult task of finding and assessing property which is subject to taxation.

There probably should be an appraisal of tax exempt property in the state -- particularly that property exempt for religious, educational and charitable purposes, and tax exempt irrigation projects and cemeteries. This appraisal could be made either by public officials or by some competent independent body. If we had an estimate of the value of such tax exempt property classified by kind and by uses it would be much easier to decide the effect of liberal and often lenient rulings of the court relative to the problem. After obtaining this information it also would be easier to agree upon changes in the system of tax exemption if amendment seemed advisable. A revision, although perhaps politically difficult, would not encounter many legal problems as the tax exemptions causing the greatest concern are statutory and not constitutional.[5]

Tax Rates and Tax Rate Limits

Tax Rates

The property tax rate is customarily expressed as a particular mill levy per dollar of assessed valuation. For example, the rate in 1945 for state purposes was 3.50 mills. This means that property owners were required to pay taxes to the state government equivalent to 3.50 mills for each dollar of assessed valuation of their property. The rate can also be expressed as a percentage, in which case the 3.50 mills would become .35 per cent -- a 10 mill levy would be 1 per cent.

Actually, in Colorado as in most other states, the property owner does not pay any property tax directly to the state government. There is local collection by the county treasurer, who in turn, forwards the state's share to the state treasurer. In order to facilitate collection, particular mill levies of each layer of government (state, county, city or town, and school district) are added together and the total levy thus obtained is applied against the property located within the governmental units concerned. Thus actual collection of the total tax is made by the county treasurer.

If all property were uniformly assessed among the various taxing districts and if valuations were relatively equal from one year to another, a comparison of mill levies for the purpose of determining relative tax burdens would be more significant. However, as we have already seen, property assessments are not uniform throughout the state, nor have they been made in a uniform manner over the years in the past. Nevertheless, with this limitation in mind let us briefly review the past and current tax rates which have been levied by the state and local units.

Table 29 gives the total mill levy for state purposes by years since 1912. It may be seen that considerable fluctuation in rates has occurred. For example, the levy was drastically reduced in 1913 (1.30 mills) as compared with the previous year (4.05 mills), the reason being that in 1913 assessed valuations were tripled by the new tax commission. Actual taxes levied and collected in dollars remained relatively constant. After 1913 the mill levy gradually increased until by 1922 it was 4.48. However, there was a reduction the next year, thereafter the rate remaining about the same (fluctuating around 3.50 mills) until 1937. The beginning of a 10 year building program for state institutions caused an increase in that year, the levy rising to 4.50 mills. Since then the trend has been down, declining to 3.42 mills by 1946.

Throughout the years the effective state rate has remained remarkably constant; it has always represented a relatively small proportion of the total levy made by all governmental units (state and local): and always the state levy has remained well below the maximum rate permitted under the constitution.

Table 29

State Mill Levy and Average Total Mill Levy, All Governmental Units in Colorado, by Years 1912 - 1946 Inclusive

Year	State only	Average for all units[1]	Year	State only	Average for all units[1]
1912	4.05	39.8	1930	3.59	31.0
1913	1.30	13.8	1931	3.49	31.2
1914	1.39	14.1	1932	3.49	31.2

Table 30 shows the allocation of the 3.50 mill levy in 1945 according to various state functions. During recent years (including 1945) the state general fund has received no revenue from the property tax -- all levies being earmarked for special functions or funds. A discussion of the levies for these special purposes would lead to a discussion of governmental expenditures -- a topic beyond the scope of our present study.

Table 30

Mill Levy for State, Classified by Major Functions, 1945

Function	Mill Levy	Anticipated Revenue
Educational Institutions	1.58741	$ 1,934,764
Eleemosynary Institutions	.40844	497,814
Building Program	.81314	991.070
Interest and Debt Retirement	.35768	435,947
Police Pensions	.20000	243,764
State Military	.07000	85,317
Stock Inspection	.03333	40,623
State Fair Tax	.03000	36,565
Total (state purposes)	3.50000	$ 4,265,864

Source: Annual Report, 1945, Colorado Tax Commission

In addition to the figures indicating mill levies since 1912 for state purposes only, Table 29 also shows average total levies by years for all governmental units (state and local) within Colorado. The total levy sharply declined after 1912, dropping from an average of 39.8 to an average of 13.8 mills. However, since then the rate has gradually but steadily increased until by 1945 it was almost back to the level of 1912 -- 38.7 mills as compared with the former 39.8 mills.

Considerable variation occurs throughout the various counties relative to property tax rates. In Table 31 the counties are listed in order according to total assessed valuation -- the larger and more wealthy counties being listed first. It may be seen that in 1945 the county mill levy varied from a low of 4.16 in Baca county to a high of 24.32 mills in Hinsdale county. The average for all counties was 9.2 mills. It is significant that the smaller and poorer counties at the bottom, with one or two exceptions, had the highest mill levies. Thus the 14 counties with total valuations below $4 million had an average mill levy of 14.42 or 56 per cent above the average for all counties in the state. It may be concluded that these counties particularly, and to a lesser extent some of the other smaller ones, possess insufficient population and resources for efficient and economical operation of county government.

The same table also shows the average total mill levy (state, county, city or town, and school district) for each county. These figures represent the average tax rates which property owners are called upon to pay in the various counties. Here the range is from a low of 22.5 mills in Park county to a high of 50.66 mills in Huerfano county -- the average for the state being 38.72 mills. Because the smaller and poorer counties have fewer cities and also because they provide less adequately for schools, the combined total levy for all purposes in these poorer counties tends to be at or below the average level for the state.

An interesting comparison is shown in Table 32 which gives the total mill levy in the 25 largest cities and towns of the state. Although property assessments are not uniform among all of these cities and, consequently, conclusions relative to tax rates must be qualified, the wide variation among the cities has some significance. For example, the city of Longmont in Boulder county in 1945 had a total mill levy of only 39.36 as compared with 67.17 mills in Walsenburg, Huerfano county, a city of about the same size. Although evidence indicates that property in Boulder county is assessed at more nearly the full value than in Huerfano county, the entire difference in mill levies as between the two cities cannot be explained in assessments. Another explanation of the tax rate differences could be in terms of the governmental services and educational facilities offered in the two communities. However, the level of these services in Longmont is probably higher than in Walsenburg. Consequently, some other cause must be found to explain the wide variation in rates as between the two cities. By examining the table, other interesting comparisons among different cities can be made.

Tax Rate Limits

Rate limits relative to the property tax found in the Colorado Constitution are confined to restrictions upon the state government. As previously discussed, the original constitution provided for a sliding scale of limitations, maximum rates at a particular time depending upon total assessed valuations. However, an amendment in 1892 fixed the maximum rate for state purposes at four mills. Another amendment in 1920 permitted the levying of one additional mill for erection of buildings for state educational institutions. Thus, present restrictions limit the total tax rate on property for all state purposes to a maximum of five mills on each dollar of valuation.[1] One exception to this limitation has been ruled by the courts. The legislature may levy any rate required to finance the cost of suppressing an insurrection.[2]

Tax levy limits imposed upon political subdivisions of the state are all statutory rather than constitutional. The scope of this study permits merely a brief summary of these statutory limits.

I. Counties. The maximum county levy to defray ordinary expenses including support of the poor and contingencies is limited according to

1 Colorado Constitution, Article 10, section 11
2 In re State Board of Equalization, 24 Colorado 446.

a detailed classification established by the legislature. The range is from a maximum of six mills in counties having an assessed valuation of $1 million or less to a maximum of one mill in counties having a valuation of $400 million or more.[1] In addition, a number of special provisions in the law permitting maximum levies for specific purposes may be mentioned as follows:[2]

1. Judgments against county, 15 mills.
2. Outstanding warrants, 3 mills.
3. Additional levy for unpaid warrants, 5 mills.
4. Mothers' Compensation, 1/8 of 1 mill.
5. Bonds and interest, amount of levy sufficient to equal 10 per cent of bonds issued.
6. To promote immigration through advertising, etc, 1/5 of 1 mill.
7. County or union high school, 4 mills.
8. Control and eradication of rodents, amount of levy not to exceed a yield of $20,000 annually.
9. Postwar improvements, 1 mill.
10. Road purposes, 10 mills.

II. School Districts. No general maximum levies apply specifically to school districts except for third class districts which are limited to 20 mills.[3] All classes of districts are permitted to levy taxes sufficient to pay interest and principal of maturing bonds. A maximum levy of .1 mill is permitted for the purchase of library books.[4] As previously mentioned, counties may not levy more than four mills for union high schools.

III. Cities and towns. No maximum limits are prescribed by general state law specifically for cities and towns of Colorado. Thus, the municipalities are largely free from such restrictions relative to tax levies. Cities over 100,000 population are specifically permitted to levy a maximum of 1/4 of one mill and 1/10 of one mill for firemen's and policemen's pension funds respectively.[5] In all cities, tax levies for public libraries are not to exceed one mill per dollar of assessed valuation. Also levies for current operation are limited in a number of home rule cities through provisions contained in their own charters.

IV. The five per cent limit. The most significant property tax restriction relative to rates in Colorado is the 5 per cent limit. Unless exceptions are permitted by law, the provision restricts the state and all political subdivisions to a tax levy which will yield for a current year no more revenue than 5 per cent in excess of the preceding year.[6]

2. Ibid, Chapters 33, 45, 143; also Supplement, 1945, Chapter 33.
3. Chapter 146, par. 32.
4. Chapter 146, par. 194.
5. Chapter 163, par. 451, 499.
6. Colorado Statutes Annotated, 1935, Chapter 142, par. 39.

Levies made to provide for the payment of bonds and interest are exempt from the limitation. Also exempt are levies up to a maximum of one mill for any county, city or town postwar improvement.[1]

In any taxing district, except the state, if officials believe the maximum levy permitted by law will not produce sufficient revenue for the current year, an appeal may be made to the state tax commission for the privilege of increasing the maximum levy. If, after investigation, the commission is of the opinion that the request is justified, an additional levy not exceeding five mills may be granted. Should the commission fail to grant the request, or should the excess levy of five mills be insufficient, the question may be submitted to the voters of the taxing district. If three-fourths of the voters at a general or special election favor the increased levy it can be made.[2]

Table 33 shows the number of petitions for selected years which have been submitted to the tax commission by the various classes of local governmental units. Because of the more rigid limits placed upon county governments, a larger proportion of the counties than of other local units usually request increases. In fact, each year since 1935, every county in the state has found it necessary to present petitions for increased levies. Also a great many school districts annually esperience difficulty in levying sufficient taxes to cover budget needs, and, consequently, request permission to make additional levies. It may be observed that the number of petitions tends to fluctuate throughout the years according to general economic conditions -- the number rising during inflation years and falling in times of depression. For example, note the contrast in number of petitions submitted in the years 1920 and 1921.

Table 33

Petitions to Tax Commission for Increased Levies, Selected Years Since 1915

Year	Counties	Cities and Towns	School Districts	Total
1915	28	35	344	399
1920	40	66	762	868

1 Chapter 45, par. 237-40.
2 Chapter 142, par. 41.

From time to time the tax commission has questioned the advisability of requiring tax districts under existing arrangements to submit petitions for increased levies. For example, in 1926 it reported, "With the small force available to the commission, its action in these applications are necessarily more or less perfunctory, as it is impossible for us to examine into the needs of these taxing districts as contemplated by the statutes."[1] Again in 1928 it stated, "It is perfectly obvious that this commission has no facilities for making the examinations contemplated...and, unless the examinations are properly made, there is always danger of excess levies which frequently cause many complications and clouds on titles that last for years and sometimes indefinitely."[2]

Although facilities of the commission are limited for examing petitions, as long as rigid mill levy restrictions are operative, some flexibility appears desirable to take care of hardship cases. Perhaps the commission is as well prepared to provide this flexibility as any other agency. Moreover, since 1934 local units have been required to file with the commission copies of their budgets. This has greatly facilitated the effectiveness of the commission's work.

During the years following 1931 when assessed valuations were drastically reduced, most of the petitions going to the commission were from local units which were facing insolvency. Without mill levy increases the governmental functions of these units would have been seriously crippled. Thus for a number of years most all of the requests were granted by the commission.

In fact, over the years, since 1914 the commission has usually approved most of the applications for increased tax levies. Lacking information, there has been a tendency to give to the local unit "the benefit of the doubt," the request being granted. In many instances if the application is turned down, the issue is submitted to the people of the district who usually approve the tax increase.

This raises the question as to whether or not tax limitation provisions can ever be very effective. Apparently some elasticity is required or, at least in special hardship cases, the evils resulting may be much more serious than the ones which the law is intended to avoid. However, the loophole permitted by the flexibility provisions may largely nullify the effects of any limitation.

Relative to the problem, we might briefly examine the experience with the tax limits imposed in other states. All but about 10 states have imposed various kinds of property tax rate limits -- some restrictions being constitutional and some statutory. As a general rule the restrictions are either by fixing maximum tax levies relative to assessed valuation or else by limiting the tax to a certain per cent of the last levy. Until the depression period beginning in 1930, the limits in most states were too high to affect the ordinary operation of the property tax, either from the viewpoint of protecting property, or of embarrassing

1 Annual Report, 1926, p. 5
2 Annual Report, 1928, p. 6

local finances.

However, in the early thirties a number of states began adopting much stricter property tax limits. Among these was Ohio, whose restrictions became probably the most drastic of any state. An overall limit was established of 10 mills for all purposes except financing of indebtedness incurred prior to January, 1934. The only possibility of exceeding this 10 mill limit in any particular case was through a popular referendum. Since adoption of these severe restrictions, the experience in Ohio has been far from satisfactory. Conditions have developed there which bear out the earlier findings of a New York special joint committee on local property tax limits which concluded:

> "(1) Tax limits do not limit. Cities with tax limits spend as much and raise as much by taxation as cities without tax limits. The tax limit may serve to curtail expenditures for one or two years, but as soon as the restraint is felt an amendment is secured which encourages expansion since the tendency is to levy the full amount permitted whether it is necessary or not; (2) Tax limitation encourages unsound bonding; (3) Tax limitations should never apply to debt service; (4) In a democracy there is no way of blocking a genuine popular demand for increased governmental service through an arbitrary limitation upon the tax levy; (5) The only effective method of securing a restriction of tax levies without hampering municipal services, encouraging unsound bonding and promoting periodic expansion and extravagance, lies along the lines of centering full responsibility upon a single elected official through (a) the establishment of a comprehensive and binding budget system, (b) the enactment of a complete bonding act which will prevent unsound bonding and (c) the wide distribution among the electorals of the direct tax burden."[1]

In the opinion of the writer the various limits placed upon property tax rates in Colorado, as elsewhere, are largely ineffectual. Perhaps occasionally a school district or more likely a county may continuously forego some expenditure because of restrictions which cannot be circumvented, but this is probably the exception, rather than the rule. On the other hand, experience in other states indicates that it would not be wise for Colorado to attempt to strengthen the restrictions by reducing tax limits or by making them less elastic. The present arrangement of presenting applications to the tax commission for additional tax levies (up to five mills) by local units appears to be working fairly well.

Moreover, the limitation restricting current tax levies to a level not exceeding 5 per cent in excess of the previous year appears to be as rigid an over-all limit as can practically be established. Perhaps this limit with the "safety valve" of appeal to the tax commission, or if this fails, appeal to popular referendum, is a good one. Furthermore, the 5 per cent limit may be a genuine advantage, by stilling the fears of

---

1 Quoted by Jensen, Jens P., Colorado State Tax System, 1930, p. 199.

property owners who would otherwise oppose the state's return to a 100 per cent valuation basis for property. Such fears might arise from the belief that if tax valuations were drastically raised, governmental units would become extravagant because of receiving more revenue from the same mill levies. However, the 5 per cent limit would be a safeguard against this possibility.

Collection and Delinquency

As in most other states, the legal arrangements in Colorado are rather complex for enforcing collection of the property tax. These complexities have developed through the years because of an attempt, on the one hand, to improve collections, yet on the other hand, a desire to extend proper protection to the owners of delinquent property.

A very general and simplified description of the procedure in Colorado for collection of the tax would necessarily include a discussion of certain steps as follows:[1]

1. A tax lien (for current taxes) attaches to all property, real and personal, not exempt by law, on the first day of March of each year. The tax lien remains perpetual on the property until taxes are paid.[2]

2. Taxes are due and payable on or before the 30th day of April, the year following assessment. If paid in installments, the first half is due not later than the last day in February; the second half, not later than July 31.

3. Although notices are mailed to the last known address of property owner, a personal demand of taxes is not necessary. Each person subject to taxation is legally obligated to pay to the county treasurer the amount of taxes due.

4. During August a list is compiled of the names of owners of personal property whose taxes have become delinquent. This list with addresses of owners indicating the amounts of delinquent taxes plus interest and penalties is published during the month of September in a newspaper of the county.

5. Any time after the first day of December, the State Department of Revenue may require a remittant county treasurer to enter suit in court for judgments against personal property in order to collect delinquent taxes levied the previous year. After obtaining such judgment a public sale is held to recover an amount equal to the delinquent taxes plus interest and penalties.

---

1 Chapter 142, Colorado Statutes Annotated, 1935, and 1945 Cumulative Supplement.

2 Burton vs. Denver, 99 Colorado 207.

6. After taxes become delinquent upon real property (after August 1) property owners are notified by mail. The notice is also published over a period of four weeks in a paper of the county, announcing a sale at public auction of the property concerned.

7. On or before the second Monday in December all tax delinquent real property is sold at auction under tax certificates of purchase. Any lands remaining because of inadequate bids are taken by the county which in turn receives certificates of purchase.

8. Certificates of purchase held by the county may be sold by the county commissioners at any time or in any manner in which they may see fit, except if taxes due for any one property owner are im excess of $10,000, the Tax Commission must give approval and notice of sale must be published in a local paper.

9. Three years after sale, a tax deed may be issued to the holder of a certificate of purchase (either private individual or county).

10. The owner has five years thereafter in which to redeem his property.[1] In effect, he enjoys the privilege of redemption for eight years after sale.

11. If redemption occurs during the first three years (before tax deed is issued) the owner pays the amount for which property was sold and certain costs and penalties, together with interest at the rate of 2/3 of 1 per cent per month.

12. If redemption occurs after the tax deed has been issued (during the subsequent five year period) the owner pays to the holder of the tax deed an amount equal to the purchase price plus the current value of any improvements which may have been made, plus all back taxes paid with interest at the rate of 12 per cent, plus other costs and penalties including an abstract if one was obtained and cost of treasurer's deed.

13. The holder of a tax deed (private person or county) may enter suit (subject to legal limitations) to quiet the title, thus obtaining a marketable title.

This brief review of the law relative to the collection of taxes and disposal of delinquent property, when taxes remain unpaid, indicates a procedure probably no more involved than necessary if all interest parties are to be protected. During recent years the collection procedure has been improved. Consequently, the system at present, although not perfect in Colorado, is more satisfactory than that found in a majority of the

---

1 Except that a minor, insane person or idiot may enter suit to redeem at any time if within one year after such disability is removed.

states.

A record of actual collections for selected years since 1930 is shown in Table 34. These collections expressed as percentages of taxes levied were calculated at the end of the fiscal year after unpaid taxes had been delinquent, in each case, for a period of 11 months. Ultimately, a somewhat larger percentage of taxes is always collected due to sale of delinquent property, collection of interest and penalties, etc. The figures in the table show a wide variation by years. For example, only 84 per cent of the taxes levied in the depression year of 1932 were collected by June 30, 1934; while 99.4 per cent of the 1944 taxes were collected after a corresponding period had elapsed. This improvement has been due partly to a strengthening of the tax collection procedure, but

Table 34

Tax Collections Expressed as Percentages of Taxes Levied, State of Colorado for Selected Years, 1930 to 1944[1]

perhaps mainly to an improvement in the economic welfare of the people of the state. During prosperous years, collections are always better than during years of depression.

The record of collections by counties for the year 1932 contrasted with 1944 is shown in Table 35. In the former year the range was from a low of 38.7 per cent in Costilla county to a high of 97.0 per cent collections in Jackson county. Fifteen counties collected less than two-thirds of the taxes levied, while 38 counties collected less than 80 per cent.

Such heavy tax delinquency was due to a number of factors. Faulty assessments, placing excessive tax burdens upon some properties as compared with others; an over-emphasis upon the property tax, particularly for local governmental purposes; insufficient state aid to the poorer school districts which were attempting to maintain minimum standards; and the general economic depression, more severe in some counties than others, for example, the dry farm acreas of Eastern Colorado -- all were contributing factors. After a time, the heavy delinquency caused such

an accumulation of interest and other penalties for many property owners that the payment of back and current taxes became impossible.

As a consequence, many local governmental units, including school districts, found themselves financially insolvent. Even after reducing standars and cutting of governmental services far beyound that which was in the public interest, expenditures often exceeded revenue. Many school, town and county warrants were issued for salaries, etc. which could not be paid because of insufficient funds. Financial distress was also experienced by the state institutions which were depending upon a property mill levy for sources of revenue.

In 1935 an effort was made to rehabilitate delinquent property owners who were unable to pay the accumulation of taxes, interest, and penalties. The legislature amended the revenue act, permitting back taxes, (those delinquent prior to August 1, 1934) to be paid without interest or other penalty. In order to benefit from this waiver of interest and penalty costs, back taxes had to be paid prior to December 31, 1935.[1] Such an arrangement for relieving delinquent property owners was perhpas warranted because of the critical aspects of the period. However, should this inducement for property owners to pay back taxes be extended repeatedly, it would defeat its own purpose. In the long run, more taxes than otherwise would probably become delinquent.

Table 35 indicates that collections of 1944 taxes were excellent in most counties of the state. Twelve counties actually collected 100 per cent or more of the taxes levied. The explanation for collection in a few cases being more than 100 per cent is that assessment rolls were changed perhaps slightly during the year, or else county treasurers through error reported some interest and penalties along with taxes. According to the table, only four counties experienced what might be considered poor collections. They were Hinsdale with a percentage of 61.9, San Juan with 66.6, Gilpin with 72.0 and Clear Creek with 80.2 per cent collections. The next lowest percentage was 88.2 for Teller county, while average collection for the state as a whole was the remarkable figure of 99.4 per cent.

By way of conclusion it may be stated that the administrative procedure for collection of the property tax as established by law is at present fairly satisfactory. However, actual collections could be improved in some counties through a more careful selection of administrative officers. Moreover, greater uniformity of assessment of property would be conducive to a more complete collection of taxes in all counties. An increase of state aid would also be helpful by relieving part of the local property tax burden. Such state aid provides relief in two ways. First, through a program of equalization according to need, the aid relieves poorer districts of the state which otherwise would be forced to adopt excessive mill levies upon property within their areas. Secondly, if the state obtains revenue for distribution to local units from sources other than the property tax, for example, the income, inheritance, or severance tax, the property tax tends to be lightened in all districts receiving any aid. In either case, such assistance is helpful in maintaining good tax collections, particularly during periods of economic distress.

RE: Press statement on Legislature's tax, fiscal and budget actions.

I believe you will find the attached press statement informative and useful both for you and your staff. It summarizes the tax and fiscal actions of the 42nd General Assembly, and explains the need for changes against the background of Colorado's rapid growth.

I believe you will agree, after reading it, that the tax measures passed by the General Assembly were realistic, necessary and fair, in order to meet the responsibilities of State government.

If you desire further information about the tax, budget and fiscal policies discussed, please feel free to request it.

Office of Governor, Colorado

COLORADO FACES UP TO ITS FUTURE
By
Governor Steve McNichols

The Legislature has just completed the most extensive program of tax revision in Colorado's history. Changes were long overdue.

For the first time changes were made in Colorado's tax structure with full knowledge of what effect those changes would have on each taxpayer. Other state governments are suffering financial strain and embarrassment because they did not plan ahead in such basic matters as state taxes.

Other states, too, are confronted with financial crises. Governors of 21 states requested increased taxes for the coming year, while many other states are eating into surpluses or facing further deficits. Notable examples are Michigan, New York, Pennsylvania, Connecticut, Massachusetts, and our Western neighbors, Utah, Texas, California and Washington.

In contrast to these states, Colorado was in a unique position because of the comprehensive analysis of Colorado's tax and fiscal situation that came out of the special tax study completed in February.

Colorado is fortunate, also, in its favorable standing among other states on the basis of per capita state taxes. Before changes made by the various legislatures this year, Colorado ranked 8th from the top in per capita taxes of the eleven Western states.

Per Capita State Taxes

in Western States

1958

1.	Nevada	$140.66
2.	Washington	137.38
3.	New Mexico	130.05
4.	California	120.45

6.	Oregon	106.13
7.	Arizona	104.27
8.	COLORADO	99.47
9.	Utah	94.12
10.	Montana	84.21
11.	Idaho	82.60

Source: State Gov't. Finances, 1958
U. S. Department of Commerce

The changes made in Colorado's tax structure this year will not shift Colorado's ranking appreciably in the per-capita-taxes list of the eleven Western states.

The citizens of Colorado are entitled to review the action of the Legislature. Now is the time to see whether or not the changes made by the Legislature live up to the goals of the tax study: to make Colorado's taxes fair and equitable to all taxpayers. This "new look" in our tax structure comes at a time when Colorado must of necessity provide for the increased growth it has experienced since 1950 -- and must prepare for continued economic, industrial and population growth in the future.

Changes Came From Study

The recommendations I made in a special message to the Legislature on February 16 ranged from repealing the State sales tax on food to changing the personal income tax rate structure and correcting the inequitable features of both the income and excise taxes. The recommendations were adopted from the special tax study group's analysis of Colorado's tax structure, income sources and revenue management.

The basic objective of such recommendations was to achieve a more equitable over-all tax structure by shifting part of the tax load from property taxes, and from regressive, earmarked sales and excise taxes, to the direct personal and business income tax. The income tax is a more fair tax in that it spreads the tax burden among all income groups because it is based on the ability-to-pay principle.

The House of Representatives, where all finance measures are introduced, acted on most of my suggestions. The House did not accept the recommendation to drop the 2% sales tax on food, but instead eliminated one-third of the State property tax. In addition the House decided to act this year on the tax study recommendation to bring the corporation income tax into line with the personal income tax by removing the deductibility of Federal income tax in computing State income taxes.

The Senate made further slight changes in the rates of the personal income tax, a revised capital gains provision, and virtual elimination of the 2% surtax on dividend and interest income. The action of the Senate was then approved by the House, and the legislation passed in its final form.

Most State Funds Earmarked

In reviewing the tax program passed by the General Assembly to meet the financial needs of the State, it is important to remember that nearly 77% of the total State revenue is earmarked for only certain uses.

This money -- from sales taxation, highway user taxes, federal aid, excise taxes set aside for pensioners, State land rentals and other earnings -- is not the subject of annual appropriation by the Legislature.

During the past few weeks, the discussion about both taxes and appropriations has covered only the 23% of total State revenue that constitutes the General Fund -- the main State source of financing public education, colleges and universities, hospitals, mental and other institutions, and all forms of general State government.

The total appropriated amount of general fund revenue coming from all non-earmarked taxes -- the 23% referred to above -- is $71.1 million for fiscal 1959-60. The dollar increase in taxes, in terms of new revenue going into the general fund for fiscal year 1950-60 amounts to $8.5 million after eliminating the $3.2 million of State property taxes. In 1960-61, the first full fiscal year under the new program, the net new general fund revenue will be $16.2 million, and the repeal of the State operating mill levy will save the property taxpayers $4.5 million.

Changes the Legislature made in the income taxes drew most of the attention and publicity. Some said the changes would "soak the poor", while others said they would "soak the rich." Neither statement is correct.

The tax study showed that individuals with incomes below $5,000 made up 68% of all taxpayers but that they paid only 16% of the total personal income tax collected by the State. In contrast, individuals with incomes of $10,000 or more represented less than 5% of all taxpayers, yet contributed 57% of the total personal income tax paid.

Thousands Paid No Taxes

Another startling fact that emerged from the tax study was that of the more than 525,000 income taxpayers, approximately 170,000 individuals paid a total State income tax of $2 or less in 1958. Despite the apparent 200% increase in the minimum bracket tax rate, it is important to remember that the increase for any taxpayer in this group cannot exceed $4 -- less than 10 cents per week.

Moreover, 134,000 persons paid no State income tax at all, although 58,000 of these did pay a Federal income tax. For this group of 134,000

taxpayers the change in the minimum bracket rate from 1% to 3% does not constitute a tax increase since they do not have any taxable income.

In other words, 25% of all Colorado taxpayers who file returns -- mainly those in the low income groups -- will not be affected at all by the increase in the rate from 1% to 3%.

As a matter of fact, with the newly-passed provision for full medical expense deduction and the virtual elimination of 2% surtax on dividends and interest income for 98% of taxpayers, most low-income families and many middle income families who itemize their deductions will be either unaffected or will receive a tax "break" by the income tax revisions just made by the Legislature. In addition, the new income tax law permits deductions for expenses of caring for children of working mothers -- more popularly known as the "babysitter provision." The new law also excludes sick leave pay from income taxation.

How Income Tax Revision Affects Average Families

(Husband, wife and two children)

Adjusted Gross Income	Old State Income Tax	New State Income Tax	Increased State Income Tax	Increase Tax per Week
$ 3,500	$ 0	$ 0	$ 0	$ 0
5,000	11.20	32.80	21.60	.42
7,500	42.46	99.92	57.46	1.10
10,000	88.84	181.40	92.56	1.78
15,000	276.88	406.88	130.00	2.50
20,000	577.60	777.64	200.04	3.85

NOTE: 96% of Colorado's taxpayers have adjusted gross incomes of less than $10,000. Less than 2% have adjusted gross incomes of more than $15,000. The overwhelming majority of taxpayers with incomes above $15,000 will also be paying an increased capital gains tax and a surtax on their interest and dividend income, which are not included in the above figures.

For example the table above shows that a family of four -- man, wife, and two children -- with an adjusted gross income of $3,500 or less pays no tax. The four exemptions at $750 each add up to $3,000, leaving

$500 of taxable income. The 10% standard deduction removes another $350, leaving $150. Federal income tax on the $3,500 income is $150, and when this amount is deducted from what is left ($150), this family has no taxes to pay because it has no taxable income.

It is important to note here that more than 45% of all returns filed in 1958 showed taxpayer incomes of less than $3,500 per year.

Another example is the taxpayer with a four-member family who has an adjusted gross income of $5,000. The exemptions again add up to $3,000, leaving $2,000 of taxable income. The 10% standard deduction removes another $500, leaving $1,500. Federal income tax on $1,500 amounts to $420. Deducting this ~~and the standard 10% deduction of $500~~ brings taxable income down to ~~$580~~ 1080.

The State income tax on ~~$580~~ 1080 under the new program is $32.80. Compared to the previous State tax of $11.20, this means an increase of $21.60, or 42¢ per week.

The significant fact of the tax study to point out in this case is that more than 68% of all Colorado's income tax returns filed in 1958 showed taxpayer incomes of less than $5,000 per year.

New Setup for High Incomes

A taxpayer with a larger income who has heavy medical expenses to bear can now deduct these expenses from his taxable income. Also, taxpayers who own their own homes will benefit from the reduction in the State property tax repealed by this Legislature.

On the other end of the scale, although the maximum rate was reduced from 10% to 9% the overwhelming majority of high income taxpayers will also incur a net increase in their income tax bill because of: (1) the change that reduced the preferential treatment previously granted on capital gains income; (2) the increased lower bracket rate, which applies to these taxpayers as well as all others who have taxable income; and (3) the 2% surtax will still apply to dividend and interest income of only those taxpayers in the highest income groups.

It is worth noting that 96% of Colorado's taxpayers have adjusted gross income of less than $10,000. Less than 2% have incomes of more than

$15,000. The overwhelming majority of taxpayers with incomes above $15,000 will also be paying an increased capital gains tax and a surtax on their dividend and interest income.

This demonstrates that the income tax increase is spread among all income groups, from the low to the high.

Changes in income tax were not limited to individual taxpayers. Colorado's corporate income tax, which had been significantly lower than those of other states, was increased by removing the provision which permitted corporations in Colorado to deduct their Federal income tax in computing their State tax bill. In making this revision, Colorado is following the pattern of what has been done in 19 of the 34 states which levy a corporate income tax and do not permit any deduction of the Federal income tax.

Corporations Pay More Now

The actual net increase in the State corporation income tax will amount to about only 1/10 of 1% of the total business expense of corporations operating in Colorado. Recent talk of higher taxes preventing new industrial growth for Colorado is unwarranted. A State's taxes are a minor item in the decision of a company or corporation in locating for industrial expansion, as numerous industrial development surveys and recent case histories show.

The corporations' share of the total tax increase is estimated to be $3.7 million for fiscal year 1959-60, and $7.2 million for fiscal 1960-61 -- the first full fiscal year the tax revisions will be in effect.

However, the actual effective cost to the corporations operating in Colorado will amount to about half of these increases, or $1.8 million and $3.6 million respectively. This is due to the fact that corporations, making more than $25,000 profit, pay their State taxes with 50¢-after-Federal-tax-dollars, since they deduct their Colorado income tax payments from their taxable income on their Federal tax returns.

So half of the new revenue for Colorado from corporations is actually a transfer from the Federal government and not a direct tax cost to the corporations.

The new State tax structure for corporations also works out to be more equitable, or fair, to the smaller corporations since the increase in their effective rate is less than the increase to the larger corporations.

This is shown in the table giving effective rates as a percent of net income.

STATE

Net Effective Corporate

Income Tax Rate *

Net Income	OLD Rate	NEW Rate
$ 25,000	2.49%	3.5 %
50,000	1.78%	2.95%
100,000	1.46%	2.68%
500,000	1.24%	2.46%
1,000,000	1.21%	2.43%

* State corporation income tax rate is 5%. However, because amounts paid to the State are deductible from Federal tax returns, the effective rate is much less than the actual rate.

For example, the combined Federal-State income taxes of a small corporation with a net income of $25,000 have been raised from $8,121 to $8,375, an increase of $254. In contrast, the corporation with a net income of $1 million will now pay a combined Federal-State income tax of $544,000, compared to $531,827 previously, or an increase of $12,173 a year.

Taxes More Fair Now

This means the smaller corporations will have the smaller actual increase in taxes, whereas the larger corporations will now have to carry a larger amount of the tax load.

In short, the increased income tax is spread among all income groups. The result is a more balanced and equitable tax structure -- with individuals, families and corporations paying income taxes on the basis of ability-to-pay.

To achieve an over-all equitable State tax structure, the Legislature closed major loopholes in the excise and sales tax fields. For example, the State taxes on alcoholic beverages, which has been among the lowest in the nation, were increased to the national average level, and insurance premium taxation was extended to all insurance companies operating in the State.

This major tax revision program not only made Colorado's tax structure more equitable but it also raised the additional revenues required to meet the increased demands on the general fund. Before we review how this general fund money is to be spent, let's glance briefly at the great changes that have occurred in our State since 1950.

Colorado has been experiencing an era of unprecendented economic and population growth. The growth since 1950 has been just double the national average, but it is a mixed blessing. It has meant that schools, colleges, highways and other State services have been seriously overloaded.

Growth Pushes Costs Up

Since 1950 the population of Colorado has increased 35% -- with a resulting increase in public school enrollment of 65% and a 29% increase in resident population of our State institutions. State supported colleges and universities have increased 42% in enrollment since 1950.

This growth has been solid as well as rapid, as indicated by the rise in per capita income in Colorado. This income figure has climbed from $1,496 in 1950 to an estimated $2,000 in 1960.

Schools, colleges, highways and welfare are the principal services of State government. It is in these areas where the sharp increase in population is first felt -- both in the demand for services and in the need for more revenue to provide such service. There are many other services which the public does not give much thought to but which are equally important, such as mental health, rehabilitation of institution inmates and natural resource development.

To meet this greatly expanded demand on schools, two-thirds of the general fund has been appropriated for public schools, colleges and universities. For fiscal year 1959-60 public schools have been appropriated $27.7 million, which is 39% of the total general fund. The colleges and universities will receive almost $20 million, which is 28% of the total fund.

Some critics say this is too much, others say it is too little. Regardless of conflicting opinions, Colorado's State school aid is at the minimum amount necessary to solve our primary and high school education problems. It is a minimum amount, also, to support the growing academic responsibilities of colleges and universities in meeting the demand for higher education in an

increasingly complex society. The field of education will require further increased financing in the near future.

Institutions Pose Crisis

Of the remainder of the general fund budget, 20% of the total has been appropriated for one of Colorado's most pressing problems: State institutions and the care and rehabilitation of the patients and inmates in those institutions.

This is a problem that cannot be ignored. It grows as Colorado grows. Institutions -- our mental hospitals and treatment centers at Pueblo, Ridge, Grand Junction, the prisons and reformatories, the boys' and girls' schools, and the Childrens' Home -- all are badly overcrowded. Over the years the State's institutions program has grown largely by patchwork. It has never been looked at as a total problem.

Colorado's crowded mental institutions have operated largely on a custodial and not on a treatment basis. The U. S. Public Health Service report on the State Hospital at Pueblo pointed out this fact. Almost 6,000 patients are housed in buildings capable of maintaining only 4,200 under modern standards. As a result, the overworked staffs have been forced into custodial methods that are not directed at reducing the number of patients -- and thus expense to the State -- through rehabilitation and treatment.

The first steps to remedy this situation were taken in this session of the Legislature. The Federal offer of the Ft. Logan site near Denver provides Colorado with an opportunity to help solve the mental treatment problem. Building a treatment center there will provide another facility for Colorado's mentally ill and help solve the problems of overcrowding at Pueblo. It will also relieve the invisible but real burden of heartache and despair of treatable patients who could be rehabilitated into useful lives and not be a burden to their families or to the State.

Other general fund items -- the "all other" -- combined make up 10% of the total budget, and include: judiciary, 1%; public health, 1%; maintenance buildings group, of State Capitol, 1%; and 7% for disaster fund, parole, industrial commission, advertising and publicity, insurance department, racing commission, banking commission and other administrative agencies.

Administrative Costs Checked

A fact worth noting is that the "all other" section of the 1959-60 budget is only 2% greater, or $147,000, than the same item in the 1958-59 budget. This amount reflects certain automatic increases, such as the statutory salary increases that boost State employees salaries an average of 5% per year. Many administrative costs, that have gone up due to increased duties of serving a larger population, have been absorbed by the various departments. Despite this increased work load, plus the fact that prices of materials have increased substantially, the costs of State government have been held in line very well as a result of changes instituted during this administration.

Credit for this accomplishment must go to many persons, including many conscientious career employees and department heads, and a responsible State Legislature that held down appropriations.

Completion of the tax study is a landmark for Colorado. Thanks to the study, Colorado was not required to make hasty, uninformed changes in its tax structure -- as is happening to some other states now, and has happened to Colorado in the past.

Colorado could wait for the tax study to be completed because of special tax collection and treasury management methods put into effect in the past two years. These measures, sometimes referred to as "gimmicks" in the press, provided the extra income Colorado needed to maintain progress while the tax study was being completed as well as to correct inequities in the time of paying income tax.

The first two measures required corporations, professional people and the self-employed taxpayers to pay their income taxes on a pay-as-you-go basis the same as wage earners who have their taxes automatically withheld from their wages and salaries.

The third measure adopted last year, makes it possible to use earmarked State funds to meet current cash needs of the general fund at those times of the year when tax collections are low.

Earlier Tax Raise Avoided

Through these measures -- which are actually only modern, enlightened methods of collecting taxes and managing treasury funds -- Colorado

two years ago was able to increase its school aid, raise its financial support to State colleges and universities, and bring State salaries up to adequate levels without a major tax increase.

The Legislature revised the treasury management measure in this session. It is the plan now to use surplus from the general fund for non-recurring capital improvements such as buildings and permanent equipment. It makes sense, I believe, to use non-recurring revenue from the general fund for such non-recurring expenses. This is another important step toward better all around money management and budget planning of the State's funds.

Local Governments Helped

In addition to State fiscal problems, the financial needs of our local governments were not overlooked. The increase in State school aid makes it possible to continue to make financial responsibilities to public education without putting the entire load on the already overburdened property taxpayer.

The elimination of the State operating mill levy will be reflected in lower property tax bills. A substantial revision of the highway user tax allocations, increasing the State allocations to cities, will markedly improve municipal street programs.

A final word should be said for the session of the Legislature just closed. The men and women of this history-making session should be commended for doing a responsible job. No one likes to pay taxes, much less be involved in raising them. Yet the legislators in this session faced up to problems, reviewed the findings of the tax study, and enacted the most comprehensive tax reform program in Colorado's history.

Colorado is facing up to its future. After considering all the facts of the new tax program, I believe Colorado's citizens will conclude that the changes made by the Legislature were not only necessary but were as fair as possible to all concerned.

FINANCING GOVERNMENT IN COLORADO

1959

Report of the Governor's
Tax Study Group

STEVE McNICHOLS
Governor of Colorado

THE STATE OF COLORADO
EXECUTIVE CHAMBERS
DENVER

STEVE McNICHOLS
GOVERNOR

To the Citizens of Colorado:

It is with pleasure that I present to you this report on Colorado's tax structure.

The report is based on an intensive and impartial study conducted by the Tax Study Group, composed of Dr. Eugene T. Halaas, Research Director, and his immediate associates, Dr. E. H. Plank and Dr. Reuben A. Zubrow, assisted by a staff of economists and research analysts from the faculties of the University of Colorado and the University of Denver.

To that Tax Study Group, I want to express my personal appreciation for this report, which represents an effort which has resulted in one of the most comprehensive and significant tax studies ever made by a State government.

The study was undertaken in compliance with my statement in the 1956 gubernatorial campaign: "To keep pace with our ever-increasing growth, we must launch a thorough-going study of all sources of tax revenue, projecting the revenue needs of the State, counties and governmental subdivisions for a substantial period of years so that each source of tax revenue, principally excise, ad valorem and income tax, may be evaluated and apportioned in the light of its effect on the development of Colorado, together with the ability of Colorado taxpayers to support government functions and improve the quality of administration of our taxes."

In accord with this pledge, I asked the Tax Study Group to review the total tax, revenue and expenditure picture of Colorado, and to give us facts on: changes in expenditures caused by the State's growth and changing economy; the revenue and expenditure history of our state and local governments; the impact of taxation on individuals and businesses; the equity of existing State and local taxes among various levels of taxpayers; fluctuations in revenue produced by the different types of taxes; the responsibility of the State to local governments in maintaining revenue sources. I also asked the group to suggest any changes that might make Colorado's tax structure more responsive to modern conditions, and more equitable.

In short, this report presents a thorough and critical over-all review of the methods used in financing government in Colorado. In Colorado, as in other states in the West, rapid post-war economic development and population growth have intensified the need for public services, with resulting increases in governmental revenue requirements. Under these conditions of change, the maintenance of a tax structure that will be productive and equitable to accommodate the demands of growth becomes increasingly difficult. Therefore, this factual basis for guiding fiscal policy action is of particular and timely importance.

To all of you who are interested and concerned in good government, I commend this study as a means for reviewing our State and local finances and for providing a basis for examination of the expenditure and revenue changes that will help make our State a better place in which to live.

Steve McNichols

Letter of Transmittal

February 14, 1959

Honorable Stephen L. R. McNichols
Governor of Colorado
State Capitol
Denver, Colorado

Dear Governor McNichols:

In accord with your instructions that comprehensive revenue and expenditure data be assembled and analyzed which would be helpful in the formulation of a fair and adequate system of taxation in Colorado, I have the honor to present on behalf of the Governor's Tax Study Group this report, which includes a general summary of findings and statement of recommendations.

Although study objectives have comprehended the entire state and local tax structure, the principal area of analysis has been that of the State government. The essentials of the revenue structure of local governments have not been neglected and are included wherever they were deemed pertinent to a fuller understanding of the fiscal system of the State.

The report is the joint product of the Governor's Tax Study Group, the senior staff of which included Eugene T. Halaas, Ph.D., Research Director of Governor's Tax Study, and Professor of Finance, University of Denver; E. H. Plank, Ph.D., Professor of Finance and Public Administration, University of Denver, and Reuben A. Zubrow, Ph.D., Professor of Economics, University of Colorado.

In the planning stages of the study invaluable assistance was received from Walter Heller, Ph.D., Professor of Economics, University of Minnesota; Clyde Reeves, Ph.D., former Commissioner of Revenue, State of Kentucky, and Ronald B. Welch, Ph.D., Director of Research, California State Board of Equalization. The guidance of these nationally recognized authorities in state and local finance is gratefully acknowledged.

Generous and continuous assistance in gathering data has been furnished by the State departments and agencies, particularly the Department of Revenue, Robert A. Theobald, Director, and John F. Healy, Assistant Director, and Edna Bigelow and the Office of Accounts and Control, E. G. Spurlin, Controller, and Con F. Shea, Budget Officer. The Department of Revenue did much of the statistical work requiring electronic data processing equipment in connection with the thousands of reported tax returns used in the sample study of Colorado's income tax. The Office of Accounts and Control assembled from the field all of the required detailed information for projecting budget requirements of the various state agencies and institutions. Without the help and wholehearted cooperation of these two departments and their staffs, it would have been impossible to have developed certain significant findings of the study.

The Tax Study Group is also greatly indebted to L. Donald Daily, Executive Assistant to the Governor, upon whom fell much of the task of providing facilities and making contracts to secure information from sources not otherwise available to the staff. His efforts in obtaining the cooperation of agencies in other states and of federal offices made possible a number of vital interstate and federal-state comparisons.

In addition to the material assistance and information supplied by the several departments of the State government, important statistical aid has been provided by the U. S. Bureau of the Census, the U. S. Department of Labor, and the U. S. Department of Health, Education and Welfare. In addition, the highway departments of Arizona, California, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming were most cooperative in releasing to us their detailed studies of highway user taxes. Assembly of these data made possible a definitive analysis of interstate highway user taxes in western states as presented in Chapter X of this study.

Other sources of valuable aid and encouragement might be mentioned not the least of which were the many communications received from citizens throughout the State. Citizen groups, business organizations and colleges and universities have also made valuable contributions. Principal among these were the Colorado Public Expenditure Council, the Colorado Municipal League, the Colorado Life Convention, the University of Colorado, and the University of Denver.

I wish to express to you our sincere appreciation for the opportunity which has been afforded us to work independently as a group in our research effort. At no time has there been any indication of any intent, official or otherwise, to influence the direction taken or subject emphasis made during the course of the analysis. The conclusions here arrived at represent the unanimous judgment of the staff based upon the evidence that this study has provided.

Respectfully submitted,

Eugene T. Halaas

OBJECTIVES OF STUDY, GENERAL SUMMARY AND CONCLUSIONS

Objectives of Study

Colorado's continuous economic and population expansion, particularly marked in the post-war years, has correspondingly increased the need for public services and facilities both in amount and variety. This in turn has resulted in a greatly increased per capita tax load reflected in sizable rate increases in the general property tax and by the addition of new taxes.

The adjustment of revenue (and expenditure) policies to growth, both in terms of the amount of taxes collected and the kinds of taxes used, has been determined basically by the nature of the State's economy and the particular needs of the people living in the State. However, in Colorado, as in many other states, these determinations have at times been importantly influenced by considerations of expediency, political change and group pressures. It could well be expected, therefore, that distortions and inequities have developed that can only be seen in the context of the state and local tax structure as a whole. Accordingly, this study is oriented on a broad base in which all taxes are examined individually and in relationship to each other. As such it is designed to provide a source of information for increased public understanding of the tax structure of Colorado, thus facilitating its revision and improvement as an instrument for meeting both the immediate and long-term revenue demands of growth as these can be presently foreseen.

Procedurally and by specific lines of inquiry, the study objectives may be stated in these terms:

(a) To review the nature and growth potential of the State's economy which conditions both the magnitude and pattern of present and future public expenditures and revenue requirements.

(b) To examine the organizational structure of state and local government which affects both the cost and adequacy of public services.

(c) To present historically for both state and local government and in comparison with other states, total expenditure and revenue trends including particular taxes currently used.

(d) To generally define and measure the over-all state and local "tax burden" as it applies to individuals and as a factor affecting the location and development of industry in Colorado.

(e) To evaluate individual state and local taxes (including rates) and the tax structure as a whole in terms of:

(1) Their fairness in the distribution of the tax burden among individuals and business enterprise, and,

(2) Their capacity to produce a steady and adequate revenue for the future estimated needs of both state and local government.

(f) To examine critically state and local relations insofar as these bear upon the responsibility of the State in providing local government with revenue sources commensurate with functions assigned.

(g) And, in the light of the above analyses to draw conclusions and to suggest such changes in the tax structure and fiscal policy as would appear to be necessary to remove inequities in the tax burden, and to produce such additional revenues, as might be indicated by Colorado's current and anticipated future growth demands.

General Summary

The following summary of the main report contains both descriptive highlights of the analysis as well as the principal findings relating to each of the principal subjects of the study. These are presented in logical order by chapter title and number as noted.

The Economy of Colorado (Chapter I). Colorado's rate of population growth has consistently exceeded that of the country as a whole. As such it reflects the larger continental trend toward the West which has been observed since the beginning of the nation's history. Most recent estimates show a total population in Colorado of 1,612,000 for 1956. This represents a 22 percent increase since 1950—a rate of gain exceeded by only five other states. It is significant that of the ten states in the union showing the largest increases for this six-year period, five were Mountain States.

Despite impressive growth rates, Colorado is still sparsely populated ranking seventh among the forty-eight states in land area but thirty-fourth in population. Population growth has not been distributed uniformly, however, but has tended to concentrate in the large urban areas and particularly in the Denver Metropolitan Area which, in 1956, accounted for 45 percent

of the State's total population. In 1930 the comparable ratio was 34 percent.

Apart from its growth and distribution other noteworthy features of Colorado's population are (1) a higher than national-average ratio of persons in the lower age group, (2) an average ratio of persons in the age category 65 years and over, and (3) a substantially better than national average educational achievement measured by both the "median school years completed" and the "ratio of population with four years of college training." All add up to an effective labor force and a cultural setting conducive to progress.

Colorado's economic well being measured by per capita personal incomes shows a better than average rate of growth. In 1957 personal income totalled $3.3 billion, a figure which exceeded by 73 percent the corresponding total for 1950 and by 420 percent the aggregate reported for 1929. After eliminating the effects of inflation these gains, on a uniform purchasing power basis, were 48 percent and 217 percent, respectively. As an approximation it can be said that the "real" productivity of the State as a whole was about 50 percent greater in 1957 than in 1950 and slightly more than 200 percent over what it was in 1929. For the country as a whole the comparable real gains were somewhat lower or at the rates of 31 percent and 146 percent, respectively. In per capita terms Colorado's income of $1,996 in 1957 was slightly under the national average of $2,027. It was higher however than that of thirty-two other states including the Mountain States excepting Wyoming and Nevada.

Colorado's economic growth, most marked over the past decade and a half, has had its basis in a sustained employment increase which is estimated at 239,403 for the period from 1940 to 1956. Specific industrial sources of these new jobs were the service industries which accounted for 37 percent; trade, 25 percent; construction, 13 percent; manufacture, 14 percent and unclassified sources the remainder or 11 percent.

Aside from its definite metropolitan bias, 60 percent of the new jobs originated in the Denver area, the over-all 1940-1956 employment increase had no outstanding single industry attraction such as a new oil development or similar episodic event that might have accounted for the sizable advance that was made. On the contrary, and despite some decline in agriculture and mining, employment increases covered a broad industrial front in which the traditional "agricultural-trade-service" pattern was largely retained. Manufacturing while gaining rather substantially in number of workers did not materially increase its relative employment position.

Assuming no fundamental change in the industrial pattern, the future growth of the State's economy is therefore contingent on the development of its existing extractive, trade, service and manufacturing functions. Of these, manufacturing presents the greatest potential if for no other reason than that it is by all odds the most underdeveloped sector in the economy of the State. However, distances to markets hamper growth, notably in the case of heavy industry producing for national markets. But by the same token, the locational factor has given strong impetus to the growth of local manufacturing oriented to the large regional market of the West. Coupled with this has been the development of specialty products of high value and low bulk. Aggregatively these adjustments in a comparatively isolated area account for the substantial increase in manufacturing which has occurred in Colorado in recent years. It is also along these lines that manufacturing in the region may be expected to advance in the future.

Agriculture and mining are both more or less stabilized industries and little, if any, employment change may be expected here. Agriculture remains, however, the principal single industrial source of employment in the State and as such its continued development is crucial to the progress of the entire economy. Increased agricultural production rather than increased employment may be expected with water the principal limiting factor. Mining, on the other hand, is expected to show little change, at least in the short run, with large gains from oil shale development likely in the long run.

Trade and services combined continue to constitute the larger part of the income and employment base with the Denver Metropolitan Area forming the central core. Slow growth is inherent, however, in both these lines since they tend in large degree to follow rather than to lead population and income advances.

On the basis of all aspects of the State's economic structure, as presently constituted, a steady but better-than-average trend line movement of population, employment and income is envisaged in which the "western movement" of peoples is a basic causal factor that cannot be denied. Population projections of the Bureau of the Census show for Colorado an estimated population of 2,197,000 by 1970 or an increase of 40 percent over the estimated population in 1955. By Census prediction also, this rate will exceed that of any other Western state excepting Nevada, Arizona, California, and Utah. Moreover, the Mountain States group, with an estimated growth rate of 44.4 percent, is expected to grow faster than any other region excepting the Pacific Coast States.

Coincident with population growth new jobs are expected to increase to a total of approximately 843,000 by 1970, or a gain of 234,000 jobs over 1956. Similarly, it is estimated that per capita personal incomes will increase from $1,870 in 1956 to $3,403 by 1970 or at the rate of 82 percent. Comparable projections for the country as a whole show changes from $1,961 to $3,255 or at the rate of 66 percent.

In conclusion, Colorado's problem of financing government in the future, unlike that of many states, is not one of finding ways and means for retaining its population and preserving its tax base but one of finding appropriate ways and means for supporting enlarged government as its employment and population continues to grow at a better-than-national-average rate. The nature of Colorado's economy, whose industries and natural resources are more diverse than any other state in the union, magnifies not only the task of determining the right patterns of public service but patterns of taxation as well. It is in this setting of variety and dynamic change that a state-wide fiscal policy must be formulated.

The Structure of Government in Colorado (Chapter II). In addition to state government proper, governmental services in Colorado are performed by 1,675 separate governmental units consisting of 63 counties, 245 municipalties, 936 school districts and 431 special improvement districts. All, as separate government entities, derive their legal authority from the State. In theory and practice their existence acknowledges the fact that government at the "grass roots" is essential for the effective administration of the State's function in all its various parts.

At the State level the administration of government is performed by 138 agencies variously designated as "offices," "departments," "divisions," "bureaus," "boards," and "commissions." Each is a separate legal entity established by law and differing only in degree of individual responsibility and independence of supervisory authority. Some agencies are included in larger "agencies" or "departments" and "divisions" which may exercise considerable control while others may be grouped within, or merely identified with a department or division which exercises little or no central control.

At the local level, county governments, functioning primarily as arms of the State, are administered by a standard or traditional complement of elective offices, more or less independent of each other as well as the central administrative body of County Commissioners. To achieve local autonomy and flexibility in the management of local affairs not possible by county government, local government in Colorado finds its fullest expression in its municipalities, school districts and special improvement districts all of which have the power to tax and to spend.

Viewed critically, Colorado's structure of government presents areas of weakness that are probably inherent in the traditional pattern of state and local organization and administration as it has developed in this country. At the state level, a perennial sore spot is the conglomerate of statutory administrative agencies which tend to duplicate functions and to diffuse control and responsibility to the point where central direction is severely weakened. Students of government have long advocated a consolidation of agencies in major departments directly responsible to the Governor.

County government in Colorado, as elsewhere, is undoubtedly antiquated and needs re-examination. Rapid population increase in some counties has created new demands upon counties and a degree of flexibility in their operation not possible under existing law. Conversely, population decline in other county areas has reached a point where boundary revision is mandatory if "economy in government" is to have any meaning at all.

Other governmental units at the local level—municipal, school and special districts—present organizational problems somewhat distinctive yet interrelated by common purpose of providing, singly or in combination, a full complement of needed local governmental services. Primary of the municipal problems is the so-called "fringe area" problem of the larger cities and the associated question of the role of fringe areas or "metropolitan special districts," whose development tends to block logical expansion of municipal boundaries to accommodate growth. And finally, Colorado's present number of 838 school districts (exclusive of high school and junior college districts) in which there are still 183 one-teacher schools clearly point to the need for more consolidation.

Expenditures of State and Local Government (Chapter III). From 1946 to 1956 combined expenditures of state and local government increased from a total of $106 million to $382 million, or at the rate of 260 percent. Paralleling and, in large degree, explaining this sharp advance was a population increase of 38 percent and a general price rise of 65 percent. If adjustments are made for these latter changes, that is, by expressing expenditures in per capita terms and in uniform purchasing power dollars (in this analysis in terms of the 1956 dollar), the per capita expenditure totals for 1946 and 1956 amount to $145 and $237, respectively, or an increase at the rate of 63 percent. Adjusting

further to differentiate between operating and capital expenditures the results then read as follows:

	1946	1956	Percent increase 1946-1956
Operating	$131	$181	38
Capital	14	56	300
Total	145	237	63

From this more refined base of reference, it will be seen that state and local government spent 38 percent more per person in "real" terms for operating purposes in 1956 than in 1946 and 300 percent more for capital items. If expenditures can be viewed as having their counterpart in services or capital values acquired it can be said that 38 percent more in real services and 300 percent more in capital values were received per person in 1956 than in 1946.

Whether or not the average person in Colorado was getting these additional services and values from the current public dollar spent is, of course, a matter of individual judgment. About all that can be said is that with due allowances for the limitation of the adjustment techniques used, the over-all increases do not appear to be out of line with present levels of public services received as compared with 1946. Although memories are short, it will be recalled that the immediate post-war years were marked by extreme shortages in both the private and public sectors of the economy. The large changes that have taken place since then in both the number and variety of available consumer goods and services and such capital items as highways, schools and other public facilities are universally recognized.

The broader purposes for which the public dollar is spent in Colorado are readily identified. In 1956, 38 percent of aggregate disbursements were directed to educational uses; 22 percent to welfare, and 19 percent to highways. The remainder, or 22 percent was committed to a wide variety of other purposes. The notable fact is that education, welfare, and highways together accounted for nearly 80 percent of public expenditures in the State.

The "big-three" functions of government in Colorado deserve more than catch-phrase attention, for it is here, and here only, where major reductions in government expenditures and, therefore, taxes can be made. What the possibilities are for substantial cost savings in these vital areas of public service and what public reaction might be to any steps taken in these directions is quite another matter.

In the comparison group of eleven Western States, Colorado's per capita expenditures of $217 in 1953 (the latest date for which comparative data are available but which are believed to be reasonably representative of current relationships) placed it in 6th position in the Western State comparison, being preceded by Nevada, Oregon, Montana, Wyoming and California. In 1942, Colorado occupied 5th position reading from high to low, being preceded by Nevada, Montana, Wyoming and California. Per capita total expenditures in all Western States were substantially above the national average, both in 1942 and 1953—a fact which may be attributed in part to the relatively low population density of the West.

In further detail Colorado in 1953 spent more per capita for "welfare," "public safety," "sanitation" and "health and hospitals" than the general average for the eleven Western States. Conversely, it spent less than the average for "highways," "education" and "all other."

In rank order, which changes the picture only slightly, Colorado ranked 1st in per capita expenditure for both welfare and hospitals; 4th in expenditures for both public safety and sanitation; 5th for education; and 9th for both highways and all other.

Colorado's expenditure pattern differs most widely in its expenditures for welfare. In 1953, per capita welfare payments in the State amounted to $40.05, which exceeded the general average of all eleven Western States by $18.06. It also was over the national average by approximately the same amount, or by $18.43. If, for instance, Colorado's outlay for welfare had been the same as the Western State average, its total per capita expenditure of $217 for all purposes in 1953 would have been reduced to $199. In rank order, this total would have placed Colorado in 9th position rather than in 6th. A similar computation for 1942 would drop Colorado from 5th to 10th place in the eleven-state comparison.

Tax Revenues of State and Local Government (Chapter IV). Colorado's combined state and local tax bill in 1956 amounted to $276 million—a total nearly four times its corresponding total in 1940 and nearly three times the figure reported for the first post-war year, or in 1946. If allowance is made for population growth and price inflation, that is, if taxes are expressed in per capita dollars of uniform purchasing power, the resulting per capita figure of $171 for 1956 is only one-third greater than it was in 1940 and about one-half again as large as in 1946. Moreover, combined state and local taxes took, on the average, less out of personal income in 1956 than in 1940, the respective ratios being 9.2 percent and 11.7 percent.

Unfortunately for state and local fiscal policy, which must compete with the federal government for the public tax dollar, the over-all tax bill—federal, state and local—on a per capita price-adjusted basis is currently nearly three times as great as it was before the war. Currently also, it takes 27 percent out of total personal income as compared with 17 percent in 1940.

Compared with all other states and on the basis of 1953 data (which is the latest date for which comparable information is available) combined state and local taxes in Colorado, in terms of per capita taxes and measured as a percent of income, are high, ranking 8th and 12th, respectively. For 1953, for the eleven Western States only, Colorado's per capita tax total was slightly over the median average. In rank order Colorado placed in 5th position in the eleven-state array while its ratio of taxes to personal income was the second highest.

Colorado's combined state and local tax structure rests heavily upon the general property tax base which, in 1956, accounted for 48.66 percent of total state and local tax revenues. Next in importance were various taxes based on expenditures or consumption (including the highway user group) which accounted for 38.32 percent while income and "all other" taxes accounted for the remainder or 9.44 percent and 3.58 percent, respectively.

Although the individual parts—state, county, school districts and municipalities—make up the whole, the tax structure of these individual governmental units vary in marked degree. For example, in 1956 state government obtained only 7.68 percent of its total tax revenues from the general property tax, but 67.81 percent from its consumption taxes, including the highway user group, and 18.75 percent from the income tax. On the other hand, the counties and school districts derived their entire tax revenue from general property while the municipalities obtained 68.66 percent from this source.

The complex of these arrangements, in which property and consumption expenditures are the primary bases of revenue support, has resulted in a state-local tax system which can be generally regarded as being essentially regressive. In other words, on the whole, state and local taxes tend to weigh more heavily on the lower income groups than the other way around.

In the main, the kinds of taxes used at both the state and local levels differ little between the Western States. In general, local governments depend heavily upon the property tax; the states much less so. On the other hand, for state governments "special" taxes present points of difference both in kinds of taxes used as well as degrees in which they are used. Of the major of these, namely the income and sales tax, only three states—Wyoming, Washington and Nevada—exclude the income tax, while the general sales taxes are absent in Montana, Idaho and Arizona. Similarly, only three states—Colorado, Oregon and California—exclude a special tax on tobacco.

Finally, the question as to whether the overall tax burden in Colorado is greater or lower than elsewhere must remain largely unanswered. Important as this question is from a policy standpoint, there is no quick or simple answer. Although customary "indices" of the "tax burden" based on per capita totals and the ratio of taxes to personal income would place Colorado well above the national average and perhaps at a median position in respect to the eleven Western States, such indicators are by no means conclusive. As averages these measures cannot tell how the burden is distributed nor do they disclose values received in return for the tax dollars paid. Similarly, the impact of taxes on business development is not readily ascertained. Although a tax climate favorable to business is unquestionably a factor of importance this too must be seen in its proper perspective.

The Influence of State and Local Taxation on the Location of Industry (Chapter IV—Appendix Note). A multitude of factors, both economic and non-economic, play a role in the location of industrial activity, and therefore, a generalization concerning the significance of any one factor must be made with certain caution. Moreover, the importance of any one factor must be discussed in terms of other location factors and not in an isolated or absolute sense.

Although there is controversy regarding the locational importance of taxation, it is generally agreed that the major general factors influencing industrial location are market orientation, availability of materials, and labor considerations. The lack of agreement concerning taxation is due in large part to difficulties inherent in the problem. The seemingly easy task of measuring tax burdens between two given areas becomes extremely complex when consideration is given to differences in tax rates and bases, types of taxes employed, enforcement procedures, collection policies, and relationships between various taxing jurisdictions. Moreover, accounting for the benefits received from government expenditures and attempting to locate the elusive incidence of various taxes provide problems which are essentially insoluble. Hence, the nature of the problem is such that conclusive and precise evidence is virtually impossible to obtain.

While there are numerous approaches to the question of the locational significance of taxation, one analytical method is to examine each area of economic activity and attempt to exclude those areas where taxes appear to exert little if any influence. Hence, it is reasonable to dismiss agriculture, mining, construction, government, transportation, communications, public utilities, and real estate as areas in which taxation is of little locational significance. In addition, few service and trade organizations could attach a great deal of importance to taxation although it would be unreasonable to dismiss categorically all firms in these areas. In the field of manufacturing, there are undoubtedly many firms which are locationally restricted by

their manufacturing process or the nature of their product. It appears that few firms possess sufficient locational freedom that substantial consideration can be given to taxation as a location determinant. While this approach can provide little insight into what proportion of these firms actually premise their location decisions on levels of taxation, it does indicate that even if they all did, a major portion of national income would nevertheless be generated by industries in which taxation exerts little locational influence.

Another approach to the problem is to conduct inductive studies which involve personal interviews or the use of questionnaires directed at business executives. While most of these studies are subject to certain limitations and criticisms, in total they indicate that state and local taxes are a relatively unimportant location factor. In addition, two studies conducted specifically in the Colorado area reach similar conclusions, one study ranking the importance of state and local taxes 27th in a list of 30 location factors.

In summary, while the available evidence is somewhat less than conclusive it does suggest that, in general, state and local taxes exert less locational influence than a magnitude of other factors; and, that the frequently-made assumption regarding a simple direct relationship between a "favorable tax climate" and rapid economic growth cannot be defended.

State Government Finance (Chapter V). From 1946 to 1957 Colorado's state government expenditures (including payments to counties and cities) increased from a total of $57 million to $238 million, or at the rate of 315 percent. For the shorter period, from 1950 to 1957, the increase was from $130 million to $238 million or at the rate of 82 percent. In per capita "real" terms, that is, in constant purchasing power dollars, total state government outlay in 1957 was 70 percent greater than in 1940 and 8 percent greater than in 1950. In 1957 also, nearly 90 percent of total expenditures were for three principal purposes, namely, welfare, highways and education.

On the revenue side, taxes collected by the State were, in 1957, approximately three times what they were in 1946, having increased from $49 million to $149 million, or at the rate of 200 percent; while for the more recent period from 1950 to 1957 taxes increased from a total of $86 million to $147 million, or at the rate of 72 percent. On a per capita basis in uniform purchasing power dollars taxes show for 1957 an increase of 114 percent over 1946 and a 37 percent increase over 1950.

Comparatively, per capita state taxes in Colorado were below both the general and median average for the eleven Western States. Similarly, the ratio of Colorado state taxes relative to state personal income was less than the general average but coincided with the median average of the Western States.

Sales, highway user and income taxes constitute the principal sources of revenue of state government in Colorado. In 1957 these accounted for 77.95 percent of total tax revenues. Viewed generally, the so-called "consumer taxes" (sales, liquor, highway user, insurance and pari-mutuel) accounted for 67 percent and general property 8 percent of total State tax revenue. In this sense, the tax structure could be regarded as predominantly regressive in nature—a feature which characterizes state taxation in the West generally.

Approximately 80 percent of the State's total revenue is earmarked—a fact which not only explains the existence of 190 "cash" funds (in addition to which there are 101 other funds or a total—"cash" and "all other" funds of 291), but explains also (in a basic sense) the current plight of the General Fund. As a kind of a residual legatee of State revenues, the General Fund is under severe pressure due to growing expenditure requirements for school aid and the enlarged needs of the State colleges and universities and other state institutions. Projected general revenues and expenditures to 1965 indicate the immediate need for a sizable increase in revenue to avoid future General Fund deficits. The following tabulation based on four different assumptions or projections show revenue and expenditure differences for the fiscal years 1960-1965 as follows:

Estimated Current Revenue Surplus (+) or Deficit (—)

Year	Projection 1 millions	Projection 2 millions	Projection 3 millions	Projection 4 millions
1960	$—13.8	$—24.4	$— 6.4	$—16.9
1961	—13.9	—24.9	— 6.0	—17.0
1962	—12.5	—23.9	— 4.1	—15.6
1963	—10.7	—22.6	— 1.9	—13.8
1964	— 8.5	—20.8	+ .7	—11.6
1965	— 6.2	—18.8	+ 3.5	— 9.1

Not included in these totals are estimated expenditure requirements for new buildings which would add to General Fund deficits (as variously estimated above) annual amounts ranging from $457,000 to $1,580,000 exclusive of the total of $19,036,000 projected for 1960.

The foregoing outlines the large revenue problem faced by the State Assembly for 1960 and the immediate years thereafter. How effectively it will be resolved will, in large degree, depend on judgment in the selection of the appropriate priorities and timing of expenditure needs but more importantly on the selection of the particular means used to finance them.

Essentials of a Sound Tax System (Chapter VI). The recognized standards of a sound tax system include: (1) productivity; (2) equity in the distribution of tax burdens; (3) a recognition of the rights and problems of taxpayers; and (4) adaptability of the tax program to the

immediate and long-range needs of the economy as a whole. From a practical standpoint the productivity requirement means that the yield of individual taxes and the entire system must be predictable within reasonable limits, and that certain major tax sources must be sufficiently flexible in structure and rates to handle the rising costs of government. The possibility of effective and economical administration is another facet of the productivity problem.

Equity in the distribution of tax burdens is a universally accepted goal, but the full ramifications of the concept are seldom understood. Basically, equity in taxation is dependent upon a series of social judgments concerning the existing and future economic relationships between individuals, family groups, business enterprises and other private organizations. Recognition of the complexity of the problem is the first step. The crucial elements are the social decisions as to the best approach or approaches to the distribution of tax burdens and the most appropriate measures of implementing them.

Two broad theories concerning the distribution of tax burdens are presently accepted and applied with varying degrees of qualification by tax economists and those concerned with the formulation of tax policy, namely, the ability to pay principle and the benefits received standard. While the preponderance of opinion favors the ability principle, a limited application of the benefits standard is generally thought to be desirable.

The ability to pay concept is socially oriented. That is, it involves a determination of the current economic position of the individual and business organization, the essential demands upon their resources for living and other costs, and, consequently, the actual capacity remaining, if any, to pay taxes. Net income is regarded as the most reasonable and effective measure of taxpaying ability with property or accumulated wealth as a possible supplemental standard. In the case of individuals, at least, it is generally assumed that the taxpaying ability reflected by net income in excess of absolute subsistence requirements increases on a progressive basis.

The benefits received doctrine rests upon the broad proposition that the cost of governmental services should be apportioned among individuals and business organizations on the basis of the relative benefits which they enjoy. Essentially, it is the quid pro quo method of financing, and contemplates that the government would operate like a huge, private supermarket with the prices clearly marked on each item.

As a general approach to the distribution of governmental costs the benefit principle is clearly unacceptable. It disregards the primary social purpose of many public programs, and would deny their use to those who could not afford to pay the full cost. Furthermore, it is impossible from a practical standpoint to determine the individual benefits derived from some of the most important governmental programs such as national defense or security. The proper role of benefit financing, therefore, is necessarily a restricted one. In fact, it is only in those areas where the government actually functions in a manner comparable to a private or commercial enterprise that the benefit principle has a wholly logical application. Apart from governmentally-owned utilities the most significant application of the direct benefit standard today is the financing of highways and streets. The use of the special benefit approach in this instance is believed to have merit, though it is subject to significant limitations.

Equity in taxation, therefore, requires a predominant emphasis upon the ability standard supplemented by a limited application of the benefit principle under the special conditions noted. Judgment and moderation must be exercised in the use of both approaches. Extreme progression under the net income tax may unduly curb the incentive to save and invest funds by high income groups. Similarly, an overemphasis upon the benefit standard may place oppressive burdens on the low income classes and thereby curb their incentive or capacity to produce and to consume.

Finally, it must be recognized that the federal government occupies a primary position in virtually all phases of public financial policy. Considering the magnitude of its revenue needs the choice of federal tax sources clearly is the principal determinant of the effects of public revenue programs. The emphasis placed upon personal and corporate net income and certain sales and excise taxes serves as a possible model for state action, but also may tend to delimit the scope of state policy. Double or multiple taxation of a given base should be considered in appraising the equity and productive potential of a given source. However, it is the latter elements that are important, not the duality of use. Alleged saturation of the net income tax base, for example, is a delusion in the light of its fundamental character and accepted merits. Certainly the use of less equitable tax forms worsens rather than improves the economic effects of a given level of taxation.

Property Taxation (Chapter VII). The general and other forms of the property tax are presently a minor source of state financing but are still the mainstay of local finance. Colorado obtains nearly 8 percent of state tax revenues from property levies which is over two times the national average of 3.3 percent. However, the eleven Western State average is 7.5 percent. Decreasing reliance on the property tax for state purposes is the direct outgrowth of the development of new state sources (highway user, sales and income levies) and the critical pressure upon local units of finance expanding service needs.

The theoretical justification for the property tax is rather confused and has been seriously questioned by tax experts. However, it is supported both as a charge for benefits received and as an index of taxpaying ability. In the first instance it is alleged that property owners are the beneficiaries of certain basic public services such as fire and police protection and the administration of justice, and that they may be appropriately taxed to pay for a part of the cost. Secondly, property ownership is said to evidence taxpaying ability. While both concepts have some element of validity, it is obvious that property does not constitute a direct or complete measure of benefits, and it is even less reliable as a measure of ability to pay. The principal reasons for the continued use of the property tax, therefore, are practical rather than theoretical. It is a good revenue producer, receipts are relatively stable; the tax is generally acceptable to the people; and no suitable replacement has been developed on the local level.

Colorado employs the general form of property tax insofar as the application of uniform rates is concerned. The tax applies to all types of real and personal property except those exempted by constitutional provision. The excluded classes of property include the typical governmental (federal, state and local) religious, educational and charitable uses plus intangibles and tangible personal possessions and household goods of a non-income producing character. While motor vehicles are exempt from the general tax, they are subject to a comparable specific ownership tax on value. A special income surtax is also applied to the income from intangibles under the state income tax as an in lieu measure. With the exception of the personal possessions exemption (most states exempt a specified value of such goods) Colorado's exemption policy is relatively strict.

The Constitution and statutes of Colorado require assessment of property at its true and full cash value. Market value is specified as a general guide, and value or capability of use and other just methods of valuation may be considered by the assessor.

The present official basis of assessment for the major classes of property as prescribed by law and the Tax Commission are as follows:

1. Agricultural land — capitalized average net income for a ten-year period, 1933-1943, on a typical or key farm under average management;
2. Extractive land — "producing mines" which includes most metallic mineral properties with gross production in excess of $5,000 at 25 percent of gross product or if net income is greater on net income; producing oil and gas wells at 87½ percent of gross product (does not include surface improvements); and non-producing mineral lands or rights therein at a flat sum per acre;
3. Situs lands — used for buildings or other permanent improvements (other than agricultural and extractive) at 40 percent of average market value;
4. Improvements — 1941 construction costs with appropriate deductions for depreciation and other factors reducing value;
5. Personal property — livestock at specific recommended values per head which are redetermined annually; merchandise and manufactures inventories on the basis of 50 percent of average annual value; and furniture, fixtures, machinery and equipment on conversion of original cost to 1941 level of cost less depreciation, 40 percent of original cost or 80 percent of book value; and
6. Public utilities — three factors: planned account or historical cost, average market value of stocks and bonds during preceding 12 months and capitalization of net operating revenues during a five-year period are employed in arriving at a valuation and the property is assessed at 40 percent of the value allocated to Colorado.

The assessment, equalization and collection machinery in Colorado is generally comparable to that in other states. Original assessment powers are vested in the office of the county assessor, except for public utility property which is assessed by the Tax Commission. Tax collection is the responsibility of the county treasurer, and the equalization boards composed of ex officio members are typical. Finally, the Tax Commission has the usual powers to aid, supervise and equalize the assessment process on the local level.

Property taxes may be levied by the State, counties and nearly every other form of local governmental unit including nearly 200 special districts. The millage rates for state as well as local units, however, are subject to various constitutional and statutory limitations.

The total State mill levy presently amounts to 3.56 mills. Millage rates for the major local units have increased significantly in recent years. From 1953 to 1957 the average county levy rose from 8.69 to 9.72 mills; the school rate from 23.58 to 29.82 mills; and the municipal from 11.48 to 12.94 mills. The combined average mill levy for the State as a whole has also shown a marked upward trend starting in 1945. The aggregate levy, which amounted to nearly 39 mills in that year, rose to 49 mills in 1950 and to nearly 52 mills in 1957.

Receipts from the property tax naturally reflect the combined impact of rising rates and an expanding base. The total property tax revenue for all units was slightly under $42 million in 1940; it nearly doubled during the next decade ($82 million in 1950); and doubled again in the seven-year span to 1957 ($163 million).

The structure of the property tax as well as assessment practice reflect a series of inequities and unsolved problems that are critical in nature. The constitutional requirement of assess-

ment at full cash value has only been closely approached upon one occasion, and the present legal or official bases of assessment bear no reasonable relation to this standard. According to the Sales Ratio Study, the state-wide average ratio is approximately 28 perecnt, and there are extreme variations as between counties, rural and urban areas and the major classes of property. Thus, it is obvious that reasonable equalization has not been achieved.

The specific bases of assessment presently required by the statutes or Tax Commission decisions involve serious inequities as between types of property which are further accentuated by disparities in the practice of county assessors, and the 1941 costs concept applied in the assessment of certain major types of property is wholly unrealistic. As a consequence, there is no firm basis for true equalization of property tax burdens according to any reasonable measure of percent values.

Another important facet of the administrative problem is the lack of effective control over local assessment practice by the State Tax Commission. While its powers are generally adequate, they have not been exercised due to inadequate staff and other considerations. Strengthening of the Commission's efforts in this area is essential. In view of the inherent problems involved, state assessment of extractive lands also appears to be desirable.

The foregoing aspects of property tax policy and assessment practice indicate an urgent need for a general overhaul of the State's property tax system to the end of establishing consistent and realistic bases of assessing all types of property, of achieving effective and equitable assessment of all types of property, and of providing a firm foundation for continuing equalization efforts.

Finally, there are compelling reasons which appear to dictate eventual state withdrawal from the property tax field. State use might well be limited to capital construction requirements wihch are committed until 1965 in the immediate future, and as a long-range policy such needs might appropriately be met (after 1965) through a capital budget program based upon the General Fund.

Retail and General Sales Taxes (Chapter VIII). Sales taxes of the broadly-based variety are presently a major source of tax revenue in thirty-three states. The popularity of the retail or general sales tax is attributable primarily to its general productivity, its relative simplicity of administration and its flexibility in meeting growing revenue requirements. Total receipts in 1957 amounted to $3.4 billion or 33 percent of the aggregate tax revenues of the jurisdictions employing the tax. Colorado's levy accounted for only 27 percent of State tax revenue.

The principal features of the Colorado retail sales tax, adopted in 1935 as an emergency measure, have remained unchanged until the present time. However, a special services tax also enacted in 1935, which applied to virtually all types of services, was repealed in 1945, and the constitutional provision earmarking 85 percent of sales and excise revenues for welfare purposes was amended in 1956.

The base of Colorado's retail sales and use tax compares favorably with that of the other state taxes. The definition of a taxable sale or transaction is very broad and inclusive. Similarly, sales for use or consumption to other businesses are generally taxable subject to the "physical ingredient" rule and certain direct use exceptions. The commodity exemptions are those typically found in other states with the exception that liquor and tobacco are usually not exempt in other jurisdictions. In the services area Colorado only taxes three types of public utility services. While such a limited application of the tax to services is not unusual, this type of activity and personal services in particular provides the chief opportunity for enlarging the retail tax base.

In terms of a possible narrowing of the tax base the chief issue concerns the desirability of exempting food (purchased for use off the premises). Nine jurisdictions now exempt all or specified food products. The problem is clearcut; exemption of food largely relieves the regressive impact of the tax, but it also reduces revenue by 20 percent or more. The 2 percent rate of the Colorado sales and use tax represents a minimum.

Fifteen states including Colorado employ the 2 percent rate; fifteen, 3 percent; one, 2½ percent; and one, 3⅓ percent. Indiana, which has a gross income tax, imposes a tax of ⅜ of 1 percent on individual income. Eight jurisdictions which employed the sales tax on January 1, 1952 have increased their rates, usually from 2 to 3 percent.

The Colorado sales and use tax has been a highly significant source of State tax receipts. Net collections amounted to $38,947,000 in 1957, and net receipts have increased steadily each year since its adoption with one exception in 1954. While the use tax is a relatively minor factor in over-all collections, receipts have increased significantly in recent years. The ill-fated services tax was a good revenue producer, collections amounting to about 16 percent of total sales and use tax receipts during the eight-year period, 1938-1945, inclusive.

The yield of the Colorado sales tax is considerably below the average of the seven other Western States using the tax. Colorado ranked

in eighth position in terms of the percentage of total state tax receipts derived from this source; eighth in collections per capita; and seventh in the ratio of sales tax revenues to total state income payments.

While the Colorado sales tax is a major factor in state finance, the bulk of the revenue has been channeled to welfare programs. In the years preceding the 1956 constitutional amendment, which changed the original earmarking provisions, transfers to the General Fund amounted to about 8 percent of net sales and use tax collections.

Direct costs of administering the sales and use taxes have averaged well under 1½ percent during the last decade. This is close to the median position for the leading sales tax jurisdictions, but does not include the retailer's discount of 5 percent which is exceptionally liberal.

The study of sales and use tax administration reveals certain basic deficiencies in the audit program. There is no regular or comprehensive office audit of sales tax returns, and no systematic basis of selecting returns for field audit investigations. There is also a surprising paucity of information on the operation of the sales and use tax which is essential to an analysis of policy considerations as well as an evaluation of enforcement activities.

The primary objection to the retail sales tax is its allegedly unfavorable effect upon the lower income groups. Studies of the impact of the Colorado levy demonstrate conclusively that it is regressive throughout all income ranges. These effects are particularly marked for income categories of $3,000 and less. It is also clear that the exemption of food (other than restaurant meals) would largely relieve this influence as between the low and medium income classes.

The economic effects of the sales tax, as presently constituted, on business do not present serious problems. Most of the adjoining states have a 2 percent tax on retail sales and mail order competition does not appear to be a significant factor. Colorado's allowance of 5 percent of collections for compliance expense, being exceptionally liberal, probably exceeds actual expense for most firms.

The revenue potential of the sales and use taxes for future General Fund purposes appears to be substantial on the basis of existing constitutional provisions and revenue trends. Tighter enforcement would undoubtedly increase yields substantially. There are also a number of possible changes in the base and/or rates which would significantly raise the level of receipts. Introduction of a food exemption would, of course, have the opposite effect. The estimated impact of these changes in terms of the 1957 tax base are as follows:

Change	Estimated yield (1957 base)	Estimated decrease
Food exemption:		
All food		$10,428,000
Food consumed off premises		8,408,000
Removal of exemption:		
Motor fuel	$3,315,000	
Liquor	1,723,000	
Cigarettes	1,200,000	
Total	6,238,000	
Inclusion of:		
Amusements	1,384,000	
Personal service enterprises	1,252,000	
Lodging: hotels, motels and camps	1,094,000	
Automobile and other repairs	995,000	
Rate increases:		
½ of 1 percent	10,429,000 (sales and use)	
1 percent	21,293,000 (sales and use)	
Reduction of vendor's discount to 2 percent	1,300,000	

Alcoholic Beverage Taxes (Chapter IX). A special excise tax is levied on the consumption of alcoholic beverages by the Federal government, all 48 states and the District of Columbia. Public revenues in the form of excise taxes, license fees, import duties, and profits from state operated stores exceeded $4 billion in 1956.

In the same year, receipts from the liquor tax in Colorado amounted to $4,354,000, or 3 percent of total tax revenues. In accordance with the Old Age Pension Amendment, 85 percent of revenues collected from the liquor tax after administrative expenses, are earmarked for the Old Age Pension Fund.

On a per capita basis, 1956 revenues amounted to $2.70, which is somewhat below the average per capita rate for the 29 license states of $3.60. (The remaining 19 states are either "dry" or have a monopoly over some phase of the marketing of alcoholic beverages. These states should therefore not be compared with Colorado or other license states.)

The Colorado tax rate of $1.59 per gallon on spirits is nearly identical to the 29-license state average of $1.59 per gallon. The Colorado rates on wine and beer, however, do not compare as favorably with the median rates for the 29 license states. Colorado's rate on beer of $.03 per gallon is less than half the median rate of $.065 per gallon for the 29 license states. If the Colorado rate were increased to $.06 per gallon, additional revenue of approximately $625,000 annually could be obtained. The median rate for light wine (less than 14 percent alcohol) is $.20 per gallon, while Colorado levies a rate of only $.12 per gallon. Were Colorado to increase the light wine rate to $.20 per gallon, additional revenue of approximately $25,000 annually could be obtained. Colorado's rate of $.24 per gallon on fortified wine (over 14 percent alcohol) is also below the 29-state median of $.30 per gallon. An increase of $.06 in the fortified wine rate would effect additional revenue of approximately $55,000 annually.

In addition to collecting revenues from special excise taxes on alcoholic beverages, significant revenues are usually obtained by the common practice of including alcoholic beverages in the state sales tax base. Of the 20 license states which employ a sales tax, only 4, Colorado in-

cluded, exempt alcoholic beverages from the base. Although somewhat difficult to estimate, Colorado could obtain approximately $1.7 million annually by extending the sales tax base to include alcoholic beverages.

The sale of liquor licenses in Colorado also provides a source of revenue, although annual collections approximate the costs of the Liquor License Division. For example, collections in 1957 were $219,000 while costs, incurred in both licensing and tax enforcement, were $202,000. In addition to the revenues from these licenses, municipalities and counties collect revenue from the sale of state licenses to liquor retailers. Although significant costs are incurred by localities due to the sale of alcoholic beverages, 85 percent of the revenues they collect from the sale of state licenses (averaging about $550,000 annually) accrues directly to the Old Age Pension Fund.

While Colorado has adopted the licensing method of liquor control, an alternative technique, which has been adopted in 17 other states, is for the state to engage directly in part or all of the merchandising of alcoholic beverages. Considering the revenue potential and the more effective control possible in a monopoly system, further study of this alternative would undoubtedly be of value.

Highway User Taxes (Chapter X). Highway user taxes are presently a major element in the tax systems of the great majority of states. They produced over $4 billion in 1957 or 29 percent of total state tax revenues. In general, the fuels tax outproduces the registration tax and related charges by a 2 to 1 margin, but the relative importance of each tax varies widely from one state to another. Nebraska obtains the maximum share from the fuels tax or nearly 41 percent of total tax revenues and New York the minimum or somewhat over 9 percent. Colorado was slightly above the national average of 19 percent. The percentage significance of the registration tax ranged from 2 percent in Alabama to over 22 percent in New Jersey, and Colorado was slightly below the average of 9.4 percent.

The general concept that those who benefit directly from the use of highway facilities should bear the principal responsibility for their cost is simple and logical. It also appears to be equitable and desirable. However, there are significant theoretical as well as practical problems involved in its application. Broadly speaking, the basic questions to be resolved are: (1) is the special user tax approach actually justified in principle; (2) as non-users also derive general benefits from highway facilities what proportion of the total costs should be borne by the users; and (3) how should the costs assigned to the user group be apportioned among the various classes of users?

The proper allocation of highway and street costs assigned to motor vehicle owners among the various types of vehicles is a crucial and certainly the most troublesome problem in this field of taxation. Cost factors are commonly classified as the readiness to serve element which is a function of the number of vehicles; relative use as reflected in miles traveled; and relative damage which is attributable to vehicle weight and its distribution.

In actual practice the registration tax is well adapted to the allocation of readiness to serve costs, and the fuels tax provides a rough but acceptable measure of use. However, no wholly satisfactory basis of measuring and assigning costs attributable to weight and weight distribution has been developed.

Colorado's motor fuels tax applies to all types of fuel used in motor vehicles on the highways of the State. The uniform tax and fuel consumed constitutes a rough measure of actual use, and involves a bias against the heavier vehicle as well as a discrimination in favor of diesel and other special fuels. Typical exemptions of non-highway and governmental uses of fuel as well as a 2 percent allowance for distributor and dealer losses and costs are permitted. The current trend to limit or deny non-highway use exemptions (14 states) is not reflected in Colorado practice which follows the traditional special benefit principle. Regular fuel brought into the State for use, storage or consumption and not otherwise taxed in Colorado is subject to a use tax.

The present uniform rate of 6 cents in Colorado represents an approximate average of state rates as of January, 1958. Net fuels tax receipts have manifested a remarkable growth from approximately $8,000,000 in 1940 to over $32,000,000 in 1957. With the exception of the World War II period, collections have averaged from 22 to 25 percent of total state tax receipts since 1940. Refunds currently reduce gross tax collections by about 11 percent, and other direct exemptions, exclusions and allowances by an additional 10 to 12 percent. Costs of administering the fuel tax in Colorado are relatively low, 0.77 percent in 1957.

The Motor Fuels Tax Section of the Department of Revenue is responsible for administration of the fuels tax with minor assistance from the general field of service of the Department. Legal provisions relating to the filing of returns and reports and the enforcement of tax liability are generally adequate. A comprehensive office audit procedure covering all returns, but emphasizing the regular fuel returns is employed. The check in the case of special fuel returns and tax payments by interstate carriers is generally superficial. Only 59 field audits were conducted in 1957, and there is no regular field inspection service on refunds.

Several questions merit attention in the case of the fuels tax. They include the tax free status of certain uses and users of fuel, the equity of the uniform rates on all types of fuel and the

economic impact of the fuels taxes on the incomes of individual or non-business users. Increasing federal encroachment upon the fuels tax base is also a highly significant problem. There is no theoretical justification for taxing non-highway uses of fuel, although exemption is costing the State over 14 percent of gross collections or about $5,000,000 per year. The fuels tax undoubtedly has a regressive effect upon the incomes of private non-business users, and for the typical $5,000 a year income family the total (federal and state tax) burden equals or exceeds that of the State retail sales tax. Increasing federal encroachment upon the fuels tax base is wholly illogical in terms of facts of federal-state fiscal relationships and should be vigorously resisted.

The principal fiscal purposes of the registration tax are to compensate for readiness-to-serve costs and in some degree at least the differential costs attributable to weight and weight distribution. It is also used singly or in combination with special commercial carrier taxes to impose an additional burden upon this class of users.

The specific bases for registering motor vehicles vary widely as to type of vehicle and often vehicle use and user categories. Colorado licenses private passenger cars on the basis of shipping or empty weight. This is the most popular approach considering the practice of other states, although the flat fee is also widely employed. Empty weight is also employed by Colorado in registering property-carrying vehicles, and the truck or truck-tractor is registered separately from the trailer or semi-tailer. Gross weight (vehicle and load) is preferred by the majority of states, and is a much more realistic measure of costs. Gross weight per axle is a desirable modification of this base. The ton-mile tax overcomes this deficiency for the inter-city commercial vehicles. Colorado registers buses on seating capacity only in contrast to the more popular and logical bases of net weight and seating capacity on gross weight.

Registration tax rate schedules are commonly very complex, and Colorado's provisions are no exception. The customary graduation according to weight or seating capacity is employed, but the number of steps is limited. Farm trucks and combinations are favored over other private and intra-city vehicles. However, the rates for carriers subject to the ton- and passenger-mile taxes are nominal in relation to all other major classes.

Receipts from the Colorado registration tax, operator's licenses and other special charges have increased steadily since 1941. Total collections in 1957 amounted to nearly $7,000,000 or slightly under 5 percent of total state tax receipts. Rising revenues are attributable primarily to the increased number of vehicles rather than higher rates.

Administration of the registration tax is "farmed-out" to the counties and appears to be generally satisfactory. Costs of collection average around 6 percent of the receipts.

Various types of special or additional taxes on certain types of commercial carriers are now imposed in 29 states including Colorado. These levies commonly apply as in Colorado to common and contract carriers operating on an inter-city or interstate basis, though there are many variations.

Several different bases are used including: gross weight in 8 states; gross receipts, also in 8 states, mileage in 7 states; ton- and/or passenger-mile in 3; and a flat fee of $10 or more in 3 jurisdictions. As might be anticipated, there is little uniformity in rates. However, graduation in relation to weight is typical for the gross weight and mileage taxes, and is, of course, "built in" in the case of the ton-mile levies. Specific rate comparisons, in the case of both the registration and carrier taxes, are not too significant in view of differences in the tax base and the relationship between the two types of taxes.

The ton- and passenger-mile taxes in Colorado are administered by the Ton-Mile Section of the State Department of Revenue with assistance from the State's port-of-entry stations and the Highway Patrol. A comprehensive system of checking tax liability by the office staff has been developed, but there are certain gaps in the available data, and field audits, which are the responsibility of the general investigation service of the Department, are sporadic and limited in number.

Receipts from the ton- and passenger-mile tax increased steadily from 1941 to 1954, amounting to $2,900,000 in the latter year. Since 1954 they have more than doubled following the passage of the revised law, and totaled approximately $6,300,000 in 1957 or over 4 percent of state tax revenues.

The total user tax and fee burdens of the 819,143 vehicles registered in Colorado in calendar 1956 amounted to approximately $45,632,000. Private passenger cars accounted for the bulk of total payments or 63 percent; the 157,286 single unit trucks (all major uses)—19.3 percent; the 6,763 combinations—16.2 percent; and 1,803 buses—1.5 percent. For hire inter-city carriers of persons and property were responsible for 21.8 percent of total payments as compared to 78.2 percent for the private and intra-city vehicles.

Costs per mile for the various classes of vehicle exhibit a broad range of variation from 3/10¢ to 5.2¢. For hire combinations were subject to the maximum of 5.2¢ per mile. Gas-propelled vehicles generally paid more than the diesel-powered units. For hire buses ranked second in terms of costs per mile with a low of 1.8¢ for diesel and a high of 3.2¢ for other special fuel users. The for-hire single unit trucks were third, and showed a broad cost spread of from 1.2¢ to 2.6¢ per mile. As a general rule, the costs

of for hire vehicles increase progressively in the larger, heavier vehicle categories. Not for hire combinations are next in line, costs per mile ranging from 9/10¢ to 2¢. Not for hire, gas-powered buses occupy an intermediate cost position averaging 1.6¢ per mile; and the "practical minimum" of 6/10¢ per mile applied to private passenger cars.

In the case of single unit trucks, costs in Colorado, with certain minor exceptions, are well below the average in the Western States. The differential is marked for virtually all types of use, but is most extreme in the case of not for hire and most categories of farm trucks. For the 3-axle not for hire vehicles Colorado's costs actually decline in relation to weight and range from ¼ to ½ of the average.

For the for hire combinations, both gas and diesel, costs in Colorado are generally below average for the tractor semi-trailer units with three or four axles. The favorable differential is greater for the diesel than for the gas-powered units. Colorado's costs are average or above in the instance of for hire five-axle tractor semi-trailer units, and are above average in most categories for the truck full trailer and tractor semi- and full-trailer units. Costs in Colorado exhibit a significant progression in relation to weight for all the for hire combinations.

In the case of not for hire combinations, Colorado's costs are substantially below the average, and the costs for gas-propelled units are virtually constant in relation to weight. Meaningful interstate comparisons cannot be made in the instance of farm combinations, but Colorado's costs are very low for most weight categories.

Colorado costs per mile for the for hire gas-propelled buses are generally below average, while those for diesel powered buses are usually above the average. The data in Colorado and most of the other states are spotty, and consequently the bases of comparison are limited.

Costs for private automobiles in Colorado are exactly equal to the Western State average of 6/10¢ per mile. Of the 7 states for which such data were available 3 have the same or average cost, 1 is higher and 2 are lower.

While the analysis of user tax burdens does not provide all of the answers to the burden problem, several broad conclusions are inescapable. First, it is apparent that Colorado's charges on the for hire carrier group are heavy but not excessive in relation to the average for the other Western States considered. Generally speaking, Colorado's costs per mile vary from about 25 percent below to 25 percent above the average. Second, it is equally clear that user taxes in Colorado are abnormally low in the case of not for hire and farm vehicles; Colorado's costs per mile are as low as 21 percent of the average, and the disparity is greatest for the heavier types of vehicle.

The revenue potential of the existing user tax system is excellent in terms of the inevitable increase in motor vehicle traffic both private and commercial. Certain changes in the structure of the existing system would also increase receipts significantly. For example, a doubling of the registration taxes on not for hire and farm vehicles would produce in excess of $1,600,000 (1956 base), and a change to a gross weight basis of licensing would result in an equivalent or greater increase. A 2¢ per gallon increase in the tax on special fuels would increase receipts by more than $500,000. If the general tax rate were raised to 7¢ (1957 base) some $5,400,000 in additional revenue would be realized. Elimination of the non-highway use exemption should increase yields by approximately 14 percent. Finally, intensified enforcement efforts in certain areas would produce minor but significant gains.

Insurance Tax (Chapter XI). Insurance companies operating in Colorado, unless expressly exempted, are subject to a 2 percent tax on premiums paid on business written in the State. With the exception of the general property tax no other state or local tax can be imposed upon this type of business enterprise. In 1957 receipts from the insurance tax amounted to $3.9 million or 2.65 percent of total tax revenues of the State. As general revenue, however, they accounted for slightly over 7 percent of the total receipts of the General Fund.

Although a 2 percent rate is the one most commonly used by the states—and all states have a special tax on insurance companies—relative burdens are difficult to measure because of varying rate schedules and exemptions. It would appear, however, that the Colorado tax law imposes a somewhat lighter burden than the average for the eleven Western States. Thus, Colorado's rate of 2 percent is equal to that of two states, New Mexico and Nevada, but below that of five other states, Idaho, Wyoming, California, Montana and Utah. Colorado is distinctive in that it exempts from the tax all companies with 50 percent of their assets invested in Colorado. In practice all domestic companies avail themselves of this exemption.

Colorado's relatively low tax rate and favorable exemption policy is reflected in per capita insurance tax collections which in 1956 amounted to $2.13 — a figure below both the Western State average of $2.58 and the national average of $2.41.

Changes in the Colorado law designed to produce more revenue could be directed to either the reduction of exemptions or the increase of rates or both. Thus, it is estimated that on the basis of 1957 premium income the elimination of the exemption of companies which have at least one-half of their assets invested in Colorado would increase tax receipts in the amount of $306,000. However, this amount would be reduced to an estimated total of $46,000 if the tax were exclusive of renewal premiums.

An increase of rates would be more productive, however, although the fact has to be borne in mind that the laws of 29 states, including 6 in the West, have a retaliatory feature. If, however, Colorado's tax rate of 2 percent were increased to 2.25 percent (and limited to foreign company business), which is the rate used in Utah, an estimated added yield of $534,000 would be realized. Similarly at 2.50 percent, which is the rate used in Wyoming, revenue would be increased by $1,068,000 and by $2,136,000 if, as in Idaho, the rate were increased to 3 percent.

Personal Income Taxation (Chapter XII). The paramount significance of personal income taxation on the state level is that it alone in our battery of taxes is capable of providing a substantial element of progressivity to a combined state-local tax structure which otherwise is steeply regressive. The adoption of personal income taxation for Colorado was strongly advocated by organized farm, labor and public education groups for a quarter of a century before it was finally enacted in 1937. Since then, the total number of individuals filing Colorado personal income tax returns have increased tenfold. Either as taxpayers or dependents of taxpayers, 81 percent of the State's total population in 1957 can be traced directly to the more than one-half million 1957 resident tax returns filed in 1958. Non-resident returns filed in the same year numbered slightly more than one percent of the total. Dollarwise, personal income tax receipts rose from less than $1.8 million in 1939 (the first full year of the tax) to $21.8 million in 1957, a twelve-fold increase. Notwithstanding its broad extension during the past two decades, personal income taxation in Colorado produced less than one-sixth of the State's tax revenues in 1957, while general sales, excises and highway user taxes alone accounted for more than two-thirds of the total.

Interstate Comparisons. Twenty-nine states and the District of Columbia levied personal income taxes in 1957. Only three Western States—Nevada, Washington, and Wyoming—do not impose a personal income tax. Interstate comparisons are summarized below with regard to the personal income tax base, rates, liability and collections. Some of the more important provisions are the following:

(1) *Split-income*—Colorado and 20 other income tax states do not permit the splitting of income for tax purposes by married taxpayers.

(2) *Capital gains*—In addition to Colorado, only eight states exclude 50 percent of "long-term" capital gains, defined as realized earnings on assets held at least six months. The majority of income tax states do not distingiush capital gains from other types of taxable income.

(3) *Federal income tax deductibility*—In addition to Colorado, 15 personal income tax states permit full deductibility of federal income taxes. However, only Colorado and three other states which permit a standard deduction of 10 percent of adjusted gross income, or $1,000, whichever is lesser, also allow the federal income tax as an additional deduction against taxable income.

(4) *Medical expense deductions* — About one-third of the states, including Colorado, allow medical expenses to the extent they exceed five percent of adjusted gross income. The remainder generally either allow the full expense or an amount in excess of a fixed dollar figure, or percent of adjusted gross income.

(5) *Personal exemptions* — Only five states follow the federal code of allowing a standard $600 exemption per individual. Colorado's $750 exemption is unique and considerably below the average of the other states.

(6) *Tax rate structures*—No two states have identical tax rate structures. The most common minimum rate is one percent, but it is applied to varying amounts of taxable income. There is even less uniformity with regard to maximum rates—they range from a low of 3.75 percent to a high of 11 percent. Colorado's 10 percent maximum rate, applied to taxable incomes above $11,000, is the second highest among all states, and for taxpayers subject to the two percent additional surtax on income derived from intangibles, the combined normal and surtax rate may actually work out to be the highest rate in the nation.

The 1957 personal income tax liability for a married couple with two dependent children was computed on a comparable basis at eight different levels of adjusted net income for each of the 29 income tax states and the District of Columbia. The results of this comparative analysis are summarized below:

Adjusted net income level	Dollar amount of tax liability			Computed Colorado tax:	
	Colorado	National average	Highest state	Rank from top state	Percent of nat'l average
$ 3,000	$ 0	$ 3.91	$ 20.00	—	——
5,000	14.62	36.36	100.00	23	40.2
8,000	56.27	119.46	295.00	23	47.1
10,000	98.72	191.24	445.00	24	51.6
15,000	278.80	402.29	820.00	22	69.3
25,000	818.72	864.52	1,748.90	14	94.7
50,000	1,871.36	1,938.64	4,232.40	17	96.5
100,000	3,313.98	3,891.00	9,179.40	18	85.2

On the basis of the computed tax burdens, a married taxpayer with two dependent children would incur in Colorado an income tax liability which was less than the national average at all levels of income. The tax bill of Colorado taxpayers with adjusted net incomes of $10,000 or less works out to be smaller than that of similar taxpayers in three-fourths of all the other incomes tax states, and 95 percent of Colorado's income taxpayers are to be found in these medium and lower income categories.

Interstate comparisons of the relative importance of personal income tax collections for

fiscal year 1957 show that on a per capita basis the Colorado collection of $14.24 was almost 15 percent below the national average; that as a percent of total tax collections they represented less than 16 percent of the total, a ratio which was one-fourth below the national average; and as a percentage of income they amounted to less than 7/10 of one percent of the total personal income received and worked out to be approximately one-fifth below the national average.

Erosion of the Income Tax Base. The major portion of the personal income received by Colorado residents in 1957 was never subjected to state income tax since it never found its way into the tax base. Colorado personal income, as reported by the U. S. Department of Commerce, amounted to $3.3 billion; but net taxable income for normal tax reported on the 1957 returns amounted to only $.8 billion, or less than 24 percent of the total income received. This gap of more than $2.5 billion between the actual flow of income and that subjected to State taxation can be attributed to: (1) Statutory exclusions and conceptual differences amounted to about $459 million, or 14 percent of personal income received. (2) The underreporting of income was estimated to be $500 million, or approximately 15 percent of the total income flow. This can be partly explained by the fact that returns were not legally required from an undisclosed number of individuals with incomes below $750 per annum. The remainder represents a leakage due to deliberate tax evasion and/or oversight on the part of taxpayers. (3) The nontaxable returns, plus the itemized expense, optional standard, and federal tax deductions claimed on the taxable returns represented another 26 percent of the personal income received in Colorado in 1957. The most important single deduction reported on all returns was the federal income tax expense. It was taken by 70 percent of the taxpayers and amounted to $285 million, or practically one-half of all the deductions claimed. The least important itemized deduction was represented by allowable medical expenses which were claimed by only 12 percent of the taxpayers and amounted to less than $20 million, or approximately three percent of the total deductions. (4) The largest single factor responsible for the shrinkage of the tax base was the personal exemption provision which in 1957 amounted to $725 million, or 22 percent of the income flow.

In addition to the above, the Colorado code permits a special $600 exemption against surtaxable income which effectively eliminated the payment of the two percent surtax for three out of every four taxpayers who derived income from legally taxable interest and dividends. On the basis of the survey data, more than 100,000 of Colorado's half million taxpayers reported *gross surtaxable income,* which totaled $128 million. However, after surtax exemptions, only 27,000, or less than five percent of the returns showed *net surtaxable income* which totaled $80 million, or 10 percent of the $800 million of net income subject to normal tax.

Thus, at the end of the income circuit, the net individual income tax base for Colorado in 1957 was $880 million, or slightly more than one-third of the adjusted gross income reported on all tax returns. Viewed in terms of erosion, only one-fourth of the total income received by Colorado residents in 1957 found its way into the State's individual income tax base.

Who Pays the Tax? On the basis of the detailed 1957 survey data, a distribution was obtained of the $18.3 million of combined normal and surtax liability, classified by the taxpayers' source of income, geographic location, size of income, and dollar amount of tax liability.

(1) *Source of income*—The most important industrial sources of Colorado adjusted gross income and personal income tax revenues were wholesale and retail trade, government (federal, state and local), personal and business services, and manufacturing. These four categories alone accounted for approximately 65 percent of the total number of taxpayers and adjusted gross income, and almost 55 percent of the total income tax liability. In contrast, only 7 percent of the taxpayers indicated that agriculture was a primary source of income and their reported adjusted gross income and tax liability amounted to less than 5 and 4 percent, respectively. Similarly, mining represented approximately 4 percent of the total returns, income and tax liability.

(2) *Geographic location*—As a group, the eight counties with the largest populations—Denver, El Paso, Pueblo, Jefferson, Arapahoe, Weld, Adams, and Boulder—accounted for approximately 80 percent of the total dollar amounts of adjusted gross income and tax liability. In contrast, taxpayers in the remaining fifty-five counties reported only 22 percent of the income and paid less than 18 percent of the total tax. The high degree of urban concentration of income and tax is further indicated by the fact that the four counties comprising the Greater Denver Metropolitan Area represented more than one-half of the tax returns and approximately three-fifths of the total adjusted gross income and tax liability. Denver alone—with a population actually less than that of the fifty-five nonurbanized counties combined—accounted for 36 percent of the taxpayers, 40 percent of the total income, and 47 percent of the total income tax liability for 1957. Finally, nonresident taxpayers accounted for only one percent of the taxpayers, income, and tax reported

on the 1957 tax returns. In brief, the personal income tax in Colorado works out to be essentially an urban tax due to the marked concentration of income, wealth and economic activity in the geographic band of metropolitan counties situated along the east-central slope of the State.

(3) *Size of income*—The overwhelming majority of taxpayers account for a relatively small part of the total income tax burden, while a minority of taxpayers account for the lion's share. This situation primarily reflects the existent inequality and concentration of income before tax, the extensive erosion of the tax base, and the low marginal rates for the lowest taxable income brackets. Individuals with incomes of less than $5,000, representing more than 68 percent of all taxpayers, had 41 percent of the adjusted gross income but were liable for only 16 percent of the total personal income tax. Taxpayers in the middle income categories, with adjusted gross incomes ranging from $5,000 to $10,000, accounted for 40 percent of the income and 27 percent of the returns and tax. In contrast, taxpayers with reported incomes of $10,000 or more represented less than 5 percent of all taxpayers and 18 percent of the adjusted gross income, but as a group were liable for 57 percent of the total amount of combined normal and surtax reported on the 1957 tax returns. This distribution was relatively more progressive than that obtained under the federal personal income tax.

(4) *Amount of tax*—The normal tax liability amounted to $16.7 million and the surtax to $1.6 million. The total tax of $18.3 million worked out to be a burden of 2.1 percent on the total income tax base reported by approximately 525,000 Colorado taxpayers in 1957.

Less than 5 percent of all returns showed a combined normal and surtax in excess of $100 a year, and less than 1 percent reported state income taxes in excess of $500. On the other hand, approximately 134,000, or over 25 percent of all individuals filing returns, paid no tax on their 1957 returns. Another 78,000 incurred a total income tax liability which ranged from $1 to $5. Thus, for some 200,000 taxpayers, representing 40 percent of all individual returns, the personal income tax was less than $5 for the year of 1957. Since it cost the State on the average more than $2 to process a single income tax return, it would appear that a large part of the Department of Revenue's personal income tax collection and administration activity takes on the character of "pouring water in a bushel basket."

Estimates of Effects of Selected Income Tax Revisions. The estimated effects on state revenues of six possible revisions in the present Colorado personal income tax are shown in the following tabulation:

	Amount of change in State revenue (thousands)
1. Federal income tax deductibility:	
A. Permit deduction up to $300 of federal tax	$ 8,341
B. Permit deduction of 10 percent of federal tax	8,973
C. Permit no deduction of federal income tax	10,069
2. Include net capital gains at 100 percent	1,401
3. Eliminate 2 percent surtax	—1,599
4. Eliminate $75 minimum travel allowance	281
5. Increase medical expense allowance:	
A. Allow expense in excess of 3 percent of adjusted gross income	—108
B. Allow full medical expense	—265
6. Increase normal tax rate structure:	
A. From 2 to 10 percent	6,173
B. From 3 to 10 percent	10,968
C. From 3 to 8 percent	11,638

1. *Federal income tax deductibility*—It is estimated that alternative "A" would affect approximately one-half of all taxpayers, but only one-third of those with incomes of less than $5,000. The distribution of the effective tax burden would be less progressive if a fixed percentage of the federal tax were used rather than a lump sum for the deductibility limit. Under alternative "B" more than three-fifths of the total number of taxpayers would be affected, and almost one-half of the taxpayers in the lowest income category. If Colorado were to adopt alternative "C," the number of taxpayers affected and the relative distribution of this tax burden by income categories would be similar to that of alternative "B."

2. *Special treatment of capital gains income*—At present more than one-half of all the income tax states do not make any distinction between the taxation of long-term capital gains and other forms of taxable income.

The survey data show that less than 10 percent of the Colorado taxpayers reported long-term capital gains on their 1957 returns. Among these that did, the 2 percent with incomes of $10,000 or more accounted for approximately 50 percent of the total net long-term capital gains reported on all returns. Moreover, the very small minority of taxpayers reporting capital gains who had incomes in excess of $50,000 actually represented less than 1/10 of 1 percent of all taxpayers, but as a group they accounted for over 20 percent of the total amount of capital gains. The average long-term capital gain in this category was slightly more than $34,000 per taxpayer, of which only 50 percent was subject to state tax.

3. *Surtax on income from intangible assets*—The $600 exemption is estimated to have effectively excluded from surtax 75 percent of all taxpayers who reported income from interest and dividends on their 1957 returns. Changes in the tax structure during the past two decades have weakened the rationale for the continuance of the surtax. As in the case of the special treatment of long-term capital gains, designating a particular source of income for either lighter or heavier taxation under the personal income tax inevitably results in "horizontal" inequities between taxpayers who in other respects are in

similar economic circumstances. On the basis of the survey data almost two-thirds of the 27,000 taxpayers who would benefit by the removal of the surtax provision had incomes of less than $8,000 in 1957.

4. *Special $75 minimum travel allowance*—On the basis of the survey data almost 300,000 taxpayers claimed a travel expense deduction which averaged $150 per return. If the provision were revised to allow only itemized travel expenses in excess of $75, it is estimated the State would obtain less than $300,000 of additional revenue, with the major cost borne by taxpayers with incomes of less than $5,000. However, even for these taxpayers the increased cost would be minimal, about 30¢ per taxpayer per year.

5. *Medical expense allowance*—The Colorado code is less generous than the federal government in that it permits the deduction of only those expenses in excess of 5 percent of adjusted gross income. On the basis of the survey data the medical expense allowance reported on all 1957 tax returns was dollarwise the least important of the itemized deductions, and it was claimed by less than one-eighth of the taxpayers, mainly concentrated in the lowest income category.

6. *Statutory bracket rates*—Consideration should be given to raising the relatively low statutory rates for the bottom tax brackets if the Colorado income tax is to be expanded to the point where it actually serves as the major fiscal instrument for meeting the State's continuing need for increased General Fund revenues. The table below shows the three hypothetical rate schedules which were used as the basis for estimating the state revenue and taxpayer costs shown as possible alternatives for revision of the Colorado personal income tax structure.

Net taxable income brackets	1958 marginal rates	Alternative hypothetical rate structures "A"	"B"	"C"
$ 0—$ 1,000	1.0	2.0	3.0	3.0
1,001— 2,000	1.5	2.5	3.25	3.5
2,001— 3,000	2.0	3.0	3.5	4.0
3,001— 4,000	2.5	3.5	3.75	4.5
4,001— 5,000	3.0	4.0	4.0	5.0
5,001— 6,000	4.0	4.5	4.5	5.5
6,001— 7,000	5.0	5.0	5.0	6.0
7,001— 8,000	6.0	6.0	6.0	6.5
8,001— 9,000	7.0	7.0	7.0	7.0
9,001— 10,000	8.0	8.0	8.0	7.5
10,001— 11,000	9.0	9.0	9.0	8.0
11,001 and over	10.0	10.0	10.0	8.0

Administration. It is estimated that the office and field auditing staffs could be increased and that such action would result in a substantial increase in state revenues above the salary costs incurred. In addition, consideration should be given to expansion of the federal exchange program since it presently results in about half of the total dollar amount of deficiencies assessed by the office auditing staff.

In the past five years, administrative costs have averaged slightly over 3 percent of total income taxes collected and in fiscal 1957 amounted to less than $1 million. The average cost per return in 1957 was $2.17, representing an increase of 54 percent since 1950.

While a federal tie-in offers possible simplification of return preparation, it is subject to numerous and significant criticisms. Moreover, a certain amount of simplification is possible within the present system, without delegating state responsibility to Congress and federal tax administrators.

The withholding technique, as presently constituted, results in a particularly large number of refunds to taxpayers with incomes of less than $5,000 annually. While employer use of withholding tables prepared by the state would diminish this problem to some degree, it could also be reduced by simply using two "flat-percentage" withholding rates in place of the present "one-rate" system.

Consideration also should be given to expanding the computational tax table to include individuals with adjusted gross incomes between $5,000 and $10,000. Such action would simplify the preparation of returns for a large number of taxpayers, and at the same time would reduce auditing and other administrative costs without materially affecting state revenues.

Corporation Income Taxation (Chapter XIII). The corporation income tax, originally utilized as an emergency source of revenue, has come to be widely accepted as an indispensable component of the modern American tax system. On both federal and state government levels it has been proven to be not only a highly productive source of revenue, but an essential instrument of fiscal policy as well. It serves as a necessary supplement to the personal income tax, a role especially significant at the state level. State government revenues from the corporate income tax have grown more rapidly over the past two decades than any other source of state revenue.

The fundamental justification of the corporate income tax is the special benefit or privilege theory of the corporation. The United States Supreme Court as early as 1911 upheld the tax as "an excise upon the particular privilege of doing business in the corporate capacity." The development of the modern American business system has given substance to the special privilege theory.

The corporate income tax has also been justified on the government "partnership in enterprise" principle. An important part of the responsibility of both state and federal government is to help maintain the kind of conditions under which free enterprise can flourish; the concommitant obligation of successful corporate enterprises, as of all business organizations and individuals, is to bear a share of the costs of government. Corporations are taxed separately from their individual legal owners because they are established and function as separate and independent entities.

Additional considerations for levying the corporate income tax are: (1) due to the limited taxing jurisdiction of state governments, the personal income tax cannot reach the entire income produced within the state and corporate profits channeled to out-of-state stockholders will escape a state's taxable income base entirely unless a corporate income tax is also levied; (2) the corporate income tax can provide an important source of revenue without adding to the regressivity of the over-all structure of state and local taxes; and (3) the revenue growth potential of the corporate income tax in an expanding economy, when geared effectively to the corporate income base, makes it an ideal tax for the long-run growth requirements of state finance.

Thirty-four states and the District of Columbia levy corporate income taxes. In 1958, all states which had an individual income tax also levied a corporation income tax. Four states taxed corporate income only, and several states levied additional corporate privilege or excise taxes based in part on net income.

In Colorado, taxable returns filed under the corporation income tax have grown from less than 2,000 in 1939 to almost 8,000 in 1958. By 1944, taxable returns accounted for approximately two-thirds of all returns filed, and have maintained that ratio since. Net collections under the tax grew from $1.2 million in 1942 to $6.5 million in 1951. From 1951 to 1957, however, a serious contraction occurred in the Colorado corporate income tax base due largely to the effects of the American Can case which diminished legally taxable income of foreign interstate firms operating in Colorado. During this six-year period, the corporate taxable income base declined by 14 percent, while Colorado personal income increased by 73 percent, taxable retails sales of foreign corporations by 94 percent, and federal corporate taxable income reported in Colorado by an estimated 69 percent.

The corporate income tax has been utilized much less fully in Colorado than in the majority of income tax states. Among 27 states reporting corporate income tax collections in fiscal 1957, Colorado's collections from the tax ranked:

(a) Twenty-fifth from the top as a percent of total tax collections;
(b) Twenty-sixth from the top as a percent of the total state income tax collections;
(c) Twenty-seventh from the top as a percent of federal corporate income taxes collected in the state; and
(d) Twenty-fourth from the top as a percent of personal income received.

The definition of taxable corporate net income under the Colorado law follows generally that of most other states and the federal code. With respect, however, to the exclusion from gross corporate income of dividend receipts and the deductibility of federal income tax, Colorado is in a distinct minority in permitting more generous treatment than do most income tax states. Only 6 other states allow an equal or greater exclusion of dividends than the 85 percent permitted by Colorado. Nineteen states permit no deduction of federal income taxes, and Wisconsin permits only limited federal tax deductibility. Moreover, the fourteen states that allow federal tax deductibility are relatively non-industrialized and they place little reliance on the corporate income tax as a source of state revenue. Corporate tax collections in 1958 for these states averaged only 5 percent of their total tax revenue; whereas, they averaged over 10 percent for the twenty states not permitting full federal tax deductibility.

The deductibility of the federal income tax quantitatively is the most significant single "erosion factor" responsible for the shrinkage of Colorado *taxable* corporate income tax base. The reciprocal deductibility of the Colorado tax from federal taxable income and the federal tax from Colorado taxable income reduces the tax liability of many firms by as much as one-half, giving rise to the well-known "50-cent dollar" with which these corporations pay their Colorado income tax.

For example, in 1957, the net cost of each State tax dollar was 54 cents for Colorado firms, i.e., those with intrastate operations only, exactly 50 cents for interstate firms operating in Colorado, and 52 cents for the two groups combined.

Another factor causing reduction of the corporate income tax base in recent years has been the deductibility of the oil and gas gross income tax. As originally enacted, the tax was not an allowable deduction under the regular income tax. During the 1953 general revision of statutes, however, a substantive alteration in the Income Tax Act was made by the revision committee. The position in the statute of the oil and gas tax subsection was shifted in such a manner that the tax was no longer non-deductible under the regular income tax.

The 1958 nominal or statutory 5 percent rate of the Colorado corporate income tax (except for banks) was equal to the median for the thirty-four income tax states. However, Colorado's *effective* tax rates, i.e., the real net cost of the tax as a percent of total net income, was regressive, as shown by the following tabulation computed with and without federal tax deductibility:

Corporate net income before any income taxes	Colorado effective rate: With Federal deductibility	Without Federal deductibility
$ 25,000	2.49	3.50
50,000	1.78	2.95
100,000	1.46	2.68
500,000	1.24	2.46
1,000,000	1.21	2.43

It is evident that reciprocal tax deductibility has converted Colorado's proportional corporate income tax into a highly regressive tax, so that those with the lowest net incomes pay the highest relative rates. Moreover, interstate rate comparisons are meaningful and valid only in terms

of effective rates, since all states do not permit federal tax deductibility.

Who Pays the Corporate Income Tax? A part of the corporate tax burden is shifted to customers and/or factor sources through the pricing and investment decisions made by corporations. The burden does not rest entirely on corporate stockholders or undistributed profits, but is diffused broadly throughout the economy. Thus, the impact of the tax upon corporations, or the immediate net cost of the tax, does not represent the true burden of the tax upon corporate stockholders and retained earnings. Nevertheless, it is meaningful to measure the distribution and net cost of the tax to corporations, its relationship to other items of corporate expense, and its distribution among firms.

For the year 1957 the total State income tax liability for all corporations amounted to $6.3 million. Interstate companies, representing 18 percent of all taxable firms, accounted for 52 percent of the total tax. The remainder was accounted for by firms doing business solely in Colorado. Virtually all of the latter are "domestic" firms in the sense that they have their principal place of business in Colorado. On the other hand, among the taxable interstate corporations, "foreign" firms, or those with out-of-state head offices, constituted 86 percent of the total number of all such firms, but incurred only 54 percent of the total tax liability of all interstate firms.

For the entire group of taxable firms in 1957, the net cost of the tax amounted to less than one-tenth of a cent of each corporate revenue dollar. For all taxable Colorado corporations the net cost of the tax was 0.1 percent of total business expense, while for interstate corporations reporting Colorado cost items the net cost was 0.15 percent.

The Colorado income tax appears to exert an equally insignificant impact on corporations when the effective tax liability is expressed as a percentage of their total Colorado tax bill, including federal income tax allocated to their Colorado operations. For the interstate firms it amounted to 1.8 percent of their total Colorado tax bill, and for the intrastate firms it amounted to 2.6 percent. This difference is due in part to the inadequacies of the statutory allocation formula and the federal tax deductibility permitted under the Colorado code.

Effects of Eliminating Federal Tax Deductibility. On the basis of the 1957 data, elimination of the federal tax deduction would increase the corporate tax liability of all firms by approximately $5.2 million and the net cost of such an increase would be $2.7 million. Elimination of the deductibility provision has advantageous effects not obtainable by a compensating increase in statutory rates: it would result in a greater degree of equity between interstate and intrastate firms; it would offset some of the inadequacies of the interstate allocation formula; and reduce the regressivity of the effective rate structure.

The elimination of the federal income tax deductibility provision of the Colorado corporate income tax would achieve a more equitable corporate tax structure and help meet the expanding needs for General Fund revenues.

Severance Tax (Chapter XIV). The severance tax upon certain types of natural resource production is largely a development of the present century. It is a special tax both in terms of its scope and the purposes it is intended to serve, and is commonly defined as a levy on the extraction or removal of certain natural resources from the soil or water. Twenty-eight states now impose severance taxes on certain mineral products, and there are six jurisdictions that include specified extractive industries under their general sales taxes. Finally, there are 20 states (most of which impose severance taxes) that have modified the application of property taxes to forest lands. The scope as well as the rates of the taxes differ widely. Oil and gas resources are taxed in 23 states; coal and/or iron ore in 9; other specified minerals in 11; and timber in 6.

A variety of tax bases, including physical units of product, sales, gross receipts and gross income, are employed. The terminology used by legislative bodies in describing the tax also differs, and a special or additional tax may be incorporated under a general tax statute such as the sales or income tax laws. The severance tax may be in lieu of property taxes, but this is not the usual practice.

The support for severance taxes rests upon theoretical as well as practical grounds. Generally, it is alleged that they are preferable to the property tax which has many deficiencies in its application to mineral and timber properties; that they serve to compensate the state for the exploitation of its natural resources and to promote conservation; that they are an effective means of taxing absentee owners and of offsetting tax advantages which certain natural resource properties enjoy under other tax forms; that they are productive and relatively easy to administer; and that as state measures they permit a state-wide sharing of fiscal benefits.

The opposition to severance taxes stresses their allegedly unfavorable impact on resource development and production; the instability and unsatisfactory character of receipts in the case of local governments if the tax is a substitute for the property tax; and the discriminatory nature of the tax if it is in addition to the property tax.

While the issues involved are complex, the case for moderate severance taxes is generally sound. Employment of the tax as a substitute for the property levy, as the latter tax is commonly

applied, is certainly advantageous from the standpoint of equity, conservation and administration. As an additional tax it serves to compensate for low level assessments under the property tax, and unusually favorable treatment or inadequate coverage under other general tax forms. The total tax burden on the resources in question should be reasonably equated with that on other forms of business enterprises. Certainly, the severance tax should not be used as a punitive device.

The burden of the severance tax is normally shifted to the consumer of the taxed products. There is no reason to believe that a severance tax under the conditions stated will have an unfavorable effect upon resource development or production with the exception of a chronically depressed industry.

For practical purposes Colorado's experience with severance taxes dates from the passage of the oil and gas income tax in 1953, which imposed a substantial tax on the gross income from oil and gas production. It applies to individual royalty income as well as corporate. Property taxes on the oil and gas resources or lands are creditable against gross oil and gas income, and the oil and gas tax paid is allowable as a deduction under the income tax. Royalty payments to the United States or to the State of Colorado are exempted. The base of the tax is obviously strictly limited both in terms of the minerals taxed and by the property tax credit.

The rates of the tax are progressive, ranging from 2 to 5 percent of taxable gross income. Tying of the tax to the state income tax system was intended in part to avoid the possibility that the levy might be considered an excise and therefore subject to the constitutional provision earmarking 85 percent of receipts for welfare purposes. Compared to the other states taxes in this region the rates of the Colorado tax are about average. However, considering the fact that the other levies are not in lieu of property taxes, the burden of the Colorado tax appears to be below the average.

Receipts from the Colorado severance tax have increased substantially since 1954, totaling $3,894,708 in 1957 or 2.64 percent of state tax collections. The tax is administered as an integral feature of the state income tax structure, and costs cannot be distinguished.

The fiscal significance of the severance tax in Colorado as compared to that of similar taxes in the other leading mineral producing states is obviously an essential basis of evaluating present and future policies in this field. Of the top 28 states in mineral production all except 7 imposed severance taxes, and Colorado ranked 8th in terms of severance tax receipts inthe 27 states which reported tax collections. Severance tax receipts in 1956 exceeded 1 percent of the value of minerals in 10 jurisdictions including Colorado.

It should be noted that 8 of the eleven Western States impose severance taxes. Colorado ranked second to New Mexico in the amount of tax collections; fourth in the ratios of severance tax collections to total tax receipts and to personal income payments; and fourth in terms of per capita receipts.

During the taxable year period covered by the Colorado income tax study, 135 corporations reported gross oil and gas income, but only 95 actually paid a net tax. Most of the companies involved were domiciled or had their headquarters outside of Colorado, and the majority were interstate concerns. The gross tax liability of all companies was approximately $5,900,000, and the property tax credits claimed amounted to $2,836,000 or 48 percent of the gross tax. Foreign corporations reported over 98 percent of net taxes, and interstate companies not headquartered in Colorado about 91 percent. There is also a marked concentration of the oil and gas tax burdens on concerns with assets in excess of $50,000,000 and particularly the interstate organizations.

The effective rate of the oil and gas tax in relation to oil and gas income reaches a maximum of 2.68 percent in the case of foreign interstate companies. For all other categories it is below 2 percent.

There were 4,122 individual income tax returns reporting oil and gas income, but only 2,986 showed a net tax liability. Total net tax liability amounted to $214,611 or 6.3 percent of the net severance tax for both corporate and individual taxpayers. Property tax credits claimed, in contrast to the corporate taxpayers situation, amounted to 85 percent of the gross tax. The oil and gas tax burden in relation to individual income levels reveals a broad spread, ranging from 5 percent of the total tax for the $8,000 to $10,000 income group to 38 percent for the $50,000 and over class. The effective rate of the oil and gas tax on individual oil and gas income is approximately 1.6 percent.

The future role of severance taxation in Colorado should be dictated primarily by considerations of equity and the economic effects of the tax on resource development and utilization. Revenue potentials are important but of secondary concern. In terms of achieving the broad objective of equality in taxation as between the various types of mineral production and with reference to other industries, it is evident that existing policies are deficient in both respects. Colorado's present policies are highly favorable to producing mineral properties in the case of the property and income taxes, and the severance tax on oil and gas which permits crediting of property taxes is very moderate as compared to those of most neighboring states. At the same time, the severance tax on oil and gas does result in an additional burden on these resources as compared to other types of mineral produc-

tion. These considerations give strong support for the extension of the existing tax on a selective basis to include such minerals as molybdenum, vanadium and uranium, and the elimination of the property tax credit. The bases of property assessment as well as their application by county assessors also should be modified to ensure consistent and equitable results.

Elimination of the property tax credit under the oil and gas tax (using 1956 yield figures) would produce an additional $3,000,000 in tax receipts. The increase factor is 88 percent. Extension of the tax to the three other minerals noted (with no property tax credit) would produce approximately $2,200,000 or an increase of nearly 65 percent as related to 1956 data. The former percentage factors are, of course applicable to current yields, and the latter estimate involves a calculated effective rate of 3.51 percent on the gross value of product.

Inheritance, Estate and Gift Taxes (Chapter XV). State death taxes are one of the most firmly entrenched state revenue sources, as evidenced by the fact that 47 states have retained this form of taxation for over 25 years. Such utilization is due in part to the Federal estate tax which may be partly offset by state death tax payments. Hence, 37 states, including Colorado, impose an inheritance tax and with the exception of Oregon, supplement the levy with a differential estate tax. The latter applies only when the federal credit exceeds the inheritance tax liability and is therefore designed simply to absorb the federal credit. Of the remaining 11 states, 7 impose an estate tax based on the federal credit, 3 impose an independent estate tax and 1 state, Nevada, imposes no death tax of any form despite the federal credit.

A major problem associated with inheritance taxation is the *inter vivos* gift (between living persons) which is made prior to and in anticipation of the death tax. To avoid revenue losses from this subterfuge, 12 states including Colorado have adopted a gift tax, which generally carries the same rates as the state inheritance tax. Although Colorado stands with a minority of states which impose a gift tax, this procedure undoubtedly prevents a substantial loss of revenue due to the avoidance of the inheritance tax.

In 1956, death and gift tax collections in Colorado amounted to $3,936 thousand or 2.73 percent of total tax revenues which is slightly above the 47-state average ratio of 2.13 percent. On a per capita basis, 1956 revenues in Colorado were $2.44 which is somewhat above the average per capita collection of $1.75. In rank order, Colorado's per capita collection was 9th, i.e., 8 states collecting a higher per capita rate and 38 states collecting a lower rate. In addition, Colorado's death and gift tax collections represented .13 percent of the State's personal income which is slightly above the average of .09 percent for the 47 states.

The features of Colorado's inheritance tax are similar to those found in other states. Certain deductions and exemptions are allowed and the rates are graduated not only according to the amount received but also according to the relationship of the inheritor to the deceased. Although different rates of progressivity make interstate comparisons somewhat difficult, Colorado's rate structure appears to be slightly above the average while exemptions are somewhat more liberal than those given in most states. In addition, Colorado permits exemptions to be taken before the rates are applied whereas most states simply deduct the exemption from the first bracket. Hence, an exemption in Colorado is applicable to the top bracket whereas in many other states an exemption is deducted from the first bracket.

Although the federal credit has essentially preserved the death tax as a source of state revenue, some states, notably Florida, Nevada, and Arizona, continue to use the tax as a competitive device to attract or retain wealthy persons. As long as some states continue to use death taxes in this manner, attempts to raise substantial revenues through death taxes by other states may result in some loss of wealthy individuals. However, state death taxes are only one factor in the establishment of a residence and the danger of losing or failing to attract wealthy residents does not appear to be great in a state with attractions such as Colorado's unless burdens become significantly higher than those in other states.

In conclusion, Colorado's death tax burden appears to be somewhat above the average as measured by per capita collections, the ratio of death taxes to personal income, and the ratio of death taxes to total revenues.

Pari-Mutuel Tax (Chapter XVI). The tax on pari-mutuel racing is a source of revenue in twenty-four states of which seven are located in the West. Of this total number also, four states —Michigan, New Mexico, Colorado and Nevada —have introduced pari-mutuel since World War II. In most of these states the tax is a relatively minor source of revenue, the notable exceptions being Florida, New Hampshire and New Jersey. In absolute dollar collections, however, the ranking states are New York, California, Florida and New Jersey with revenues ranging from $22 million to $53 million.

Colorado revenue from pari-mutuel in 1957 amounted to $2.1 million, a figure exceeding any preceding annual total since the inception of the tax in 1948. This figure represented also 1.47 percent of aggregate tax revenues of the State in 1957 and 4.57 percent of total receipts of the General Fund.

All states which have a pari-mutuel, tax wagers on either a flat or graduated base. Colorado's flat rate of 5 percent could be regarded as a fair average covering the entire twenty-four state

group. All states provide for breakage but differ widely in respect to its distribution. With the exception of California, the seven Western States including Colorado, which have parimutuel, permit the race track operators to keep all breakage; while in the remaining states the general practice is to divide such receipts between the operator and the state. Exceptions in this regard are Florida, New Jersey and California which claim the entire amount.

Breakage in Colorado was originally retained by the State but since 1954, and as a result of State Supreme Court decision, proceeds from this source have reverted to the racing associations. Since annual breakage has averaged over $300,000 this decision caused a corresponding loss to the General Fund to which all parimutuel revenues are dedicated. Failure to revise the law to overcome the court's objection may be attributed to the assumption that the associations need the breakage to stay in business.

Miscellaneous State Revenues (Chapter XVII). A wide variety of miscellaneous "taxes," "licenses and fees" and "earnings" are realized by the State government not elsewhere classified in preceding chapters. For the most part these sources represent "special" levies or charges designed to recover costs of rendering certain State services or privileges granted to persons or groups of persons engaged in particular activities. Hence, the revenues derived are in large degree, but not entirely, earmarked for the particular agency rendering the service in question and not available as revenues for the General Fund.

Although the receipts from a number of individual sources are relatively small they constituted in the aggregate a total of nearly $30 million in 1957, or an amount representing 13 percent of the State's aggregate revenues in that year.

The general category of individual "taxes"—foreign and domestic corporation, coal mine, metal mining, oil and gas conservation, predatory animal, hail insurance, safety and accident prevention, mattress stamp, tax for revised statutes, gate admission and public utility commission—came to a total of $714,000 in 1957.

The first mentioned tax, or the "foreign and domestic corporation tax" has been recently revised with a rate structure which places Colorado in about a median position with other Western States in terms of costs imposed for the incorporation of business enterprise. The "coal mine tax" is, because of the decline of the coal mining industry, falling short of revenues needed to cover the inspection costs of the Coal Mine Inspection Department. There is no easy solution to the problem but in the meantime the General Fund must be drawn upon to cover deficits. The "metal mining tax" is currently fully sustaining the activities for which it was designed while the "oil and gas conservation levy" indicates a possible shortage by 1961 unless services are curtailed or added revenues are forthcoming. The "predatory animal tax" at the present rate is deemed adequate for all purposes. The "hail insurance tax" as presently administered is adequate for covering losses as well as for building a necessary reserve fund. The "safety and accident prevention tax" currently is developing a small surplus and presumably is sufficient to meet requirements as is equally true in the case of the "mattress stamp tax." Of the remaining miscellaneous tax sources the "aircraft ownership tax" presents a special case of apparent under collection. Thus for 1957 a total of 175 private planes were subject to assessment. It is estimated however that there are from 1,000 to 2,000 planes in the State that should be subject to the tax.

The area of "licenses and fees" constitutes a veritable maze of licenses, "charges" and "fees" imposed by various state departments on affected persons or groups of persons and business enterprise for public services rendered. Total revenues from these sources amounted in 1957 to $6.7 million of which $4 million represented license receipts of the State Game and Fish Department. Another $1 million was accounted for by licenses and fees directly related to the use of public highways (automobile title fees, motor vehicles dealers and salesmen's licenses, inspection stickers, and penalty assessments and J. P. Court fines). The remaining $1.7 million represented a host of regulatory fees associated principally with the departments of State and Agriculture and the State Board of Stock Inspection.

A sample review of regulatory fees collected suggests that in a number of instances—notably in the Department of Agriculture and in Stock Inspection—the payment of fees is not being fully enforced. This fact may not be too important from a revenue standpoint since the amounts involved are relatively small in any event. However, it should not be forgotten that in most instances licenses and fees are for regulatory purposes designed to protect the public and have been intiated by industry groups for establishing and maintaining self-imposed standards. Inadequate collections therefore presumably mean an inadequate system of inspection—a situation clearly contrary to the public interest.

Departmental earnings and miscellaneous receipts which in 1957 amounted to $22 million were derived from fees and tuitions of educational institutions ($5.7 million of which $3.5 million represented tuitions collected by the University of Colorado not included in the $22 million total noted above); reimbursements to the State Highway Department for road work done for other governmental units ($8.4 million); earnings of penal and eleemosynary institutions ($3.6 million); receipts from rental and

sale of State lands ($4.3 million); and income from all other miscellaneous sources ($3.5 million).

The Tobacco Tax (Chapter XVIII). The historical and traditional justification for levying a tobacco tax has been that such a tax will result in higher prices and thereby discourage a habit which is deemed undesirable from a social as well as an individual point of view. In addition, the tax is commended for its stability, convenience of payment, ease of collection, and ability to extract revenues from all taxpayers regardless of income class. This rationale has been questioned by those who point to the indefensibility of labeling tobacco consumption a "vice," and the evidence which indicates that increased prices do not, in fact, curtail tobacco consumption. Moreover, the tax is subject to the indictment of regressivity, and, although it is characterized by a certain ease of collection, the common practice of allowing dealer discounts results in a relatively high cost of collection.

Despite certain criticism, the tobacco tax, and more specifically the tax on cigarettes, has achieved considerable popularity. In addition to the federal tax of 8 cents per pack, 42 states collect a levy which ranges from 2 to 8 cents per pack, the most popular rate being 5 cents. Eleven states have given cities the power to impose a tobacco tax and municipal use is extensive in 5 of these states, Colorado included.

As a state source of revenue, the tobacco tax plays an important role in most of the 42 states which employ the tax, accounting on the average for 5 percent of total taxes collected. In 18 states, tobacco tax collections exceed 5 percent of all taxes collected.

Of the six states which do not employ a special excise tax on cigarettes, 3 states (California, Maryland, and North Carolina) include cigarettes in the sales tax base. Of the 3 remaining states (Colorado, Oregon, and Virginia) Colorado is the only state which employs a sales tax. Hence, Colorado is the only state in the union which neither includes cigarettes in the sales tax base nor subjects cigarettes to a special state excise tax.

Colorado's failure to adopt a cigarette tax may be partly explained by the fact that such revenues would have accrued to the Old Age Pension Fund prior to the 1956 constitutional amendment which now permits an overflow into the General Fund. An additional factor is the widespread municipal use of the tax in the State. This latter point remains a significant factor if State adoption is being considered, because about 30 cities and towns presently utilize the tax. Considering the revenue restrictions faced by Colorado municipalities, it would appear that the State may have more alternatives from which to choose if additional revenue is needed.

It is estimated that a State cigarette tax in Colorado would yield an annual amount of approximately $2,218 million for each cent of tax levied. The most popular rate in surrounding states is four cents, hence a similar tax in Colorado would yield approximately $8.8 million annually. Considering the common municipal rate of two cents per pack in Colorado, a State rate of only 2 cents per pack might also be an alternative worthy of consideration. On this basis, the yield would be $4.4 million. Tobacco tax rates in surrounding states however, are not necessarily a criterion to be followed by Colorado.

In addition to a cigarette tax, a few states place a special excise tax on other tobacco products. While this practice is commendable from an equity standpoint, it involves certain administrative difficulties. Were such a tax adopted in Colorado, however, it is estimated that the yield would be approximately $600,000 to $700,000 annually.

Although the tobacco tax is subject to significant criticism, it can not be denied that the inherent ease of payment renders the tax politically popular and capable of achieving substantial revenues.

Federal Grants (Chapter XIX). In 1957 federal grants to Colorado totaled $55 million—an amount equal to approximately 23 percent of total revenues of the state government. Of this amount highway grants amounted to 28 percent, public assistance 49 percent, and all other (education, health and hospitals, non-highway transportation, natural resources, etc.) 23 percent. Old age assistance alone constituted 35 percent of total grants and 71 percent of all grants for public welfare.

Comparatively, Colorado's per capita total federal grants in 1957, amounting to $36.55, placed it in 8th leading position among the forty-eight states and in 5th position in relation to the eleven Western States.

In per capita grants for public welfare Colorado was surpassed nationally by only three states. In per capita grants for purposes other than public welfare Colorado ranked 13th in the nation being exceeded by all Western States except California and Washington.

Colorado's relatively high per capita rank as a recipient of federal aids is due to a combination of factors of which a sparse population is one; another factor is the relatively large State old-age pension program which gives full implementation to federal aids for this type of public welfare. Coupled with this is the fact that highway aid is a function of size of area and Colorado, as one of the largest states, in area, is favored accordingly.

However a relatively favorable aid position does not necessarily indicate that Colorado is taking full advantage of federal assistance in

the various programs eligible for federal aid. Whether such a state policy is desirable is an open question since aids are obtained at a price and the price may be high. Nevertheless a recognition that participation in jointly financed state-federal programs can and frequently does relieve pressure on state finances calls for careful and continuous review of federal aid legislation as it is enacted and amended from time to time.

State-Local Relations (Chapter XX). State responsibility for providing a tax base commensurate with locally assigned functions is by all odds the most vital consideration in state-local relations as presently constituted. The role of the State in this regard has become increasingly important as well as burdensome as local governments, limited essentially to the overworked property tax, have been pressed by mounting costs induced by population growth and price inflation.

Currently local governments as a whole derive approximately two-thirds of their total revenue from their local revenue sources and the remaining one-third from the State in the form of shared taxes and grants.

All evidence indicates that the property tax, which accounts for three-fourths of all locally collected revenues, is reaching its maximum point of utilization in many areas of the State. This is notably the case in the larger cities and towns. Pressure on the property base has been contained somewhat at the municipal level by the development of new tax sources such as the sales tax (presently used in only two cities, Denver and Pueblo), tobacco taxes (found in 28 cities) and a local levy on liquor (imposed in 26 cities). The sales tax has been highly productive but its wider use by cities is problematical in view of its competitive nature and the fact that the State also taxes sales. Taxation of tobacco has been expedient in view of the fact that the State has not entered this field. Should, however, the State tax tobacco in the future close state-local fiscal policy cooperation would be needed to avoid burdening this base. This applies equally to the liquor tax, now employed by both the State and municipalities.

Shared taxes and state aids amounted to $111 million in 1957, or approximately one-third of total local government receipts. Of this total 62.5 percent was distributed for public welfare, mainly old age pensions; 22 percent for school aid; and 15.5 percent for highway and street purposes and certain miscellaneous items. Viewed jurisdictionally, the total was distributed as follows: counties 76.1 percent; school districts 22 percent; and cities and towns 1.9 percent.

In principle, the transfer of funds from the state to local government (financed by both state and federal funds) is designed to provide desired levels of services in which there is statewide interest. Aids are also intended to "equalize" the financial capacity of all local participants in a given program. In respect to the latter, Colorado falls far short of achieving this objective.

In the public welfare field the old age pension program meets a uniform state standard and, not being locally financed, raises no problems of equity. In the other aided welfare categories, required equal percentage contributions by individual counties presumes equal financial capacity—a situation that is far from being the case. In this connection it is of interest that 27 states including 5 Western States (New Mexico, Arizona, Nevada, Washington and Idaho) administer and finance all categorical aids at the state level.

The most serious inequity in the welfare field is the unaided program known as "general assistance." Failure of either federal or state funds to cover, in part at least, this vital area of public needs has placed upon the counties a burden which cannot now be adequately carried by many counties. This is evidenced by monthly payments per applicant which in 1957 averaged only $11.88 with a range varying from a low of $3.52 to a high of $30.44. It is apparent, therefore, that this program needs to be reconstituted on a more realistic basis wherein State financing will be a part of it as it was in earlier years.

Aid for education as revised by law in 1957, which attempts to promote both a higher level of educational performance throughout the State as well as to effect a more equalized distribution of the burden, is sound in principle. Unfortunately it is premised on the assumption of uniform assessment which will continue to plague the program's effective implementation. In the absence of any correction here full implementation by state aid, which is now 80 percent as per formula, may not be desirable from some points of view. However, Colorado's urgent need for State support of schools, which has lagged behind that of other Western States, cannot wait upon reform of the property tax. More perhaps can be said for postponing full implementation until more has been done to consolidate schools which in view of gratifying progress during the past year need not long be deferred.

Colorado's distribution of highway funds on the basis of its existing formula needs re-examination. The municipal share of only 5 percent is apparently inadequate in view of the rapid growth of the larger metropolitan areas in the State in the past decade and a half. Ensuing traffic congestion has become not only a major problem for the cities but one that also importantly affects the efficiency of the entire primary road system of the State.

The allocation formula is subject to further question on grounds that it places on the counties (via a 30 percent allocation) the full responsibility for the construction and maintenance of

"county roads." The point can be made that a sizable part of these roads are in fact "state roads" and should, therefore, be administered by the State. Such transfer of functions would result in a system that would be stronger than would be possible under a county jurisdiction which in many cases has neither the administrative nor financial capacity to shoulder this burden.

State and Local Debt (Chapter XXI). Rapid post-war growth of Colorado's industries and population has resulted in a corresponding increase in the need for public facilities. Although operating budgets have been balanced on the whole, capital programs have, in the main, necessitated borrowing on a scale heretofore unknown. Thus in 1957 Colorado's combined state and local debt reached an all-time high of $421 million—a figure nearly four times what it was before World War II and nearly three times the figure reported for 1950.

Colorado's over-all public debt does not however indicate excessive use of credit. At the State level outstanding issues, largely for the construction of highways and college dormitories are self-liquidating and appear to be adequately covered by anticipated income. Interstate comparisons show also that per capita state government debt is presently at the median average for the eleven Western States. In this connection it is of interest that Colorado is one of only three Western States that does not have any general debt.

At the local level debt is largely confined to issues of the school districts and municipalities which together account for 80 percent of combined state and local debt. In turn, nearly two-thirds of this ratio is applicable to the four-county Denver Metropolitan Area where the most rapid population growth has occurred. It is in terms of this development and the adjustment of capital expenditures thereto that much of the current outstanding public debt in Colorado can be explained.

Concluding Summary Statement. Certain specific features of Colorado's economy and fiscal structure as well as probable future developments provide the basic foundation for the tax policies recommended in this report. In terms of the economy as a whole a continued better-than-national-average rate of population, and employment growth is anticipated. The direction of movement will be toward the larger metropolitan areas as it has in the past. Coincident with growth it may reasonably be assumed that enlarged demands for public services and capital facilities will correspondingly increase the pressure on public budgets at both the state and local levels of government. Although anticipated higher taxes both in the aggregate as well as in per capita terms will be paralleled and likely will be exceeded by increased personal incomes the cushioning effect of the latter could be nullified by improvident expenditure policy and an inequitable tax structure incapable of effectively accommodating the larger needs of a growing state.

Measured in terms of per capita public expenditures, costs of government in Colorado, as is true for all Western States, run above the average for the rest of the country. This may be expected to hold for the future since the reasons are deep-seated and continuing in nature. A sparse population in most parts of the State with widely separated smaller communities—which are required to provide complete utility services, schools and other public facilities including highways constructed and maintained in difficult terrain — combine to create a situation where high per capita as well as high unit costs of operation are almost certain to exist. Another impelling factor causing Colorado's cost levels to be relatively high lies in the culture of a people who have wanted and have received more than a bare minimum of governmental services. Colorado's social conscience manifested in its regard for the aged, its desire for good schools reflected in its high educational achievement record measured by "number of school years completed" and its nationally recognized "clean government" are all evidences of a peoples' continuing desire and will to have a better than average government. Such services have to be paid for and how they are paid for and, by whom, becomes increasingly important as expenditures and correlative tax burdens grow larger in size and variety. Colorado's over-all state and local structure, a product of nearly a hundred years of development, reflects in its component parts the varying economic and social changes that have taken place over time. The traditional concept that he who owns property has capacity and, accordingly, should pay taxes in proportion to what he has in real and personal property has been the predominant criterion for distributing the burden of government cost in Colorado. At the local level, the property tax is the mainstay of support and will no doubt continue this role in the future. However, at the state level, where property taxation has only a limited use, tax policy both in theory and practice has taken quite a different turn.

During the 1930's mounting welfare payments and subsequent postwar demands imposed by rapid growth and inflation saw an increase in revenue need that the property tax could obviously not absorb. As a consequence and, perhaps, without too much regard for tax principles, per se, legisative policy turned increasingly to other forms of measuring and utilizing taxpaying capacity. Thus, was born the retail sales tax, the liquor tax, the tax on personal and corporate incomes, the tax on pari-mutuel racing, severance tax on gas and oil, and the ton-mile tax. Predating these changes but a part

of the "non-property tax" family are the various highway user taxes which over the years have grown to a relatively large proportion of the State government's total revenue receipts.

The emergent tax structure, both State and local, naturally leaves much to be desired. On the State level it is highly complex and sharply regressive, and shows little evidence that any unified or consistent policy guided its formation. These undesirable features and the inherent problems are compounded by a fund structure which currently earmarks over 80 percent of the State's total revenues. As a consequence pressure for needed revenues mainly for general operation, educational aid, and the State's institutions, have resulted in periodic revenue shortages. Currently the general fund picture shows a revenue shortage estimated for 1960 of approximately $9 million. And, depending upon policy development in respect to state school aid, subsequent needs could go beyond this total by an estimated $10 million.

The local tax structure based primarily on the property tax has increasingly lost its capacity to meet advancing costs, particularly marked at the municipal level. Here the City and County of Denver presents the outstanding example. Cities and towns have been forced to seek revenues which not only overlap state taxes in a number of cases, but being essentially consumer taxes, they have further added to the regressivity of the tax structure of the State as a whole. In addition to these efforts to break through a "boxed in" revenue structure, local governments have turned more and more to the State for assistance in order that they might properly perform their function as assigned by law. Thus another pressure has been imposed on the State's General Fund.

Guiding Principles: It is against this background of fiscal arrangements and anticipated developments that the Staff of the Tax Study Group has examined Colorado's taxes individually and in relationship to each other. During the course of the analysis, the Staff has constantly kept in the foreground certain basic principles by which taxes and tax policy must, in the final analysis, be judged. Accordingly, stated recommendations as presented below have been tested against these essentials which in question form may be stated as follows:

(1) Will possible changes contribute to a more equitable system of distributing the tax burden?
(2) Will the changes produce a more productive and reliable base for meeting the anticipated increased demands of Colorado's state and local governments?
(3) Will the changes produce a more equitable tax environment for Colorado business including agriculture and mining?
(4) Will the changes simplify and ease the problem of taxpayer compliance as well as increasing the effectiveness and reducing the cost of administration?

RECOMMENDATIONS: GENERAL

The following tax program incorporates recommended changes covering the entire tax structure in Colorado. The order of presentation is by individual taxes and by subclassifications wherein particular areas calling for revision are identified and described. This is followed by recommended changes, the reasons therefore and the estimated revenue effects.

All recommendations call for early consideration. Most pressing, however, are those which include measures designed to provide additional general fund revenue for State Government in 1960. These are described in this section under separate tax subjects but are brought together into an integrated program as outlined in the succeeding section on page 34.

General Property

1. Standard Assessment

General Statement: The present legal standard of assessment is full cash value based on market value or other appropriate factors.

Recommendation: The general standard of assessment should be changed from full cash value to a percentage of present value (market or cost) approximating the average maximum ratio presently in effect.

Reasons: The full cash value rule is inoperative; its implementation is impractical; and the proposed change would provide a realistic and equitable standard of assessment as well as a sound foundation for equalization efforts.

Revenue Effects: It is not contemplated that this change in assessment standards should be employed to increase property tax revenue, though rate adjustments would undoubtedly be required to avoid this result in some jurisdictions.

2. Specific Bases of Assessment

General Statement: The present legal bases of assessing the following types of property are inconsistent: (a) farm land and improvements and urban site land and improvements and (b) producing oil and gas properties and other producing mineral properties and non-producing mineral property or rights therein.

Recommendation: (a) Consistent specific bases of assessment related to present market or costs value should be formulated and applied in the case of agricultural and urban land, and improvements thereon, and tangible personal property other than merchandise and manufactures.

(b) Uniform bases of assessing producing, and non-producing, mineral properties should be adopted. In the case of producing mineral

property the basis should be related to current value using a capitalization of net income factor. Several factors may be essential in the case of non-producing mineral property or rights thereto, but they should be uniformly applied. Finally, the original assessment of both types of extractive land should be vested in the State Tax Commission.

(c) No change is recommended in the basic approach to assessing merchandise inventories and manufactures.

Reasons: The present basis of assessing agricultural lands is not consistent with that applied to urban lands and improvements, and is needlessly complicated. Considerations of tax equity dictate uniform or non-discriminatory standards of assessment for these types of property. The discrimination involved in the present policy is especially grievous in the case of urban homes which do not produce a cash income.

The present assessment differential is highly discriminatory as between oil and gas and other producing mineral properties and the factors to be considered in assessing non-producing mineral property are not clearly defined. In view of the inherent complexities of the problems involved, State assessment as practiced in many other states is essential to the achievement of uniform results.

The present average inventory basis of assessing merchandise inventories is generally employed and the percentage ratio appears to be reasonable under present conditions. In view of the fluid nature of this property it is not possible to relate the ratio of assessment directly to that employed for fixed assets. The result in any case is fractional assessment as compared to the capital value of fixed assets.

3. Frequency of Assessment

General Statement: The law requires that personal property be re-assessed every year, but there is no firm rule in the case of real property.

Recommendation: A policy of continuing assessment should be established with personal property re-assessed annually and all real property in each jurisdiction over a three-year period.

Reasons: The reasons for the present rule in the case of personal property are self evident due to its relatively fluid character and rapid changes in value. Re-assessment of all real property every three years is essential to avoid inequities caused by changes in value, to ensure reasonable conformance to the general current value standard and will require utilization of a full-time assessment staff.

Revenue Effects: A substantial increase in assessed valuations may be anticipated in many counties. This gain will be offset in part by higher administrative costs, and state aid will be necessary in some of the less populous counties to accomplish the objective.

4. The Sales Ratio Study

General Statement: The Sales Ratio Study initiated in 1957 under the Legislative Council has produced significant results; but further data are essential in many areas.

Recommendation: The present comprehensive sales ratio study should be continued for at least a three-year period, and this type of research, perhaps on a sampling basis, should be continued to provide a permanent basis for equalization efforts.

Reasons: It is quite evident that further data are needed from many counties to provide a firm base for conclusions which are essential to implementing a statewide equalization program and other fiscal policies which are dependent upon such information.

5. Tax Commission

General Statement: The present staff of the Tax Commission is strictly limited and the members once they are appointed by the Governor are subject only to Civil Service rules and regulations.

Recommendation: The State Tax Commission should be reconstituted to ensure executive responsibility and the staff enlarged to permit effective control over local assessment practices and the equalization problem.

Reasons: This agency has been largely ineffective in the areas noted, and an increase in staff accompanied by executive control is needed. Continuing efforts by an expert, specialized staff are the only means of ensuring equalization of tax burdens and the correction of other disparities in local assessment practice.

6. State Use of Property Tax

General Statement: The State is now using the property tax to finance certain capital and operating requirements for educational and other state institutions.

Recommendation: The State government should relinquish the property tax source to its local units—this policy to be implemented on a gradual basis by the substitution of a capital budgeting program financed from the General Fund as soon as existing mill levy commitments are met.

Reasons: The urgent revenue requirements of local units which have a very limited tax base should be recognized, and the proposed change in policy can be implemented without sacrificing revenues essential to the State.

Revenue Effects: The State presently derives approximately $12,000,000 or 8 percent of its total tax receipts from this source.

Retail Sales Tax

1. Food Exemption; Extension of Base; and Vendor's Discount

General Statement: Food purchased for consumption off the premises and restaurant meals are subject to the Colorado sales tax. On the other hand, certain non-professional services, and liquor and tobacco products which are taxed by one-half or more of the states are not subject to the Colorado retail sales tax and there is no special excise levy on tobacco. The Colorado law permits a vendor's discount of 5 percent.

Recommendation: (a) Exempt food purchased for consumption off the premises from the retail sales tax base.

(b) Include lodging (hotels, motels and camps) in the sales tax base.

(c) Reduce the vendor's discount to 3 percent.

Reasons: Equity in tax policy demands a reduction in the regressive impact of the sales tax on low income groups which is largely attributable to the taxation of food. The desirability of this step is generally recognized, and there are 9 other states that presently exempt all or specified food products.

Taxation of lodging service does not involve the same degree of regressive influence as food, and will partially offset the loss of revenue resulting from the food exemption.

The proposed discount is the highest allowance made by any state, and studies indicate that compliance costs generally range from 2 to 3 percent.

Revenue Effects: The food exemption will reduce revenues by about $8,400,000 (1957 base) or 21.3 percent; inclusion of lodging will increase receipts by at least $1,000,000; and reduction of the vendor's discount to 3 percent will raise receipts by about $850,000.

2. Sales Tax Administration

General Statement: Basic responsibility for administration is placed in the Sales and Use Tax Division of the Revenue Department with assistance from the general field investigation staff of the Department.

Recommendation: Strengthen the sales tax enforcement machinery by inaugurating a comprehensive office audit of sales tax returns, by establishing a systematic and selective field audit procedure and by appropriate expansion of the audit staff.

Reasons: The present administrative procedures and staff are inadequate in terms of generally accepted standards of sound administration. The results inevitably are substantial losses of revenue and extreme inequities as between individual taxpayers.

Revenue Effects: While the precise effect upon revenues cannot be determined, significant net increases in receipts are assured.

Alcoholic Beverage Taxes

General Statement: Colorado levies a special excise tax on four classes of alcoholic beverages —spirits, light wine, fortified wine, and beer. The present rates on a per gallon basis are: spirits, $1.59; light wine, $.12; fortified wine, $.24; and beer, $.03.

The sales tax, as presently established in Colorado, exempts alcoholic beverages from the base.

In addition to excise taxes, revenues are collected from liquor manufacturers, wholesalers, and retailers in the form of annually issued licenses.

Recommendation: The following rate changes are recommended: the light wine rate be increased from $.12 to $.20 per gallon, the fortified wine rate be increased from $.24 to $.30 per gallon, and the beer rate be increased from $.03 per gallon to $.06 per gallon. No change is recommended in the levy on spirits.

No change is recommended in the present rate structure of alcoholic beverage licenses. It would be desirable, however, if some means were devised to permit local governments to retain more than the present 15 percent of the state license fees they collect, although any change in the present system would probably require a constitutional amendment.

Considering the numerous advantages of a state quasi-monopoly control system and its adoption by 17 states, further consideration should be given to this alternative for Colorado.

Reasons: The above suggested rate changes would make the State's alcoholic beverage tax structure more commensurate with those in the other 28 license states. Since Colorado's rate on spirits is nearly identical to the 29-license state average, no change is advocated.

The license fees imposed on liquor and beer manufacturers and dealers seem to be designed to cover the costs of administration of the Liquor License Division. The present rate structure is adequately fulfilling this objective.

Revenue Effects: If the above rate increases were enacted, an estimated increase in annual revenue of $705,000 would be achieved. The estimated revenue resulting for each of the proposals is as follows: Light wine rate increase, $25,000; fortified wine rate increase, $55,000; and beer rate increase, $625,000.

Highway User Taxes

1. Rate on Diesel and Other Special Fuels

General Statement: Colorado imposes a uniform rate of 6¢ per gallon on all types of fuel used in motor vehicles.

Recommendation: A minimum differential rate of 2¢ per gallon should be imposed on diesel and other special fuel.

Reasons: The present uniform rate involves a discrimination against the owners of gas-propelled vehicles who receive less mileage than special fuel users; the Colorado Highway Planning Committee Report and virtually every other study of this matter in other states have recommended a similar percentage differential; and some 11 states now follow such a policy.

Revenue Effects: The increase in receipts based upon 1957 collections would amount to about $553,000. However, special fuel collections have been increasing rapidly in recent years, and this trend may be expected to continue.

2. Registration Tax on Not For Hire and Farm Trucks and Combinations

General Statement: Colorado now imposes very low rates on these vehicles based upon empty weight.

Recommendation: The user tax costs per mile (in relation to gross weight) of not for hire and farm trucks and combinations should be reasonably equated to that of for hire vehicles, using recent data on relative tax burdens. Gross weight and use factors should be considered in formulating a revised schedule of rates based upon gross weight for the not for hire and farm vehicle classes.

(An alternative proposal to apply the ton-mile tax to all trucks over 9,500 pounds and trailers and semi-trailers over 4,500 pounds, which was made in the highway financing portion of the 1950 Highway Planning Committee Report, would achieve substantially the same result, but would involve somewhat greater administrative problems.)

Reasons: The present tax burden upon the types of vehicles noted is unreasonably low in terms of any defensible measure of cost responsibility and the practice of the great majority of Western States. Costs per mile for such vehicles in Colorado tend to remain constant and in one case are actually regressive in relation to gross weight.

Revenue Effects: Considering the complexities of the rate schedule required, a precise estimate of increased receipts is not feasible. They would be substantial, however, and a doubling of existing registration tax burdens for the vehicles in question would produce about $1,600,000.

3. Administration of User Taxes

General Statement: The administration of the major elements of the user tax program, with the exception of the registration tax, is presently vested in the Motor Fuels Tax and Ton-Mile Divisions of the Revenue Department with some assistance from the field investigation staff of the Department.

Recommendation: Strengthen office and field audit efforts in the case of special fuels, motor fuel tax refunds, the fuels tax as applied to interstate vehicles and the ton-mile tax on intra-state operators.

Reasons: Present procedures in these areas are deficient and the staff is inadequate to achieve effective results. Gains in revenue as well as greater equity in the application of the fuels and the ton-mile tax are assured.

Revenue Effects: While the over-all effect upon receipts cannot be estimated, the fact that each ton-mile tax auditor earns his salary in about one month is indicative of probable results.

4. Ton-Mile Tax

General Statement: The present law involves a differential ton-mile rate of .8 mill and 2 mills on the empty vehicle and vehicle load, respectively.

Recommendation: Narrow the existing mill rate differential as between vehicle and load under the ton-mile tax by increasing slightly the empty vehicle factor and a similar reduction in the load factor.

Reasons: The present differential produces a degree of burden progression for the very heavy for hire trucks and combinations which is somewhat greater than that in most of the Western States. While the disparity is not great (25 percent or less), the adjustment proposed would remove any reasonable basis of criticism by carrier groups.

Revenue Effects: No appreciable change in over-all yields is anticipated as the adjustments are compensating in character.

Insurance Tax

Rates and Exemptions

General Statement: Insurance Companies operating in Colorado, unless expressly exempted, are subject to a 2 percent tax on premiums paid on business written in the State. Exempt are the following types of underwriters: fraternal benefit societies; domestic fire insurance companies; mutual employers liability associations; mutual benefit associations; medical and hospital associations (Blue Cross and Blue Shield); and benevolent societies. Also exempt are all companies with 50 percent of their assets invested in Colorado.

Recommendation: (a) That the present rate of 2 percent be retained.

(b) That the law, as amended, exempting companies which have 50 percent of their assets invested in Colorado be repealed.

(c) That all companies now exempt under the above noted provision of the law be taxed on premiums paid on Colorado business acquired after the date of repeal of this provision.

(d) That all other exemptions remain unchanged.

Reasons: A rate of two percent on gross premiums is the one more commonly used by other states. Because of the retalitory feature contained in the insurance laws of most states, an increase in the Colorado rates would hurt domestic companies operating in other states.

The exemption of companies meeting the 50 percent investment rule (and, in practice, this exempts all domestic companies but does not affect foreign companies) was presumably intended to "keep the money at home" by directing funds into local industry and government. It is doubtful that this provision has significant bearing on investment policy decisions as far as the affected companies, themselves, are concerned. Moreover, and in accordance with sound economic principles, taxes should have a minimum influence in determining the allocation of economic resources in a relatively free market. Such allocation in a private enterprise system will best be determined according to the pattern of consumer preferences and relative costs. This being so the existing exemption is considered to be both economically and socially undesirable.

From the standpoint of tax policy, no good reason exists for exempting domestic companies. Like foreign companies, they are subject to no other special business tax; they use and benefit from state governmental services and, like foreign companies operating for a profit, they have capacity to pay taxes. However, it is recognized that domestic companies are in the main stock companies whose existing contracts with policyholders are largely fixed in terms of premium charges. On old business, therefore, removal of tax exemption would cut into their surplus since the tax could not be shifted, at least in part. Since domestic companies are relatively young and small, this would place an undue burden upon them. It is, therefore, recommended that the tax be applied only to their future new business where contract terms can be adjusted.

Other companies expressly exempted by law are presumed to be operators on a non-profit basis. As such, they are properly exempted from the premiums tax.

Revenue Effects: It is estimated that recommended changes would increase premium tax income by $40,000 as a minimum.

Personal Income Tax

1. Normal Tax Rate Structure

General Statement: Normal tax rates range from 1 percent on the first $1,000 of net taxable income to 10 percent on all over $11,000.

Recommendation: The tax rate structure should be revised to start at 3 percent on the first $1,000 of net taxable income and increase at one-half percent steps for each additional $1,000 of income, with a maximum of 8 percent on all net taxable income over $10,000.

Reasons: Narrowing the range of the normal rate structure at both ends will make the tax more productive and equitable. At present the Colorado tax is considerably more progressive than the federal income tax. The minimum rate is among the lowest of the 29 income tax levying states. The maximum rate is the second highest in the entire nation. The vast majority of Colorado taxpayers pay only a "token" income tax under the present statute. More than one-half of all individuals who filed returns in 1958 had a combined normal and surtax liability of less than $10 for the year, or 20¢ per week. Approximately 170,000 individuals, or almost one-third of all taxpayers filing returns, paid a total state income tax of $2 or less in 1958. Since it cost the State on the average more than $2 to process a single income tax return, it appears that a large part of the Department of Revenue's personal income tax collection and administration activity takes on the character of "pouring water in a bushel basket." With regard to the apportionment of the tax burden between income groups, individuals with incomes below $5,000 represented 68 percent of all taxpayers but they paid only 16 percent of the total amount of normal tax collected by the State; in contrast, those with incomes of $10,000 or more, representing less than 5 percent of all taxpayers, were liable for more than 56 percent of the total tax. However, a balanced tax structure does not require that direct income taxation be essentially limited to the wealthy—with major reliance placed on sales, excises and various forms of hidden taxes to exact a state tax contribution from the remainder of the population. A highly progressive but insignificant income tax does not offset the effects of a quantitatively important but regressive tax either in terms of equity or revenue. Direct income taxation which takes into account variations in the taxpayer's economic well-being and family obligations is to be preferred to indirect regressive taxation as the principal means of raising revenues for the General Fund. To paraphrase a distinguished tax authority, it is high time the State quit the ludicrous business of dipping into the average taxpayer's income with a sieve.

Revenue Effects: State revenues would be increased by $11.6 million.

2. Federal Income Tax Deductibility

General Statement: Present law permits full deductibility of federal income taxes paid as an expense in computation of net taxable income for normal tax.

Recommendation: Eliminate the federal income tax deduction provision as an alternative to revising the rate structure.

Reasons: The elimination of this provision would remove one of the most important causes of the erosion of the present tax base. In 1957, the federal income tax deduction reported on individual returns amounted to $285 million, or practically one-half of the total personal expense deductions claimed by all taxpayers. In addition to Colorado, fifteen income tax states permit full deductibility of the federal tax. This alternative would yield an estimated $1.6 million less in additional state revenues than would be obtained by increasing the normal tax rates, as recommended above. However, the distribution of the tax increase resulting from the removal of the federal tax deductibility provision would make the income tax structure more progressive; whereas, the recommended rate change would have an opposite effect.

Revenue Effects: State revenues would be increased by $10.1 million.

3. *Long-term Capital Gains*

General Statement: Present law excludes from the tax base 50 percent of capital gains derived from the sale of assets held by taxpayers for six months or longer.

Recommendation: Include 100 percent of all net capital gains as taxable income, except in the case of income derived from the sale of a homeowner's own residence.

Reasons: The present special treatment of capital gains is inequitable. It provides a minority of taxpayers with a special tax benefit not available to taxpayers with other forms of income included at 100 percent. The rationale for preferential treatment of capital gains on the federal level is not applicable on the state level because of significant differences between the rate structures—a 91 percent maximum federal rate as compared with a 10 percent maximum rate under the present Colorado code. The majority of income tax states, 15 out of the 29, include 100 percent of capital gains in the tax base regardless of the length of time the assets were held by the taxpayer. Only eight states, in addition to Colorado, exclude 50 percent of gains realized on the sales of assets held six months or longer. This type of income is highly concentrated among a small minority of upper-income taxpayers. Less than 10 percent of the Colorado taxpayers reported long-term capital gains on their 1957 returns, 2 percent of all taxpayers accounted for approximately 50 percent of the total, and 1/10 of 1 percent accounted for over 20 percent of the total capital gains. The average long-term capital gain for the latter group was about $34,000 per taxpayer. Moreover, approximately 50 percent of the increased cost resulting from the removal of this provision, in effect, would be absorbed by the federal government since such taxpayers are generally in the higher federal tax brackets.

Revenue Effects: State revenues would be increased by $1.4 million.

4. *Surtax on Income from Intangible Assets*

General Statement: Under present law income derived from intangible assets, i. e., dividends and interest, are subject to a special surtax of 2 percent, in addition to normal tax.

Recommendation: Eliminate the surtax provision.

Reasons: The present surtax is inequitable. As in the case of the special treatment of long-term capital gains, designating a particular source of income for either lighter or heavier taxation under the personal income tax creates inequities between taxpayers who in other respects are in similar economic circumstances. The surtax was originally enacted in 1937 in lieu of the property tax on intangibles. Changes in the over-all state tax structure during the past two decades, particularly the relative decrease in the importance of property taxation on the state level, have considerably weakened the rationale for this type of tax. Moreover, the present $600 exemption taken against gross surtaxable income has effectively excluded from surtax 75 percent of the 100,000 taxpayers who reported surtaxable income from interest and dividends on their 1957 returns. About two-thirds of the taxpayers who would benefit by the removal of this provision reported incomes of less than $8,000 for 1957.

Revenue Effects: State revenue loss would be $1.6 million.

5. *Medical Expense Allowance*

General Statement: Present law permits deduction of only those medical expenses in excess of 5 percent of adjusted gross income, limited to $2,500 on separate returns and $5,000 on joint returns.

Recommendation: Permit full deduction of medical expenses, but retain the present maximum limits of $2,500 on separate returns and $5,000 on joint returns.

Reasons: The personal income tax is considered to be a highly desirable form of taxation because it takes into consideration, in addition to income, variations in the taxpayer's size of family, physical infirmities of old age and blindness, and extraordinary expenses due to serious illness and accidents. With regard to the latter, however, the Colorado code is less generous than the federal government which permits the deduction of expenses in excess of 3 percent

of adjusted gross income. The medical expense allowance reported on 1957 tax returns was the least important of the itemized deductions, and it was claimed by less than one-eighth of the taxpayers, mainly concentrated in the lowest income category.

Revenue Effects: It is estimated that the State revenue loss would amount to $.3 to $.5 million.

6. Withholding

General Statement: Under present law employers are required to withhold an amount equal to 4 percent of the tax withheld for federal income tax purposes.

Recommendation: Payroll withholding should be graduated by two rates applied to the taxpayer's federal withholding.

a. If the present rate and base structure is continued, a rate of 3 percent should be applied to federal withholding of less than $50 a month, and a rate of 5 percent to that of $50 or more.

b. If the rate and base structure is revised as recommended above, the present 4 percent rate should be continued on federal withholding of less than $50 a month, and a rate of 6 percent should be applied to that of $50 or more.

Reasons: The present 4 percent withholding results in a large number of refunds, and the problem is concentrated in the lower income groups. During 1958 the Department of Revenue had to process and pay refunds on more than two-thirds of the total number of returns subject to withholding, and on more than three-fourths of the withholding returns filed by individuals with incomes of less than $5,000. It is believed the above adjustments in the withholding rates would reduce the number and amount of refunds for the lower income groups and would more closely match the tax liabilities of taxpayers with incomes of $5,000 or more.

Revenue Effects: None.

7. Tax Table

General Statement: Taxpayers with adjusted gross incomes of less than $5,000 have the option of using a prepared tax table which incorporates exemptions as well as standard and federal income tax deductions.

Recommendation: The tax table should be made optional for all taxpayers with incomes up to $10,000.

Reasons: The use of a tax table greatly simplifies preparation of returns and reduces the amount of verification and auditing which otherwise must be performed by the Revenue Department. On the basis of the returns filed in 1958 it appears that such extension of the table might affect as many as 63,000 taxpayers with incomes between $5,000 and $10,000. The major convenience of using the table for such taxpayers would be that they no longer would be required to complete Schedule I which has proven to be one of the most troublesome features of the present tax form.

Revenue Effects: None.

Corporate Income Tax

General Statement: Present law permits full deductibility of federal income tax in the computation of the State corporate income tax.

Recommendation: Eliminate federal tax deductibility.

Reasons: The corporate income tax is highly unutilized and should be raised in order to achieve a more balanced and equitable tax structure. Compared with the other 33 corporate income tax states, Colorado ranks below the national average by every relevant measure of tax significance. Nineteen out of 34 corporate income tax states do not permit the deduction of federal income taxes. Removal of the federal deductibility provision would result in a real or effective rate which more closely corresponds to the statutory or nominal rate, and would lessen the degree of regressivity of the present effective rate structure. Moreover, to some extent federal deductibility favors interstate firms relative to firms operating solely within the State. Elimination of this provision would materially improve the equity of the tax and provide a source of sorely needed General Fund revenue.

Revenue Effects: State revenues would be increased by $5.2 million.

Severance Tax

Scope and Base of Tax

General Statement: The present oil and gas tax has a sound base and rate structure, but is limited in scope and burden. It applies to gross oil and gas income, less the property tax credit, at progressive rates ranging from 2 to 5 percent.

Recommendation: (a) Eliminate the property tax credit under the existing law.

(b) Extend the application of the existing tax (without a property tax credit) to molybdenum, vanadium and uranium as an initial step.

Reasons: The limited scope of the present tax involves an unjustified discrimination in favor of the untaxed minerals; taxation of the minerals noted will not prejudice present or future production; and the burden of the tax will fall largely on out-of-state consumers.

Producing mineral properties now enjoy substantial tax advantages under the property and state income taxes which constitute a discrimination against other types of industry; the property tax credit has the effect of reducing

corporate tax liability by nearly 50 percent and individual tax liability by 85 percent, thereby greatly accentuating the inequality in overall tax burdens; the burden of the tax exclusive of the property tax credit will not be out of line with that imposed by most neighboring states; and there is no reason to anticipate unfavorable effects upon resource development and utilization.

Revenue Effects: Elimination of the property tax credit will increase yields by approximately $3,000,000, and taxation of the three minerals (using 1956 data on value of product) will produce in excess of $2,200,000 annually.

Pari-Mutuel Tax

Breakage

General Statement: Under existing law "breakage" resulting from paying, in even multiples, winnings from pari-mutuel betting cannot revert to the State. Instead such proceeds are a part of the gross take of the racing associations conducting the meets.

Recommendation: That breakage continue to be retained by the racing associations.

Reasons: Average proceeds from breakage covering experience in recent years have amounted to approximately $300,000. Racing associations in Colorado have had a varying profit record in which developmental costs have been a factor limiting income. This and the fact of a relatively low volume indicate that the breakage factor may spell the difference between a profit and a loss.

In this connection it is of interest that of the six Western States which have legalized pari-mutuel racing only California requires that proceeds from breakage shall revert to the State government. A review of all twenty-four states which have pari-mutuel indicates that dollar volume of betting (and therefore profits) determines state policy in the distribution of breakage. Thus in Florida, New Jersey, New York, Illinois and California—all high volume states—a whole or a part of the breakage reverts to the State. On the other hand in low volume states the reverse tends to hold, that is, the racing associations retain all receipts from breakage.

The Tobacco Tax

General Statement: At present, Colorado does not impose a special excise tax on cigarettes or other tobacco products. Approximately 30 municipalities in the State, however, levy a cigarette tax at a rate of from 1 to 3 cents per pack, the most common being 2 cents.

Recommendation: A state cigarette tax should be enacted at a rate of 2 cents per pack. The tax should be administered by the sale of stamps to the "first handler," usually the wholesaler, who will then be required to affix the stamps to the cigarette packs. For this service, and to encourage compliance, the dealer should be given a 5 percent discount when he purchases the stamps.

A tax on other tobacco products should not be imposed at this time.

Reasons: Colorado is one of only six states which presently do not impose a cigarette tax. In addition, the earmarking of the revenues from such a tax no longer provides a barrier to the use of the tax since the 1956 Constitutional Amendment will permit an overflow into the General Fund. Hence, Colorado would join a majority of 42 states by enacting the tax and the revenues will accrue essentially to the General Fund.

Although the most common rate in surrounding states is $.04 per pack, the proposed rate for Colorado is only $.02 because municipal use is widespread in Colorado. Hence, with the common municipal rate of $.02 and a state rate of $.02, the aggregate burden would be commensurate with that of most bordering states.

While the allowance of dealer discounts results in a loss of revenue, it appears necessary as an enforcement measure and to encourage compliance with the tax. Moreover, 41 of the 42 tobacco tax states allow such discounts which, on the average, amount to approximately 5 percent.

The special taxation of other tobacco products is commendable on the grounds of equity but involves administrative problems and is not widely used by other states. Hence, no excise tax on other tobacco products is recommended at this time.

Revenue Effects: It is estimated that a State cigarette tax in Colorado would yield an annual amount of approximately $2.177 million for each cent of tax levied. Hence, a $.02 tax would yield a gross annual amount of approximately $4.4 million. Administrative expenses, and discounts of approximately $220,000 would have to be deducted to determine the net amount which would be realized by the State.

Shared Taxes and State Aids

Distribution of Highway User Fund

General Statement: The Highway User Tax Fund is allocated on the basis of 65 percent to the State Department of Highways, 30 percent to the counties, and 5 percent to the cities and towns.

Recommendation: Change present basis of allocation to the counties and cities to insure equal aid for the same types of facilities.

Reasons: It is obvious that a policy which denies cities and towns a substantial and increasing share of motor vehicle tax funds is

unacceptable on theoretical grounds and wholly unrealistic in terms of the practical problems involved. First, the predominant use principle requires that a large and constantly increasing part of urban facilities be classified as general rather than access, and that state financing be provided on the same basis as for general use facilities outside municipal boundaries. Second, state aid is presently being extended for certain rural roads that are primarily access in character. Equity also clearly dictates uniformity in this phase of state policy. In short, so long as the type of use and nature of benefits principle is employed as a basis of financing policy, there is no justification for applying it in a discriminatory manner. From a practical standpoint, also, the most crucial technical and financial problems of developing and maintaining adequate motor transportation facilities are centered in the urban areas. Interstate or through traffic may be diverted around or to one side of the cities and towns to lessen congestion and save time for the tourist, although the urban economy may suffer. However, a state highway program and policy which disregards the needs of the majority of motor vehicle owners and the major portion of traffic volume is clearly unsound. Such action is even more flagrant when this same group of users is paying the lion's share of the cost of a system financed by special user benefit taxes.

General Assistance

General Statement: State payments for welfare cover (1) old age pension, (2) aid to dependent children, (3) aid to the blind, (4) aid to needy disabled, (5) child welfare, (6) tuberculosis hospitalization, and (7) administration. Not included as an aid program is "general assistance" which is financed exclusively by the counties.

Recommendation: Re-establish State Aid for General Assistance on a basis comparable to that which existed prior to 1952.

Reasons. State aid was available for general assistance until 1952 and was dropped with the introduction of the federal program of Aid to the Needy Disabled under the assumption that the latter would, in its effect, replace the first. This has not proved out. In many cases general assistance is needed for resident persons who still cannot qualify for one of the existing welfare programs. This applies particularly to aged persons who lack residence to qualify for the old age pension. In many cases also, persons who do qualify under the federal and state aid programs need supplemental aids to carry them through. Finally the transient problem is one that falls heavily on certain communities, particularly the larger cities.

As a result of this "uncovered" area of need, a continuing and sizable demand is placed on local funds for this purpose which in 1957 amounted to a total of $3.5 million or nearly one-half of the county provided welfare payments on all programs of welfare. Yet the average payment per person for general assistance was only $11.88 with individual county payments varying from a low of $3.42 to a high of $30.44.

State financing of the program which is now inadequately supported would, aside from improving standards, importantly reduce the pressure on county budgets notably the City and County of Denver which carries the lion's share of the burden.

Revenue Effects: Added cost to State would be $750,000 to $1,000,000.

RECOMMENDATION: PROGRAM FOR STATE BUDGET REQUIREMENTS IN 1960

It has ben estimated that demands upon the State's General Fund for the fiscal year ending in 1960 will require approximately $10 million in additional revenue. To meet this requirement a tax program as outlined below is presented. It will be observed that the recommended changes are designed to reduce the regressivity of existing taxes and by placing principal reliance on the income tax for net revenue additions, the changes would, as a whole, result in a more balanced and equitable tax structure.

	Change in Revenues Increase	Decrease
1. Personal Income Tax		
(a) Adjust bracket rates to range from 3 to 8 percent	$11,638,000	
or		
Eliminate federal tax deductibility	10,069,000	
(b) Include capital gains at 100 percent, except on personal homes or residences	1,401,000	
and		
Eliminate surtax on interst and dividend income		$1,599,000
(c) Permit full medical expense deduction		500,000
2. Retail Sales and Excises		
(a) Exemp food (off premises)		8,408,287
(b) Add:		
Amusements	1,384,000	
Lodging, hotels, motels, camps	1,094,000	
(c) Reduce vendor's discount from 5 to 3 percent	850,000	
(d) Special excise on cigarettes at 2 cents	4,435,000	
(e) Increase light wine rate from $.12 to $.20 per gallon	25,000	
Increase fortified wine from $.24 to $.30 per gallon	55,000	
Increase beer rate from $.03 to $.06 per gallon	625,000	
Total Sales and Excises	$ 8,468,000	$8,408,287
Net Increase in sales and excise revenues	59,713	
3. Insurance Tax		
(a) No change in existing 2 percent rate		
(b) Eliminate companies exempt because of 50 per cent asset investment in State	40,000	
NET INCREASE IN TOTAL REVENUES:		
A. If bracket rates are revised	11,039,713	
B. If federal tax deduction eliminated	9,470,713	

Other Policy Questions—Economy and Governmental Reorganization

Economy in government has been variously covered throughout the course of this study. The reason for bringing it up again is to both emphasize and qualify this concept and its fiscal importance.

When a unit of government proposes that additional revenues be raised to meet increased expenditure requirements, the question of economy or reducing costs is invariably brought into policy discussion as a possible alternative. This is understandable since the paying of more taxes is always a painful adjustment to make.

Unquestionably, economy in the use of public funds is as essential as is the use of any scarce resource in the private economy. However, "cutting the suit to fit the cloth" can be overdone. If it results in cutting essential services the "economy move" would be ill-advised at best. In Colorado over 80 percent of total state and local governmental expenditures are directed to education, welfare and highways. If cost savings on any sizable scale are to be relied upon to cover revenue needs it is important to recognize that it is in these major functional areas that the pruning knife would have to be applied.

Undoubtedly there is waste and inefficiency that could be eliminated but many activities that may be inefficient now are inefficient because personnel or equipment is inadequate and removing this kind of inefficiency will cost more money, not less. Efficiency in government, as elsewhere, means efficiency in the use of the public dollar and not necessarily spending fewer dollars.

State Organization. The greatest opportunity for achieving increased efficiency in government and in time cost savings is in the large area of administrative organization of the State government. Colorado's structure was found to be one of the most complex in the nation, with 138 independent or semi-independent agencies variously designated as "offices," "boards," "bureaus" and "commissions," each of which has a separate existence in law, including in most cases a legally established "cash fund" to sustain it. As such the complexity of the administrative organization is reflected in an equally complex and cumbersome fund structure.

The duplication of functions, salaries and overhead necessitated by the existing arrangements are obvious. More importantly, the independent agency system diffuses executive power to the point where the Governor's authority and responsibility under the Constitution to see "that the laws are faithfully executed" are seriously impaired.

All evidence indicates a need for a thorough overhaul of an antiquated system that like Topsy has "just grown." This would involve the consolidation of agencies under major integrated departments headed by an appointed official responsible to the Governor.

Urban Government. The revolutionary growth of urban population in and around established cities and towns has placed a tremendous strain on municipal finances as well as existing arrangements for providing needed services. Traditional devices including municipal annexation and the special district have proved to be inadequate as a means of meeting these problems.

The City of Denver which contains one-third of the State's total population is the cardinal example of the "Metropolitan Movement" which in Denver has meant a larger and more prosperous community but one also that has brought to it a seemingly insuperable fiscal problem. Its solution which is a matter of state-wide concern waits upon new approaches in state-local and local-local governmental cooperation, the inauguration and formulation of which is definitely a prime responsibility of the State.

County Government. County government in Colorado is antiquated in parts and needs reexamination. Rapid population increase has created new demands upon counties and the needed degree of flexibility in their operations is not possible under existing law. Conversely, population decline in other county areas has reached the point where boundary revision is mandatory if "economy in government" is to have any meaning at all.

School Consolidation. The future course of consolidation faces many problems which are not readily solved. Great distances and sparse population is a principal deterrent to early action. Extreme "localism" is another. That the need exists for much more extensive reorganization of Colorado's school system is apparent from the fact that in 1958 there were 731 third-class districts, of which 183 were one-teacher systems.

CHAPTER I

THE ECONOMY OF COLORADO

Colorado's public expenditure and revenue policies are basically a reflection of its economic and population structure. It is clear, for example, that the kinds and aggregate amount of governmental services called for, and therefore public costs incurred, stem from, and are conditioned by the economic and social needs of the citizens of the State. Similarly, the over-all cost of government as well as the particular revenue sources used must conform in some reasonable degree to the resource pattern and income levels that exist.

As a corollary of the above any planning of future governmental budgets must necessarily be premised on economic growth and population change as these can presently be foreseen. To that end public finance must be so ordered that it will accommodate the State's development. It has been aptly said that a tax pattern, like a suit of clothes, must fit the wearer. Although the economy is recognized as the principal factor shaping fiscal policy, final decisions are subject to a host of value judgments, some of which may, and frequently do, conflict with the general interest.

How well the fiscal system in Colorado has been measured to the requirements of the economy and the people of the State is a question that will occupy principal attention in succeeding chapters of the study. In this chapter the objectives are limited to a summary review of the State's economy, in which its characteristics and growth potentials are set forth. As such, it provides a basic frame of reference for subsequent expenditure and tax policy review and analysis.

General Features of Economy

Colorado is one of the eight states included by Census classification in the "Mountain Division."[1] To most people this area suggests a rugged region of snow capped mountain ranges, high peaks, deep valleys, rushing streams and generally breath-taking scenery of endless variety. Associated also in general thinking about the region is an economy facing natural odds but one which nevertheless can support a limited population from its mines and from such agriculture as is possible on a semi-arid land surface with limited water supply, and intervening mountains and waste lands.

As one of the Mountain States, Colorado probably most closely approaches the popular conception of what such an area should look like from a scenic point of view. In the main, also, its economy is typical of the mountain region. Its population is necessarily sparse because of its natural environment but it is growing at a rate faster than most states. Personal incomes have increased substantially although on a per capita basis they are still slightly under the national average. Historically, mining and farming have been the basic activities of the State's economy but both have declined in importance relative to manufacture and trade. The latter has established Colorado as a principal industrial and supply center for the entire Mountain West and accounts for such growth as the State has experienced over the past three decades.

Colorado's economic development has been and may be expected to continue to be importantly affected by its location, topography and population density each of which, singly, or in combination coordinately tend to both enhance as well as to retard industrial progress.

Colorado's location places it at a long distance from heavily populated areas—a physical fact that has limited the development of industry, notably heavy industry, producing for national markets. But, by the same token, the locational factor has given strong impetus to the growth of local manufacturing and wholesaling oriented to the large and growing regional market of the West.

Wide variation in topography and climate, complemented by a similar variation and location of basic minerals and agricultural products, has separated the State into a complex of local specialized economies each dependent, in large degree, upon a single basic product or activity. Community specialization, though inherently unstable and uneven in income opportunity, results in a highly diversified economy for the State as a whole. The over-all leveling effects of this may more than offset the hazards of the one-crop or single-industry specialty of the local communities.

Sparse population in most areas of the State and great distances between trade centers has caused the latter to become largely autonomous

[1]This is a standard area classification used by the U. S. Bureau of the Census and includes Colorado, Wyoming, Utah, Idaho, Montana, New Mexico, Arizona and Nevada. In this and subsequent chapters the "Mountain Division" will be referred to as the "Mountain States" and when joined with the "Pacific Division" which includes Washington, Oregon and California, the consolidated group of 11 states will be designated as the "West" or "Western States."

in providing a full complement of both business and public services. As a result, small business and local government are characteristic and very important in Colorado.

The cost implications to local government are clear. A sparse population and the need for complete utility services, schools and other governmental facilities and services including highways—which must be constructed and maintained on difficult terrain—combine to create a situation where high per capita as well as high unit costs of operation are apt to exist. Attempts to consolidate governmental units to reduce costs as well as to improve service, notably among school districts, are hampered by intervening distances although movement in this direction is being made with some success. Although not meeting the cost problem, as such, the fact that railroad property constitutes an important part of the tax base in many sparsely settled county or smaller governmental jurisdictions has helped to carry the per capita burden as has state and federal aids in one form or another.

Although the principal areas of the State are essentially rural, the overriding fact is that the greater proportion of the population is urban and largely contained in the four-county Denver Metropolitan Area. It is in this urban setting where over-all State growth, both in industrial employment and population, has largely taken place in recent years. The sharp rise in the population of Denver as well as its immediately adjoining suburban areas has forced a corresponding increase in the need for public services with resultant tax problems which are distinctive both in character and magnitude.

Colorado's future progress may be expected to follow past trends with industry and population tending to grow most rapidly in the State's three major metropolitan areas,[2] but chiefly in the Denver Area. Coupled with this trend, a less rapid but steady growth is most likely to occur in the sparsely populated areas of the State where natural resources are highly diversified and large in developmental promise.

Population

Colorado's rate of population growth has consistently exceeded that of the country as a whole. As such, it reflects the larger continental trend towards the West which has been observed since the beginning of the nation's history. Decennial growth rates have varied sharply, however, since the State's origin as an organized territory in 1861. As can be seen from Table 1.1 and Chart 1.1 these have ranged from a high of 387 percent from 1870 to 1880—a period marking the mining boom of the 1870's—to a low of 8 percent for the depression years from 1930 to 1940.

Most recent estimates of the Bureau of the Census show a total population in Colorado of 1,612,000 for 1956. This represents a 22 percent increase since 1950—a rate of gain exceeded by only five other states, namely, Nevada, Arizona, Florida, California and Delaware. It is significant also that of the ten states in the union showing the largest percentage increases for this

POPULATION GROWTH IN COLORADO
1860 - 1957

six-year period, five were mountain states, namely, Nevada, Arizona, Colorado, New Mexico, and Utah.

The 1950 to 1956 population increase of nearly 300,000 people is accounted for by natural increase, or births over deaths—estimated to have amounted to 57 percent of the total increase—and by in-migration or 43 percent of the total (Table 1.2). The last, which stems from increased incomes and new jobs, considered later in more detail, largely explains Colorado's relatively rapid growth during the period.

Table 1.2

Estimated Changes in Population of Colorado 1950-1956

Census population, 1950		1,325,089
Live births	251,200	
Deaths	80,500	
Natural increase		170,700
Net civilian migration	104,300	
Net military migration	22,500	
Net migration, total		126,800
Population, July 1, 1956		1,622,589[a]

Migration. The State's capacity to attract people from other sections of the country measured from 1940 to 1955 is shown in Table 1.3. It will be observed that during the war Colorado actually lost civilian population, or a total of 33,000, a number which was more than offset from 1945-1955 by a net increase through migration of 152,000 persons. Of this number somewhat over one-half came into the State after 1950. Furthermore, after 1950 the eleven Western States added through migration a total of 1.7 million to their combined civilian population while the rest of the country lost, on balance, a total of 233,000 persons.

Migration is not a one-way street however. As people move in there are also people moving out. An outward movement can be quite large even if the inflow of population is sizable. Colorado's experience for a selected one-year period (1949-1950) is illustrative. During this period in-migrants numbered 75,155 while out-migrants totalled 64,000.[3] If this can be taken as a fairly typical relationship it would mean that for every 7 persons coming into the State another 6 are moving out.

[a] Net civilian migration comprises both net migration from abroad and net interregional, interdivisional, or interstate migration of civilians according to area shown.
[b] Less than 1,000.

Source: Derived from U. S. Bureau of the Census, *Current Population Reports*, P. 25, Nos. 72 and 145, May, 1943 and October, 1956.

[3] U. S. Bureau of the Census, *Population Mobility—State Economic Areas, 1950*, Table 6, p. 4B-29 and Table 8, p. 4B-32 (Washington, D. C., 1950).

The intra-state movement of the population is of interest also. For this same one-year period Census reports show an internal movement including persons moving out of the State as follows:

Number of persons moving to a different county in Colorado	140,260
Number of persons moving to a different house in same county	170,460
Number of persons moving to another state	64,490
Non-movers	956,066
Total population reporting	1,331,276

Activity such as this has many facets of interest and carries implications of considerable importance to tax administration in the State. A large ebb and flow of population is unlikely to be fully reflected on tax rolls and revenue losses occur as a result. The magnitude of both in-migration and out-migration including intra-state movement in Colorado indicates what the scope of the problem might be.

Population Density and Distribution. Despite impressive growth rates, Colorado is still sparsely populated. In 1950 it had an average of only 12.8 persons per square mile, ranking seventh in land area but only thirty-fourth in population. Its over-all population density placed it in thirty-ninth position reading from high to low followed by the remaining seven Mountain States and North and South Dakota.[4]

Population growth has not been distributed uniformly, however, but has tended to concentrate in urban areas and particularly in the Denver Metropolitan Area. The trend in this direction, which has been continuous over the years but one that has been most marked during the past two and a half decades, shows that about two-thirds of the State's population was urban in 1956. By contrast the comparable ratio in 1930 was one-half. Moreover, in 1956 the Denver Metropolitan Area alone accounted for 44 per cent of the population while in 1930 it was 34 percent (Tables 1.4 and 1.5).

Table 1.4

Urban[a] and Rural Population of Colorado Census Years 1930-1950 and 1956

	Number			Percent		
Year	Urban	Rural	Total	Urban	Rural	Total
1930	519,882	515,909	1,035,791	50.2	49.8	100.0
1940	590,756	532,540	1,123,296	52.6	47.4	100.0
1950	759,939	565,150	1,325,089	57.3	42.7	100.0
1956	1,067,573	545,016	1,612,589	66.2	33.8	100.0

[a] Defined as incorporated places of 2,500 population and over.

All rural counties have in a greater or lesser degree felt the impact of the country-to-city movement. Either they have lost population in the absolute or they are growing at such a slow rate as to indicate that their natural increase is not being retained. Thus, from 1940 to 1956, when the over-all State population increased by 44 percent, 23 counties lost population at rates ranging from slightly less than 1 percent to 57 percent, while 32 gained at rates which varied up to, but in no case, reached the general State average. The remaining 8 counties which are predominately urban, including the four-county Denver Metropolitan Area, were responsible, therefore, for the bulk of the over-all State increase that occurred.[5]

Table 1.5

Percentage Distribution of Population, by Metropolitan and All Other Areas in Colorado Census Years 1930-1950 and 1956

Area	1930	1940	1950	1956
Metropolitan Area[a]	42.6	47.2	54.9	59.2
Denver	34.0	36.3	42.5	44.3

Colorado Springs	4.8	4.8	5.6	7.9
All other areas	57.4	52.8	45.1	40.8
Total State	100.0	100.0	100.0	100.0

[a] Metropolitan area as defined by the U. S. Bureau of the Census. (See footnote 2 of this chapter.)

Source: Derived from U. S. Bureau of the Census, *Census of Population, 1930-1950*, and Bureau of Business Research, University of Colorado, *Colorado Income, 1958.*

The trend toward urban areas is by no means peculiar to Colorado but is a nation-wide development generally attributed to increased industrialization in metropolitan areas which has attracted rural populations released by labor saving machinery, notably the tractor, and by enlarged acreages per farm with ensuing decline in the number of farm owners and operators. The decline of mining activity in certain areas of the State has also been a contributing factor.

The total population of the State, as well as its internal movements, raises a series of questions bearing on present as well as future tax problems at both the state and local levels. For example, does a decline in the number of people in a given area mean also a drop in local revenues, with a corresponding need say, for increased state aids? Or, is the reverse true? On the other hand, does a growing community gain a tax base proportionate to the increased public service which growth demands? If not, where and by what means can either the local government or the State or both make the adjustment that will meet the problem? These and other questions call for more than quick answers and are dealt with in some detail in later chapters. Here it is sufficient to point out that basic changes in both population and its underlying economic base require a continuous review of tax policies since some may no longer apply in a situation that has changed.

Age Pattern. Colorado has a larger ratio of population in the lower age groups than that for the country as a whole—a fact attributed in large degree to its relatively high net gain from migration which favors younger families (Table 1.6). From the viewpoint of industry this means a relatively younger and more vigorous labor force. A younger age group structure has meaning for government also since it results in added pressure on school facilities with ensuing enlarged demands on public budgets at both the state and local levels of government.

Table 1.6

Percentage Distribution by Age Groups of Civilian Population for Colorado, Western State Groups, and the United States, 1955

Age Group (years)	Colorado	Mountain States	Pacific States	United States
	Percent of Total			
0- 4	11.9	13.0	11.1	11.3
5-17	23.3	25.5	21.8	23.0
18-34	24.1	23.5	22.9	22.6
35-44	13.1	12.9	14.6	13.9
45-64	18.9	17.7	20.8	20.5
65 and over	8.7	7.4	8.8	8.7
Total	100.0	100.0	100.0	100.0

Source: U. S. Bureau of the Census, *Current Population Reports*, Series P. 25, No. 151, February 1, 1957.

The proportion of persons in the age bracket from 65 years and over is, however, the same as the national average. It is somewhat above the general average of the Mountain State group but slightly under the ratio shown for the Pacific Coast states.

Particular attention is directed to this advanced age category since the impression is not uncommon that Colorado tends to attract older persons because of its relatively high old age pension program. The above-noted relationships do not indicate this nor do recent increases in this age group. As noted in Table 1.7, Colorado's percentage increase between 1950 and 1955 of persons 65 years and over was under the general average reported for both the Mountain States and the country as a whole.

Table 1.7

Percentage Increase, by Age Groups, of Civilian Population for Colorado, Western State Groups and the United States from 1950 to 1955

Age Group (years)	Colorado	Mountain States	Pacific States	United States
0- 4	20.9	21.7	22.5	13.3
5-17	29.7	27.0	41.0	21.9
18-34	7.0	5.9	5.6	5.1
35-44	10.8	10.3	13.2	5.7
45-64	11.0	12.7	14.4	8.9
65 and over	14.0	20.7	20.3	15.4
Total	15.2	15.6	18.2	15.4

Educational Level. Colorado has a relatively favorable educational achievement record. The Census for 1950 provides two indices that point to this. The first, which shows by areas the "median school years completed by persons 25 years old and over" finds Colorado, with a median of 10.7 school years completed, well above the national average of 9.3. The second index, derived by determining the "percent of population 25 years old and over that had completed 4-years of college," places Colorado with a ratio of 8.3 percent also above the national average of 6.2 percent and in second leading position in the comparison group of eleven Western States (Table 1.8).

Table 1.8

Educational Level of the Population in Western States, 1950 and 1954

(Rank order of states appears in parenthesis)

State	Median school years completed by persons 25 years old and over, 1950	Persons with four or more years of college as a percent of persons reporting 1950	Percent failed Selective Service Mental Test 1954
Utah	12.0(1)	7.8(3)	3.0(2)
California	11.6(2)	8.4(1)	11.0(8)
Nevada	11.4(3)	7.6(5)	16.7(11)
Washington	11.0(4)	7.4(6)	4.6(6)
Wyoming	10.9(5)	7.3(7)	3.2(4)
Colorado	10.7(6)	8.3(2)	5.7(7)
Oregon	10.7(7)	6.8(9)	2.5(1)
Idaho	10.5(8)	5.6(11)	4.3(5)
Montana	10.1(9)	6.2(10)	3.1(3)
Arizona	9.9(10)	7.7(4)	12.4(9)
New Mexico	9.3(11)	7.1(8)	14.1(10)
United States	9.3 —	6.2 —	16.9 —

Source: U. S. Bureau of the Census, *Census of Population, 1950*, Vol. II, parts 3-50, Table 65 and *Statistical Abstract of the United States, 1955*, Table 273, p. 230.

A third measure of the relative educational level of the State is provided from the record of the Selective Service showing the percent of draftees failing the mental test given in 1954. As noted in Table 1.8 the ratio of failure among Colorado residents was 5.7 percent as compared with the national average of 16.9 percent. It will be observed, however, that the Colorado ratio was slightly above the median average of the eleven Western States.

The conclusion is that Colorado as a whole has done a relatively good job in providing mass education at both the elementary and secondary school levels. Moreover, its relative showing in higher educational achievement is outstanding.

From this it may be assumed that Colorado's margin of unemployables is relatively small while its supply of skilled and professionally trained workers is relatively high—a situation favorable to continued industrial advance. It may be assumed also that a well educated citizenry will continue to require and call for a high standard of governmental performance and facilities which will likely not be denied by the apparent limitations of public budgets.

Income

Evidence based on personal income data[6] indicates that Colorado is best described as an average income state. However, a better-than-average rate of income growth both in total and per capita terms reflects a constantly increasing capacity of the State's economy to support such population increases as have been experienced, particularly during the past decade and a half.

Total Personal Income. In 1957 Colorado's personal income totaled $3.3 billion, a figure which exceeded by 73 percent the corresponding total for 1950 and by 420 percent the aggregate reported for 1929 (Table 1.9). After eliminating the effects of inflation these gains on a uniform purchasing power basis were 48 percent and 217 percent, respectively. As an approximation it can be said that the real productivity of the State as a whole was about 50 percent greater in 1957 than in 1950 and slightly more than 200 percent over what it was in 1929. For the country as a whole the comparable real gains were somewhat lower or at rates of 31 percent and 146 percent for the two periods, respectively.

In Table 1.9 Colorado's relative performance is shown by its increased proportion of the nation's income total. Thus, Colorado's share, though relatively small, increased from 0.75 percent in 1929 to 0.97 percent in 1957. The State's relative gain has been particularly marked during the past decade as witnessed by a fairly continuous advance from 0.81 percent of the total in 1946 to 0.97 percent in 1957—a development which parallels as well as explains, in an immediate sense, the relatively rapid population gains of the State in recent years.

Per Capita Income. Although over-all income and its rate of change is a meaningful indicator of the health and vigor of an economy, it is important to recognize that it is the level of income related to people that matters most. The usual statistical expression of this relationship is per capita income.[7]

In 1957 Colorado's per capita income was $1,996 or an amount equal to 98 percent of the national average of $2,027 (Table 1.9). It was

[6] "Personal Income" by states, as defined and reported by the U. S. Department of Commerce, includes all wages and salaries received, proprietors income and income from property ownership and miscellaneous sources including public assistance and other payments of a similar nature. Excluded are: incomes earned in the state by non-residents and corporate earnings retained. Included, however, are incomes of residents received from out-of-state.

Personal income aggregates fall short of measuring the total current incomes earned in a state in a given year. In other words, these data if combined for all 48 states would not add up to the nation's "Gross National Product" or "National Income"—a breakdown of which, unfortunately is not available either by individual states or regions. Changes in personal income totals do, however, correlate closely with changes in total income and in that regard are useful indicators of economic progress. Moreover, personal income totals serve quite well as measures of economic wellbeing and capacity.

[7] As an over-all average, per capita income fails to show income distributions by persons or families. However, in the absence of more refined data this average is used throughout the study to the extent that it points to significant relationships and trends.

higher, however, than that of thirty-two other states including all the Mountain States except Wyoming and Nevada.

Since World War II per capita income in the State has moved steadily upward due in part to productive efficiency and in part to price inflation. If the price influence is eliminated the "real" per capita increase has been substantial. Thus, from 1950 to 1957 the real increase amounted to 18 percent. Over the long run taking 1929 to 1957 as years of reference the gain was 91 percent. Comparable national ratios are 16 percent and 76 percent, respectively.

Over the years Colorado's per capita income has been somewhat below the median average of the eleven Western States. In 1957, however, it was slightly above the average as noted in Table 1.10.

Table 1.10

Per Capita Personal Income in Western States
Selected Years 1940-1957

(Rank order of states appears in parenthesis)

State	1940	1946	1950	1957
Nevada	$876(1)	$1,717(1)	$1,938(1)	$2,423(2)
California	840(2)	1,654(2)	1,848(2)	2,523(1)
Washington	662(3)	1,395(4)	1,671(3)	2,128(3)
Oregon	623(4)	1,396(3)	1,602(4)	1,914(6)
Wyoming	608(5)	1,340(5)	1,629(5)	2,038(4)
Montana	570(6)	1,278(6)	1,606(6)	1,896(7)
Colorado	546(7)	1,195(7)	1,446(7)	1,996(5)
Arizona	497(8)	1,083(10)	1,297(8)	1,750(8)
Utah	487(9)	1,094(9)	1,283(9)	1,694(9)
Idaho	464(10)	1,169(8)	1,279(10)	1,630(11)
New Mexico	375(11)	906(11)	1,163(11)	1,686(10)
Average 11 States	704	1,478	1,688	1,971
United States	595	1,249	1,491	2,027

Source: Derived from U. S. Department of Commerce, *Survey of Current Business*, Annual articles.

Despite a relatively rapid growth record Colorado's annual per capita totals have been below corresponding national averages in every year excepting five since 1929. It is significant that of the five above-average years four are fairly recent, or from 1947-1952. Had it not been for the decline in agricultural income, it is likely that this period of better-than-average performance might have extended to the present. As can be seen in Table 1.11, farm income including that of both proprietors and farm labor dropped from $250 million in 1952 to $117 million in 1956 or a decrease of 54 percent. This decline is also reflected in the reduced ratio of farm income to total state income from 10.1 percent in 1952 to 3.8 percent in 1956. However, as also noted, an increase of 65 percent in farm income in 1957 over 1956 brought this ratio up to 5.8 percent.

Per Capita Income by Counties. Per capita incomes differ widely between individual counties. Thus in 1956 when the State's per capita average was $1,863[8] the corresponding county averages ranged from the low of $576 for Costilla County to the high of $6,510 estimated for Rio Blanca County. Moreover, of the sixty-three counties fifty-one had per capita incomes which fell below the State average (Table 1.12). This apparent inconsistency is explained by the fact that Denver County, which accounted for 31 percent of the population and 42 percent of the total income, (Table 1.13) had a per capita income of $2,415, a figure substantially above the State average.[9]

[8]This figure is based on data from the Bureau of Business Research, University of Colorado, included in Table 1.13, which differs slightly from Department of Commerce data reported in Table 1.9.

[9]Data used in this paragraph are from the Bureau of Business Research, University of Colorado, *County Income* (Boulder, Colorado, 1958).

Stability of Total Income. Historically, Colorado's income has followed the general cycle pattern described for the nation as a whole. There is some evidence, however, that on the downturn income in the State drops less than the average for the nation as well as that for most Western States. For example, during the major decline from 1929 to 1933 Colorado's income dropped at the rate of 40.8 percent which was less than the country-wide average of 45.0 percent and was less than the percentage declines noted for all the other seven Mountain States except Nevada. Similarly, during the brief recession from 1948 to 1949 Colorado's gain in income of 1.9 percent was in contrast to the average national decline of 1.0 percent (Table 1.14).

Analysis limited to only two periods may not be conclusive. However, as later described, the nature of Colorado's economy, heavily based on diversified consumer goods production and distribution, gives support to the statistical evidence noted.

Employment Trends: Summary Review 1940-1956

Population and Employment Relationships. In 1950, the latest date for which complete employment data are available, the civilian labor force numbered 497,648 or 38 percent of the total population of the State. Of this number, 96 percent or a total of 476,538 persons, were employed (Table 1.15). On the average it can be said that the population in 1950 was supported by its employed persons in a ratio of 2.78 to 1. For 1956, the estimated ratio (population 1,612,000, employment 586,000)[10] was approximately the same or 2.75 to 1.

Looking at population as having its support in employment, it can be said that the population gain from 1940 to 1950 amounting to 291,795 persons was made possible by a net increase of 130,000 new jobs (difference between 1940 and 1950 employment totals). The population and employment movement during this period was in a ratio of 1.6 to 1. Similarly, the population increase from 1950 to 1956—estimated at 287,000—had its support in an estimated employment increase of 109,000 or in a ratio of 2.6 to 1.

[10]Estimate of employment for April, 1956, from Bureau of Business Research, University of Colorado, *Colorado Business Review*, Vol. XXIX, No. 6 (Boulder, Colorado, June, 1956).

Transportation	20,730	29,701	6.0	6.2
Comm. and utilities	8,607	15,304	2.5	3.2
Construction	18,034	38,080	5.2	8.0
All other	6,831	7,807	1.9	1.7
Total	346,535	476,538	100.0	100.0

Source: U. S. Bureau of the Census, *Census of Population*, 1950, Vol. II, "Characteristics of the Population."

Past relationships would indicate therefore that one new job in Colorado is capable of sustaining two to three additional persons in the population. Assuming a reasonably full employment situation, this would have the effect of retaining residents who might otherwise go elsewhere in search of work as well as attracting persons from out-of-state. This is clearly what happened from 1940-1956 as evidenced by a population increase totalling 489,000 persons of which net migration accounted for nearly one-fourth or 119,000.

Population and Employment Growth—Colorado and United States Compared. Colorado's better-than-the-national-average-rate of population growth since 1940 is paralleled by a similar comparative relationship for employment as shown for the census period from 1940 to 1950:

Increase in population	Percent
Colorado	18.0
United States	14.5
Increase of employment	
Colorado	37.5
United States	35.2

The meaning of a relatively favorable employment growth can be shown in these terms:

Colorado's actual employment in 1940	346,535
Colorado's employment in 1950, if employment had increased at the national growth rate	433,862
Colorado's actual employment in 1950	476,538
Lead of Colorado's employment growth relative to national growth	42,676

Similarly, the Denver Metropolitan Area, where the employment increase was at the rate of 54 percent, exceeded the average rate for a comparable group of metropolitan areas[11] as follows:

Denver's actual employment in 1940	140,159
Denver's employment in 1950 if employment had increased at the average metropolitan growth rate of 42.9 percent	200,287
Denver's actual employment in 1950	217,998
Lead of Denver's employment growth relative to comparable metropolitan areas	17,711

Furthermore, in the comparison group of metropolitan areas Denver ranked in fourth highest position in rate of employment increase being preceded by Dallas, San Antonio and San Diego.[12]

Sources of New Employment 1940-1950. The location and industrial sources of the 130,000 new job opportunities that developed during the 1940-1950 decade were the following:

Industry	Total new jobs	In Denver Met. Area	In remainder of State
Agriculture	—1,521	—83	—1,438
Mining	—5,622	—278	—5,344
Manufacturing	22,798	15,227	7,571
Wholesale and Retail trade	32,890	17,818	15,072
Finance, Ins., and Real Estate	5,387	3,409	1,978
Other Business and Pers. services	8,916	4,381	4,535
Professional services	18,055	9,882	8,173
Public Administration	12,410	7,637	4,773
Transportation and Utilities	15,668	9,743	5,925
Construction	20,046	9,814	10,232
Other	976	289	687
Total	130,003	77,839	52,164

Sources of New Employment 1950-1956. Complete data are not available showing employment changes since the last 1950 Census. However, estimates which exclude agricultural workers and self-employed persons are reported by the U. S. Department of Labor and are fairly indicative of what has happened in more recent years. On the basis of these reports the new jobs that developed between 1950 and 1956 were distributed as follows:

Industry	Total new jobs	In Denver Met. Area	In remainder of State
Mining	6,200	2,000	4,200
Manufacturing	12,000	9,300	2,700
Wholesale and Retail trade	27,200	18,300	8,900
Finance, Ins., and Real Estate	7,000	5,400	1,600
Other Business and Pers. services	12,800	14,200	—1,400
Government services	23,800	3,800	20,000
Transportation and Utilities	3,800	5,000	—1,200
Construction	10,600	5,200	5,400
Total	103,400	60,200	40,200

To this should be added an estimated 6,000 new jobs[13] in industry groups not included in the foregoing tabulation. This would bring the total employment increase for the 1950-1956 period to 109,000, a total slightly less than that reported for the preceding decennial period.

[11]These include 16 metropolitan areas, all of which were within the population range of 500,000 to 850,000 in 1950. In addition to Denver, these include Kansas City, Mo.; Dallas; Houston; San Antonio; Portland, Ore.; Seattle; San Diego; Atlanta; Birmingham; Louisville; New Orleans; Albany; Schenectady; Youngstown; Columbus; and Indianapolis.

[12]Department of Planning, City and County of Denver, *Working Denver* (Denver, Colorado, 1953), pp. 18-19.

[13]Based on estimated total employment increase from 1950 to 1956 of 133,400 (difference between the 1950 Census total of 476,538 and estimated 1956 total of 586,000).

Summary. Only a cursory examination of the over-all employment change from 1940 to 1956 is needed to see its outstanding features, namely:

(1) The sustained employment increase throughout the entire sixteen-year period which found the gain from 1950 to 1956 only slightly under the total ten-year employment increase from 1940 to 1950.

(2) The relatively large share of new jobs generated in the Denver Metropolitan Area, or nearly 60 percent of the State total.

(3) The movement in agriculture and mining against the general trend. Both industries experienced a fairly sizable employment decline from 1940 to 1950 but there was some apparent reversal of the trend indicated for mining after 1950.

(4) The predominant employment role of trade and service industries, including government was evident. Together these accounted for 63 percent of all new employment in the State, as noted in the following summary covering the entire sixteen years from 1940-1956.

Industry	New Jobs	Percent
Service, incl. government	88,368	36.91
Wholesale and Retail trade	60,090	25.10
Total trade and services	148,458	62.01
Construction	30,646	12.80
Manufacture	34,798	14.54
Unclassified	25,501	10.65
Total other	90,945	37.99
Grand Total	239,403	100.00

Industrial Pattern. Apart from its definite metropolitan bias, the over-all 1940-1956 employment increase had no outstanding single industry attraction such as a new oil development, or similar episodic event that might have accounted for the sizable advance that was made. On the contrary, and despite the decline in agriculture and mining, employment, during the first period, from 1940 to 1950, covered a broad industrial front in which the traditional agriculture-trade-service pattern was largely retained. As seen in Table 1.15, these three major industry groups together accounted for 70 percent of the State's total employment in 1940 while in 1950 the ratio was 66 percent. Manufacturing while gaining rather substantially in number of workers, increased its relative position by only 2 percentage points or from 10.2 percent to 12.2 percent. Important gaps in available data covering the later period from 1950 to 1956 prohibit firm generalizations, but evidence noted in Table 1.16 gives little indication of any marked shift in the relative employment importance of any industry since the last Census.

Conformance to traditional industrial pattern also characterized the employment increases which occurred in the Denver Metropolitan Area. As can be seen in Tables 1.17 and 1.18, trade and service continue to be dominant areas of employment with manufacturing, which while increasing relatively, still occupying a secondary position in the total employment picture.

Table 1.16

Non-Agricultural Employment of Wage and Salaried Workers by Major Industry Groups Colorado, 1950 and 1956

Industry	Number		Percent	
	1950	1956	1950	1956

Industrial Specialization and Basic Industries

Further insight into the nature of Colorado's economy is afforded by noting (1) the relative degree of development of specific industries in the State and (2) the relative degree to which specific industries contribute to the basic support of the economy. The first identifies the industrial areas where greater development effort might possibly be directed, while the second defines the specific industrial areas upon which all the rest depend.

In the following analysis both are reviewed with employment based on the 1950 Census used as the principal measure.[14]

Specialization: Developed and Underdeveloped Industries. Table 1.19 presents a detailed view of the particular industries in which Colorado has tended to specialize and presumably is most capable of attracting, as well as those which are relatively underdeveloped in the State. It will be observed that each industry is ranked in order of its "index of local specialization" rather than by its aggregate or share of total employment in the State. An industry with an index number greater than 1 is defined as being more specialized than the national average for that industry and vice versa.[15]

As so considered, Colorado's most specialized industry is metal mining with an index of 4.94. However, it accounts for only .79 percent of the State's total employment. In contrast, the most underdeveloped industry is textile manufacture with an index of only .03.

By inference a specialized industry (index ranging over 1) is particularly favored by the locale in which it is established. A glance at Colorado's group of specialized industries which range from an index of 1.01 to 4.94 will suggest why they are so classified. Mining and agriculture are clearly indigenous to this area. Trade and service industries reflect regional market opportunities of which the tourist trade is an important contributing factor. Transportation, which ranks high on the specialty list, may be regarded as having an advantage in a location which is regionally in the center, but at great distance from, highly populated market areas.

Turning to the other side of the picture, it will be seen that manufacturing is clearly the single important area of underdevelopment in Colorado. Thus, of all the principal manufacturing groups included in Table 1.19, seventeen out of the twenty-three listed have an employment concentration less than the national average.

Table 1.19

Industries in Colorado Ranked According to The Index of Local Specialization 1950

Industries of greater-than average specialization	Percent of total employment Colorado	U. S.	Index Colo./U.S. (U.S. = 1.00)
Metal mining	0.79	0.16	4.94
Air transportation	0.46	0.17	2.71
Rubber products (mfg.)	0.92	0.42	2.19
Miscellaneous foods (mfg.)	0.52	0.27	1.93
Hotels and lodging	1.60	0.93	1.72
Auto repair service	1.78	1.19	1.50
Meat (mfg.)	0.72	0.49	1.47

---

[14]Employment data are most complete and probably present the industrial picture more realistically than other measures, such as production volumes or sales. Some question may be raised as to the applicability of 1950 data to the more current scene. The answer to this is that the present employment pattern has not changed materially in recent years as was noted in the preceding section.

[15]Specialization, measured by this index, indicates the importance of an industry to the nation. The index is derived by dividing the ratio of a local industry's employment to the total employment in the locality by the comparable ratio for the industry as a whole on a nation-wide basis. By formula, the calculation of the index is as follows:

$$e_i - \frac{e_t}{E_t} E_i \text{ where}$$

e_i=local industry employment

e_t=local total employment

E_i=national industry employment

E_t=national total employment

The limited growth of manufacturing, although there are a number of important single exceptions, is attributed to locational factors—a matter considered in further detail at a later point. It is apparent, in any event, that Colorado's industrial development faces, as its principal challenge for the future, the enlargement of its manufacturing on a broader as well as a more intensive basis than now obtains.

Finally, it appears clear that, with the exception of manufacturing, Colorado has done relatively well in achieving a highly diversified and balanced economy. This is noted essentially in two ways. First, over 80 percent of total employment is found in the specialized industry group—a fact which can be interpreted to mean that 80 percent of Colorado's industries are "naturally" adjusted to their environment and therefore possess such stability as a situation of this kind would imply. Second, no one industry is overbalanced in size. Agriculture, with an employment ratio of 15 percent, is the only industry that stands out. But in any measure of concentration a ratio of this size covering as broad an industrial area as agriculture would not be regarded as large.

Basic Industries. In a general way the economic significance of an individual industry is indicated by the amount of its employment. And whether specialized or underdeveloped in the manner described above the criterion, in any event, is the number of persons employed. To a degree such a measure describes the industrial pattern and supporting basis of a state's economy. It fails, however, to delineate with any degree of precision the "ultimate" basis upon which the economy rests and upon which its future growth is predicated. In this ultimate sense industries are basic only to the extent that their sale of goods and services are made in out-of-state markets. Such sales generate the income needed to pay for purchases from the "outside" without which a state's economy could not be maintained much less grow.[16]

The measure of out-of-state volumes of a given industry is known as "basic" employment, or that proportion of its total employment which is calculated to be engaged in producing for the outside markets. Remaining employment is presumed to serve the local market exclusively and may be termed "local service" employment.

A commonly employed method for deriving basic employment is to determine the number of workers in a local industry in excess of the area's pro rata share of national employment in that industry.[17] An excess of workers is presumed to measure its "export" significance, that is, its relative importance, if any, as a "basic industry."

It should be noted, however, that a greater than pro rata share of industry employment could, in part at least, be attributed to an unusually heavy local per capita consumption of a particular industrial product. Moreover, low productivity of local labor could also be a contributing factor. Accordingly, some discretion is called for in the interpretation and application of basic employment analysis in any given case.

Within the more refined context of basic employment shown in Table 1.20, it is now possible to observe certain features of the State's economy which, in some respects, were suggested but not fully identified or measured in the preceding analysis. The principal of these, with certain qualifications noted, are:

(1) Colorado's basic industries represent 17 percent of total employment in the State. This means that Colorado's basic industries exercise a leverage of 1 to 6, meaning that, in effect, one basic job generates the outside income needed to sustain 6 local service jobs. Together these may be said to balance the population structure in an approximate ratio of 1 worker for 2.5 persons in the population.

(2) Agriculture, as a single industry, is the principal "bread winner" in the State's economy accounting for 17 percent of total basic employment.

(3) Mining, as a whole,[18] which accounts for only 3.94 percent of all basic employment reflects essentially this industry's relatively minor role as an employer. However, there are other features of the industry which combine to give to it an importance that employment data, as such, cannot take into account. Here perhaps, production volume or dollar sales values would be most appropriate as indices of the industry's growth-inducing influence, a fact which points to the limitations of the formula used.

[16]This applies equally to any area whether it be a nation, region, state, metropolitan area or any other geographic unit, none of whom could, under conditions of modern economic life, be fully self-sustaining.

[17]By formula the calculation of the index of basic employment is as follows:

$$e_i - \frac{e_t}{E_t} E_i$$ where

e_t = local industry employment

e_t = local total employment

E_i = national industry employment

E_t = national total employment

(For a full description of this formula see also, John M. Mattila and Wilbur R. Thompson, "The Measurement of the Economic Base of Metropolitan Areas," *Land Economics*, Vol. XXXI, No. 3, August, 1955.)

[18]Represented in Table 1.20 by "metal mining" and "coal mining."

(4) Manufacturing, represented in Table 1.20 by six separate industry groups, accounts in the aggregate for 8.57 percent of basic employment. This ratio may be low, yet as was noted in Table 1.19 the industry, as a whole, is underdeveloped in Colorado.

(5) The trade and service area, considered in its broader dimensions to include public administration, transportation and the utility services, accounts for 59.52 percent of all basic employment. As such, it constitutes the principal supporting base upon which Colorado's economy rests and upon which its growth prospects must presumably depend in a large degree.

Table 1.20

Basic Industries in Colorado Ranked by Number of Workers in Excess of Pro Rata Share (Basic Employment), 1950

Industry group	Total employment	Workers in excess of pro rata share (Basic employment) Number	Percent of total
Agriculture	71,760	13,454	16.83
Construction	38,080	8,903	11.14
Public administration	26,576	5,471	6.84
Educational services	22,730	5,179	6.48
Hospital and medical service	18,989	5,177	6.48
Railroads	15,617	3,856	4.82
Hotels and lodgings	7,632	3,190	3.99
Metal mining	3,765	2,979	3.73
Auto repair service	8,477	2,820	3.53
Rubber products (mfg.)	4,409	2,395	3.00
Eating and drinking places	16,338	2,040	2.55
Telephone services	7,081	1,998	2.50

Coal mining	4,500	168	0.21
Jewelry stores (retail)	304	146	0.18
Florist stores (retail)	651	137	0.17
All other industries	120,455	0	0.00
Total	476,538	79,932	100.00

Source: Derived from U. S. Bureau of the Census, *Census of Population, 1950*, Vol. II.

As noted in Table 1.20 the trade-service area as here considered, includes 29 separately listed industry groups which may be classified as follows:

Class	Percent of total basic employment
Trade	14.04
Wholesale (1 listed industry group)	2.22
Retail (12 groups)	11.82
Services	45.48
Bus., Prof., Pers., (8 groups)	25.26
Public administration (1 group)	6.84
Transportation (5 groups)	9.44
Utilities (2 groups)	3.94
Total	59.52

The relatively high basic significance of retail trade may be questioned in view of its inherently "local service" character. Two reasons are suggested and probably both apply. There is, first, the possibility that strictly "local" consumption is relatively high in Colorado, thus distorting the results given. The second explanation would be that Colorado's retail trade is heavily affected by tourist business which indirectly is an "export" industry in its own right. It is likely that this factor accounts in larger part for the high basic ratio indicated.

Business, professional and personal services, which account for slightly over one-fourth of total basic employment, are also normally regarded as essentially local service functions. Again, as in the case of retail trade, tourism and the regional character of much of Colorado's business which centers in the Denver Area can be offered as a possible explanation.

Public administration is obscure in view of Census practice which excludes government functions that can be classified in other industry groupings. Hence, the basic ratio of 6.84 percent is probably low.

Transportation with a ratio of 9.44 percent is understandably important as a basic industry in light of Denver's position as a transcontinental shipping point for rail, trucking and air transportation. As noted in the detail of Table 1.20, the percentages applicable to these three services are 4.82 percent, 2.10 percent, and 1.69 percent, respectively.

Addendum — Basic Industry and "Newly Created Wealth." A somewhat different concept of the "basicness" of a given industrial structure is that which measures a given industry by the value of its production (or its contribution to "newly created wealth"). This approach assists in more fully analyzing and interpreting the industrial structure of a community. It does not, however, attempt to isolate values produced for "export." Hence, it falls short of measuring the real growth-inducing element contained in production totals reported.

Industries commonly reviewed are agriculture, mining and manufacturing. Sometimes tourism is included where this is of importance. As so considered Colorado's "basic industries" in 1954 were as follows:[19]

Industry		
Manufacture (value added)		$471,507,000
Agriculture (cash sales)		379,899,742
Mining (value or production)		
Petroleum and gas	$122,734,960	
Uranium	118,000,000	
Metallic production	73,641,170	
Non-metallic production	22,837,321	
Other Cash	14,611,825	
Total		351,825,276
Tourist expenditures		185,805,018
Total		$1,389,037,036

Viewed in these terms Colorado's number one industry in 1954 was manufacturing followed in order by agriculture, mining and tourism. Historically agriculture has held the leading position. Since 1954 was a poor year for agriculture the comparison is probably unrealistic. However, substantial increase in manufacturing production at a rate greater than that of agriculture points to a continuance of this relationship barring unforeseen developments in mining.

Principal Industries: Recent Developments and Future Outlook

Colorado's continued growth is contingent on the degree in which its economy responds in each of its principal areas of industrial activity. In the following analysis these are considered individually in greater detail than was possible in the preceding summary tabulations. Particular attention is directed to more recent trends and growth promise of each industry reviewed.

Agriculture. The outstanding economic role of agriculture has been noted both in terms of basic employment as well as in dollar value of products. The combined impact of these two factors on economic activity within the State is reflected in a number of ways.

As a producer, agriculture supplies a basic raw material which enters into and sustains in a large degree other local production, notably meat packing, grain milling and miscellaneous food manufacture. The end result is that the aggregate value of agricultural production far exceeds the initial value of farm products sold or personal incomes realized.

As a basic producer agriculture also generates "local service" jobs which largely explain the existence of most small towns in the State and in no small degree the existence of the larger cities as well.

The industry's importance as a direct employer of labor is shown by the most recent Census of Agriculture which reports that as of October, 1954, the total labor force on Colorado farms, including family and hired workers, totalled 96,043 persons. In addition, farm workers provided a sizable labor pool to supplement labor needed in town and city. The Census reports that a total of almost 10,000 farm operators worked off the farm 100 days or more in 1954. Over 8,000 more worked off the farm from 1 to 99 days.[20]

Agriculture's support of local and state government is indicated by a total property valuation in 1955 amounting to $537.6 million or 19 percent of the grand total net state assessment of $2.87 billion. On a sales value basis, assuming an assessment ratio of 35 percent, the calculated value of all farm property would amount to somewhat over $1.5 billion.[21]

Historically agriculture has not maintained its relative position, measured by employment, value of production and personal income, either in Colorado or in the nation as a whole. As noted earlier, farm employment in Colorado declined both relatively and absolutely between 1940 and 1950, a development which was even more marked for the nation. As noted also, farm production in the State declined sharply after 1952 as did personal income. Added to this has been the very definite reduction in number of farms which, for the period 1935 to 1954, declined from 63,644 to 40,749.

On the more favorable side, it can be pointed out that nationally the value of agricultural production while declining relative to say, manufacturing output, is not declining in any absolute sense. In Colorado, following World War II, notably from 1947 through 1952, agricultural production reached an extremely high level. During this period farm cash receipts exceeded $500 million annually reaching a peak of more than $600 million in 1952. The sharp decline thereafter, as shown in Table 1.21, largely reflects drought conditions which were not felt universally. Actually, farm cash receipts (from product sales) for the country as a whole reached an all time peak in 1953. Recent recovery in Colorado is indicated by a cash receipts total of $512 million for 1957. This has led to the prediction that farm cash receipts totals of the early 1950's will again rule at around $500 million annually.

The decline in number of farms in Colorado has been brought on, in large degree, by increased mechanization. However, this has meant little in terms of production since there has been no corresponding decline in the land in farms. Actually, acreages have increased in Colorado.

As noted in Table 1.22, the percent of land in farms has been constantly increasing, reaching an all-time peak of over 38 million acres in 1954 or 57.7 percent of the State's total land area.

Table 1.22

Number of Farms and Total Farm Acreage in Colorado, Selected Years, 1910-1954

Year	Number of farms	Total acreage (thousands)	Percent of land in farms
1910	46,170	13,532	20.4
1920	59,934	24,462	36.9
1930	59,956	28,876	43.5
1940	51,436	31,527	47.4
1945	47,618	36,218	54.5
1950	45,578	37,953	57.1
1954	40,749	38,385	57.7

Source: Bureau of Business Research, University of Colorado, *Colorado Business Review*, Vol. XXVIII, No. 11, November, 1955.

Limits to this advance are now in sight, largely because of restricted water resources. Hence, the main elements of growth depend upon increased water conservation and improvements in such areas as fertilization, hybrid seeds, farm machinery, crop rotation, livestock breeding and feeding, all of which would add to productivity. In line with such efforts a recent study of the agricultural situation in the State prepared by a group of economists from Colorado State University suggests that the following steps be taken.[22]

Irrigated Agriculture

(1) Resolve east-west slope controversy over use of Colorado water.
(2) Intensify state cooperation and coordinate with water programs of the federal government and with local affiliated groups.
(3) Intensify research of ground water resources.
(4) Reduce needless economic damage to irrigated land by super highway right-of-way requirements.
(5) Study administration of irrigated water to (a) codify present water requirements, (b) facilitate changes in diversion points and flexibility of storage and beneficial exchange policies, and (c) define beneficial use.
(6) Intensify research into problems of irrigability of soils, reclamation of saline and alkaline soils and feasibility of drainage to restore presently unproductive land.
(7) Accelerate present soil-water plant studies to determine best timing for irrigation and residual effects of irrigation water.
(8) Adopt a strong state program to support education of farmers in water use.

Dryland Agriculture

(1) Maintain an adequate research and educational program to provide information needed for wise resource use by farmers in the dry land areas and to aid the department of natural resources in recommending land-use policies.
(2) Agree upon a system for classifying all eastern Colorado dry land by type of use under varying climatic conditions.
(3) Study ways and means for stabilizing productivity as it effects both individual incomes and governmental units.

Plains Range Livestock Operations

(1) Study possibilities for accurate prediction of range forest production and range seeding success.
(2) Determine best systems of range use and management practices in an experimental range in the 11-to-13-inch precipitation belt of eastern Colorado.
(3) Hire a range management specialist to help plan and execute educational programs for effecting better range practices.
(4) Place personnel trained in range management on the staff responsible for administration of state lands.
(5) Study feasibility of establishing three to five grades of grazing lands based on potential productivity in order to provide incentive for proper rates of stocking and as an addition an equitable basis for tax assessment.
(6) Require highway building authorities to make special right-of-way seeding programs a part of their overall construction programming.
(7) Accelerate programs for control of noxious weeds and range rodents.

Mountain Range Livestock Ranching

(1) Continue studies for control of weedy trees, shrubs and herbs.
(2) Include or enlarge range improvement studies on (a) management of ponderosa pine bunch-grass, (b) game habitats, (c) balancing stocks and game grazing, water production, and timber production, (d) range rodents, (e) mountain meadow development.
(3) Include in study of water resources on mountain ranges, (a) irrigation practices, (b) underground storage, (c) runoffs, (d) relative cost and benefits of water, (e) influence of rodents and other animals on the watershed and (f) water loving plants.
(4) Educate public on wiser use of the mountain range resources.
(5) Examine the tax structure to note the degree in which it encourages or deters

[22]Department of Agriculture, State of Colorado, *Colorado's Agriculture and Forestry*, July, 1957, pp. iii-xiii.

proper use of privately owned range land as the case may be.
(6) Recognize, through financial participation by government, the downstream benefits by improving the quantity and quality of water.
(7) Allocate a portion of state lease income to improvement of mountain range lands.

To what degree these recommended measures will or can be adopted in the near future is, of course, a matter of conjecture. As recommendations they do, however, represent authoritative thinking on the State's agricultural base which must be developed to its optimum capacity if the economy of the State is to continue to grow at the rate that it has in the past.

Mining. The mining industry in Colorado, while not a significant employer relative to other major industry groups, does, nevertheless, account for an estimated one-fifth of the "new wealth" produced in comparison with agriculture and manufacture. It is in this sense as well as in its known potentials, which are large, that the mining industry in Colorado is of principal interest.

In 1953 Colorado ranked seventeenth among the states in the value of minerals produced. It is believed that her position is higher than that at the present time. At least thirty-eight mineral substances with an aggregate value of $306 million were mined in 1956, an amount exceeding any year since 1950 (Table 1.23).

Table 1.23

Value of Mineral Production in Colorado 1950-1956

Year	Value (thousands)
1950	$154,898
1951	179,435
1952	187,589
1953	211,586
1954	255,852
1955	286,104
1956	306,270

Of the large number of different minerals produced in the State the more important by a a wide margin are petroleum, uranium and molybdenum. These three, including coal and vanadium, accounted for 78 percent of the total value of mineral production in 1956 (Table 1.24).

Petroleum. Currently, Colorado ranks ninth among the twenty-seven oil producing states. In 1956 total production was somewhat over 58 million barrels with a value estimated at about $163 million (Table 1.25).

As of June 1, 1957 Colorado's oil production came from 186 fields distributed through 17 counties. The yield from individual fields ranged from less than 5 barrels per day from several one-well pools to a maximum of approximately

The outlook for future production in the State is suggested by a recent comprehensive study of oil reserves in the United States.[24] For Colorado it is estimated that the original content of its reserves was 3,047 million barrels and that total oil production to June 1, 1956 was 342 million barrels. Additional recoverable oil by primary methods is given as 300 million barrels.

[23] Department of Natural Resources, State of Colorado, *Colorado's Mineral Resources*, July, 1957, p. 13.
[24] From Paul D. Torrey as quoted in *Colorado's Mineral Resources*, State of Colorado, Department of Natural Resources, July 1957, p. 14.

In the absence of secondary recovery operations not now carried on or new discoveries, which always remain a possibility, it would appear that further petroleum production in Colorado is definitely limited in growth promise at the present time.

Oil Shale. Brighter prospects for oil are envisaged in Colorado's vast storehouse of oil shale which exceeds the combined reserves of the rest of the world. Unfortunately such prospects are more or less in the long run since oil shale development depends upon such future unknowns as the price of petroleum, new discoveries and oil imports. It is generally recognized that the State's huge oil shale potential will ultimately be developed on a commercial scale. Most predictions conceive of a million-barrels-a-day industry in western Colorado by 1975—a development which would support a population of 340,000 persons.[25] Currently, such a prospect is dimmed by limitations of water supply—a factor that probably has not been adequately considered in oil shale projections.[26]

Uranium.[27] Colorado's known uranium reserves as of mid-year 1956 amounted to 4,100,000 tons with an average of U_3O_8 content of .033 percent. This represented about 6.8 percent of all known domestic uranium reserves, the largest of which, or 68.0 percent, being located in New Mexico.

As of mid-year 1956, Colorado production involved 150 active producers in the field and five mills with an aggregate rated capacity of 2,260 tons per day.

In recent years the national market for the product has been favorable owing to a relatively heavy government buying program which is, however, expected to stabilize by 1959. Thereafter, military and industrial development will govern. It is now evident that the industrial market will not materialize on any wide scale for some years.

The prospect for a substantial increase in uranium ore production in Colorado in the near future is not considered to be favorable. In addition to the general stabilizing developments anticipated in the national market, the mining of uranium in the State is moving at a pace that is faster than new ore discoveries are being made. This has resulted in a net loss of reserves. Added to this is the new and lower A.E.C. price schedule which may force certain marginal mining units to suspend operations.

Molybdenum. Colorado molybdenum production, which accounts for about 60 percent of the nation's total, is produced from one mine, owned and operated by Climax Molybdenum Company. As the second largest underground mine in the world, it had an output in 1956 amounting to approximately 37,500,000 pounds of concentrate with a value of more than $44 million. This amount exceeded in value all other metals, excepting uranium, in that year. As can be seen in Table 1.26, Colorado's production of molybdenum has steadily increased and is expected to do so in the future.

Table 1.26

Production and Value of Molybdenum Mined in Colorado[a] 1946-1956

Year	Crude ore (tons)	Value[b]
1946	1,731,574	$ 8,774,200
1947	1,953,578	10,000,000
1948	2,256,268	11,400,000
1949	2,025,440	12,000,000
1950	2,257,723	13,000,000
1951	4,566,548	22,500,000

The possibility of an accelerated market demand is recognized as likely in view of considerable current research designed to find means to reduce oxidation of the metal at high temperatures and to increase its ductibility. Both would greatly enhance its principal use in the manufacture of high strength steel.

Coal. Coal was Colorado's fourth most valuable mineral produced in 1956, the estimated total amounting to approximately $20 million. Comparatively, Colorado occupies a strong position in reserves of coal above the grade of lignite, which is known to be present. Closest estimates place these at a figure of about 19 percent of the national total which clearly exceeds that of any other state. Of interest, in this connection, are the findings of a study completed in 1950 by the United States Geological Survey of Colorado's original coal reserves. These were found to be as follows:[28]

Type of Coal	Production (thousands of short tons)
Anthracite and Semi-Anthracite	100,000
Bituminous	213,071,000
Subbituminous	104,175,000
Total	317,346,000

[25] Charles H. Prien and John A. Welles, "Shale Oil: Economics of a New Industry," *Western Business Review*, Vol. I, No. 4, (University of Denver: Denver, Colo., November, 1957) pp. 147-152.

[26] This problem is being currently studied by Dr. Morris E. Garnsey, Professor of Economics at the University of Colorado. Dr. Garnsey, under a Ford Foundation fellowship, is researching methods of regional economic analysis, and plans to apply his findings to resource development along that sub-region of the upper Colorado River Basin, which includes the major oil shale deposits.

[27] Data on this section from: State of Colorado, Department of Natural Resources, *Colorado's Mineral Resources*, July, 1957, p. 35.

[28] State of Colorado, Department of Natural Resources, *Colorado's Mineral Resources*, July, 1957, p. 24.

The estimated amount of depletion to January 1, 1950 allowing for a 50 percent loss in mining, amounted to little less than 1 billion tons.

Because of increased competition with fuel oil and natural gas, production of coal in Colorado declined from a maximum of 12,658,055 tons in 1918 to 3,567,930 tons in 1955. While small production increases may occur in the near future, important changes will likely have to wait until coal again becomes more competitive with other fuels. This, in turn, waits upon a demand for power on a vastly greater scale than now exists.

Problems and Outlook. Although progress of mineral production in the State will likely continue at perhaps a better than the recent past average rate, it should be recognized that the industry as a whole faces many problems some of which are inherent and therefore difficult to resolve.

For many minerals the possibility of discovery of economically significant deposits is highly uncertain and the loss ratio is great. A high degree of technological skill is needed by management, and labor is expensive because of working conditions. Due to the large cost factor, wasteful practices are encouraged which result in loss of value both in the mine and mill.

Adding to the technical difficulties of production is price instability and associated uncertainties growing out of frequent changes in federal legislation including purchase policy.

Not the least of the worries of the mining industry is state tax policy. Here government faces no easy task since it must weigh considerations of revenue need against the desire to encourage optimum expansion of the industry. How well this is being done in Colorado is a question for later discussion in this study. It is, however, a matter that must be recognized as one that could materially affect the future course of the industry in the State.

Real as these problems may be, the fact should not be overlooked that the industry as a whole has also much cause for being optimistic. This rests on the following considerations as reviewed in a recent report:[29]

(1) The stimulating effect of ultimate price stabilization of the base metals.
(2) The existence of large areas which have been inadequately explored.
(3) The growing importance of industrial minerals.
(4) The eventual large-scale development of oil-shale reserves.
(5) Advances in efficiency in mining and extractive practices.
(6) The discovery of new uses for minerals presently underdeveloped, as well as those not now recognized as being of potential value.
(7) The increase in demand accompanying the unprecedented surge in population growth and industrialization of the West.

[29]Department of Natural Resources, State of Colorado, *Colorado's Mineral Resources*, July, 1957, p. 12.

As a concluding comment it may be added that all evidence points rather definitely to a continued absolute increase in mineral production in the State but at a rate insufficient to materially alter the current employment and income trend of the industry. Any substantial growth waits perhaps upon oil shale development and such new discoveries as may occur in other areas of mineral resource.

Manufacturing. Unlike mining and agriculture the manufacturing industry in Colorado is, in the main, at a natural disadvantage because of distance to market which prohibits, to a large degree, the development of mass production. As a result, and as noted earlier, most manufacturing lines in the State are underdeveloped (index of local specialization less than one) in comparison with the national average.

Although manufacturing cannot be regarded as a leading industry in the State, its role in the economy is vastly important in that it provides diversity and therefore stability to a degree not otherwise possible. Its service in absorbing workers laid off in agriculture and mining has been noted earlier. Its continued role in this capacity becomes increasingly important as employment in other sectors of the economy declines either temporarily or permanently.

Efforts to develop manufacture in Colorado have centered on means to circumvent natural barriers. One approach has been to produce specialty lines where the value-to-weight ratio is high. This has had the effect of cushioning to some degree the impact of transportation cost. Other efforts have recognized the difficulties of attempting to penetrate national markets. In consequence, many firms have elected to remain relatively small by limiting their operations to a strictly local or regional market.

Growth according to this pattern of development is reflected in an over-all manufacturing structure which features many extremely small firms and a wide diversification of products of which consumer items for local and regional distribution are dominant. This can be seen by reference to Tables 1.27 and 1.28. However, it will be also observed that important departures have been made from this logical pattern of development evidenced by the existence of a limited number of relatively large firms whose combined employment accounts for the greater proportion of total manufacturing employment in the State. Several of the larger firms have, over the years, defied the barrier of distance by mass-producing standard consumption items, notably rubber tires, V-belts and luggage, for the national and world markets. Others have specialized in primary steel or heavy steel products, both of which would not be regarded as logical items for major production in this area. The success of these firms can be attributed to personal factors or to other special circumstances that have more than offset natural lo-

cational disadvantage. In any event, their successful development sets no pattern that could be expected to be followed in the near future.

Table 1.27

Size and Number of Manufacturing Establishments in Colorado, 1954

Size of establishment (number of employees)	Number of establishments

The progress of manufacturing in the State since World War II measured by such factors as employment and value added by manufacturing has not been outstanding. Nevertheless, Colorado's record is good, all things considered, as shown in Tables 1.29 to 1.32. Principal developments indicated therein and conclusions suggested may be summarized as follows:

(1) From 1947 to 1956 Colorado gained on balance a total of 748 new manufacturing establishments and 9,100 new factory jobs (Table 1.29). It will be noted that the majority of the new establishments were small. In that respect their addition caused no marked change in the traditional manufacturing structure in which small business is characteristic. Nevertheless, they did account for a sizable proportion of the new jobs that developed over the period.

Table 1.29

Estimated Number of Establishments and Employment in Manufacturing in Colorado 1947-1956

Year	Number of establishments	Employment
1947	1,586	58,500
1948	1,652	58,300
1949	1,697	54,600
1950	1,762	54,100
1951	1,814	63,600
1952	1,888	67,100
1953	1,974	68,400
1954	2,055	64,600
1955	2,190	64,400
1956	2,334	67,600

Source: Bureau of Business Research, University of Colorado, *Colorado Business Review*, Vol. XXX, No. 2, February, 1957.

(2) The over-all growth rate of Colorado manufacture in recent years has been slightly above the national average measured in terms of both employment and value added: the differential in favor of Colorado for the 1947-1954 period being 2 percent in case of employment and 4 percent for value added (Tables 1.30 and 1.31). Colorado's growth rate was smaller, however, than the average for the eleven Western States both in employment and value added (Table 1.32).

Table 1.30

Growth of Employment in Manufacturing in Colorado Relative to the National Rate of Growth, 1947 to 1954

Major industry group	Number of employees 1947	1954	Ratio of employment 1954 to 1947 Colo.	U.S.	Relative change Colo./U. S.

Transportation equipment	3,518	5,362	1.524	2.384	0.64
Total	284,040	454,199	1.599	1,538	1.04

[a] See footnote, Table 1.30.

Source: U. S. Bureau of the Census, *United States Census of Manufacturers: 1954*, Vol. III, "Area Statistics."

Point (2) is significant in that it demonstrates average growth with no boom-like manifestations which in some quarters may have been assumed because of the relatively rapid population growth experienced in recent years.

Point (3) supports point (2) since a wide general industry growth is not the sort of development from which booms are generated. More significant, however, is the fact that underdevelopment is being removed albeit slowly. If this continues, a better balanced industrial structure will result to the advantage of the State's economy as a whole.

Table 1.32

Total and Percent Increase of Employment in Manufacturing and Value Added by Manufacture in Western States, 1947 to 1954

State	Increase of employment Number	Percent
New Mexico	7,485	113.7

Any prediction as to what the future holds for manufacture in the State must necessarily allow for the inherent limitations that exist. A somewhat better-than-average growth would appear as the most likely, much in the manner of the recent postwar trends. This should not, however, rule out the possibility of certain sharp increases. These could conceivably happen in a western location which offers the attractions of space, air and possibly security, all of which are becoming increasingly important in the determination of plant site.

Wholesale Trade. Colorado's wholesale trade originates largely in the Denver Metropolitan Area where it accounted in 1950 for 8 percent of total employment and 11.5 percent of total basic employment.[30] When considered in terms of the Denver Area alone, wholesale trade is far more important than might be inferred from over-all State employment statistics where wholesale employment represented only 4 percent of total State employment in 1950, and only 2.5 percent of basic employment. The Denver and State interconnection is important, however, in that a significant factor in Denver's growth, of which wholesaling is clearly one, tends to have a multiple impact on the economic wellbeing of the entire State.

Wholesaling in Denver, to which the following discussion is confined, may be summarized by noting certain trends in the structure during the last fifteen years. Table 1.33 shows these by number of establishments, employment and sales.

[30] Basic employment as measured for the Denver Metropolitan Area, applies to this area only and is not a part of the basic employment calculations for the State as a whole. See Department of Planning, City and County of Denver, *Working Denver*, (Denver, Colorado, 1953) p. 68.

Table 1.33

Structure of Wholesale Trade, Denver Metropolitan Area, 1939, 1948 and 1954

Year	Number of establishments	Employment	Sales (thousands)
1939*	993	9,804	$ 339,719
1948	1,327	18,648	1,256,706
1954	1,556	18,361	1,746,390
Change			
1939-48	34%	88%	258%
1948-54	17%	—1%	43%

* Figures for 1939 available for City of Denver only.

Employment. Perhaps the most significant single change observed is the absolute decline in employment from 1948 to 1954. The question which immediately occurs is whether or not this points to a continued employment decrease or at most an employment plateau at which growth hereafter could be expected to be moderate at best. The answer is that the latter is likely to be the case. In any event, an upward employment trend is not indicated and for a number of reasons. Among them, three have been noted as primary in recent studies on wholesale trend in Denver.[31] These are (1) the marked shift in the commodity sales pattern from consumer goods to durables or items for business and industrial use, (2) increased decentralization, which finds many items formerly supplied from Denver now being handled at smaller trading centers in the region or shipped directly from the factory, and (3) increased technology and automation which reduces employment per unit sales.

Sales. Denver's wholesale sales have continued to be relatively favorable, however, although the inflation factor has magnified dollar volume in some degree. In 1954, Census reports placed Denver in 5th leading position in per capita sales in a comparison group of 16 metropolitan areas of comparable size. Similarly, Denver occupied 3rd position in rate of per capita sales gain from 1948 to 1954 (Table 1.34).

Wholesaling in the Denver Area in the future must face up to the fact, however, that competition is keen and the market for Denver products is subject to steady pressure from surrounding major wholesale centers, notably Minneapolis and Saint Paul, Kansas City, Houston, Dallas, Albuquerque, Phoenix and Salt Lake City. This outer ring of larger competitors, in addition to the smaller sized cities now flexing their industrial muscles as they grow in size with the western population drift, has tended more and more to "box in" Denver's market. The latter now includes mainly Colorado, Wyoming and northern New Mexico. In addition, Denver claims as its territory some slight part of South Dakota, Montana, Nebraska and Kansas. Further sales increases may, therefore, be expected to be intensive rather than extensive in which progress will be dependent upon resource development and population growth within these existing boundaries.

Retail Trade. Retailing is normally a passive rather than an activating factor in the growth of an economy. As population and incomes increase, therefore, retail employment and sales could be expected to respond accordingly. However, as earlier noted, retail trade in Colorado has a relatively high ratio of basic employment (or sales outside the state). For this reason the progress of the industry is a matter of considerable importance in any evaluation of the State's growth potential.

Data from the *1954 Census of Business* generally indicate, when compared with comparable data from the earlier *1948 Census*, that Colorado in expanding more rapidly in its retail sales market than the average western state (as well and much above the national average). As noted in Table 1.35, Colorado ranked 5th in rate of sales gain (1948-1954) in the comparison group of eleven Western States. However, on a per capita basis, which is a more significant measure of growth, Colorado ranked 2nd, being preceded only by Nevada.

Sales in the Denver Metropolitan Area for the same period show an over-all gain as well as per capita gain of 49.2 percent and 22.8 percent, respectively. At these rates Denver ranked 3rd and 1st in the comparison group of eight Western Metropolitan Areas (Table 1.36).

The relatively rapid per capita sales gain in the State is reflected in per capita sales totals which advanced from $989 in 1948 to $1,157 in 1954. This change moved Colorado from 7th to

5th place in the eleven Western State array. Similarly, the Denver Metropolitan Area moved into 1st from 3rd place in the comparative group of eight Western Metropolitan Areas.

Table 1.35

Retail Sales in Western States, 1948 and 1954

State	Sales (millions) 1948	1954	Percent increase 1948-1954	Per capita sales 1948	1954	Percent increase 1948-1954
Colorado	$ 1,250	$1,727	38.2	$ 989	$1,157	16.9
Wyoming	307	385	25.1	1,143	1,291	12.9
Utah	576	733	27.2	882	962	10.9
Idaho	579	670	15.8	1,050	1,120	10.7
Montana	599	778	29.8	1,106	1,257	11.4
New Mexico	474	733	54.5	617	953	15.4
Arizona	654	1,001	52.9	948	1,076	13.4
Nevada	200	330	65.2	1,281	1,557	21.6
Washington	2,203	1,564	30.4	977	1,137	15.0
Oregon	1,586	1,921	21.2	1,129	1,166	3.8
California	10,950	15,644	42.9	1,088	1,251	16.4
United States	128,849	169,968	31.9	882	1,054	11.9

Source: U. S. Bureau of the Census, *Census of Business: 1954*, Vol. II, "Retail Trade—Area Statistics," Parts 1-2.

Much of Colorado's over-all and per capita sales gains stem from the relatively rapid growth of the Denver Metropolitan Area where industrialization and tourist concentration have been most pronounced. Hence, the future outlook for the retail sales market in Colorado may be expected to correlate closely with population and industrial growth in the Denver Area plus such trends in the tourist trade as may develop.

Table 1.36

Retail Sales in Western Metropolitan Areas 1948 and 1954

Metropolitan Area	Sales (millions) 1948	1954	Percent increase 1948-1954	Per capita sales 1948	1954	Percent increase 1948-1954
Denver	$595	$ 888	49.2	$1,055	$1,296	22.8
Kansas City, Mo.	991	1,274	28.6	1,216	1,341	10.3
Houston	819	1,214	48.2	1,015	1,186	16.8

Selected Services. "Selected services" as defined by the U. S. Bureau of the Census are a special type of retail sales and in that sense much of what has been said above is equally applicable to this category. Comparative data from 1948 to 1954 are not available but it is likely that relative growth rates have been much the same as in retail trade.

Colorado ranked in 1954 well above the eleven Western-State-average in the per capita volume of its service business. As noted in Table 1.37, Colorado's per capita receipts from all service activities in 1954 were the 4th highest among the eleven states in the West. Two principal categories, "amusements" and "hotels and motels," are of particular interest, since they reflect the impact of the tourist trade. In these services, Colorado ranked 3rd and 5th, respectively, in the eleven state comparison group.

It will be seen also that Colorado in the remaining designated catgories, namely, "business and personal services" and "auto and miscellaneous repair," ranked 3rd and 7th respectively.

Table 1.37

Per Capita Receipts of Service Industries, By Major Groups in Western States, 1954

(Rank order of states appears in parenthesis)

State	Total	Bus. & personal	Auto and misc. repair	Amusements	Hotels and motels
Nevada	$813(1)	$78(2)	$36(2)	$411(1)	$288(1)
California	200(2)	90(1)	40(1)	46(2)	24(7)
Wyoming	157(3)	44(8)	29(5)	24(6)	60(2)

Source: Derived from U. S. Bureau of the Census, *Census of Business: 1954*, Vol. VI, "Selected Service Trades—Area Statistics," Parts I and II.

From these relationships it is apparent that the service industries in Colorado have a strong "basic" component, a fact that earlier analysis has also indicated.

Tourist Trade. While not an industry in the accepted meaning of that term, the tourist trade is often so regarded. In any event, it is an important market factor which causes the trade and service industries in the State to have a "basic" or "export" significance not otherwise possible.

In 1956 an estimated total of 3,878,000 tourists visited Colorado (Table 1.38). On the average, each tourist stayed 7.4 days and spent $7.87 daily. On this basis it is estimated that tourist expenditures totalled $226 million — a figure equal to 13 percent of total retail sales or an amount approximately equivalent to 100 percent of total receipts of selected services as reported by the 1954 Census of retail sales and services. It is no small wonder then that the health of this "outside" market has become a matter of almost as much concern as the weather and the crop outlook.

Future indications are that the number of tourists coming to Colorado will continue to increase. A number of causal factors are clearly evident, the principal of which are: (1) an increasing population in which the ratio of older people outside the labor market is expected also to increase, (2) the urbanization movement which induces a desire to escape crowds and to get away from things for a while, and, (3) better transportation facilities. Added to these one may expect accelerated promotional effort. The latter has become increasingly important as all regions of the country have entered the arena of competition for this lucrative business.

Table 1.38

Number, Expenditures and Length of Stay of Tourists in Colorado, 1950-1956

Year	Number of tourists	Expenditures Total (thousands)	Per person per day	Per person per stay	Average stay in days
1950	2,009,000	$107,903	$6.10	$33.71	8.8
1951	2,201,000	123,014	6.73	55.89	8.3
1952	2,636,000	151,280	7.86	57.39	7.3
1953	2,882,000	155,777	8.07	54.05	6.7
1954	3,088,000	185,805	8.02	60.17	7.5
1955	3,344,000	214,247	7.91	64.05	8.1
1956	3,878,000	225,816	7.87	58.23	7.4

Source: Bureau of Business Research, University of Colorado, *Colorado Business Review*, Vol. XXX, No. 5, May, 1957.

The outlook for tourism, though apparently bright, is not entirely so and from some points of view the skies are not bright at all. Analysis of trends indicates that since World War II the number of tourists have been increasing at the rate of 254,000 per year. At this rate Colorado could expect about 6 million tourists by 1965. So far, so good.

However, tourist expenditures are not keeping pace with the increased number of tourists. Tourist expenditures, although basically a function of the number of tourists, are importantly conditioned by the length of stay of each tourist on the average. Since 1946 the latter has declined from 9.5 days to 7.4 days in 1956. This is attributed largely to faster cars and increased travel in which a broader area of the country can be encompassed within a typical vacation period. If this continues, and there seems to be little in sight that could change the situation, it is calculated that the average tourist will spend 5 days in Colorado by 1965. Average expenditure, based on 1956 expenditures rates per day, will then amount to about $41 per-person-per-stay rather than $58.23 as reported for 1956. Thus an aggregate increase of 60 percent in the number of tourists in 1965 may mean only a 15 percent increase in the number of tourist days (number of visitors multiplied by the average length of stay). At this rate, total expenditures may not exceed the total reported in 1956.

Undoubtedly, Colorado welcomes visitors but from an economic point of view a declining profit margin in the face of increased volume is not easily accepted and probably need not be. How promotion effort in the State will resolve this problem remains to be seen.

Government. Government workers in Colorado including federal, state and local numbered 93,087 in 1956. This number included 33,605 civilian employees of the federal government and 59,482 employees of state and local governments (Table 1.39). In 1956, Colorado, on a per capita basis, ranked 4th among the states in number of federal civilian employees and 12th in number of state and local government.

As a growth-inducing factor federal employment is by all odds the more important component of the governmental employment structure. State and local government is inherently "local service" in character and, accordingly its employment follows and accommodates fundamental growth trends—it does not "cause" them.

The future growth of civilian employment in federal agencies in Colorado should, on the basis of past trends and in the light of new developments, continue to increase at a rate which will at least maintain Colorado's high per capita position in comparison with other states. The strategic location of Denver, which accounts for approximately two-thirds of all federal employment in the State, has been recognized by the fact that over 150 federal agencies of various size are located in this area. These serve varying sized jurisdictions and, in many cases, cover as much as three-quarters of the country or more.[32] Trends now apparent suggest an enlargement in future federal activity in Denver. In the opinion of local officials these have their basis in the following: [33]

(1) Availability of space for building at the Federal Center which is already served with utilities and highway access.

[32] On this point see Department of Planning, City and County of Denver, *Working Denver* (Denver, Colorado, 1953), pp. 134-137.

[a] Civilians only.

[b] Includes employees of special districts as follows: 1956-514; 1955-468; 1954-449.

Source: U. S. Department of Labor, Bureau of Labor Statistics, "Colorado Bulletin 65," March 30, 1958.

(2) Decentralization of federal agencies is taking place for a variety of reasons, and Denver is benefiting thereby.

(3) Denver is benefiting to some extent also from reorganization and consolidation of over-extended regional organizations.

(4) Denver's strategic location as the only city in its population range located in a very sizable geographic area tends to make it a logical center for any governmental activity proposing to serve the area as a whole.

(5) Certain agencies which are primarily serving the Western States are endeavoring to move closer to the areas which they serve.

The foregoing has applied exclusively to certain employment in federal government. Federal military payrolls must be recognized also as an important factor in the State. The closing of one or two large military establishments as proposed in 1957 could, for example, result in a substantial decrease in business volume in several sections of the State now dependent in large degree upon such activity.

Obviously, any prediction of what may happen here would be quite meaningless. There are, however, certain straws in the wind, notably, an indicated decline in the number of military personnel due to the development of new weapons systems and new concepts of warfare and defense.

Industrial Progress and the Question of Water

In the background of any thinking on Colorado's economic future is the constant spectre of progress being brought to a sudden halt because of water. The significance of this vital but highly limited resource and its likely impact on the future of the economy of the State has been well expressed in a recent report, excerpts from which are quoted below:

> Any long range analysis of social and economic trends in Colorado must necessarily consider the problem of water. It is assumed herein that there will be adequate supplies of domestic and industrial water in the State for two to three million persons, nearly one million of whom will live in metropolitan Denver. These assumptions cannot be verified easily. Certainly, the optimum use of known water supplies will be required. A large system of storage reservoirs, controlled industrial and economic use, trans-mountain diversions, cloud seeding, and possible limited agriculture use will be required. All can be envisaged. The actual outcome will depend upon the course of numerous individual and governmental decisions, not many of which can be predicted with any certainty at this time.
>
> It can be reasonably assumed that water will be a limiting factor in the Colorado economy, both from the point of view of the cost of control and the absolute limits of quantity. Given the semi-arid climate of most of the state and its mountainous terrain, the population density of Colorado is likely to remain much below that of the United States. . . .
>
> It is, of course, very difficult to assume that present conditions which define such variables as technological change and growth in absolute numbers of people can be projected very far into the future. One can conceive of assumptions under which Colorado could sustain a population of many millions. On the other hand, when future conditions are assumed to be not radically different from the present, then a limit on the probable population growth appears. . . .
>
> The economy of the State is likely also to grow progressively into an "oasis" economy, in which the population is concentrated in relatively small areas where climate, terrain, and available water supplies are most conducive to the amenities of life. Such areas would be largely urban in character, and their growth will require careful consideration of the desirable directions of future urban development—and of such problems as zoning, traffic control, air pollution control, and provision of parks, auditoriums, and other public facilities.[34]

Apart from its longer run implications the problem of water scarcity is a continuous one since there has never been enough water to meet all demands. Hence, there is an ever increasing need to develop, conserve, and to allocate scarce water to its optimum use between sharply competing demands.

The State Water Development Plan. Colorado's efforts to develop as well as to conserve its water resources including power is manifest currently in "Colorado's official water plan" which includes projects in actual construction or in the planning stage. In most cases the participation of the U. S. Bureau of Reclamation is a crucial factor.[35] Because of the magnitude of these undertakings and their great meaning to Colorado's economic future their identification and stage of development are pertinent data here. The major projects are the following: (1) The continuation of the Colorado-Big Thompson project (practically completed), (2) the continuation of the Mancos project (now completed), (3) Animos-LaPlata project, (4) Pine River Extension project, (5) Paonia project, (6) The Sell project, (7) Cherry Creek Flood control (now completed), (8) Colorado Springs Flood Control and Improvement Project (now completed), (9) San Luis Valley project (Conejos unit completed), (10) Smith Fork project, (11) Frying Pan-Arkansas project, (12) Curecanti project, (13) Denver-Blue Diversion project, (14) Florida project, (15) Trinidad Reservoir project.

---

[34]Morris Garnsey and R. E. Pelz, *A Projection of the Population of Colorado*, University of Colorado (Boulder, Colorado, 1955), pp. 36-37.

[35]The financial participation of the Bureau of Reclamation in assisting water development in the State has been and continues to be on a large scale as evidenced by an outlay to date of $195,684,735. Moreover, studies have been completed on projects which, when authorized, will cost an estimated $209 million. In addition, the Corps of Engineers, U. S. Army has spent $31,088,489 in flood control projects while authorized projects in the amount of $39 million await appropriation. (In further reference to this see: Department of Natural Resources, State of Colorado, *Water Resources of Colorado*, November, 1957, p. 118).

Recent Study Recommendations. Reference has already been made to recommended conservation measures as these apply specifically to agriculture. Broad policy action recommended in a current report[36] prepared for the State Department of Natural Resources calls for the following:

(1) The introduction of a more comprehensive and economic development program which will guide *all* resource use and, in the case of water, determine the optimum allocation of water among industrial demands.
(2) The initiation by the new Department of Natural Resources of a thorough review of the factual basis required for adequate planning and regulation of water use and for all phases of planning, design, construction and operation of water resource projects.
(3) The granting of appropriate powers to the State's water agency to reserve blocks of water from currently unappropriated waters.
(4) The development of a stricter interpretation of the term "beneficial use" which presently is unclear in respect to what *is not* "beneficial use."
(5) The adoption of legislation for the control of ground water use.
(6) The study of Colorado's water law with the end in view of bringing it in step with current conditions.
(7) A fuller recognition of the water saving opportunity that lies in better stream sanitation.
(8) The expansion of programs of water resource planning to include local and subarea levels.
(9) The development of state studies on a continuing basis relative to technological changes and their impact on water development planning.

Population, Employment and Income Projections

Preceding analyses suggest a strong and well balanced industrial growth for Colorado in the future in which the "western movement" of peoples is a basic causal force that cannot be denied. A steady but better-than-average trend line movement as envisaged could, however, be easily shifted from course. A rich oil strike, an accelerated development of oil shale of considerable magnitude, a large heavy industry coming into the area, are several of a number of industrial changes that could happen overnight.

Any effort, therefore, to translate unknowns into the specifics of future population, employment and income totals obviously calls for a degree of fore knowledge that no one can be presumed to possess. Nevertheless, important policies in both business and government are necessarily premised on the future and require the guidance of projections in one form or another.

[36]Department of Natural Resources, State of Colorado, *Water Resources of Colorado*, November, 1957, p. 118.

Population Projections — General. Two definitive studies of the future population trends in Colorado have been completed and published during the past year. The first, which is an estimate of the U. S. Bureau of the Census, projects the population by five-year intervals from 1955 to 1970. The second study, by Professor Peterson of the University of Colorado, projects the population by five-year intervals to 1980. Estimates are made for the State as a whole as well as for the three major geographical areas of the State including the Denver Metropolitan Area.

Population Projections to 1970. The Census estimates that the population of Colorado will reach 2,197,000 by 1970 or an increase of 42 percent over its reported total for 1955. By Census prediction, also, this rate will exceed that of any other western state excepting Nevada, Arizona, California, and Utah (Table 1.40). Moreover, the Mountain States group, with an estimated growth rate of 44.4 percent, is expected to grow faster than any other region excepting the Pacific Coast States (Table 1.41).

[a] Based on assumption that the population will increase by an amount equal to the average over 1950-1956 ("High" projection), or 1940-1956 ("Low" projection).

Source: William Peterson, *A Critical Survey of Several Forecasts of the Population of Colorado*, State of Colorado, Dept. of Natural Resources, Technical Paper No. 1., July, 1957.

Professor Peterson makes two projections designated as "Projection A" and "Projection B." The first, or the "high" projection is based on the assumption that the population of the State will increase (1956 to 1970) by an amount based on the average annual growth rate from 1950 to 1956. The figure arrived at for 1970 totals 2,277,000, or an increase of 40.3 percent. The second, or "Projection B," which is the "low projection," assumes a growth equal to the past growth rate from 1940 to 1956. With this as a basis, Colorado's population in 1970 is estimated at a total of 2,044,000 for 1970, or an increase at the rate of 25.9 percent (Table 1.42 and Chart 1.2).

Of the two projections, the first or the "high projection" comes closest to the Census estimate and is in the opinion of the Staff of the Study the most likely of the two.

Estimates of population growth for specific areas within the State based on Professor Peterson's projections assume a growth rate equal to that of given past periods. Hence, the relative future size of each area remains constant. Thus, in 1970 the western slope with an anticipated population of 319,000 is expected to account for 15.6 percent of the State's total population, the eastern slope with a population of 819,000 for 40.1 percent, and the Denver Metropolitan Area with a total of 1,139,000 for 44.3 percent.

Employment Projection to 1970. It is estimated that employment in 1970 will reach a total of approximately 843,000 which represents a gain of 234,000 jobs over 1956. This increase is based on the assumption that the population employment ratio of 2.7 to 1—derived by averaging 1950 and 1956 relationships—will also apply in the future.[37]

An employment increase of this size or by nearly 40 percent seems high, yet as earlier noted, the employment gain over the ten-year census period from 1940 to 1950 was 37.5 percent. If the industrial pace set in the past is maintained and it is expected to be that great at the very least, this predicted total cannot be regarded as being excessive.

Personal Income Projections to 1970. A further study recently completed estimates that from 1956 to 1970 per capita personal incomes will increase in Colorado and the United States at the rate of 82 percent and 66 percent, respectively, or in per capita terms as follows:[38]

Area	1956	1970	Percent Increase
Colorado	$1,870	$3,403	82
United States	1,961	3,255	66

Underlying assumptions are that the general price level or the purchasing power of the dollar will not change and that the population will increase at the rate estimated by the Bureau of the Census.

Aside from the substantial improvement anticipated by this project of the economic well-being of individuals not only in Colorado but for the country as a whole, a point of added interest is that the projected per capita income for Colorado will exceed that of the national average. This, as earlier noted, is in contrast to past relationships which have usually found the State under the national average. The logic of this change-over for the better, as far as Colorado is concerned, is apparent in view of her anticipated better-than-average population growth over the next decade and a half.

[37] The estimate of employment is a staff estimate and is not a part of population studies referred to in the text.

[38] John G. Welles, "Colorado in 1970—a Forecast," *Western Business Review*, Vol. 2, No. 2, University of Denver, p. 5.

Public Finance and the Economy

Unlike many states, Colorado's problem of financing government in the future is not one of finding ways and means for retaining its population and preserving its tax base, but one of finding appropriate ways and means for supporting enlarged government as its population continues to grow at a better-than-average national rate. The future capacity of the people of Colorado to finance government will undoubtedly increase, but a neat and quick adjustment of public needs to means in a situation of continuous change is not one that can be presumed to be automatic with ready precedents as guides for policy action. Judgments as to what is needed now from government and who shall pay now rests currently on quite a different base of reckoning than that which guided action in the past or which will serve as a criterion of judgment for the future.

The nature of Colorado's economy, whose industries and natural resources are probably more diverse than that of any other state in the union, increases not only the task of determining appropriate patterns of public service, but patterns of taxation as well. To strike an optimum balance in a milieu of varied and changing interests in which agriculture will be suitably fostered, mining adequately encouraged, manufacturing promoted, and trade and service appropriately recognized, are but examples of the challenge faced by government in Colorado. Added to this are highly uneven population, industrial, and income distributions in which the rural and metropolitan areas face different sets of problems but nonetheless join economically to make the existence of both possible.

It is in this setting of variety and dynamic change that a state-wide fiscal policy must be formulated as it will be judged.

CHART 1.2

Chapter II

THE STRUCTURE OF GOVERNMENT IN COLORADO

The expenditure and revenue policies of government in Colorado are importantly influenced by the existing patterns of governmental organization at both the state and local levels. The purpose of this chapter is to highlight principal structural features of governmental arrangements and their implications for effective administrative and financial operations.

Early Developments

Colorado's present organization as a geographical and political unit has evolved out of a series of complicated land deals, treaties and territorial adjustments dating from the Louisiana Purchase in 1803. The latter brought into the Union a vast land area including most of the eastern half of present Colorado. War with Mexico in 1848 resulted in further extension of the Nation's domain of which the western half of the State was a part.

As these lands were acquired by peace or war, territorial governments were established with the area now included in Colorado divided jurisdictionally between the territories of Utah, Nebraska and Kansas. In addition, a part of the latter territory designated as Arapahoe County and formed in 1855, covered much of what is now the eastern half of the State. This unit, largely a "paper division" of Kansas territory, and virtually unknown and unpopulated prior to 1858, suddenly sprang into life upon the discovery of gold on the plains at the tributaries of the South Platte near Denver. In quick succession from 1859 to 1862 organized municipal governments were formed principal of which were Denver, Black Hawk, Golden, Central City, Mount Vernon, Breckenridge, Empire, Gold Hill, Georgetown and Mill City. These in turn were supplemented by "Peoples Courts" that meted out justice as they saw it.

Dissatisfaction with territorial government, the seat of which was over 400 miles away, started a movement for statehood which was rejected by the people who instead formed an "extra legal" entity called "Jefferson County." Acting as a bona fide governmental agency it proceeded to charter cities and towns including Denver. All of these had to be given new charters when legal territorial status was achieved in 1861. The new territory of Colorado, and so named, included seventeen counties and embraced a territory substantially the same as that of the State today. The number of counties was enlarged to twenty six with the advent of statehood in 1876.

Immigration due to further mineral discoveries and the development of agriculture during the decades from 1870 to 1890 led to a general division of larger counties into smaller units. Thus on the Western Slope seven new counties (Delta, Eagle, Garfield, Mesa, Montrose, Ouray and San Miguel) were created in 1883, and two counties (Montezuma and Rio Blanco) in 1889. Similarly, on the Eastern Slope eleven new counties (Baca, Cheyenne, Kiowa, Kit Carson, Lincoln, Morgan, Otero, Phillips, Prowers, Sedgwick and Yuma) were created in 1889.

In 1902 Denver and Adams counties were carved out of parts of Arapahoe County, the former as a city and county with home rule status. Finally in 1913, and thirty-seven years after statehood, Alamosa County was formed thus completing the county structure as it now exists with a total of sixty-three counties. Along with the formation of counties came also the growth of towns and cities and the formation of school and other districts to accomodate particular governmental needs as these developed. Following the national pattern, the number of school districts in Colorado has tended, in more recent times, to decline while other special districts have followed the opposite course of increasing both in number and variety (Tables 2.1, 2.7 and 2.9).

Number and Kinds of Governmental Units in Colorado—General

In addition to state government proper, governmental services in Colorado were in 1957 administered by 1,675 separate governmental units each having, in most cases, the power to tax or to assess persons for services rendered (Table 2.2). Of this number the counties accounted for 63 units, municipalities 245, school districts 936,

Table 2.2

and special districts, other than schools, 431. All, as separate governmental entities, derive their powers from the State. In theory and practice their existence acknowledges the fact that government at the "grass roots" is essential in the effective administration of the State's function as a whole.

Comparatively, Colorado has, as noted in Table 2.2, more local governmental units than any other Western State excepting California. In detail, Colorado has, with the exception of California, more municipalities than other states in the West. In number of school districts it ranks third in the eleven Western State comparison and fourth in the number of other special district governments. It is of interest in this connection that, aside from Washington, none of the Western States have the township form of government, a unit that is quite commonly found in the middle and eastern states.

State Government

The organizational pattern of Colorado's state government embodies the national concept of the separation of powers between the legislative, judicial and executive branches.

Legislative. The people of Colorado are represented by a General Assembly composed of 35 senators, elected from 25 senatorial districts and 65 representatives, each elected from one or more counties designated as representative districts. The State Constitution provides that representation of both the senatorial and representative districts be appointed on the basis of population; however, no reapportionment of representation has been made since 1932. Because of considerable population increase and its shift to metropolitan areas since that time certain distortions in the pattern of representation have developed. Thus, Jefferson County—where the population is estimated to have nearly doubled between 1950 and 1957—had only one senator for an estimated population in 1957 of 105,000 persons. At the other extreme four counties (Kit Carson, Cheyenne, Lincoln and Kiowa) which together form one senatorial district had one senator for an estimated aggregate popu-

lation of 20,000 (Table 2.3). Similarly, Jefferson County had two representatives for its aggregate population of 105,000 or an average of one representative per 52,500 persons as compared with Cheyenne and Lincoln counties which together with an aggregate population of 8,900 persons were represented by one (Table 2.4).

Judiciary. The judicial power of the State is vested by the State Constitution in a supreme court, fifteen district courts, and a county court in each of the counties. In addition there are justice of peace courts in various designated precincts in each county. The supreme court exercises appellate jurisdiction as well as original jurisdiction and has a superintendency control over all inferior courts. The supreme court consists of seven judges elected by the voters at large while the fifteen district judges are elected by the voters of the district they serve. Similarly, the voters of each county elect the county judges. Supreme and district court judges are required to be attorneys, but county judges and justices of the peace are not required to be so qualified. As a result the majority of the sixty-three county judges have no formal legal training which holds to even a greater degree for the justices of peace.

Other officials performing functions in the administration of justice include for each district court, a district attorney elected by the people of the district, a county attorney appointed by the board of commissioners in each county, a clerk of the district court in each county appointed by the district judge, and a clerk of county court appointed by the county judge. Supplementing these in the administration of justice is a sheriff elected in each county, and two constables who may be elected in each justice's precinct.

General Administration. The administration of state government in Colorado is performed by 138 agencies[1] variously designated as "offices," "departments," "divisions," "bureaus," "boards" and "commissions."[2] Each is a separate

[1]Colorado law defines an "agency" as follows:—"the term 'agency' shall mean every agency in the executive branch of the state government which is required by the constitution or statute of the state to exercise discretion or to perform judicial or quasi-judicial functions. As so qualified the term 'agency' shall include, but not by limitation, boards, commissions, departments, divisions, offices and officers." *Colorado Revised Statutes, 1953.*

[2]The use of specific terms in describing the administrative parts of the state organization is tricky since a "department" or "division" may exist on paper only. Moreover, titles do not of themselves indicate the relative scope of a given agency's administrative activity or responsibility.

Source: Derived from Colorado State Planning Commission, *Colorado Year Book, 1956-1958.*

legal entity established under constitutional or statutory law and differing only in degree of individual responsibility and independence of supervisory authority. Some agencies are included in larger "agencies" or "departments" and "divisions" which may exercise considerable control while others may be grouped within, or merely identified with a department or division which exercises little or no central control.

Colorado's administrative organization, being made up of many independent or semi-independent parts, cannot be readily described as a whole. However, a general outline of the structure has been attempted by graphics as shown in Chart 2.1 and supplemented by Appendix Table 2.A. As therein indicated it is convenient to show the total administrative activities of the State (all activities other than those contained in the legislative and judicial branches of the government) by pointing first to the elective offices or the top echelon of the "Executive Branch." These include the offices of the Governor, Lieutenant Governor, Secretary of State, State Treasurer, Auditor of State, and Attorney General. Other elective offices are the Board of Education and the Board of Regents.

The Governor's administrative role, depicted in Chart 2.1, is more clearly identified with the Executive Department of which he is the designated administrative head. This department includes 19 agencies all of which are more or less independent of each other and 10 other major departments or boards which together embrace 48 separately constituted agencies. Added to these are a series of 19 miscellaneous agencies that have no departmental status or affiliation and hence must be presumed to be under the Governor's direct line of authority. In sum, the Governor's administrative attention must be more or less directed to a total of 102 legally constituted departments, divisions, boards and other agencies over which he also exercises appointive control in most instances. Other elective officials administer their respective departments also with a certain amount of agency responsibility, but on a much more limited scale.

In the Department of State the Division of Registrations includes 17 agencies in addition to which there is a separate agency or the State Licensing Authority. Other elected offices include 8 agencies as follows: Office of Lieutenant Governor (no other agencies); State Treasurer (no other agencies); Attorney General (3 agencies); State Board of Education (4 agencies); and Board of Regents (1 agency). In addition to these, but not an elective office, is the Governor's Council consisting of the Secretary of State, State Treasurer, Director of Revenue, State Commissioner of Education, Attorney General, State Controller, State Purchasing Agent, and such other heads of departments as the Governor may designate.

The office of the Governor presumably heads the total executive offices of the State. This could be expected to follow from the fact that the Governor is charged by the Constitution to see "that the laws are faithfully executed." However, the courts have held that these seemingly broad grants of power give the Governor no definite authority other than such powers that are specifically provided by the Constitution or the statutes. Moreover, other executive officials elected along with the Governor very naturally feel their responsibility to the people rather than to him. In short, the Governor in Colorado as a director of administration is far from being in the independent position occupied by say the President. The national administration is largely centralized with lower officers responsible to higher officers, and these to still higher officers, until the responsibility rests finally with the President. In Colorado, there is no hierarchy of administration, each office or board or commission being regulated (and in most cases financed) rather minutely by law, the administrative supervisors usually having only shadowy directory power.

Since, however, the people expect the chief executive of the State to see that the laws are faithfully executed the Governor presumably must do the best he can with the means at his disposal. This takes the form of powers of appointment and removal as far as this may go as well as requiring reports from the various administrative officers concerning the work of their departments. In addition, personal and political influences become a potential source of power in securing effective cooperation of office holders as well as public support for recommended changes.

Colorado and Other States. Decentralization of state administrative organization is by no means unique in Colorado but is common to all states in greater or lesser degree. As a mode of government it is a product of certain historic developments, one of the earliest being the Jacksonian Movement for Democracy, which resulted in the creation of a number of administrative offices to be filled by popular vote.

A later development resulting in the creation of appointive offices and agencies has been critically described as follows:

> State governments have until recent years developed in a manner almost entirely haphazard. With new needs there has been no systematic plan of development. When it was desired to assume a new function, a new administrative agency was created, independent of other agencies, even though others may have been created for closely related purposes. So the state administrative functions came to be exercised in each state by a large number of independent offices, boards and

commissions, with overlapping and conflicting powers, and with no real supervision.[3]

In a similar vein the following statement made as long ago as 1917 by Governor Lowden on the organization of government in Illinois is still applicable to the current picture in many states.

> Administrative agencies have been multiplied in bewildering confusion. They have been created without reference to their ability economically and effectively to administer the laws. Separate boards govern the penitentiaries, the reformatories, and the educational institutions. Administration of the laws affecting labor is parceled out among numerous agencies each independent of the other —the administration of health laws is divided between boards and commissions, with no effective means of coordination — over one hundred officers, boards and commissions are charged with the administration of our laws.
>
> There is unnecessary duplication of positions and salaries not only in the chief offices of each separate bureau or board, but still more in their staffs of clerks and employees. The absence of definite correlation and cooperation between the most closely related offices necessarily leads to loss and inefficient work—conflict of authority between two or more offices is often possible. Under the present arrangements too many independent authorities have power to make expenditures subject to no effective control or responsibility. Supplies in many cases are purchased in small quantities for each office or institution. This situation necessarily leads to waste and extravagance. It is true that the greater number of these (bureaus or boards) are under the nominal supervision of the governor, through his power of appointment and removal. But the very number of separate offices makes impossible the exercise of any adequate control. At the same time, the number of matters necessarily brought to his attention, owing to the absence of intermediate supervising officers has burdened him with such a mass of details that he has been unable to exercise adequate supervision over such matters, while the very volume of such business brought to his attention takes time from more important questions of general policy. The present arrangement also fails to provide the General Assembly with adequate information or advice to enable it to perform its work wisely either in making appropriations or in enacting substantive legislation. While reports are made and published, they are so numerous and poorly organized that the general public fails to receive satisfactory information of the work that is done, and has no satisfactory means for fixing responsibility.[4]

The creation of independent agencies and the duplication of effort with resultant waste which

[4] Efficiency and Economy Committee (Illinois) *Report*, 1915, p. 18.

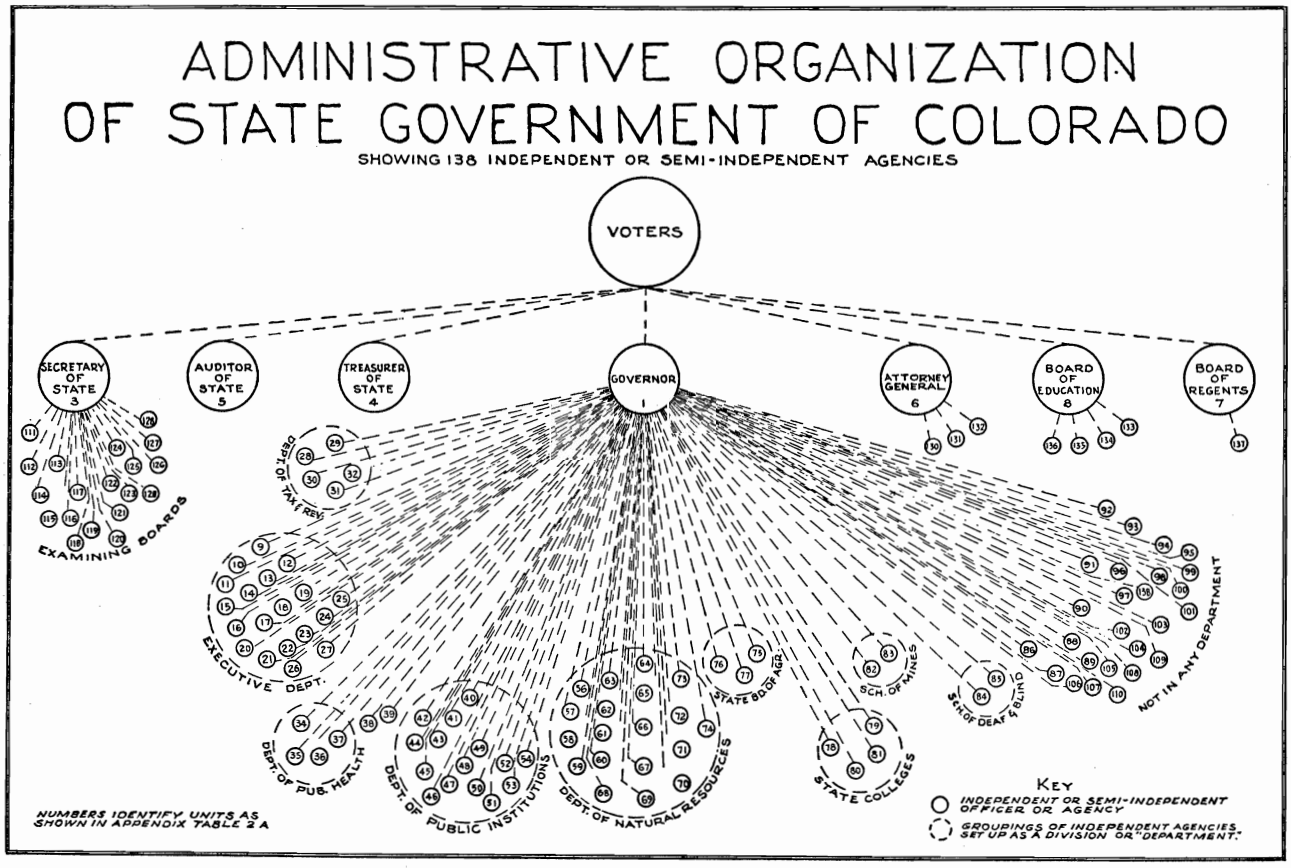

CHART 2.1

appears as the central weakness of state administrative organizations generally has not, however, been entirely without purpose. The creation of independent agencies can in part, at least, be attributed to a deep-seated fear that certain services might otherwise be controlled in the interest of partisan politics. Added to this has been the effort to prevent the centralization of power which is considered dangerous; and the agency system, despite its admitted cost, does counteract this to a considerable degree.

Efforts to organize along lines that would simplify administrative organization have been made with varying degrees of success in most states over that past three decades. The fundamental theory of these "reorganizations" has been the reduction of statutory functions (or agencies) into a small number of related departments, each under the control of a director or other head appointed by and removable by the governor. The heads of these departments constitute a sort of a governor's cabinet. An essential part of the system is the establishment of budgetary control and of a continuous financial supervision under an officer directly responsible to the governor. In all of the states that have adopted this plan, there are constitutional state officers other than the governor, who are not brought into the new organization in any effective way, if at all. The scheme is that of consolidating control over the state executive department in the hands of the governor. To make this effective the plan provides for an administrative mechanism so integrated and balanced in all its parts as to be completely responsive to central direction and control.

Administration of Finance. Colorado's efforts to simplify and centralize its administrative structure have proceeded over the years in a piecemeal basis with a number of limited advances made from time to time. The most recent changes in the State's administrative code was the creation of the Department of Natural Resources in 1957 which brought into this department, headed by the Governor and a director to be appointed by him, 19 agencies without however changing their legal status as such.

Perhaps the most complete reorganization has taken place in the administration of revenues and expenditure control which despite numerous funds established by law[5] finds a high degree of centralization of the financial function (including purchasing) under the direct control of the Governor.

Structurally, the financial administration of the State is vested in the Department of Taxation and Revenue; the Division of Accounts and Control and, as a part of it, the newly created Budget Office; the State Treasurer; and the State Auditor. The latter two offices are elective and in that sense are independent of the Governor to a degree. The State Treasurer is basically responsible for the receipt of all moneys of the State not expressly required by law to be received by some other person and to disburse public moneys upon warrant drawn upon the Treasury. The State Auditor is essentially a post auditor of the accounts and financial transactions of all spending agencies. As post auditor his status as an elective official conforms with the organizational principle that holds that the auditor should be independent of the executive department.

The Department of Taxation and Revenue is essentially a "paper department" in that there is no departmental head although the two agencies which it contains, namely, the State Tax Commission and the Department of Revenue, are a part of the Executive Department headed by the Governor. The three-member State Tax Commission appointed by the Governor and the State Treasurer, and subject to civil service regulations and tenure, has general supervision over the administration and enforcement of laws for the assessment, levying and collection of general property taxes. The Department of Revenue, headed by a director appointed by and serving at the pleasure of the Governor, is chiefly responsible for the collection, under a unified system, of state excise taxes, and license fees.

The Division of Accounts and Control, created in 1947 and headed by the State Controller appointed by the Governor, serves as an over-all financial, budgetary and administrative planning and accounting agency of the State. As such it also serves as a pre-auditor of all State bills and prepares vouchers for payment by the Treasurer. As a central agency in which budgets are assembled, analyzed and expenditure records currently made and reported, the Division of Accounts and Control is in reality the nerve center by which and through which the total financial picture of the State may be determined. As such it functions as a strategic agency of control under the direct supervision of the Governor.

County Government

Colorado's 63 counties (including the City and County of Denver[6]) which, as earlier noted, reached their total number with present boundaries in 1913, are legally subdivisions of the State and primarily designed to carry out State functions as prescribed by law. As distinguished from a municipal corporation a county holds no charter. However, it has some of the features of a corporation in that it can acquire and hold

[5]For further discussion on this see Chapter V.

[6]Since the City and County of Denver is essentialy a municipal government in character and purpose, parts of the discussion in this section is not pertinent to this particular unit of government in the State.

property, enter into contracts and enjoy some of the other privileges of a corporation.[7]

Although created by the Constitution to serve as an arm of the state administration, counties in Colorado were also given certain limited responsibilities for performing strictly "proprietary" or local county functions. This dual role makes it difficult at times to clearly differentiate between state and local services performed by the various constitutionally established county offices which include the following: board of county commissioners (three in number but may be five in counties with more than 70,000 inhabitants), judge, clerk and recorder, sheriff, coroner, treasurer, superintendent of schools, surveyor, assessor and attorney. In addition, the Constitution provides for two justices of the peace and two constables.

In relating these offices to purely state functions on the one hand and on the other to functions that are strictly local in character only general areas of services can be pointed to as suggestive of distinctions. Thus in the very important activity of law enforcement the county sheriff is primarily engaged in the enforcement of state laws, although not entirely. Legally the county sheriff and the county judge are regarded as state officers. In the administration of public welfare, notably old-age assistance, the county is an essential state agency in distributing the benefits through its own welfare department. On the other hand, the construction and maintenance of county roads is basically a county function. However, in the financing of these roads the county shares with the State in the proceeds of the State highway user taxes.

The assessment and collection of property taxes in Colorado is a function performed by the county not only for itself but for the State, municipalities and school districts as well. However, the county can tax only as authorized by the State and is required to prepare annual budgets to be filed with the State Tax Commission. Moreover, budget increases which exceed the previous year's budget by more than 5 percent require the approval of the State Tax Commission.

In addition to these legally stipulated areas of operation vested in the county by state law are a series of provisions that give some further degree of flexibility in the determination of local governmental policy. Among these, for example, is state law which allows counties to engage in physical planning and to have local health departments, the latter being a part of the over-all State program of health administration.

The top executive agency of the county is clearly the board of county commissioners which has general administration powers in the levying of taxes, the improving of county roads, purchasing and the appointment and supervision of such various employees as are not required to be elected by popular vote. However, the principal offices of the county, as listed above, are elective which results in a considerable diffusion of government responsibility in the administration of the offices of the county as a whole.

Physical and Economic Features of Counties in Colorado. Colorado's 63 counties present great extremes in area, population and income. In area, Las Animas County containing 4,798 square miles is the largest county with Denver County at the bottom of the scale with 66 square miles; the next lowest being Gilpin County with 149 square miles. Population (based on 1957 estimates) varies from a high of 515,000 in Denver to a low of 275 in Hinsdale County. Three counties have populations of less than 1,000 and four have more than 100,000. Twenty-four counties have less than 5,000 people and thirty-eight have less than 10,000 (Table 2.5). Finally, per capita personal income, as noted earlier in Chapter 1, ranged in 1956 from a high of $6,510 in Rio Blanco County to a low of $576 in Costilla County. Moreover, of the 63 counties fifty-one had per capita incomes of less than the State average of $1,863 with fourteen counties reporting totals less than $1,000.

Table 2.5

Distribution of Counties in Colorado by Population-Size Classes, 1957

Population class	Number of counties
Under 1,000	3[a]
1,000— 1,999	4
2,000— 2,999	7
3,000— 3,999	3
4,000— 4,999	7
5,000— 9,999	14
10,000—19,999	10
20,000—29,999	5
30,000—49,999	1
50,000—99,999	5
100,000 and over	4
Total	63

In 1957 property tax receipts, which are the principal source of county revenue, exclusive of state grants, varied from a high of $11.7 million for Denver[8] to a low of $19 thousand in Hinsdale County (where, as noted above, there are currently 275 residents).[9]

Problems and Issues. County government in Colorado as elsewhere has been criticized on grounds that the traditional structure is antiquated and expensive; that it is no longer needed in many places and where it is considered es-

[7]The status of counties in Colorado is much the same as that of the county system in other states.

[8]This amount is considered as county revenue and is in addition to property taxes for the municipal government as such.

[9]Colorado Tax Commission, *Annual Report, 1957.*

sential its powers are insufficient to cope with local needs. In short, a thorough overhaul of the county structure is generally advocated.

Structurally county government organization has been castigated by students of government largely on the score that it lacks central responsibility. On this point the following quotation is of interest:

> In administrative organization county government presents a picture of extraordinary complexity . . . the county violates almost every principle of business and governmental organization which experience has evolved. . . . The present system of county government is subject to serious criticism from the standpoint of administrative efficiency and of popular control. As a business organization the county lacks a responsible head. If democratic government . . . signifies effective popular control, the present organization of the county with its multiplicity of elective offices is fundamentally undemocratic.
>
> A report on County Government in Virginia . . . stated, "In our study of Virginia County government we were particularly impressed by the scattered, disjointed and irresponsible type of organization that exists in all the counties. The present county government has no responsible head; it is without a chief administrative officer and the board of supervisors controls through appointment only a small part of the county administration."[10]

Another authority on county government, quoted below, has described county organization as it generally prevails in this country in a more sympathetic vein. Here sentiment, perhaps, rather than "cold facts" appears as an important criterion of judgement.

> Across the face of America are 3,050 county seats, and at the heart of each a courthouse in a courthouse square. These courthouse squares have a peculiar American flavor; they suggest spaciousness and leisure; there are benches where old men gather to reminisce and almost invariably a monument to honor the county's military heroes. The courthouse, if old, has a certain museum quality; it is cold and austere with a slightly musty smell. The newer ones are brighter and have more of the air of office buildings. But nearly everywhere there is an atmosphere of secretiveness in county offices, a certain reluctance to reveal with frankness the details of public business. Politics is played with more finesse than in the more robust days, but the professional spirit has not yet been fully adopted. On the other hand, there is a friendliness and warmth —a certain "down to earth" quality—about county government that is as American as pumpkin pie. . . .
>
> While it may be a little foolish and wasteful to cling to political institutions that do not fit modern conditions, it is not wholly without purpose. Americans are rightfully proud of their inheritance from England—representative government, the Bill of Rights, trial by jury, the common law—and something precious might be lost if we severed the visible ties that bind us to the past. It is like our veneration for heirlooms. We see no inconsistency in furnishing a modern home wholly or in part with antiques, or in retaining a fireplace in a steam-heated house. So it is within the courthouse. We retain the ancient shirereeve, provide him with an automobile and a two-way radio set and then transfer his police functions to the state police. We set up courts of record to meet the needs of a complex society but cannot quite persuade ourselves to dispense with the six-hundred-year-old justice of the peace. The coroner, though universally recognized as an anachronism, remains in most of the states. The perpetuation of offices that have ceased to have much practical usefulness is admittedly something of an extravagance. Nevertheless, the retention of the ancient titles does lend color to local government as well as preserve a thread of continuity with our English antecedents.[11]

Sentiment apart, the fact remains that popular feeling weighs heavily on the side of efficiency and economy. County government though admittedly as "American as pumpkin pie" may have few takers in the future if it is demonstrated that it no longer serves its purpose and costs too much for the service it does perform.

In Colorado certain counties, notably in the metropolitan areas where rapid population growth has occurred in recent years, necessarily find that the quasi-corporate entity designed primarily as an arm of the State lacks the flexibility needed for coping with enlarged local problems of government. It is for this reason that a county home rule arrangement was proposed and offered to the voters in the November, 1958, election.[12]

Other alternatives which have been proposed are the County Council and Manager System. This is designed to remove, in part at least, the lack of central leadership and responsibility inherent in traditional county government.

On the other extreme, Colorado faces the problem of the sparsely populated counties which currently carry a full complement of county officials. It is hard to imagine and less so to rationalize the existence of county governments serving a population of less than 1,000 people such as obtains in three counties of the State. In this connection the following statement on county costs in relation to population in Minnesota and Texas is of interest:

> Counties within a given state tend to render fairly comparable services to their residents, especially since many of their functions are mandatory. It is significant, then, that throughout the country, county per capita costs rise the smaller the population.
>
> A study of costs in Minnesota indicated that: "Per capita costs of county operations decline rapidly as population numbers increase to the ten thousand level, and continue to decline up to a point somewhere between the thirty and thirty-five thousand level." A similar conclusion is reached by William Anderson, who suggests that in Minnesota

[10] John A. Fairlie and Charles M. Kneier, *County Government and Administration* (New York: Appleton Century, 1930) pp. 107-108.

[11] Paul W. Wager, *County Government Across the Nation* (Chapel Hill: The University of North Carolina Press, 1950), pp. 4-5.

[12] There was also a county home rule proposal being offered the voters of Oregon in the 1958 election.

"a county of about 35,000 people can have about as economical an administration as one still larger, but that the taxpayers in small counties must expect to have to pay more per capita."

A Texas study revealed that the per capita costs of "general government," as well as the per capita costs of specific county functions tended to decrease as the population increased. "General government costs per capita were found to be lowest in the counties with a population of over 30,000; while total per capita costs (including all county services) were at the lowest point in the counties with a population over 35,000. Similarly, it has been suggested that in California a county for minimum costs as well as optimum service should have a population of 50,000.[13]

Obviously the position of Colorado both in geography and population distribution differs widely from that generally existing in Minnesota, Texas, California and other states that might be cited. Nevertheless, the fact is eminently clear that Colorado's county government, representing as it does in the main a relatively sparse population, must necessarily be a relatively high-cost government. As such it stands as a challenge to any serious and concerted effort to reduce the tax burden in the State.

Municipal Government[14]

As municipal governments, Colorado's cities and towns are creatures of the State and derive their powers therefrom. In that sense they resemble counties but otherwise they differ in important regards. A county, as noted in the preceding section, is a quasi-corporation created primarily to serve the purposes of the State. Although most counties have been established as a result of local agitation, a county could be created without special regard to the will, wish or convenience of the people who live within its boundaries.

In contrast, a city or town is created at the behest of those who are within its jurisdiction and the powers and functions granted to it by charter and general law are intended to suit its convenience. While at times the municipality may be used as an instrument of the state, it is not designed so much to serve that purpose as to meet the needs of the local inhabitants who are expected to enjoy a relatively large degree of independence which, however, depends upon their classification by law.[15]

Colorado's municipalities, of which there were 246 incorporated cities and towns in 1957 (Table 2.6), fall into five legal categories: (1) unincorporated communities; (2) general law cities and towns; (3) cities organized under territorial status; (4) special charter cities; and (5) home-rule cities and towns. These can be reduced, in turn, to two general groups, namely, (a) those cities and towns over which the state legislature exercises considerable direct authority (i.e. unincorporated communities, general law cities and towns organized under territorial charters) and, (b) those cities and towns over which legislative authority is at a minimum due to constitutional provision (i.e. special charter cities and home rule cities and towns.)

Table 2.6

Distribution of Cities and Towns in Colorado by Population-Size Classes, 1957

Population class	Number or cities and towns
Under 250	58
250— 499	50
500— 999	48
1,000— 1,999	39
2,000— 4,999	21
5,000— 9,999	14
10,000—19,999	6
20,000—39,999	7
40,000 and over	3
Total	246

Unincorporated communities such as Lakewood, for example, are by far the most numerous. These have no city government as such; rather city services are provided via the expedient of special districts and county government.

General law cities and towns are similarly under direct control of the General Assembly as per law which spells out in detail the organization, powers, functions and procedures of government of such communities.[16] By legal interpretation this holds equally for the cities and towns chartered before Colorado was a state; these places being Central City, Georgetown and Black Hawk.

The two groups of municipalities (general charter cities and home-rule cities) in which considerable local autonomy is permitted, have their basis of authority established in the constitutional provision commonly known as home rule. The City and County of Denver (a special charter city) was established under the principle enunciated in Article XX, Section 6, of the State Constitution, which asserts that state matters should be managed at the state level and city matters handled at the city level. Since 1902, twenty cities and towns, in addition to Denver, have elected to come under the constitutional provision of home rule and are known as "home-rule" cities and towns. These places are Alamosa,

[13] Alvin H. Hansen and Harvey S. Perloff, *State and Local Finance in the National Economy* (New York: N. W. Norton & Co., 1944), p. 73.

[14] The material in this section is drawn largely from a series of articles on municipal government by Professors Conrad L. McBride and Leo C. Riethmayer, of the University of Colorado, and published in *Colorado Municipalities* (October, November, December, 1955; January, 1956 and December, 1957 issues), by Colorado Municipal League.

[15] Colorado divides municipalities into two general groups according to population, namely cities (population of 2,000 or more) and towns (population less than 2.000). Cities are further classified as "first class" (population 40,000, or over) and "second class" (population 2,000 to 40,000). In 1957 there were 246 incorporated cities and towns of which 50 were cities and 196 were towns. It should be noted, however, that in certain cases cities are in fact towns and vice versa. This is due to the failure of these places to reclassify in keeping with their population change.

Nature of Home Rule in Colorado. Home rule in Colorado specifically endows a municipality with almost complete local autonomy which includes "the power to legislate upon, provide, regulate and control the creation and terms of municipal officers, agencies and employments; the definition, regulation and alteration of the powers, duties, qualifications and terms or tenure of all municipal officers, agents and employees."[17]

This over-all power of local self determination can be illustrated by pointing to certain things which a home-rule city is privileged to do which is not available to the non home-rule municipalities in the State.

(1) A home-rule city may, by vote of the people, operate a municipally owned gas distribution system. A non home-rule city may not.

(2) A home-rule city may, by vote of the people, levy a sales tax.[18] A non home-rule city may not.

(3) A home-rule city may, by vote of the people, follow any procedure it desires in the issuance, funding and repayment of municipal bonds. A non home-rule city must follow a procedure prescribed by state law.

(4) A home-rule city may choose any number of alternatives in the selection of its legislative body. A non home-rule city must elect a city council in accordance with state law. For cities of the second class this calls for the election of councilmen by wards and for a fixed two-year term. In this connection the rigidity of state law (as well as its inapplicability) is illustrated by statute governing the salaries of officials of cities of the first class (population 40,000 and over). Thus the law provides that the mayor's salary shall not be less than $1,800 per year, the salary of a councilman may not exceed $600 per year; the engineer, not more than $2.000; the attorney, not more than $250 per month; the chief of police, not more than $125 per month. Fortunately for Denver, Pueblo and Colorado Springs (the only cities that can qualify as first-class cities) home-rule status removes the necessity of conforming to this antiquated law. As a result there are in effect no cities of the first class in Colorado.

Progress of Home Rule in Colorado. Colorado's home-rule law has been regarded as one of the most liberal found in any one of the twenty-one states that have adopted enabling legislation of this type.[19] Yet only twenty-four cities in the State have elected to come under its provisions. In view of the opportunities for effecting economy inherent in a home-rule government that can be largely tailored to the needs of a community, one may wonder why such a small number of cities in Colorado have adopted this constitutionally provided opportunity for self-government.

A number of reasons have been suggested of which lack of full understanding of what home rule means is a crucial factor. It is easy to overlook that which may in fact be actually wanted and needed when it may not be fully understood. There is also the fact that by law no towns under 2,000 population can apply for home-rule status—a legal prohibition which has undoubtedly limited progress in this direction. Coupled with this situation is the looseness and ambiguity of the present statutory law covering the organzation and operation of towns under 2,000 population. As a result, governing law has been broadly interpreted with towns pursuing a fairly independent course in which a kind of informal "home rule" status has been achieved. However, reliance on this basis of operation may be illusory in that new interpretations, as well as an act of the General Assembly could change the picture over night. Statutory "home rule" should not therefore be confused with that which has its basis in the State's Constitution.

Municipal Growth and Problems The rapid growth of metropolitan areas in Colorado, as noted in Chapter I, has brought in its wake a series of problems of adjustment in which the question of state law governing annexation policy and the establishment of independent districts (considered in greater detail in a later section) is closely related to the basic problem of providing the means to finance additional services as growth demands. In general, the larger metropolitan areas, notably the Denver Area, face somewhat different problems, both in nature and magnitude, than do the smaller municipalities. All, however, are concerned with the over-all problem of effecting "orderly growth" in a situation of dynamic change.

Commenting on the municpal growth problem Professor Riethmayer of the University of Colorado points to the following series of causal factors:

> To a great extent our problems today stem from the fact that municipal corporations have not grown territorially and have not been able to assume their appropriate responsibilities as our urban population has grown. This situation has been caused in part by unsound state policies, e.g., an anti-municipal

[17] *Ibid.*, Article 20.

[18] This particular power could conceivably be rescinded in view of recent State Supreme Court decision which decided that a municipal income tax could not be levied by the City and County of Denver.

[19] Charles R. Adrian, *Governing Urban America* (New York: McGraw-Hill Co., Inc., 1955), pp. 152-161.

annexation law, in part by the failure and/or inability of municipalities to adopt and carry out sound growth policies of their own, in part from the usually mistaken belief on the part of some urban residents that municipal type service can be obtained cheaper from some source other than a municipality, and in part from the selfish desire of some residents and businesses to evade their fair share of the costs of the services which they receive. Some industries and businesses are especially guilty of this practice when they locate just outside the city limits and thereby cause the owners of residential property a disproportionate share of the cost of municipal services.[20]

The so-called "fringe area" problem to which Professor Riethmayer directs principal attention is particularly noted in the Denver Metropolitan Area where the question of securing funds to finance growth is a matter of utmost present concern. The Denver picture, to which reference will be made in greater detail in a later chapter,[21] is complicated by the fact that much of its property tax base is reserved for the city school system. This has forced a search for new revenue sources that have apparently reached a point of complete exhaustion.

School Districts

Colorado is one of twenty-eight states that has established and delegated to a separate structure of governmental units known as "independent" school districts the exclusive responsibility for providing public education below the senior college level.[22] To many people this responsibility is the most important of all public undertakings and, accordingly, should be one over which a high degree of direct general public surveillance and self-determination should exist. Colorado's present number of 910 independent school districts (composed of 868 first, second and third class districts and 36 county or union high school districts and 6 junior college districts as shown in Table 2.7) expresses in principle this philosophy of government in public education.

Historic Developments. School district organization had its origin in constitutional mandate in 1877 which, in addition, provided that public education should be made available gratuitously for all persons between the ages of six and twenty-one years and that school should hold forth for not less than three months in any one year.

The specific statement of the Constitution (Article IX, Sections 5 and/or 15) reads as follows:

> The general assembly shall as soon as practicable provide for the establishment of a thorough and uniform system of free public schools throughout the state, wherein all residents of the state between the ages of six and 21 years, may be educated gratuitously. One or more public schools shall be maintained in each school district within the state, at least three months in each year; any school district failing to have such school shall not be entitled to receive any portion of the school funds for that year . . . The general assembly shall by law, provide for an organization of school districts of convenient size, in each of which shall be established a board of education to consist of three or more directors to be elected by the qualified electors of the district. Said directors shall have control of instruction in the public schools of their respective districts.

In the implementation of the constitutional provisions, general law, enacted in 1877, made it eminently clear that the provision of educational facilities should emanate by decision of the people directly affected rather than by proscription by the State. On this, the general law reads as follows:

> For the purposes of organization a new district, either from organized territory or from an old district, the parents and guardians of at least 10 children who shall possess the right to attend school in such new district must petition the county superintendent in writing.

Following early enabling legislation, school districts in Colorado expanded at a rapid rate in which the one-room schoolhouse within reasonable walking distance of the pupils was the principal criterion in the determination of a district's size. Considering the times such an arrangement was the only one that could be made and in fact served well under the circumstances. However, with the advent of automotive transportation, combined with considerable population shifts within rural areas on the one hand and, on the other, the trend of people toward metropolitan areas, the usefulness of the small district organization became as outmoded as the horse and buggy.

Out of these changes has come the "consolidation movement" designed to effect by the merger of two or more districts, a more economic and efficient educational effort. Viewed strictly in terms of districts the results of consolidation in Colorado are evidenced by a decline in the number of school districts from 2,227 in 1935 to 1,653 in 1950 and 910 as of July 1, 1958.

The decline in number of districts does not necessarily mean, however, that consolidation in any given case has been the most economical or effective from an educational service point of view. Thus the consolidation say, of two one-room school districts covering the first eight grades to form a two-room arrangement with two teachers handling all the grades from one to eight obviously falls far short of unification on a scale that would provide grades from one to twelve with a full complement of teachers to effectively sustain such an enlarged program.

Until recently school consolidation effort in Colorado was in large extent on a very limited and piecemeal basis. Opportunism, in which "gerrymandering" was characteristic, resulted in districts with similar economic circumstance tending to consolidate while at the same time carefully avoiding other districts where tax rates or resources might have been out of line with theirs. This occurred despite the likelihood that the larger unit would have resulted in a more effective educational service with an equal likelihood that in the long run school costs for all would have been reduced.

School Reorganization Act of 1949. Because of this "opportunism" enabling legislation was needed to force a program which could bring about consolidation on a more logical basis. Invariably this would mean unification on a much broader population and resource basis. In 1949 such legislation was passed which facilitated a comprehensive study of local school district organization under the leadership of the State Department of Education and provided the legal procedure to bring about sound school district reorganization. This consisted essentially of an arrangement whereby an all-county committee was required to be formed to study consolidation and to come up with an over-all plan of consolidated units to be submitted to the affected areas for their approval. Contrary to previous practice whereby a majority consent of the voters in each district affected was required to approve the proposed consolidation, the 1949 Act called for a majority of the area as a whole. Unfortunately subsequent revision restored the district consent clause which caused the Act to become inoperative.

School Reorganization Act of 1957. The School Reorganiaztion Act of 1957, which reads much like that enacted in 1949, is notable for having restored the county-wide committee and election procedures by which area rather than district consent is called for in effectuating consolidation proposals. Hence "hold outs" or district "dissidents" who may be in the minority cannot upset plans which the larger group might favor. Moreover, it provides for a continuing committee study and proposal by requiring that a new committee election be held every two years. This removes an uncertainty which existed in the 1947 law which called for an elected committee to serve for two years without, however, spelling out what could or should be done thereafter. An additional feature also requires that consolidated districts shall be first class districts. This will have the effect of increasing the number of these districts with a corresponding reduction of third and second class districts.

Recent Consolidation Effort and the Present District Structure. As of October 1, 1958, a total of seventeen elections had been held under the Reorganization Act of 1957. Of this number all except one resulted in the approval of submitted reorganization plans. Elections are currently pending in Boulder, Eagle, Lake, Moffat and Jackson counties.

The future course of consolidation faces many problems which are not readily solved. Great distances and sparse population is a principal deterrent to early action. Extreme "localism" is another. That the need exists for much more extensive reorganization of Colorado's school system is apparent as noted in Table 2.6 which shows that in 1958 there were 731 third-class districts, a large portion of which were one- or two-teacher districts. Data from the State Department of Education shows one- and two-teacher school distribution for 1956 and 1957 as follows:[23]

	1956	1957
Number of one-teacher schools	203	183
Number of two-teacher schools	121	116
Total	324	299

[23]Data for 1958 were not available at the time of this report.

Moreover, as presented in Table 2.8 there were in 1958, a total of 219 non-operating districts some of which were dormant, that is, these districts included no resident children of school age, while others relied on other district schools to educate their school population. In a situation of this kind, tuition payments were presumably financed by the non-operating district.

Further evidence of reorganization need is noted in the fact that only 193 districts in 1958 provided a unified educational program covering all grades including high school. In contrast 456 districts limited their program to the first eight grades only.

It is noteworthy, however, that since 1956 a substantial betterment in the district pattern has occurred presumably due to the recent Reorganization Act. As shown in Table 2.7 the number of third class districts declined from 794 in 1956 to 731 in 1958. Paralleling this change was an increase in first class districts from 52 to 58—a development growing out of the Reorganization Act which requires reorganized districts to be classified in this category. Moreover, as noted in Table 2.8, the number of non-operating districts declined from 239 to 219 for the same two-year period, while districts having only eight grades declined in number from 506 to 456. Conversely, the so-called "unified districts," or districts covering all twelve grades, increased from 182 to 193, a movement which again suggests the impact of recent consolidation on a systematic basis as provided by law.

Table 2.8

Type and Number of School Districts in Colorado June 30, 1956 and 1958

Type of District	1956	1958
Non-operating district	239	219
Separate elementary district, 1-8 grades	506	456
Districts with all grades, 1-12	182	192
Separate county high school districts	21	20
Separate union county high school districts	19	16
Junior college districts	6	6
Total	973	910

Financing Public Schools. In large degree Colorado's public schools are locally financed by taxation on property. This follows the accepted basic principle that schools should, as much as possible, be identified with local effort and self-determination.

In addition to local taxes, school money is derived from (a) the permanent school fund, (b) statutorily earmarked taxes and (c) legislative appropriations.

Under recent changes in state law allocated state money to public schools is based on a formula which provides for classroom units having specified value by districts toward which the county contributes from its established 12-mill levy and the State provides the remainder. This arrangement and its fiscal implications will be considered in greater detail in a later chapter of this study.[24]

Special Districts

Next to school districts Colorado's special districts are the most numerous governmental units in the State. In 1955, a Legislative Council Study counted 291, but observed that this number was tentative owing to the fact that there was "no one place where special district information is collected."[25] It observed further that:

> Despite the fact that the local government budget law (C.R.S. 1953, 88—1-17) requires filing with the tax commission of all special district budgets and levies members of the commission staff dealing directly with the problem felt that the reporting to them was far from complete.

Not only did the Council Study find it difficult to ascertain the number of individual districts but even more important found it equally difficult to secure complete financial data describing their operations. On this point, the Legislative Council Study observes:

> The questionnaire which was sent to each of the special districts asked for certain basic budget data such as receipts and disbursements for the past year, tax rates, balances on hand, estimated population of the district, and estimated area of the district. The attorney for one special district replied to the questionnaire as follows:
>
> > "Your questionnaire relative to the compilation of certain inventory data of the above district has been received by us, and we regret to advise you that we are unable to accumulate the information you request. The directors of this district are so loosely knit, that we doubt that even they can accumulate the information you seek."
>
> The assessor of a county in which a large number of special district are located indicated that in some cases the only financial record maintained by the district was a checkbook. Another assessor stated that he was unable to determine whether the requested levies were for debt service or operations. If annual audit reports were made by special districts, these reports were not known to the Council study.[26]

Lack of information on special district organization in Colorado should not be regarded, however, as a weak link for the administrative control of government peculiar to Colorado only. A recent national study, for example, found similar difficulties in all states which led to the

---

[24]See Chapter XX.

[25]Legislative Council Report to the Colorado General Assembly, *Special Districts*, Research Publication Number 16, 1955, p. 1.

[26]*Ibid.*, pp. 1-2.

conclusion that the special district system in the United States could be regarded as the "new dark continent of American politics,"[27] a term which had formely been applied to the counties.[28]

Definition of Special Districts. What then is a special district? One definition identifies this relatively rapid growing unit of government as follows:

> In common with all other kinds of governmental units, special districts have certain essential characteristics. They are organized entities, possessing a structural form, an official name, perpetual succession, and the rights to sue and be sued, to make contracts, and to obtain and to dispose of property. They have officers who are popularly elected or are chosen by other public officials. They have a high degree of public accountability. Moreover, they have considerable fiscal and administrative independence from other governments . . . Unlike most other governments, independent special districts usually provide only one or a few functions. In this respect they most closely resemble the townships in a number of Midwestern states, but it is not difficult to differentiate them. Townships are largely limited to one georgraphical region, commonly include a rectangular area of 36 square miles, constitute a territorial subdivision of the county; and are overwhelmingly rural units of government. Special districts have none of these special features. Furthermore, although individually performing fewer functions than many townships, collectively they undertake a much broader range of services than townships in general. Special districts are therefore a clearly distinguishable class of local governmental units.

In Colorado, as elsewhere, the special district is based on statutory law and comes into being for any one of a number of reasons. These fall into four general categories namely: (1) unsuitability of existing general local governments in providing a needed service, (2) desire for independence, (3) expediency and (4) private self-interest.

Typical of the service performed by the special districts in Colorado, as shown in Table 2.9, are fire protection, provision for burials (cemeteries), recreation, irrigation, drainage, sanitation, water and water conservation.

Reasons for Special Districts. A frequent general reason or the establishment of special districts is the unsuitability of existing general local governments (county or municipality) to provide needed services. These general reasons

Table 2.9

Special Districts[a] in Colorado, September 1, 1955

[a] Excludes paving and related purpose districts found in municipalities and districts subject to State administration, i.e. metal mining, vibro and predatory animal districts.

Note: An estimate based upon reports of the State Tax Commission indicates an increase of independent districts in Colorado from 152 in 1950 to 394 in 1957.

Source: Legislative Council Report to the Colorado General Assembly, *Special Districts*, Research Publication Number 16, 1955.

have several facets of which the size of the area of the existing government, its finances and functions and administration may each render it unsuitable to perform a given needed service. Frequently the area appropriate to a particular function (i. e. provision for drainage, or irrigation) does not coincide with that of any existing general local government. Perhaps equally important is the fact that existing government has reached either its tax or debt limit or both and, consequently, is not in a position to finance the new function. Sometimes also the pooling of the finances of a larger area than an existing county or city is needed to adequately finance a given enterprise (i. e. Moffat Tunnel District).[30] Frequently also—and this applies specifically to counties in the main—existing general governments cannot, as a rule, set up a taxing or an assessment area in just a part of its territory in order to finance additional service. Closely related is the fact that since financial costs are spread uniformly throughout the area, other general governments within its boundries, such as, municipalities would oppose the assumption of a function on grounds that it was already being performed for their own residents. Arguing therefore that their residents would be paying twice for the same services they would accordingly advocate a special district.

The desire for independence is another reason for the creation of special districts. This is particularly noted in the "fringe areas" of the Denver Metropolitan Area where "independence" of Denver and the avoidance of possible

[27] John C. Bollens, *Special District Government in the United States* (Berkeley and Los Angeles: University of California Press, 1957), p. 1.

[28] *Ibid.*, p. 1.

[29] *Ibid.*, pp. 1-2.

[30] A district area may be very small however. A classic case was the Miller Heights Water District in Jefferson County which in 1952 obtained $71 in tax revenue with a total assessed property valuation $77,180 (Colorado Tax Commission, *Forty-First Annual Report*, p. 144).

annexation has its real motive in avoiding possibly higher taxes. As a consequence, a type of "junior city" on the outskirts develops which, as a rule, is a composition of a series of overlapping districts each performing one function but providing a "package" of essential services needed for urban living.

Expediency is another reason that has caused special districts to develop in some cases. Setting up a district is a relatively easy method of getting a public service quickly. To attempt to get it from existing general government may take time and, as noted above, may require annexation.

Finally, unadorned private self-interest may underlie motives for district organization in certain cases. An illustration would be a manufacturer of equipment and supplies who, recognizing the opportunity of a district organization, might by one device or another "sell" interested parties on the idea of quickly assembling funds via the formation of a district. Fortunately these practices have not been general but they nevertheless pose a constant peril which must be watched.

Problems of Special Districts in Colorado. Special districts in Colorado provide a type of governmental unit that is undoubtedly needed to achieve the degree of flexibility in public services not otherwise possible. However, it is clear from findings of the Legislative Council Study that a number of weaknesses exist in the present special district system. Among these the following are indicated:

(1) Tax budgeting, accounting and reporting practices of many special districts.
(2) Conflict of taxation sections of home special district laws and the general property tax laws.
(3) Duplication of special district laws.
(4) No uniform method of forming special districts regardless of their purpose.
(5) Lack of uniformity in eligibility requirements for voting and participating in the formation of special districts.
(6) Inflexibility of methods used in consolidating districts.

In a supplemental report to the Council's Study, Representative John G. Mackie pointed to additional weaknesses as he saw them, these being: [31]

(1) Lack of a formula for limiting district taxation as well as the lack of standardized bonding powers and procedures and maximum interest rates.
(2) Lack of complete popular vote in the selection of directors.
(3) Inadequate police power in enforcing regulations.

[31]See John G. Mackie, *Supplemental Findings to Legislative Council Report on Special Districts.*

The suggested changes submitted by the study were of a general nature but dealt with each of the foregoing listed defects. Thus a tightening of financial practices was pointed to as essential in view of the volume of revenue and bonded debt involved which in 1954 amounted to $2.15 million and $3.5 million, respectively.[32] Similarly, legal changes which would eliminate conflicts in law, duplication and lack of uniformity in practices were recommended including a specific formula limitation on district tax levys and bond issues.

Summary and Conclusions

Colorado's state and local governmental structure presents a pattern of organizational arrangements typical of most states in the Union. As such, it has at the state level numerous legally constituted independent or semi-independent agencies (138 in all) variously identified as "offices," "divisions," "departments," "bureaus," and "boards." These comprise in the main the over-all administrative structure of the State's government over which the Governor exercises varying degrees of direct or indirect control. At the local level Colorado's 63 county governments, functioning primarily as arms of the State government, are administered by a standard and traditional array of elective offices more or less independent of each other as well as of the central administrative body of County Commissioners. To achieve needed local autonomy and flexibility in the management of local affairs not possible by county government, local government in Colorado finds its fullest expression in its 246 incorporated municipalities, 941 school districts and 394 special districts, all of which have the power to tax and to spend.[33]

Viewed critically, Colorado's structure of government presents areas of weakness that are probably inherent in the traditional pattern of state and local organization and administration as it has developed in this country. At the state level a perennial sore spot is the conglomerate of statutory administrative agencies which tend to duplicate functions and to diffuse control and responsibility to a point where central direction is severely weakened. Students of government have long advocated a substantial reduction of statutory agencies and the replacement by large unified departments directly responsible to the Governor.

County government in Colorado, as elsewhere, is undoubtedly antiquated in parts and needs re-examination. Rapid population increase has created new demands upon counties which require a degree of flexibility in their operations not possible under existing law. Conversely,

[32]Legislative Council Study, *op. cit.*, p. 2.
[33]These are 1957 data.

population decline in other county areas has reached the point where boundary revision is mandatory if "economy in government" is to have any meaning at all.

Other governmental units at the local level—municipal, school and special districts—present organizational problems somewhat distinctive yet interrelated by common purpose of providing, singly or in combination, a full complement of needed local governmental services. Primary of the municipal problems is the so-called "fringe area" problem of the larger cities and the associated question of the role of fringe areas on metropolitan districts, whose development tends to block annexation and systematic expansion of municipal boundaries to accommodate growth. And finally, Colorado's present number of school districts in which there are still 183 one-teacher schools clearly point to the need for more consolidation. However under a recent effective enabling act this condition should be substantially improved in the immediate years ahead.

CHAPTER III

EXPENDITURES OF STATE AND LOCAL GOVERNMENT

The following review of state and local government expenditures[1] is designed to serve as general background for later analyses of tax trends and the tax structure. A look at what the taxpayer has wanted from government and what he has been getting for his money serves also as a basis for judging the likely nature and extent of his needs for the future with correlative "tax burdens" implied.

The statistical review of expenditures by agencies and functions in succeeding sections covers mainly the years from 1946 to 1956, with one exception noted in the case of certain interstate comparisons where the data reaches back to 1942. Wherever possible, figures are presented on a year-to-year comparison basis both in total and per capita terms with appropriate adjustment for price changes.

Expenditures In 1956[2]

In 1956 state and local governmental expenditures amounted to $382 million. Of this amount, the State accounted for 26 percent (excluding funds transferred to counties, school districts and municipalities), the counties, 28 percent; the school districts, 33 percent; and municipalities,[3] 13 percent. The county ratio includes welfare payments transferred from the state welfare funds. Payments from these funds, including the contributions made for welfare by the counties themselves, represented about 70 percent of total county outlays (Table 3.1).

Expenditures 1946-1956

From 1946 to 1956 combined expenditures of state and local government increased from a total of $106 million to $382 million, or at the rate of 260 percent. Such an increase, which would be difficult to comprehend in any circumstance, occurred during a period marked by rapid population growth, price inflation and sizable personal income advance. It is only in terms of these factors that an expenditure increase of this size can be seen in proper perspective.

Table 3.1

Expenditures by Units of Government in Colorado Selected Years, 1946-1956

(thousands)

Year	Total	State	County[a]	School districts	Municipalities[b]
1946	$105,992	$22,980	$41,640	$25,961	$15,411
1948	180,002	47,063	67,003	41,271	24,665
1950	229,038	61,018	78,031	58,974	31,015
1952	269,046	70,927	90,750	69,226	38,143
1954	322,948	82,423	98,170	95,396	46,959
1956	382,162	99,300	109,503	124,934	48,425
Increase					
1946-1956	260%	322%	163%	381%	214%
1950-1956	67%	63%	40%	112%	56%

[a] Includes expenditures from "General Fund," "Road and Bridge Fund," "Old Age Pension Fund" and "Public Welfare Fund." City and County of Denver is included for the two last named funds.

[b] Includes City and County of Denver (excluding "old age pensions and "public welfare" as noted above), Pueblo, Colorado Springs, Aurora, Englewood, Fort Collins, Greeley, Trinidad, Alamosa, La Junta, Fort Morgan, Canon City, Lamar, Loveland and Golden.

General note: Expenditures applicable to each govenmental unit include both operating (current) and capital outlays. Excluded are debt retirement, intergovernmental transfers, contributions to insurance and trust funds, and outlays of public service enterprises.

Source: State of Colorado, Division of Accounts and Control, *Annual Reports;* Department of Education, *Biennial Reports of the State Commissioner of Education,* and annual audit reports of individual counties and municipalities.

Population and Price Factors. It is obvious that as the population grows the demands for public services will increase accordingly. For Colorado, between 1946 and 1956, the impact of population growth on public budgets is reflected by such changes as: public school enrollments, which increased by 54 percent; college and university enrollments, which doubled; and the number of pensioners, which increased by 33 percent (Table 3.2). These and other related developments stemming directly from over-all population change point to reasons why Colorado's expenditures increased at the rate indicated.

But how much of the 260 percent expenditure increase can be attributed to basic population growth? Here no precise answer is possible and only a fair approximation can be made. For this

[1] Unless otherwise noted, expenditures include both operating and capital outlays.

[2] Latest date for which local government data were available.

[3] See footnote to Table 3.1 for municipalities included.

Table 3.2

Basic Causal Factors of Expenditure Increase of State and Local Government in Colorado, 1946, 1950 and 1956

Item	1946	1950	1956	Percent increase 1946-1956	Percent increase 1950-1956
Population factors:					
Population	1,196,000	1,335,000	1,612,000	34.8	20.7
Enrollment-public schools	199,441	224,245	307,753	54.3	37.2
Enrollment-colleges and universities	9,870	18,544	19,811	100.7	6.8
Receipients old-age pension	40,692	50,617	54,197	33.2	7.1
Price factors:					
Index of consumer prices	83.4	102.8	116.2	39.3	13.0
Index of building costs	76.5	106.5	130.7	70.8	22.7
Index of state and local costs	88.8	115.3	146.6	65.1	27.1
Personal income:					
Total (millions)	$1,429	$1,930	$3,045	113.1	57.8
Per capita[a]	$1,195	$1,446	$1,870	56.5	29.3
State and local expenditures (thousands)	$105,992	$229,038	$382,162	260.5	66.8

[a] Based on U. S. Department of Commerce estimated population as of July 1 of each year as presented in annual editions of the *Statistical Abstract of the United States.*

Source: Population taken from *Statistical Abstract of the United States, 1946* and *1951*, and *Current Population Reports*, Series P. 25; enrollment in public schools based on State of Colorado, *Biennial Reports of the State Superintendent of Public Instruction, 1946, 1950, 1956;* enrollment in colleges and universities based on unpublished reports of the Division of Accounts and Control, State of Colorado; recipients of old-age pension taken from Colorado State Department of Public Welfare, *Annual Reports;* index of consumer prices taken from Bureau of Labor Statistics, *Consumer Price Index;* index of building costs taken from *Statistical Abstract of the United States;* index of state and local costs taken from *Economic Report of the President*, January, 1955; personal income taken from U. S. Department of Commerce, *Survey of Current Business*, annual articles; and state and local expenditures based on State of Colorado, Division of Accounts and Control, *Annual Reports*, annual audit reports of individual counties and municipalities, and Department of Education, *Biennial Reports of the State Commissioner of Education.*

purpose it is sometimes helpful in analysis to assume that expenditures advance at about the same rate as the population. Such an assumption would mean that per capita expenditures would not change over time.[4] This was clearly not the case from 1946 to 1956, however, as noted in the following tabulation which shows a per captia expenditure increase of 169 percent.

	1946	1956	Percent increase 1946-1956
Population	1,196,000	1,612,000	35
Expenditures (thousands)	$105,992	$382,162	260
Per capita expenditures	$88	$237	169

This leaves a 169 percent increase to be accounted for by other factors. The fact is, of course, that a change of this size, even after population adjustments, is highly unrealistic since it reflects a more than 65 percent increase in general prices.[5] An advance on this account means only that government has had to pay more for things it required to perform a given amount of services. "Real" expenditures (or actual services rendered or capital items acquired) need not have increased at all.

If then the public dollar expended is adjusted for price change also, i.e., converted into a constant purchasing power dollar (in this analysis, in terms of the 1956 dollar), the population-price-adjusted-expenditure totals show an increase of 63 percent as noted below.

	1946	1956	Percent increase 1946-1956
Population	1,196,000	1,612,000	35
Price index	88.8	146.6	65
Expenditures (thousands)	$105,992	$382,162	260
Per capita expenditures	$88	$237	169
Per capita expenditures (1956 dollars)	$145	$237	63

Adjusting further to differentiate between current and capital expenditures[6] the results then read as follows:

Per capita expenditures (1956 dollars)	1946	1956	Percent increase 1946-1956
Current	$131	$181	38
Capital	14	56	300
Total	145	237	63

From this more refined base of reference, it will be seen that state and local government spent 38 percent more per person in "real" items for operating purposes in 1956 than in 1946 and 300 percent more for capital items.

If current expenditures can be viewed as having their counterpart in current services, it can then be said that 38 percent more in real services per person were received in 1956 than in 1946.

Whether or not the average person in Colorado actually was getting 38 percent more from the current dollar spent is, of course, a matter of individual judgment. About all that can be said is that, with due allowances for the limitation of the adjustment techniques used, the overall increase in real services received (current spending) does not appear to be out of line with present consumption levels of the average person. Although memories are short, it will be recalled that the immediate post-war year was

[4] It is obvious that this assumption is limited to aggregative analysis since some items of expenditure will increase at a faster rate than others.

[5] Unless otherwise noted, the price index used here and in subsequent analysis is applicable to prices paid by state and local government for purchases as reported in the *Economic Report of the President*, January, 1958, Table F-5, p. 122.

The index used is based on average prices from 1947 to 1949. For the purpose of this study, the base has been shifted to 1956. Accordingly, the figures adjusted for price change are placed on a uniform 1956 purchasing power basis.

[6] Capital expenditures are not separately reported by a number of the governmental agencies. Hence, the figures on which this analysis is based are estimated, in part, but are believed to be fairly close. For 1946, capital expenditures were estimated to total $10,096,000 as compared with the 1956 figure of $89,737,000.

marked by extreme shortages in both the private and public sectors of the economy. The large changes that have taken place since then in both the number and variety of available consumer goods and services is universally recognized.

Turning to the question of the "real" increase in capital items, there should be little doubt that a 300 percent increase in this particular class of expenditure is in keeping with what is presently taking place in the construction of highways, schools and other public facilities, all of which, in terms of new construction, were virtually at a standstill in 1946.

Table 3.3 shows the impact of both population and price change on over-all expenditures by two-year intervals since 1946. From this table

Table 3.3

Expenditures of State and Local Government in Colorado, Selected Years 1946-1956

Year	Current dollars Expenditures (thousands)	Current dollars Per capita[b]	1956 dollars[a] Expenditures (thousands)	1956 dollars[a] Per capita[b]
1946	$105,992	$ 88.62	$174,904	$146.24
1948	180,002	142.52	238,098	188.52
1950	229,038	171.56	291,397	218.27
1952	269,046	196.67	301,959	220.73
1954	322,948	216.45	344,662	231.00
1956	382,162	237.07	360,021	237.07
Increase				
1946-1956	260%	169%	106%	62%
1950-1956	67%	38%	23%	2%

[a] Based on 1956 index of state and local costs, *Economic Report of the President, January*, 1958, Table F-5, p. 122.

[b] Based on U. S. Department of Commerce estimated population as of July 1, of each year as presented in annual editions of the *Statistical Abstract of the United States.*

Source.: State of Colorado, Division of Accounts and Control, *Annual Reports;* Department of Education, *Biennial Reports of the State Commissioner of Education;* and annual audit reports of individual counties and municipalities.

it is possible to separate out more fully the price influence on expenditure change as demonstrated for two periods below:

A. Adjustment for price increase only

Period	Expenditure increase unadjusted for price (percent)	Expenditure increase adjusted for price (percent)	Difference due to price increase (percent)
1946-1956	260	106	154
1950-1956	67	23	44

B. Adjustment for price and population increase

Period	Per capita expenditure increase unadjusted for price (percent)	Per capita expenditure increase adjusted for price (percent)	Difference due to price increase (percent)
1946-1956	169	62	107
1950-1956	38	23	15

Generalizing from these tabulations it is apparent that well over one-half of the increase in state and local expenditures (purchases) in 1956 over 1946, as well as 1950, were due to price increases. If allowance is also made for population increase, the price factor is not as pronounced in percentage terms since the basis of reckoning is different. In either case, however, the influence of price change has been the same.

Income Factor. Increased personal income realized over the past ten years has undoubtedly been one of the more important causal factors for the expenditure trends observed (Table 3.4). Unlike population growth, or price change, this factor cannot be isolated per se, largely because it is in a sense a part of the other two factors. Yet it is a distinctive force affecting expenditure change and should be recognized as such.

Table 3.4

Per Capita[a] Personal Income and State and Local Expenditures in Colorado, Selected Years, 1946-1956

Year	Per capita personal income	Percent of 1946	Per capita state and local expenditures	Percent of 1946
1946	$1,195	100	$ 88	100
1948	1,394	117	142	161
1950	1,446	121	171	194
1952	1,804	151	197	223
1954	1,694	142	216	245
1956	1,870	156	237	269

[a] Based on U. S. Department of Commerce estimated population as of July 1 of each year as presented in annual editions of the *Statistical Abstract of the United States.*

Source: Personal income based on U. S. Department of Commerce, *Survey of Current Business*, annual articles; and state and local expenditures derived from State of Colorado, Division of Accounts and Control, *Annual Reports;* Department of Education, *Biennial Reports of the State Commissioner of Education;* and annual audit reports of individual counties and municipalities.

According to one study, income is regarded as the most important single factor accounting for increasing public expenditures at the state and local level.[7] The reasoning is that as the economic system develops to high levels of activity its resources are devoted less to primary (extractive) and secondary (manufacturing and merchandising)industry and more to services. It is in the latter area where government has its greatest purpose as well as comparative advantage. Moreover, free income (above necessities), which develops as total income increases, provides obviously the greatest basis for paying taxes.

This general tendency of increased income causing increasing public expenditures has been expressed by John R. Commons as follows:

> Governments must have revenues in increasing amounts, not because they are corrupt or inefficient, which can be remedied, but because the social needs of education, ethics, morality, art, liberty, protection of the weak, highways, health, recreation grow faster in an improving civilization than do private needs of food, luxury, ostentation.[8]

[7] Solomon Fabricant, *The Trend of Government Activity in the United States Since 1900*, National Bureau of Economic Research (New York, 1952), Chap. 6.

[8] John R. Commons, *Institutional Economics* (New York: The MacMillan Co., 1934), p. 831.

This statement addressed to government generally has obviously varying degrees of application to different situations. It will be later observed, however, that much of what Professor Commons has in mind is fully reflected in Colorado's recent experience, notably in the fields of education, welfare and highways.

Purpose of Expenditures

The broader purposes for which the public dollar is spent in Colorado are readily identified. In 1956, 38 percent of aggregate disbursements were directed to educational uses; 21 percent to welfare; and 19 percent to highways. The remainder, or 21 percent, was committed to a wide variety of purposes which in Table 3.5 are combined and shown under the catch-all column labelled "all other."

The notable fact is that education, welfare, and highways together acounted for approximately 80 percent of public expenditures in the State, a ratio which differs little from that of recent preceding years.

Looking at the opposite side of the coin and raising the question as to where the public's tax dollar goes, the answer must, of course, be the same; that is, about 80 percent of it goes for these three general purposes.

The "big three" functions of government in Colorado (Chart 3.1), and this designation can be similarly applied to government in other states as later noted, deserves more than catch-phrase attention, for it is here and here only where major reductions in government expenditures and, therefore, taxes can be made. What the possibilities are for substantial cost savings in these vital areas of public service and what public reaction might be to any steps taken in these directions is quite another matter.

Table 3.5

Expenditures by Principal Functions of State and Local Government in Colorado Selected Years, 1946-1956

Year	Total	Education[a]	Welfare[b]	Highways[c]	All other
	Amount (thousands)				
1946	$105,992	$ 29,522	$32,544	$14,858	$29,068
1948	180,002	50,103	53,022	38,258	38,619
1959	229,038	73,213	60,818	45,209	49,798
1952	269,046	85,795	66,462	53,367	63,422
1954	322,948	112,593	71,582	64,008	74,765
1956	382,162	146,294	82,242	72,990	80,636
			Percent		
1946	100.00	27.85	30.71	14.02	27.42
1948	100.00	27.83	29.47	21.25	21.45
1950	100.00	31.97	26.55	19.74	21.74
1952	100.00	31.89	24.70	19.84	23.57
1954	100.00	34.87	22.16	19.82	23.15
1956	100.00	38.28	21.52	19.10	21.10

[a] Includes State expenditures for Educational Institutions; Office of Commissioner of Education, Education of Physically Handicapped Children, Teacher Emeritus Retirement, State Library, State Historical Society, School Lunch Program, Vocational Education, and Miscellaneous; and school districts expenditures for public schools.

[b] Includes State expenditures for Welfare Administration, Department of Health; county expenditures for old age pensions and general welfare, and municipal expenditures for Health and Hospitals.

[c] Includes State expenditures for State Highway Department; county expenditures for Road and Bridge Fund; and municipal expenditures for streets and highways.

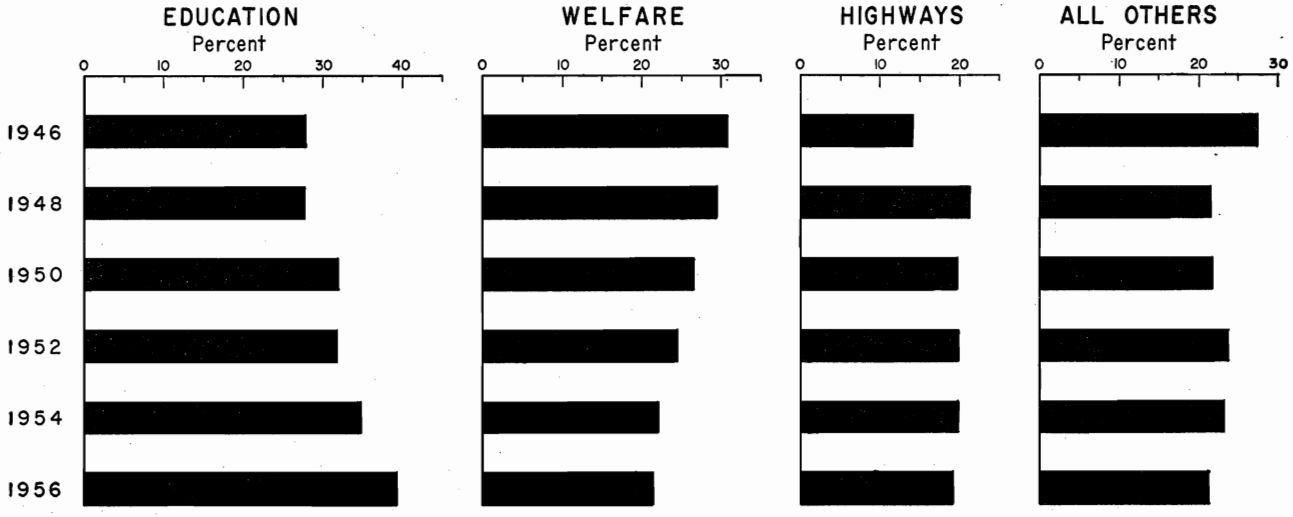
EXPENDITURES BY PRINCIPAL FUNCTIONS OF STATE AND LOCAL GOVERNMENT IN COLORADO, SELECTED YEARS, 1946 – 1956

(Expenditures expressed as a percent of annual total)



SOURCE: State of Colorado, Division of Accounts and Control, Annual Reports; Dept. of Education, Biennial Reports of the State Commissioner of Education; Dept. of Highways, Annual Reports; and Audit Reports of Individual Counties and Municipalities.

CHART 3.1

Sources of Funds By Level of Government

Of some interest in this connection is the question of the financing of the major services performed. Without raising the question of who pays the taxes, the question here is what governmental agency provides the original funds for the particular services financed? It should be clear that a governmental unit may, because of transfers from other agencies, spend more than it receives from the taxes collected for its own use. For example, welfare payments are made by the counties but such payments are largely financed from funds transferred from the State.

An effort to relate expenditures by functions to the particular governmental unit responsible for providing the funds needed has been attempted with results shown in Table 3.6.

Table 3.6

Expenditures by Functions of State and Local Government in Colorado and Estimated Sources of Funds, 1956

Function	State & local expenditures	Source of Funds: Federal[a]	State[b]	Local[c]
		Amount (thousands)		
Education	$146,294	$ 1,373	$39,459	$105,462
Welfare	82,242	27,494	41,773	12,975
Highways	72,990	11,071	43,836	18,083
Other	80,636	5,092	33,505	42,039
Total	382,162	45,030	158,573	178,559
		Percent		
Education	100.00	0.94	26.97	72.09
Welfare	100.00	33.43	50.79	15.78
Highways	100.00	15.17	60.06	24.77
Other	100.00	6.31	41.55	52.14
Total	100.00	11.79	41.49	46.72

[a] Federal funds received as reported by State of Colorado, Division of Accounts and Control.

[b] Includes state expenditures (less federal aid) for "Educational Institutions," "State Educational Agencies," "State Aid for Public Schools," "Administration of Public Welfare," "Payments by State for Welfare," "State Highways," "Payments to County Road Fund," and residual of total State "Operating Expenditures" as reported by State of Colorado, Division of Accounts and Control.

[c] Residual computed by deducting federal and state expenditures from the total state and local expenditures.

Source: Adapted from State of Colorado, Division of Accounts and Control, *Annual Report;* Department of Education, *Biennial Report of the State Commissioner of Education;* and audit reports of the individual counties and municipalities.

Viewing first, the aggregates, or column totals in this table, it will be observed that 12 percent of combined state and local expenditures in 1956 were covered by federal aids for one purpose or another but principally for welfare and highways. The state government, in turn, accounted for 41 percent and local government for the remainder or 47 percent. In terms of taxation, and by approximation only, it can, therefore, be said that in 1956 federal taxes (grants) supported 12 percent of Colorado's total government; the State, 41 percent; and local government, 47 percent.

Looking more closely at expenditures by specific functions and their related source of financing, it is noteworthy that education is essentially a "grass roots" or local governmental responsibility. As seen in Table 3.6, local government, and this means largely the school districts in this instance, accounted in 1956 for 72 percent of all educational costs in the State.

On the other hand, public welfare is largely a responsibility shared by federal, state and county government in which federal grants represented 33 percent of total welfare payments made in 1956, while the State contributed 51 percent, and the counties the remainder, or 16 percent.

Similarly, the highways are financed jointly by the governmental units including the municipalities. In 1956 federal grants represented 15 percent of the aggregate outlay for this purpose, while state and local participation accounted respectively, for 60 percent and 25 percent.

Expenditure Patterns—Interstate Comparisons, 1942 and 1953[9]

Examination of Table 3.7 shows that state and local government in Colorado spent $217 per capita in 1953 which placed it in 6th position in Western State comparison, being preceded by Nevada, Oregon, Montana, Wyoming and California. In 1942, Colorado occupied 5th position, reading from high to low, being preceded by Nevada, Montana, Wyoming and California.

Per capita total expenditures in all the Western States were substantially above the national average, both in 1942 and 1953—a fact which may be attributed in part to the relatively low population density of the West.

Further examination of Table 3.7 shows that Colorado in 1953 spent more per capita for "welfare," "public safety," "sanitation" and "health and hospitals" than the average for the eleven Western States. Conversely, it spent less than average for "highways," "education" and "all other."

In rank order, which changes the picture only slightly, Colorado ranked 1st in per capita expenditure for both welfare and health and hospitals; 4th in expenditures for both public safety and sanitation; 5th for education; and 9th for both highways and all other.

Colorado's expenditure pattern differs most widely in its expenditures for welfare. In 1953, per capita welfare payments in the State amounted to $40.05, which exceeded the general average of all eleven Western States by $18.06.

[9] These are the most recent dates for which Census data are available for comparative purposes covering both state and local expenditures. It is believed that more current data, if they had been available, would not have changed to any substantial degree the relationships shown for the years considered.

It also was over the national average of approximately the same amount, or by $18.43.

It is of interest and probably it is also worthwhile to speculate on what might have been. If, for instance, Colorado's outlay for welfare had been the same as the Western-State average, its total per capita expenditure of $217 for all purposes in 1953 would have been reduced to $199. In rank order, this total would have placed Colorado in 9th position rather than in 3rd. A similar computation for 1942 would drop Colorado from 5th to 10th place in the eleven-state comparison.

Education

Education accounted, as earlier noted, for approximately 40 percent of all state and local outlays in 1956, thus constituting by far the principal expenditure requirement in the State. Education's enlarged position in the total fiscal picture of the State is evidenced by its corresponding but lower ratio of 30 percent in 1946. When it is remembered that expenditures for all other purposes generally increased at a rapid rate for the period a relative gain of 10 percentage points is indicative of the rapid pace set by education costs in recent years. This is reflected in expenditure trends shown for both the public schools and state colleges and universities.

Public Schools. Total expenditures for public schools in 1956 were more than twice what they were in 1950 and approximately five times the amount reported for 1946. Stated in per capita terms, the 1956 total outlay was $77.50 as compared with $44.17 in 1950 and $21.70 in 1946 (Table 3.8).

Much of this advance has consisted of capital outlay. Thus, of the total accumulated annual expenditures from 1950 to 1956 amounting to $599 million, somewhat over one-fourth was for building purposes.

Increased enrollment accompanied by an enlarged ratio of the population in public schools, plus rising costs per pupil in attendance, are the developments which explain school expenditure trends in the State over the past decade.

From 1946 to 1956, school enrollment grew from 199,441 to 307,753, or a gain of 108,312 pupils (Table 3.9). For the same period also, enrollment per 1,000 population advanced from 166.7 to 190.9.

Table 3.9

Enrollment and Operating Costs per Pupil in Public Schools in Colorado, 1946-1956

Year	Enrollment	Enrollment per 1,000 population	Operating costs per pupil
1946	199,441	166.7	$122.50
1947	205,930	166.6	141.57
1948	208,928	165.4	168.45
1949	217,020	167.6	191.56
1950	224,245	168.0	201.46
1951	227,231	172.3	211.58
1952	233,367	170.6	225.74
1953	252,327	175.7	245.94
1954	271,760	182.1	259.97
1955	289,690	187.3	263.17
1956	307,753	190.9	284.44

Source: State of Colorado, *Biennial Reports of the State Superintendent of Public Instruction*, 1946-1956.

Following the same trend, operating costs per pupil from 1946 to 1956 increased from $122.50 to $284.44, or at the rate of 132 percent. By eliminating the inflation factor this ratio drops to 40 percent. Similarly the unadjusted change from 1950 to 1956 shows an increase of 34 percent which when corrected for price increase shows an actual decrease in "real" terms of 6 percent, as summarized below:

Year	Average costs per pupil	Average operating costs per pupil in 1956 dollars
1946	$122.50	$202.14
1950	211.58	304.16
1956	284.44	284.44
Increase		
1946-1956	132.2%	40.1%
1950-1956	34.4%	—6.5%

Taking 1946 to 1956 as the period of reference it can be assumed that in 1956 school districts in Colorado were, on the average, not only spending 40 percent more in "real" terms for operations per pupil than in 1946, but presumably they were also providing that much more in "real" services. This assumption may be realistic in view of the many additions to facilities that have been made during the past ten years.

The absolute decline of 6.5 percent in the "real" operating expenditures per pupil from 1950 to 1956 is largely explained by (a) an increase of 83,508 pupils — an increase which accounted for nearly three-fourths of the entire enrollment increase since 1946, and (b) sharp rise in prices amounting to 27 percent.

Whether or not school districts should have put out more money so as to maintain real expenditures per pupil on say at least the same basis as in 1950 is an open question. There is, of course, the inference that Colorado's school children in 1956 were not as adequately accommodated as in 1950. But by the same measure also, they were quite substantially better off than their predecessors back in 1946.

Despite sharply advancing public school costs (unadjusted) Colorado's position does not appear to be out of line with other places. As can be seen from Table 3.10, Colorado's operating costs per pupil in average daily attendance in 1954 were below the median for the eleven Western States, while capital outlay per pupil was at the median.

As a factor affecting current or operating costs it is significant also that as of 1954 Colorado paid its teachers less, on the average, than all the other states in the West, excepting Montana, Wyoming, and Idaho, and, it might be added, less than the average for the country as a whole.

No effort has been made to determine the quality of the educational services provided by the public school system of the State or possible cost savings that might be effected. Quantita-

tively, Colorado has undoubtedly done a good job in providing mass education at the elementary and secondary school level. As was shown in Chapter I, the 1950 Census ranks Colorado much above the national average in the number of school years completed by its population 25 years old or over.

Table 3.10

Selected Expenditure Data for Public Schools in Eleven Western States, 1954

(Rank order of States appears in parenthesis)

State	Current expenditures per pupil in average daily attendance	Capital expenditures per pupil in average daily attendance	Teachers' salaries (annual salary)
Oregon	$336.72(1)	$125.05(3)	$4,163(4)
Wyoming	329.86(2)	48.57(11)	3,512(10)
Montana	327.99(3)	62.33(8)	3,530(9)
California	314.51(4)	133.98(2)	4,787(1)
Washington	305.42(5)	105.89(5)	4,334(3)

Idaho	237.81(10)	60.67(10)	3,350(11)
Utah	208.18(11)	83.38(7)	3,746(7)
11- state average	289.16	96.49	3,943
United States	264.76	80.14	3,825

Source: U. S. Department of Health, Education and Welfare, *Biennial Survey of Education in the United States*, 1952-1954.

Greater economy in operations is suggested by further consolidation of school districts which now number nearly a thousand. However, there are definite limitations here in view of the low population density that exists in most parts of the State. In this circumstances, it is likely that at least some of the cost saving achieved through large-scale consolidation of districts will be offset by increased transportation costs.

The future trend of expenditures for schools will in any event be largely determined by population growth, a projection of which was made in Chapter I. A separate forecast of school enrollment made by the State Department of Education is of interest. This estimate shows a trend which would see a doubling of enrollment, including enrollment in junior colleges, between 1950 and 1968 (Table 3.11). If this projection can be taken as reasonably valid, and assuming a per pupil operating cost equal to that reported for 1956, the expenditure requirement for operations alone would amount to $176 million by 1968, or a figure 40 percent over the combined total of current and capital outlays made for the public schools in 1956.

It may be assumed in addition that capital outlays will have to be increased. In 1956 these represented approximately one-third of combined current and capital outlay, or a per pupil outlay of $121.51. Multiplying this sum by the anticipated enrollment in 1968, a total of $73 million is derived, which when added to $176 million for operations amounts to $249 million, or a total which is approximately double the aggregate expenditures for operating and capital purposes in 1956.

Table 3.11

Enrollment in Public Schools[a] in Colorado 1956 and Projections to 1968

Year	Enrollment
1956	307,753
1957	326,218
1958	345,791
1959	366,538

Colleges and Universities. In 1956 operating and capital expenditures for all tax supported institutions of higher learning in the State amounted to $21.8 million. This figure is approximately equal to 17 percent of total expenditures reported for the same year for the public schools.

Over-all expenditures have followed the same course as that of the public schools although at a somewhat lower rate of increase. As will be seen by reference to Table 3.12, total costs in 1956 exceeded by about $6 million the amount spent in 1950 and by $16 million the total reported for 1946. As in the case of the public schools, enlarged enrollments have been the underlying causal factor of rising expenditure requirements accelerated by inflated prices. As noted in Table 3.13, student enrollment increased from 9,870 in 1946 to 19,811 in 1956 with important fluctuations occuring in between due to veteran enrollments. Coincident with this over-all change, operating expenditures on a per student basis jumped from $534.65 in 1946 to $687.50 in 1950 and to $942.25 in 1956.

Interstate Comparisons—Enrollment and Expenditure Relationships. Next to Utah and California, Colorado had in 1954 the largest college enrollment relative to its population of any other state in the West (Table 3.14). Colorado's ratio of 2.09 percent exceeded also the national average of 1.59 percent—a relationship which generally confirms Census reported data for 1950, shown in Chapter I, which ranked Colorado well above the national average and next to California in the West in the number of college graduates to population 25 years and over.

Next to Utah, Colorado in 1954 had a lower ratio of college enrollment in tax supported schools (or conversely a higher ratio in private schools) than any other state (Table 3.14). Colorado's ratio of 67.59 percent was higher, however, than the national average of 53.94 percent.

To the extent that private institutions provide a service that would otherwise be tax supported, it could be expected that expenditures per capita of tax supported institutions in Colorado would be comparatively low. On the contrary, as seen in Table 3.15, Colorado has a relatively high per capita operating cost which, in 1954, exceeded the Western State average and the national average by a wide margin. In rank order in the eleven Western State comparison, Colorado with a per capita operating cost of $18.62 occupied the 3rd leading position being preceded by only Wyoming and Utah.

Costs or expenditures are not the same as taxes paid, however. Further review of Table 3.15 reveals that slightly over two-thirds of Colorado's operating costs were covered from income sources other than taxes. As a result, its per capita tax of $6.15 for operating purposes was the lowest of any state in the West. The other income sources for this purpose came

mainly from tuition receipts which in Colorado are swelled by a combination of factors of which a relatively large number of out-of-state students paying higher tuition rates than residents is one of the most important.

Table 3.15

Per Capita Operating Expenditures and Current Income of Institutions of Higher Education in Eleven Western States, 1954

(Rank order of States appears in parenthesis)

State	Per capita operating costs	Per capita current income — Total	From taxes	From other sources
Wyoming	$19.66(1)	$21.18(1)	$12.01(1)	$ 9.17(4)
Utah	19.62(2)	19.87(2)	9.46(4)	10.41(2)
Colorado	18.26(3)	18.64(3)	6.15(11)	12.49(1)
California	17.49(4)	17.73(4)	9.70(2)	8.03(5)

Welfare[10]

Colorado's welfare payments represent, next to education, the largest single category of expenditure in the State. In proportion to the State's population these payments as a whole are among the largest made by any state in the union. This is attributed mainly to a relatively high old-age pension payment, which over the years, has placed Colorado at, or near the top in interstate comparison.

Over-all welfare expenditure, which include all categories shown in Table 3.16, have more than doubled since 1946 and the annual rate of increase has exceeded population growth as is evidenced by a continuous increase measured by per capita expenditures. For 1956 the per capita figure was $48.43 which exceeded by 16 percent and 85 percent the corresponding figures for 1950 and 1946, respectively.

Old-age Pensions.[11] Colorado's old-age pension payments amounted, in the aggregate, to $57.4 million for the fiscal year ending in June,

[10] For more extended discussion of this subject, see Chapters XIX and XX.

[11] The data and related information included in the text of this and succeeding sections are from the annual reports of the State Department of Public Welfare and statements from officials of the Department.

Source: Records of the Colorado State Department of Public Welfare.

1957. Of this amount, the federal government contributed 37 percent and the State the remainder, or 63 percent. The relatively large State participation stems from State law which earmarks a sizable portion of the total state government revenue for the purpose[12] and, in addition, provides for a coverage of eligible persons between 60 and 65 for which no federal contribution is made. It is because of large State allocations and the fact that no other state covers the lower age bracket under 65 that Colorado has led most states both in "recipient rates" (pensioners to population over 60 or 65) and absolute amounts of average monthly payments.

The recipient rate in Colorado as of June, 1957, was 347 out of 1,000 persons, aged 65 and over. In other words, a little more than one person out of every three who is over 65 years of age was a recipient of the Colorado pension. At this rate, Colorado was the 6th highest ranking state in the nation being preceded by Georgia, Oklahoma, Alabama, Mississippi and Louisiana.

The monthly average payment during the year was $82.36. This amount placed Colorado also in 6th ranking position being preceded by North Dakota, Massachusetts, Connecticut, New York and Washington.

These relationships are of interest from several points of view. First, Colorado with its high relative recipient rate presents a characteristic of the southern states but is definitely eastern in size of its awards. Second, Colorado's traditional and much publicized position of being the most generous state in the union as far as amount of individual pension payments are concerned, no longer holds. This is significant since the State of Colorado has been a pioneer in its program attempt to establish a better than an absolute minimum living standard for its older citizens. It may be that Colorado's example has forced some general acceptance of this standard. The latter would be consonant with the federal Old-Age and Survivors Insurance program which, in theory at least, is designed through longer term savings from workers' incomes to provide adequately for old age. As such, it should in time supplant in large degree the State old-age welfare program as now constituted. This should come about in essentially two ways both of which would tend to reduce over-all pension payments. First, the number of State pension applicants should decline as insurance funds become adequate, and second, even though applicants qualify under the State pension their awards should be reduced by the amount of insurance payments received.

[12]Eighty-five percent of net revenue from sales, liquor and use taxes, and 10 percent of net revenue from inheritance tax and incorporation fees and 85 percent of beer and liquor licenses are set aside for the monthly old-age pension; $5,000,000 for the stabilization fund and $10,000,000 for the medical fund, in that order. Funds remaining flow into the "general fund."

The impact to date of "OASI" on Colorado's pension payments both in number and size is hard to measure precisely. As noted in Table 3.17, caseloads have steadily increased over the years although a decline is observed from 1956 to 1957. Similarly, monthly average payments have increased but a sharp reversal is noted also during the last calendar year.

Table 3.17

Average Monthly Pension Caseload and Payment in Colorado, Calendar Years 1946-1957

Year	Monthly average caseload[a]	Monthly average payment
1946	40,692	$41.49
1947	42,850	61.41
1948	45,386	72.01
1949	47,718	70.25
1950	50,617	70.59
1951	52,114	73.44

1954	54,016	79.41
1955	54,189	85.86
1956	54,350	89.48
1957	54,079	82.59

[a] Number of persons receiving pension payments.

Source: State of Colorado, Department of Public Welfare, data prepared by Division of Administrative Management, July, 1958.

There is no question, however, that pensions both in number and amount have been lower than they otherwise would have been if the federal insurance program had not existed. For example, the Department of Welfare reports for the period from 1952 to 1957 a gain of 7,894 cases where pensions were received concurrently with OASI payments and an average increase of the latter from $29.76 to $41.54 per month. These amounts represent also "income" which must be deducted from State pension awards.

The future trend of total pension payments in Colorado is not likely to be substantially affected by OASI for a number of years because of the large payments guaranteed by State law. However, the long run should surely see a material reduction in both caseload and average amounts paid. If further liberalization of federal law occurs, this in itself could importantly change the timetable.

Other Welfare Programs. Although Colorado's pension program accounts for nearly three-fourths of the State's total outlay for welfare, other programs cover a wide front to which was added recently a medical aid program. These are more fully described in Chapter XX and need only be briefly mentioned here.

Referring back to Table 3.16 it will be seen that the largest program next to old-age pension is "aid to dependent children" where the cost trend is definitely upward. As distinguished from old-age pensions, financial participation includes also the counties, as is true for two

other programs; namely, "aid to the blind" and "aid to needy disabled." Other programs are "general assistance" which is financed entirely by the counties, and "foster care of children" and "tuberculosis hospitalization" financed jointly from state and local funds.

Highways[13]

Highways in Colorado, which currently account for approximately 20 percent of total state and local expenditure requirements, may be divided into three broad categories. These are (1) state highways, (2) county roads, and (3) city streets.[14]

The state highway system includes 8,302 miles of roads of which "federal aid primary" accounts for 4,269 miles, "federal aid secondary" for 3,850 miles and roads with no federal status for the remainder, or 183 miles. The county system consists of approximately 63,000 miles of road and the city streets an additional 3,500. In the aggregate then, there are in Colorado approximately 75,000 miles of highways and of all types and classifications.

Expenditures for the maintenance and construction of this entire system amounted to nearly $87 million in 1956 (Table 3.18). Of this amount the state system accounted for 58 percent, the county roads for 23 percent, and the city streets for 19 percent.

The specific purpose for which highway expenditures are made cannot be precisely determined in the case of county roads and city streets. It is estimated that on the average total outlays for both counties and cities divide about equally between maintenance and capital purposes.

State Highway System. Detailed reports of the State Highway Department covering the state highway system show for 1956 a total of 588 miles of "state highways finished" which include both the net addition of highway mileage to the system as well as the replacement or resurfacing of existing highways. Of the total number of miles finished 521 miles consisted of two lanes—or a mileage which would approximate a distance half way to the Pacific Coast reaching from Denver; and 67 miles of new construction of four-lane highways—or a mileage about equivalent to the distance from Denver to Colorado Springs (Table 3.19).

[13] For other discussion relating to this subject, see Chapters X, XIX and XX.

[14] "State highways," or the "State Highway System" is defined in Colorado law as follows: "The State Highway System shall consist of the Federal Aid Primary roads, the Federal Aid Secondary roads, plus an amount not to exceed five percent of the mileage of such systems which may be declared to be State Highways by the State Highway Commission while not being any part of the Federal System."

Administratively, state highways are under the supervisory authority of the Colorado State Highway Department. The so-called "county" roads are under local county boards and "city streets" under city authority. Financially, the principal distinction between state highways and county and city administered highways and streets is that state highways receive direct federal aid while others do not.

Source: State of Colorado, Department of Highways, *Annual Highway Report*, 1956, p. 12.

As can be seen from Table 3.20, state highways finished since 1946 have ranged from 100 miles to 924 miles per year. The accumulated results from this and preceding construction finds Colorado, as shown in Table 3.21, with a present total state highway structure consisting of 8,040 miles of surfaced highways, of which 408 miles are concrete; 6,209 miles, asphalt; 1,339 miles, gravel; and 84 miles, graded or drained.

Table 3.20

Mileage of State Highway System by Type of Surface in Colorado, 1956

Item	Projected	Graded & drained	Gravel	Asphalt	Cement	Total
Federal Aid-primary						
Regular	11	0	21	3,260	301	3,593
Interstate	251	0	0	350	75	676
Federal Aid-secondary	0	83	1,193	2,548	26	3,850
State (no Federal status)	0	1	125	51	6	183
Total	262	84	1,339	6,209	408	8,302

Source: State of Colorado, Department of Highways, *Annual Highway Report*, 1956, p. 3.

In 1956 also, 29 percent of the mileage was rated as "excellent;" 17 percent, "good;" 18 percent, "fair;" 14 percent, "unsatisfactory;" 14 percent, "critical;" and "not rated," 8 percent.[15]

State and National Comparisons. Colorado's per capita highway costs of $41.62 for 1953 noted earlier in Table 3.7, were somewhat under the average of the eleven Western States but quite substantially above the national average of $35.17.

Colorado's higher-than-national-average cost position can be attributed in the main to its mountainous terrain which presents costly construction problems as well as requiring larger than average outlays for maintenance. Another factor is a relatively low population density (14 persons per square mile compared with the United States average of 53) coupled with a high per capita road mileage (55 miles per 1,000 population compared with the United States average of 23).[16] Closely related also, is traffic density which shows for Colorado a total of 452 registrations per thousand population as compared with a national average of 336.[17]

Future Needs. Colorado's ratio of total road mileage surfaced, including city streets which was 38 percent in 1953, falls far below the corresponding national average of 66 percent.[18] This, of itself, is probably not too significant in view of Colorado's physical features and low population density.

Of greater importance is the fact that, apart from city and county road development, the state highway system alone has a total of 2,229 miles of highway rated by the State Highway Department as "unsatisfactory" or "critical." It is estimated that it will cost $345 million to correct this deficiency. This is regarded as the immediate highway need of Colorado.[19] For the long run, the estimated total required to construct all roads in the state system to adequacy by 1975 (as per the 1975 Federal Aid Act) is $880 million[20]—this amount is about thirteen times the aggregate outlays for both construction and maintenance made on the state highway system in 1956. It is apparent, therefore, that the objectives of the State's highway program coupled with unforseen developments that may take priority, will press heavily on future tax resources and federal aids committed thereto.

Other Expenditures

State and local expenditures for other than the three major categories considered in preceding sections range over a wide front of needed public services including such functions defined by the Census as "public safety," "sanitation," "health and hospitals," "general control" and several other categories. The principal of these are best reviewed in later chapters. In this section it is sufficient to point to only one of these or the State eleemosynary and penal institutions, the fiscal importance of which is shown in Table 3.22.

As observed, the aggregate trend from 1948 for these institutions has advanced steadily upward coincident with an increase of over 1,000 in the number of inmates (Table 3.23). It is noteworthy, however, that per capita costs since 1950 have remained about the same. If adjusted for price change, the gain in "real" per capita cost is only 5 percent, a fact that suggests underdevelopment in this vital area of public service.

Conclusion

Throughout preceding analysis the emphasis has centered on dollar amounts spent by state and local government for the various general purposes described. Although in certain cases services provided by government, which as a counterpart of expenditures, were broadly identified, no attempt was made to judge the wisdom of expenditures either in purpose or in amount nor to evaluate in any definitive manner the relationship of costs to values received.

This apparent neglect of the popular issue of "economy in government" can be explained on grounds that the public wants what it wants, and no criterion exists for judging what it should want. Similarly, there is presently little to go by for expertly judging government performance and isolating the dollars that were "wasted" or "saved," as the case might be. Without minimizing the importance of these factors it is, nevertheless, well to recognize that in amounts of dollars spent it is, after all, the judgment of the public in respect to what it wants and how much, and when that matters most.

In the absence then of such criteria, expenditure comparisons were made with other states which were reasonably similar in economic circumstance and cultural setting.

Comparatively, Colorado's aggregate per capita expenditures were found to be higher than the average of the eleven Western States as well as that for the country as a whole. In detail, Colorado's old-age pension payments were much above the average both in the West and for the nation—a fact which accounted for its comparatively high over-all per capita outlay. Relative to the West also, Colorado spent more on a per capita basis than the average for "public safety," "sanitation" and "health and hospitals" but slightly less than the general average for "education," "highways" and "other" purposes. In all cases, Colorado averages exceeded those for the nation.

From this can it then be said that Colorado's expenditures are "too high" or "too low" in this or that, but above all much too high in its pension payments? Again, the answer must be that no simple criterion exists, even by comparative state analysis, for determining how much government should spend and for what.

Comparative analysis makes it eminently clear in any event that Colorado has recognized that more than a bare minimum of educational services, welfare, highways and all the other functional areas of government service is needed to achieve the kind of society in which its citizens wish to live.

On the other hand, it is equally clear that all these things must be paid for and how they are paid for becomes vastly important. Depending upon the nature of the taxes used some groups may receive most of the benefits while others are required to pay the larger share of the taxes. Up to a point this may be expected and may be proper since the benefit principle is not the only criterion by which a tax should be judged. However, an inept system of financing public needs, wherein the burden of the tax is unfairly distributed, serves only to nullify the benefits sought. It is in this sense that a review of the structure of public expenditure becomes essential background for any definitive review and appraisal of the parallel structure of taxes, grants and borrowing.

CHAPTER IV

TAX REVENUES OF STATE AND LOCAL GOVERNMENT

The purpose of this chapter is to show the rate at which total taxes have changed in Colorado and to indicate the kinds of taxes currently used at each level of government in the State.[1] As such, it is designed to provide a background for subsequent appraisal of individual taxes and the tax structure of the State as a whole. In addition, comparisons are made with other Western States and the forty-eight states for purposes of noting such differences in tax policy as may exist.

As an introduction to these analyses a review of the historic development of taxation in Colorado is presented.

Highlights of Tax Legislation

Colorado's present state and local tax structure is a product of nearly a hundred years of legislative effort to adjust means to ends in the face of continuous economic and social change in which group pressures, frequently conflicting, have been a part of it.

Since the turn of the century taxes have increased twenty-three fold, or from nearly $12 million in 1902 to $276 million in 1956. In per capita terms the increase over this period was about eight fold, or from $21 to $171.[2]

This large change may be generally attributed to greatly increased prices and living standards, changes in technology, notably in highway transportation and increased reliance on government for such services as health, hospitals, welfare and education. To these may be added the urbanization movement which, at the local level, has not only accelerated the expansion of public services, but, with the increasing density of the population in metropolitan centers, has increased unit costs as well.

State-Local Fiscal Relationships. The property tax, based on "full cash value" of all classes of property, has been the primary single revenue source of combined state and local government in Colorado since statehood. However, the state government has, over the years, gradually reduced its claims on the property base as other new sources of revenue became available to it. This has enabled the local governmental units, whose tax powers and resources have been neither as flexible nor as varied as that of the State, to appropriate for their own use that portion of the base vacated by state government. Hence, much of the history of taxation in Colorado concerns either the effort to increase the productivity of the property base or the introduction at the state level of new or "substitute" taxes which served to relieve the pressure on property as needs of local government increased with growth. This plus added state concessions, by tax sharing and federal grants directed to local use, gradually evolved as the appropriate pattern of state and local fiscal relationships.

In recent years, however, this arrangement has been increasingly modified by the larger cities whose budget problems have caused them, where tax powers permitted, to invade the heretofore private tax preserves of the state government notably in the fields of sales and liquor taxation.

Early Developments. Initial effort via constitutional action in 1876 to establish the revenue system on property was beset by pressures of factional interests seeking modifications of general rule or special advantage through exemptions of one sort or another. Thus the railroads fearing unfair treatment beseeched the Constitutional Convention that they be given special consideration since their particular situation was "unique." Recognition of the merits of their appeal is evidenced by later State Supreme Court ruling that railroad property, by exceptional clauses, should be assessed as a unit by the State Board of Equalization, a body created by the Constitution to generally oversee property tax administration for the State as a whole.

The mining interests were also active at the Convention. The results of their efforts saw the passage of Section 3, Article 10 of the Constitution which provided that:

> Mines and mining claims bearing gold, silver and other precious metals (except the net proceeds and surface improvement thereof) shall be exempt from taxation for a period of

[1] Unless otherwise indicated, revenues considered in the chapter are exclusive of the so-called "nontax revenues" which include such items as miscellaneous fees, licenses, charges and federal grants.

[2] U. S. Bureau of the Census, Special Reports of the Census Office, *Wealth, Debt and Taxation* (Washington, D. C., 1907).

> ten years from the date of adoption of the Constitution and thereafter may be taxed as provided by law.[3]

Since the legislature failed to enact a net proceeds tax the mines were largely tax free during this early period. Although Lake County attempted to make such a levy the effort was stopped by Supreme Court ruling.[4]

With the expiration of the mining exemption, the farmers and town and city dwellers whose position had not been as firmly advocated as a cause for special dispensation insisted that an ad valorem tax be imposed on the mines also. The miners, conceding that continued tax exemption might not be in the best interest of either the industry or the State, opposed such a tax but submitted as an alternative a "production tax." In 1887 a compromise measure was enacted by which mines were included under the property tax with the added provision that output exceeding $1,000 annually would be assessed at one-fifth of gross proceeds.[5]

Earlier attempts by the state government to secure revenues in addition to that from property had resulted in the enactment by the Fourth General Assembly in 1883 of a tax on insurance companies at the rate of 2 percent on the excess of premiums received over losses and operating expenses. This rate was changed to 2 percent gross in 1895 and this rate has remained up to the present time.

As one result of the Panic of 1893, which caused revenues for both the state and the local governments to decline to the point of fiscal embarrassment for all, a "Special Revenue Commission" was established to conduct a complete investigation of State finances. Its principal recommendation to the Thirteenth General Assembly in 1901 called for a reassessment of property values on a more realistic basis than then obtained. Subsequent action by the State Board of Equalization, raising over-all assessment from $217 million to $466 million wherein railroad assessments were increased from $33 million to $122 million, brought immediate general protest. Most vocal were the railroads who refused to pay on the new assessment basis. The State, lacking necessary backbone at the time, settled on a compromise assessment figure of $55 million.[6]

The Thirteenth General Assembly in its search for further revenue enacted the first State inheritance tax law which imposed a tax on "transfers of property by inheritance through will, gift or instrument." This tax was approved by Governor Orman on April 5, 1901, but later was declared unconstitutional by the State Supreme Court. Re-enacted in March, 1902, with subsequent amendments including a gift tax adopted in 1937, this tax now constitutes a part of the present revenue structure of the state government.

Tax Commission Created in 1911. Continuing after 1901 the feeling became more general that earlier reassessment action taken had been inadequate, and that further upward revision was needed not only on grounds that the "full value" clause of the Constitution was being violated but more because additional money was required to finance growing government. Underassessment was particularly apparent in the case of banks, mines, manufacturing capital, intangibles (including money, credit, accounts, notes of special privilege, franchises, and bank deposits) and personal property. Out of this emerged the State Tax Commission created by legislative act in 1911.

Definitively the purpose of the Commission was to supervise the work of the county assessors, equalize assessments between counties and to assess public utilities and other corporations having continuity of business in two or more counties.

Commission decision in 1913 to enforce the full cash value provision of the law resulted in a three-fold increase in assessed values from $422 million to $1,306 million.[7] Strenuous objections, this time not from the railroads as in 1901, but from Denver and Weld counties led to their sponsorship of an initiated amendment to abolish the Tax Commission, an approach toward the solution of tax problems not uncommon even today. Despite an independent report by Dr. Murray Haig of Columbia University which supported the reappraisal action, the effort to eliminate the Commission was defeated by only the narrowest of margins.

Motor Fuel Tax, 1919. An act providing for a state motor fuel tax was first introduced in 1919 when a one-cent-per-gallon levy was placed on the sale of gasoline. The act called for an even distribution of proceeds between the State Highway Department and the counties. In 1923 the tax was increased to two cents and in 1927 to three cents. The change in the latter

year was accompanied by a change in allocated shares from 50 to 70 percent for state purposes and 30 percent for the counties as a whole. In 1929 an additional tax of one cent a gallon was imposed, and distribution changed to 70 percent to the highway fund, 27 percent to the counties and 3 percent to a special highway fund for construction and maintenance. Subsequent highway needs caused the tax to be raised again in 1947, this time by two cents, thus reaching a level of six cents per gallon, which is the current rate.[8]

Tax Structure Change in the 1930's. The depression years of the 1930's brought to the foreground the need for alternative sources of revenue as the property tax declined in productivity in the face of increasing requirements for funds to finance welfare at both state and local government levels. The number of new taxes that emerged, partly in response to depression needs and partly because of other circumstances, caused this period to be one of the most notable in the entire revenue history of the State.

In 1935 an emergency retail sales act passed both houses and became effective March 1, 1935. The revenues obtained were to go to the General Fund, with the exception of $300,000 which was earmarked for relief. Optimistically, the legislature set June 30, 1937, or earlier if circumstances warranted, as the termination date of the act. However, in November, 1936, an initiated amendment known as the Old-Age Pension Amendment" was adopted which froze 85 percent of revenues from the sales tax for old-age pensions. Thus, what had originally been regarded as a temporary measure became, to all legal intent, a permanent addition to the State's tax structure.

To prevent circumvention of the sales tax a loophole in the law was closed with addition of the "Use Tax" in 1937. This amended the law by including a supplementary provision of a 2 percent tax on the retail price of tangible personal property purchased outside of Colorado and brought into the State for storage, use or consumption.

Another initiated amendment offered the voters in the thirties was an income tax proposal covering both personal and corporate income which was passed in 1936. A number of earlier efforts to introduce an income tax had met with popular disapproval. As far back as 1912 the Tax Commission had recommended a tax on incomes modeled after the Wisconsin law adopted in 1911. Thereafter interest in the initiation of such a tax vacillated between the republic and democratic administrations. In 1922, the Colorado State Tax Revenue Committee was formed to sponsor an income tax amendment to the Constitution. The measure which it proposed was defeated, however, in the November, 1922 election. A decade later three other attempts were similarly voted down. In 1935 the legislature passed a graduated income tax bill only to have Governor Johnson veto it on the grounds of unconstitutionality and the House did not overrule his veto.

The 1936 Act as passed, and as it applied to personal income, was extremely mild, especially as it affected the low income groups, or those with an income under $2,000. Post World War II saw an upward adjustment of the tax, a principal change being the enlargement of the base to include persons with an income of $1,000 and with the rate fixed at 1 percent. In addition, the rate applicable to the middle income group from $3,000 to $6,000 was increased. Tax brackets were realigned in multiples of odd numbers, rather than by even numbers which had existed. This had the effect of bringing a greater number of taxpayers into the higher rate brackets.

The tax on corporate incomes was originally fixed at 4 percent, excepting financial institutions which were subject to a 6 percent rate. In 1947 the rate on non-financial corporations was raised to 5 percent while that of the financial corporations remained unchanged.

The 1930's, which saw prohibition's demise, opened the liquor field for a variety of state imposts. Colorado made its first move in this direction in 1935 by introducing at the state level a series of taxes and license charges on the manufacture, sale and distribution of beer and later on all classes of fermented beverages including fermented malt beverages.

Finally, in the 1930's, also, an initiated amendment to the Constitution instituted a "specific ownership tax" on classified motor vehicles. In effect this tax was designed to replace the existing general property tax on such vehicles.

Postwar Developments. An outstanding development in the postwar period was the Reappraisal Act of 1947 designed to establish a common basis for the assessment of properties. Because of wartime and postwar inflation original standards has become uncertain in application with the result that valuations had gotten out of line. In cases, also, they were grossly inequitable as between individual properties. The new basis of valuation decided upon, and as it is currently applied, was 1941 reproduction cost less depreciation from date of construction.

Of the new taxes introduced since the war all have been highly controversial in nature. In November, 1948, the voters went to the polls

[8] *Session Laws of Colorado*, 1919, 1923, 1927, 1929 and 1947.

and approved a pari-mutuel tax. Historically, racing had been and continues to be a gambling enterprise, however, in 1948, for the first time, it received legal sanction in the State. A 1 percent tax on winnings was proposed but repealed. Breakage was retained by the State until 1954 when the State Supreme Court ruled against it. It now reverts to the Racing Commission established to administer the act. Total revenues from this tax currently amount to slightly over $2 million.

An income tax on oil production, really a severance tax, passed in 1953 drew much opposition from oil producers and is still subject to question on legal grounds. The tax is levied by the State on gross income on a graduated scale from 2 percent under $25,000 to 5 percent on amounts over $300,000. Credits against the tax are computed on the basis of ad valorem taxes levied on oil production by all units of government using the property tax.

The so-called "Ton Mile Tax" adopted by state government in 1954 also drew much opposition, in this case from the trucking interests which were most affected. As a replacement of existing taxes, the new rates were determined by weight classifications and, in consequence, trucks became subject to a higher tax than had formerly obtained.

Finally, the increased pressure on municipal budgets has forced most of the larger cities and towns in the State to add new taxes to their revenue structures, which traditionally have been limited almost exclusively to the property tax. In this effort Denver led the way by introducing in 1947 on a temporary basis and, in 1948, on a permanent basis, a tax on retail sales. Denver was followed by Pueblo in 1955. In addition to a general retail sales tax, presently limited to these two cities, a series of "occupation" taxes have been quite widely introduced. These cover varying subjects, principal of which are liquor, cigarettes and business units as such.

From a frontier mining community to the highly industrialized society of today, Colorado has many times been in the throes of a "financial dilemma."

Until the first quarter of the 20th century the general property tax was the prime source of revenue. Thenceforward, part of the revenue was conditioned by the automobile and subsequent revenue derived from a mobile population. Until this time, desultory revenue legislation had not come to grips with the real problem of effective taxation.

The depression years of the 1930's brought into focus the need for alternative sources of revenue which resulted in a myriad of state administered taxes which remain today. Post World War II saw further additions at both the state and local levels as population growth and inflation created new financial needs that had to be met at the time.

Table 4.1

Total Tax Revenues by Levels of Government in Colorado, 1940-1956

	Amount (thousands)					Percent				
Year	Total	State	County	School districts	Municipalities	Total	State	County	School districts	Municipalities
1940	$ 72,131	$ 32,874	$ 7,821	$19,385	$12,051	100.00	45.58	10.84	26.87	16.71

Source: Data for the "State" for 1940-1949 taken from State of Colorado, *Biennial Reports of the Auditor of the State;* 1950-1956 data from State of Colorado, Division of Accounts and Control, *Annual Reports;* "County and School District" data are derived from property tax levies reported by the State Tax Commission; data for the cities of Colorado Springs, Pueblo and Denver are from individual audit reports, while for other cities the data are derived from property tax levies reported by the Tax Commission from 1940-1956 to which were added for "other taxes" 20 percent of property taxes from 1940-1946; 32 percent of property taxes from 1947-1949; and 36 percent of property taxes from 1940 to 1956. The estimates of the relationship of "other taxes" to property taxes were based on a review of individual audit reports of a representative sample of cities.

Tax Revenue Trends, 1940-1956

As will be seen by reference to Table 4.1 combined state and local taxes increased from a level of $72 million in 1940 to a total of approximately $276 million in 1956. This represents a gain over a fifteen-year period of more than $200 million, or at the rate of 282 percent. For this period also, state government, which in 1956 accounted for one-half of combined state and local taxes, set the pace by increasing its tax revenue at the rate of 323 percent, followed in order by the school districts which gained at the rate of 286 percent, the municipalities, 241 percent and the counties, 169 percent. For all jurisdictions taxes in 1956 were nearly four times what they were in 1940 and three times their corresponding total in 1946.

Since 1946 school district taxes have increased at a faster rate than that for any of the other units of government including the state government itself. This holds also for the more recent period since 1950.

State and Local Taxes The rapid increase in aggregate taxes suggests a corresponding increase in tax pressure on the individual citizen. A frequently used device for measuring the so called "tax burden" is to divide total taxes by the population thus arriving at a per capita figure. As noted in Table 4.2, combined state and local taxes in 1956, on a per capita basis, were 168 percent greater than in the prewar year of 1940. However, if adjustment is also made for price inflation, that is if per capita taxes are expressed in uniform purchasing power dollars, the 1956 burden was 38 percent greater than in the prewar year of 1940.

Although taxpayer interest is in current dollar payments it is in uniform dollar terms that tax burden comparisons over time can have any meaning at all. This being so, it can be concluded that a fifteen-year tax increase of 38 percent for combined state and local government could hardly be regarded as being out of line with the marked increase of living standards experienced over the same period of time.

Further perspective on the tax burden may be had by comparing tax collections with personal incomes. Table 4.3 reveals that in 1956 state and local taxes took 9.1 percent of personal incomes. While this ratio is somewhat above the level that has obtained during most of the postwar years, it is substantially under its corresponding ratio of 11.7 percent reported in 1940.

S. Department of Commerce, *Survey of Current Business,* annual articles.

Federal, State and Local Taxes Combined. To observe that the Colorado taxpayer has experienced only a modest "real" increase in his state and local taxes is not enough however. State and local tax policy is importantly influenced by how the taxpayer feels about his total tax bill—federal, state and local.

An examination of Table 4.4 shows that when federal taxes are included, the per capita and price adjusted tax burden in 1956 instead of being only 38 percent greater than in 1940 was in fact 176 percent greater. Stated in different terms, the average per-person tax bill (federal, state and local) in 1956 amounting to $512.38 was approximately 2.76 times greater than in 1940. It was also about one-third again as large as in 1946 and slightly more than that when compared with the corresponding figure for 1950.

The impact of the addition of federal taxes is similarly noted when over-all taxes are related to personal incomes. As earlier indicated, state and local taxes took about 9 percent out of personal incomes in 1946. However, with the addition of federal taxes, the ratio is increased to 27.51 percent, which may be compared with corresponding ratios of 17.51 percent in 1940, 22.69 percent in 1946, and 22.84 percent in 1950. (See also Chart 4.1.)

State Comparisons. Any discussion of tax burdens invariably introduces the question as to how much more, or less, taxes are at home than they are some place else. Usually the conclusion is reached that they are most oppressive in the discussants' own locality. The conclusion, right or wrong, cannot be challenged ordinarily since facts used for comparison are limited and difficult to interpret in any event. The last, which applies not only to inter-area comparison but to intra-area analysis as well, stems mostly from the fact that since tax burden measures, such as per capita totals or ratios of taxes to income, are averages they cannot of themselves disclose how taxes or incomes are distributed between persons or groups of persons, nor can they identify the values received in exchange for taxes paid.

With these limitations in mind, an effort to compare Colorado's "tax burden" (exclusive of federal taxes) with other Western States and the United States, has been attempted with results presented in Table 4.5. For purposes of analysis the comparative years selected are 1942 and 1953, the latter being the latest date for which official data are available.

An examination of this table shows that per capita taxes more than doubled for all Western States and nearly doubled for the nation be-

[a] Based on U. S. Department of Commerce estimated population as of July 1 of each year as presented in annual editions of the *Statistical Abstract of the United States.*

[b] Based upon the 1956 Consumer Price Index.

Source: Federal tax data taken from Colorado State Planning Commission, *Colorado Year Book*, biennial reports; state and local data derived from State of Colorado, *Biennial Reports of the Auditor of the State;* State of Colorado, Division of Accounts and Control, *Annual Reports;* property tax levies reported by the State Tax Commission; audit reports of individual cities; and adjustments made for "other taxes" for cities other than Denver, Colorado Springs, and Pueblo as follows: 20 percent of property taxes from 1940-1946; 32 percent of property taxes from 1947-1949; and 36 percent of property taxes from 1950 to 1956.

tween 1942 and 1953. For 1953 in the Western States only, per capita taxes ranged from a low of $118.33 in New Mexico to a high of $180.24 in Nevada. Colorado's tax of $154.22 was slightly over the median average which, in rank order, placed it in 5th position in the eleven-state array. Colorado ranked in 8th position relative to the 48 states, being preceded in the West by Nevada, California, Wyoming and Washington. Among the latter, Nevada ranked 2nd, California 3rd, Wyoming 5th and Washington 6th in the 48-state comparison.

Colorado's relative position twelve years earlier, or in 1942, was much the same as in 1953. Its per capita total of $68.97 placed it in 5th position in the West and 14th in the nation.

Turning next to the relationship of taxes to personal income it will be further observed that in relation to income, taxes were proportionately greater in 1953 than in 1942 for all Western States excepting Montana. The ratio of taxes to income in 1953 was also higher than in 1942 for the nation as a whole.

For 1953 in the Western States only the ratio of taxes to personal incomes ranged from a low of 7.53 percent in Montana to a high of 9.17 percent in Idaho. Colorado's ratio of 8.89 percent was second highest of the eleven Western States. This placed Colorado also in 12th leading position among the 48 states in the nation. In 1942, Colorado's relative position was almost the same as in 1953 ranking 3rd high in the West and 14th in the nation.

The Tax Structure

Tables 4.6 and 4.7 present an over-all view, as of 1956, of the various types of taxes and their relative importance in providing revenue for each of the various units of government in Colorado including federal taxation in the State. From the standpoint of the tax-paying public the manner by which revenues are raised, which suggests their incidence, may be more important than the aggregate amount of taxes paid. As such, a review of the "tax structure" is an essential complement to any analysis and interpretation of the average "tax burden" as measured in the preceding section.

State and Local Tax Structure. As will be seen from Table 4.6 the combined state and local tax structure (but excluding at this point the federal levies in the State) rests heavily upon the general property tax base which, in 1956, accounted for 48.66 percent of total state and local tax revenues. Next in importance were the various taxes based on expenditures or consumption (including the highway user group), which accounted for 38.32 percent, while income (corporate and individual) and "all other" taxes accounted for the remainder or 9.44 percent and 3.58 percent, respectively, of aggregate state and local tax revenues.

Source: Federal data taken from Colorado State Planning Commission; *Colorado Year Book, 1956-1958;* State and local data derived from State of Colorado, *Biennial Report of the Auditor;* State of Colorado, Division of Accounts and Control, *Annual Reports;* Property tax levies reported by State Tax Commission; individual audit reports of Denver, Colorado Springs and Pueblo; adjustments made for other cities by taking 36% of property taxes. The estimates of the relationship of "other taxes" to property taxes were based on a review of individual audit reports of a representative sample of cities and *Colorado Year Book, 1956-1958.*

Although the individual parts—state, county, school districts and municipal government—make up the whole, the individual tax structures of these units differ in marked degree. Thus, for 1956, as noted in Table 4.7, state government obtained only 7.68 percent of its total tax revenues from the general property tax, but 67.81 percent from its consumption taxes, including the highway user group, and 18.75 percent from the income tax. On the other hand,

the counties and the school districts derived their entire tax revenue from general property while the municipalities obtained 68.66 percent from this source.

Historically, and as earlier noted, the reasons for these variations have grown from the fact the state government with its greater legal power to enact tax legislation has increasingly reduced its claims upon the property base in favor of local government while substituting therefor other taxes, notably on consumption and income.

The complex of these arrangements, in which property and consumption expenditures are the primary bases of revenue support, has resulted in a tax system which is essentially regressive. In other words, on the whole, state and local taxes tend to weigh more heavily on the lower income groups than the other way around.

Federal, State and Local Tax Structure. For perspective it is again necessary to include federal taxes. When this is done as shown in Tables 4.6 and 4.7, the over-all structure is basically progressive in its make up in which the income tax stands out as a principal feature. In other words, on this broader basis the tax system in Colorado conforms in larger degree to the principle of tax paying capacity than might otherwise be recognized. As noted in Table 4.7, particularly, the income tax—federal and state—accounted in 1956 for 61.22 percent of aggregate federal, state and local taxes. On the other hand, consumption taxes comprised 19.69 percent of the total, while property taxes and "all other" taxes accounted for the remainder or 16.25 percent and 2.84 percent, respectively.

Combining tax structures of state, local and federal government to show balance or inbalance can be pushed too far however. The fact that federal taxes are, in the main, progressive, does not remove the influence of the regressive element in the structure. Hence the considerable reliance of state and local government on property and consumption taxes is a matter that cannot be ignored in any event.

The rationale of federal-state relationships in tax policy is in some respects much the same as that applicable to established state and local arrangements. Income taxes had their origin at the federal level and by inference states were presumed to be adequately taken care of by the property tax. Moreover, because of the "uniformity rule"[9] federal government could not tax general property anyway. However, greatly enlarged revenue needs of both state and local governments resulted in the invasion of the income base by state governments which to all intent and purposes promises to be a continuous one on an increasing scale. The effect has been to cause a more equal distribution of the state and local burden by relieving the pressure induced by other less desirable forms of taxation.

Tax Structure—State Comparisons

A comparative picture of state and local tax revenues in Colorado and its ten neighboring Western States is presented in Tables 4.8 - 4.13. Tables 4.8 and 4.9 show the combined revenue systems of state and local government for the years 1942 and 1953. The latter year is the latest for which complete Census data are available since 1932.

Tables 4.10 and 4.11 include revenue data applicable to state government only, and cover the years 1942, 1953 and 1956. The concluding tabulations found in Tables 4.12 and 4.13 apply to local governments and include data for the years 1942 and 1953, the last year being the latest for which data for this particular analysis are available.

The estimates of the relationship of "other taxes" to property taxes were based on a review of individual audit reports of a representative sample of cities and *Colorado Year Book, 1956-1958.*

For each of the states, comparisons are made with the eleven-Western State average (arithmetic mean and the median) and with the general average for the country as a whole. The analysis is designed primarily to point out such state differences as well as similarities as exist both in kinds of taxes in use, their productivity and the relative degree in which they are used.

State and Local Governments. The combined tax structures of state and local governments generally reveal a fairly close similarity between the states in major types of taxes used although there are a number of important exceptions as noted in Table 4.8. Taking 1953 as a year of reference, it will be observed that in all the states in the West general property is taxed, as well as motor fuel including motor vehicle licenses. Also, taxes are levied in all the states on liquor, insurance premiums, and, with the exception of Nevada, also inheritance. In addition, all the states have an income tax (at the state level) covering both individuals and corporations, excepting Wyoming, Nevada and Washington. Similarly, all the states employ the general sales tax excepting Idaho, Montana, Nevada[10] and Oregon.

With the exception of Colorado, Oregon and California, all states have a special state government tax on tobacco. However, California includes tobacco in its general retail sales tax base and Colorado taxes tobacco at the municipal level in certain cases. The failure of the Census data to include this latter item may be attributed in part to the relatively minor importance of this revenue source in the over-all state-local revenue structure. Of the two remaining listed tax groups, namely, the severance tax and pari-mutuel, the first is found in all the states excepting Wyoming, Arizona and

[10]However, since 1953 Nevada has adopted a state retail sales tax. (See Tables 4.10 and 4.11.)

Bureau of the Census, *State and Local Government Revenue in 1953;* and U. S. Bureau of the Census, *Compendium of State Government Finances in 1953.*

Washington, while the second, or pari-mutuel, has been adopted in six of the eleven Western States, these being Colorado, New Mexico, Arizona, Washington, Oregon and California.

Further examination of Table 4.8 reveals that for both 1942 and 1953 Colorado's aggregate taxes on a per capita basis were slightly above the median average for all eleven Western States. In detail, Colorado's per capita tax revenues in both 1942 and 1953 were under the median average in the case of the motor fuel and severance taxes but above the median for general property, individual income, inheritance and alcoholic beverage taxes. In the case of the general sales tax Colorado occupied a median position in both years considered.

The relative revenue importance of the various taxes noted in Table 4.9 shows generally the outstanding role of the general property tax which in 1953 ranged from a high of 54.69 percent of state-local tax revenues in Montana to a low of 21.17 percent in New Mexico. Colorado's ratio of 48.24 percent was slightly above the median average for the Western States, as well as above the national general average of 44.84 percent. It is notable that for all the Western States the relative importance of the property tax declined rather substantially from 1942 to 1953 — a fact which, in view of sharp per capita increases, cannot be construed to mean an absolute decline in revenues from this source, but rather that the productivity of alternative sources of revenue have greatly increased in importance over the period considered.

Aside from the general property tax the principal revenue producers in 1953 as well as for 1942 were the taxes on motor fuel and general retail sales. In 1942 motor fuel taxes ranged from a high of 19.33 percent of total revenues in New Mexico to a low of 8.80 percent in California. In 1953 also, the general sales tax in the seven states where it was used ranged from a high of

Source: Derived from U. S. Bureau of the Census, *State Finances;* 1942, Vol. 3, "Statistical Compendium;" U. S. Bureau of the Census, *Government Finances in the United States: 1942;* U. S. Bureau of the Census, *State and Local Government Revenue in 1953;* and U. S. Bureau of the Census, *Compendium of State Government Finances in 1953.*

35.97 percent of total revenues in Washington to a low of 17.05 percent in Colorado. No other single tax came anywhere near these two tax groups as a revenue producer.

State Government. Tables 4.10 and 4.11 include data for state governments corresponding to those presented above for combined state and local governments but with the difference that the period covered extends to 1956.

Preceding reference to the kinds of taxes used in the various states is equally applicable to state government analysis subject to modification only to the degree in which each tax is used.

An examination of Table 4.10 shows that aggregate state government tax revenues on a per capita basis in Colorado in 1953 and 1956 were below the median average for the eleven Western States. In detail, Colorado was below the median average of the Western States for both 1953 and 1956 in the case of general property, insurance, motor fuel, and "other" or miscellaneous taxes. It was, however, above the median

[a] Based on United States Department of Commerce estimated population as of July 1 of each year as reported in annual editions of the *Statistical Abstract of the United States.*

[b] Excludes Nevada.

Source: Derived from United States Bureau of the Census, *State Finances: 1942*, Vol. 3, "Statistical Compendium;" United States Bureau of the Census, *Government Finances in the United States: 1942;* United States Bureau of the Census, *State and Local Government Revenue in 1953;* and United States Bureau of the Census. *Compendium of State Government Finances in 1953* and *1956.*

in the case of individual income, inheritance, and pari-mutuel. Colorado's above average position is clearly in the inheritance tax field where per capita collections exceeded both the Western State and national averages in each of the three years considered.

The relative importance of individual taxes used by state governments as measured by the revenue produced by each tax to aggregate revenues is indicated in Table 4.11. Of particular interest is the degree to which states continue to use, if at all, the general property tax. It will be observed that Oregon is the only Western State that has completely abandoned this tax. The other ten states rely on the general property tax in varying degree, which in 1956, ranged from a high of 19.07 percent of total revenues in Wyoming to a low of 5.07 percent in Idaho. Colorado's ratio of 7.47 percent placed it at the median average for the Western States but substantially above the national average of 3.49 percent.

Apart from the relatively important role of the property tax in the state revenue systems in Wyoming and Arizona, principal revenues for state government in the eleven Western States are derived from taxes on general sales, motor fuel, and individual and corporate in-

Bureau of the Census, *State and Local Government Revenue in 1953;* and U. S. Bureau of the Census, *Compendium of State Government Finances* in 1953 and 1956.

comes. In the five states (Colorado, Utah, California, Arizona and New Mexico) that use all three taxes, aggregate receipts from these sources in 1956 ranged from a high of 73.33 percent of total state tax revenues in California to a low of 61.64 percent in New Mexico. Colorado with a ratio of 67.83 percent ranked in 3rd position, reading from high to low.

Of the eight states (Colorado, Wyoming, Utah, New Mexico, Arizona, Nevada, Washington and California) that tax general sales, receipts from this tax varied in 1956 from a high of 55.52 percent of total tax revenues in Washington to a low of 22.94 percent in Nevada. Similarly, of the eight states (Colorado, Utah, Idaho, Montana, New Mexico, Arizona, Oregon and California) that tax individual and corporate income, receipts ranged from a high of 52.64 percent of total revenues in Oregon to a low of 5.13 percent in New Mexico. Finally, of all eleven states taxing motor fuel, collection in 1956 ranged from a high of 34.92 percent in Montana to a low of 15.93 percent in Washington.

Local Governments. As noted in Table 4.12, Colorado's per capita tax of $76.63 for local government in 1953 placed it in 3rd leading position in the West. This figure was also above the general average for the nation. Similarly, Colorado's position in 1942 was somewhat above the eleven-state median average, ranking 5th in the over-all comparison.

Table 4.13 presents what has already been generally noted, namely, that local governments depend largely upon the general property tax for their means of support. Thus for 1953 the relative importance of this tax ranged from a high of 94.94 percent of all local tax revenues in Utah to a low of 77.58 percent in New Mexico. Colorado's ratio of 90.40 percent placed it in 7th ranking position in the eleven-Western State comparison. In this connection also, it is noteworthy that other sources of local revenue are becoming more important as evidenced by the relative increase of the aggregate of these taxes vis-a-vis the property tax for all Western States from 1942 to 1953.

CONCLUSIONS

Colorado's state and local tax structure differs little from that of other Western States in number and kinds of taxes used. Resting largely on a mixed property and consumption base, taxes tend to be regressive, which is most noted at the state level where sales taxes are predominant. Whether state and local taxes are, as a whole, higher, lower or about the same in Colorado than elsewhere is a question, however, that finds no direct or simple answer. Although the so-called "tax burden" measured by per capita taxes or per capita taxes to per capita personal income places Colorado well above the national average and at about a median position in Western State comparison, such indications of burden are highly limited. As averages they cannot tell how the burden is distributed nor do they disclose values received. Similarly, the impact of taxes on business development is not readily ascertained. Granting that a tax climate favorable to business is desirable this too must be seen in its proper perspective.

APPENDIX NOTE (Chapter IV)

State and local taxes are frequently assumed to exert a significant influence on the location of industrial activity. When low taxes are advertised by industrial development groups, when opposition to higher taxes is expressed on the grounds that business will not be attracted, when people fear the migration of present industry due to an unfavorable "tax climate" the implicit assumption is being made that business is deterred by high taxes and attracted by low taxes. The tenability of this seemingly reasonable assumption has become the subject of considerable analysis and critical review in recent years.

Staff discussion on this question has led to certain conclusions which are presented here as a supplementary note to the principal analysis of this chapter.

THE INFLUENCE OF STATE AND LOCAL TAXATION ON THE LOCATION OF INDUSTRY

A multitude of factors play a role in the location of industrial activity,[1] and therefore, a generalization concerning the significance of any one factor is quite tenous. However, it is reasonable to believe that a certain number of location decisions are made primarily on the basis of non-economic factors such as the health of the owner or the desire of the owner to reside in his home town. The scope of the discussion here, however, is necessarily confined to an analysis of those factors which are essentially economic in nature. A complete list of these economic factors would be difficult, if not impossible, to compile but some of the more important can be categorized as follows:[2]

Markets:
- Availability of markets.
- Availability of future markets.

Materials:
- Availability of raw materials.
- Availability of other materials.

Labor:
- Availability of labor.
- Cost of labor.
- Labor force productivity.
- Labor relations history.

Available Site and Plant Facilities:
- Availability of land.
- Availability of industrial fuels.
- Availability of water for industrial use.
- Existing building.
- Existing transportation facilities.

State and Local Considerations:
- Attitude of the community and local and state governments toward business.
- Availability of housing.
- Desirability of living conditions.
- General appearance of community.
- State and local laws and taxes.
- Subsidies and other financial inducements.

Climate:
- Effect on labor force.
- Effect on production.

Of the major factors which influence industrial location it is generally agreed that the most important one for a large part of industry is "... orientation toward the market to which the output of the plant must be delivered."[3] In addition, orientation toward materials and labor supply are generally considered to be of major significance. In contrast there is a wide divergence of opinion as to the locational significance of state and local taxes. On one side of the controversy are the industrial development groups who attach considerable importance to these taxes. On the other side are the individuals who take the position in the professional literature that taxes exert little, if any, locational influence. The latter position has been stated as follows:

> Governmental representatives should acquaint themselves with something which business has known for a long time, i.e., state and local tax structures are of relatively small importance in orienting or deterring industrial location.[4]

[1] For example, "How to Pick the Right Plant Site," *Modern Industry*, December 15, 1949, pp. 42-43, presents a checklist of nearly 200 items to be considered when choosing a plant site.

[2] For a complete discussion of the factors which influence the location of industry see Melvin L. Greenhut, *Plant Location in Theory and in Practice* (Chapel Hill, North Carolina: The University of North Carolina Press, 1956); Edgar M. Hoover, *The Location of Economic Activity* (New York: McGraw-Hill Book Company, Inc., 1948); Walter Isard, *Location and Space—Economy* (London: Chapman and Hall, Ltd., 1956); George T. Renner, "Geography of Industrial Location," *Economic Geography*, July, 1947; Herman Schumacher, "Location of Industry," *Encyclopedia of the Social Sciences*, Volume XIX, pp. 585-93; and Leonard C. Yaseen, *Plant Location* (New York: American Research Council, 1956).

The following analysis is designed to critically examine the issue raised above by presenting analytical considerations as well as such empirical evidence as is available.

Delimiting the Problem

Most of the analytical discussions and inductive studies concerning the location effects of taxation have been confined to manufacturing. Although this limitation is often justified on the methodological need to reduce the problem to manageable proportions, a more tenable reason is that most non-manufacturing industries apparently locate for reasons other than possible tax advantages. For example, taxation clearly exerts little influence on the location of such industries as agriculture, mining, and construction. In addition, a major basic industry "government" can be excluded from consideration since tax structures would obviously not affect the location of federal, state and local government installations. Numerous other industries such as transportation, communications, public utilities, and real estate can also be excluded. Although the location of some firms in these groups could possibly be affected by taxes, it appears that taxation does not affect the location decisions of the large majority of these firms. An indication of the importance of the above mentioned industries may be obtained by comparing the personal income they produce with total personal income. It can be seen from Table 4.A1 that farming; mining; contract construction; finance, insurance and real estate; transportation, communications and public utilities; and government, together accounted for 37.3 percent of total personal income in the United States in 1957.

Of the three remaining major industrial groups, services, wholesale and retail trade, and manufacturing, it is not unreasonable to dismiss services and trade since other location factors, primarily the availability of markets, would more than offset the influence of taxation. It is clear, however, that location of more firms in these industries could be affected by taxes than in such industries as agriculture and mining.

The trade and service industries produced 31.6 percent of the 1957 personal income. Hence their exclusion from the discussion in conjunction with those industries previously omitted, leaves only manufacturing which accounted for 31.1 percent of the 1957 personal income (Table 4.A1). It should also be noted in this connection that in Colorado manufacturing accounted for only 14.8 percent of personal income in 1957. Hence the percent of Colorado industries for which taxes may play a significant location role appears to be even smaller than for the nation as a whole.

While most analyses of the locational importance of taxation pertain to all manufacturing firms, it is clear that numerous firms are "locationally dependent," that is, one location factor is so important for these firms that all other factors are relegated to an insignificant, or non-existent role. For example, some firms are highly restricted in their choice of a plant site by the nature of their production process. Industries depending on water, whether for power or for other purposes, such as the aluminum industry, and certain chemical, paper and leather manufacturers, must be located near a water source regardless of any other factors. Similarly, industries in which drainage facilities are important, or in which such operation characteristics as noise or odor are important, are limited in their choice of a location. The nature of the product manufactured may also restrict the choice of a plant site. As an example, numerous firms produce a bulky commodity which can be transported much more cheaply in raw material than finished product form. Another example is the large group of manufacturers who are assemblers and deal with a product which can be shipped much more economically in "knocked-down" form. In addition, those firms which manufacture highly perishable commodities often must be near their market to avoid costly or impractical transportation. The large group of firms which manufacture in order to supply another manufacturer would frequently have to be located reasonably near the buyer and would therefore have little control over location. For example, producers of most automobile parts must be near automobile manufacturers, in order to cooperate efficiently with them.[5]

Table 4.A1

Personal Income by Industrial Source United States and Colorado, 1957

Source	United States Amount (millions)	United States Percent of total	Colorado Amount (millions)	Colorado Percent of total
Farming	$14,450	5.2	$193	7.5

It is clear from the preceeding discussion that a certain portion of American industry does not possess a sufficient degree of locational freedom

[5]Joe Summers Floyd, Jr., *Effects of Taxation on Industrial Location* (Chapel Hill, North Carolina: The University of North Carolina Press, 1952), p. 19.

that state and local taxation could exert any appreciable influence on its location. Even using an objective criterion such as personal income however, it is difficult to measure the significance of these firms. Nevertheless, non-manufacturing concerns accounted for 68.9 percent of the total personal income in 1957, and although the location of some of these firms may be affected by taxation it would appear that this is not true for the majority. Of the personal income produced by all manufacturing firms, it is impossible to determine that portion which was produced by locationally restricted firms. Nevertheless, all manufacturing firms together produced only 31.1 percent of the total personal income in 1957. Hence, if all manufacturing and even some non-manufacturing firms were locationally independent, it seems reasonable to conclude that more than half of the personal income produced in the United States is produced by firms for which taxes could exert little locational influence.

Although it appears that the location of only a part of American industry could be directly influenced by state and local taxes, an analysis of the effect of taxes on these firms is nevertheless worthwhile. If the location decisions of these firms are actually guided by state and local taxes, their location in a community could result in general economic growth which would in turn cause the establishment of other firms whose location is not directly influenced by state and local taxation. Hence, the location of many firms may not be directly influenced by state and local taxes but it is possible that these taxes exert an indirect influence on their location.

Types of Location Decisions. Location decisions arise in the following three situations: (a) the establishment of a new business; (b) the relocation of an existing business; and (c) the establishment of a branch plant.[6]

Decisions involving the establishment of a completely new business appear to constitute a fairly small part of the total number of location decisions made each year. When a new business is undertaken, other initiating problems are often more significant than where to locate. In addition, many new enterprises start out as small firms and funds for researching alternative locations are limited.

Decisions involving relocation also appear to be uncommon in relation to the total because few firms earning a reasonable profit will jeopordize it by moving a plant in order to obtain a greater profit. The problems involved in completely uprooting a plant and relocating it are, of course, numerous and often extremely costly to resolve. In addition to the cost of moving, there is the opportunity cost of the income which is lost while the move is being made.

The most frequently made plant location decisions seem to involve the establishment of branch plants. The most common preferences given for the building of a branch plant, rather than expanding a present plant, are: (a) to be nearer a growing market; (b) to permit the building of a more efficient plant; (c) to reap the economies of decentralization; and (d) to locate nearer a material source.

From the preceding discussion it appears that if state and local taxes exert any influence at all, it is primarily on those location decisions involving the establishment of a branch plant. Therefore, a belief that taxation can result in an extensive development of new businesses and the wholesale migration of existing businesses seems to be largely unfounded.

The Problem of Measurement

The question of the influence exerted by state and local taxes on location involves two subquestions. The first is how to measure tax burdens so they may in turn be compared. If it is contended that one area's "low taxes" will attract industry, it must be shown that taxes actually result in a smaller burden to industry in that area rather than in another. Given the difference in tax burdens, the second question is, what effect would such differences have on the location of industry. Although the measurement of tax burdens may appear to be simple, the fact is that such measurement is virtually impossible for reasons noted in subsequent discussion.

Two common methods of measuring comparative tax burdens, as noted in Chapter IV, are: (a) to reduce tax revenues to a per capita basis; and (b) to compare tax revenues with personal income. Such methods may give some indication of general tax levels but they give little indication of the tax burdens which would be significant in decisions involving industrial location. If, for example, a state raises substantial revenues from a personal income tax or a residential property tax, an apparently high tax area would have little deterrent effect upon the location of industry. Hence, the composition of tax structures is more important to location decisions than an over-all measure of tax levels such as per capita tax revenues or the ratio of revenues to personal income.

Another method sometimes used in an attempt to measure tax burdens is to compare tax rates. Such a procedure is, of course, meaningless unless the bases of the taxes are also comparable. For example, a comparison of corporate income tax rates would be meaningless unless exclusions, deductions, and other provisions were also compared. Similarly, there is the matter of administrative differences which often make comparisons of tax burdens in two areas extremely difficult.

---

[6]This classification is based on that used by Glenn E. McLaughlin and Stefan Robock, *Why Industry Moves South*, National Planning Association, Committee of the South, 1949, pp. 18-20. An indication of the frequency of these types of location decisions can be obtained from this study. Of the 88 new plants examined, two were completely new businesses, three were relocations and 84 were branch plant establishments.

Another consideration which adds to the problem of measurement is the relationship between state and local taxes and the federal tax. The burden represented by the tax levels in two areas is substantially different if one compares total tax bills and not just state and local tax bills. This divergence is due to the federal income tax provision which permits deduction of state and local taxes. Hence, in the case of corporate tax burdens, the addition of the federal income tax has the effect of diminishing the differential in tax levels which would be incurred in various states. For example, if State A collected $10,000 more from a corporation than State B, the additional tax revenues would represent a burden to the corporation of only $4,800, since the federal government contributes a percent of the additional state and local tax revenues equal to the marginal rate of the federal tax, which in this case is assumed to be 52 percent. Therefore, a comparison of total tax levels is considerably more meaningful than a comparison of state and local taxes alone.

Moreover, any realistic evaluation of the impact of taxes on the location of industry must also take into account the level and character of the governmental services provided business by the taxing jurisdiction.[7] Low taxes usually mean that a community is foregoing government services. If the business concerns must as a consequence provide these services, the low taxes of an area may very well prove to be false economy.[8] For example, if a firm must provide additional fire and police protection, little savings will result from low taxes. Likewise, the ability of a firm to attract competent personnel will be greatly hindered if qualified schools are unavailable. Of course such specific benefits are usually difficult to relate directly to taxes paid. Nevertheless, general benefits are basically dependent on the general level of tax collections in a given community and cannot be ignored when comparing the tax burdens of industry.

Impact and Incidence of Taxes. Finally, there is the question of tax incidence and shifting, that is, who in the final analysis actually pays the tax? If taxes are to act as a location factor their incidence (final burden) as well as their impact (initial burden) must rest, at least in part, with the business firms involved. It is generally agreed, for example, that consumption taxes, such as tobacco and liquor taxes, are shifted totally to the consumer in the form of higher prices.[9] In this case, the business acts only as a tax collector and not as a taxpayer. Hence, these taxes would have little effect on the location of industry.

The levying of a tax on a business may have a multitude of effects. The tax may be shifted forward to the consumer in the form of higher prices, it may be shifted backward in the form of lower payments to the factors of production or lower prices to suppliers, it may be absorbed by the firm, thereby lowering profits, or finally a combination of any of the above may occur. In addition, output or input price changes may even be greater than the amount of the initial tax.[10]

In most cases it is very difficult to predict which of these effects the levying of a tax will have. Numerous factors will have an effect. The ability of a firm to shift taxes will depend primarily on the degree to which output and input prices can be modified without affecting the quantities sold or offered, or in more technical terms, demand and supply elasticities.[11] Another factor of some importance for shifting is price level movements. Forward shifting, for example, may be accomplished more easily in times of inflation than in other times.

Another determinant of a firm's ability to shift taxes is the location of the firm. Therefore, if the ostensible tax burdens of two localities are being compared, it should be remembered that the tax might be shifted in one locality and absorbed in another. For example, a firm's competitive position might permit it to shift the tax in one area but not in another. Similarly, the availability of labor in one area might be such that the tax could be shifted backward with ease whereas in another area backward shifting would be impossible.

Although there is considerable lack of agreement concerning the incidence of taxes, there is substantial agreement that the complete absorption of a tax by a firm would be rare. However, it is only the amount of taxes which are absorbed that would act as a location factor. Hence, if taxes are to play a significant role in the location of industry, it would have to be assumed that firms have little ability to shift taxes.

Considering the numerous problems encountered in attempting to measure comparative tax burdens, an analysis of the impact of these burdens on the location of industry must be made with caution, since the precision which can be obtained in measuring the effect of any variable is limited in part by the degree to which the variable can be defined.

---

[7]The necessity of considering benefits as well as taxes in public finance has been succinctly summarized as follows: "Notwithstanding a widespread impression to the contrary, the government does not raise money only for the purpose of dropping it into the bottom of the sea." Harold M. Groves, *Financing Government* (fourth edition; New York: Henry Holt and Company, 1954), p. 223.

[8]An example of a case in which inadequate services played a more important location role than low taxes, can be found in "When Low Taxes Repelled an Industry," *American City*, August, 1950, p. 5.

[9]Groves, *op. cit.*, p. 102.

[10]The firm may seize the opportunity of an increased tax to increase prices by an amount in excess of the tax. Another occurrence which results in price increases in excess of the initial tax is "pyramiding" of a tax. This may occur when a tax is passed forward through several marketing stages, if the goods are "marked up" as a percent. Hence, business firms may even make a profit on the tax.

[11]Otto von Mering, *The Shifting and Incidence of Taxation* (Philadelphia: The Blakiston Company, 1942), p. 4.

Review of the Studies Which Have Been Conducted

The numerous studies which have been undertaken concerning the importance of taxes as a location factor can be classified by their approach or method used. The four most common are: (a) correlation method; (b) questionnaire or interview method; (c) computation of taxes as percent of total costs; (d) computation of hypothetical tax bills.

Correlation Method. Representative of the correlation-type approach is the frequently quoted study made by G. A. Steiner in 1938.[12] An attempt was made to compare "industrial development" with the "tax burdens" for nine states. The industrial development index was made up of the percentage changes over a 17-year period of 12 factors, including such indicators as value added by manufacture, per capita income, and population. The tax burden was measured by the changes in property tax collections, state and local taxes, and state and local taxes compared with corporate profits. The conclusion reached was that the changes in tax burdens had not affected changes in the growth of manufacturing.

A more recent and less complex study was made by the Twin Cities Business Executives' Research Committee in 1954.[13] Again, an attempt was made to measure the effect which taxes have on the rate of economic development. The ten states which had the highest ratios of state and local taxes to income, and the ten states which had the lowest ratios, were compared with the rate of "economic development" which, in this case, was measured by the increase in employment and value added by manufacture. When the ratios of taxes to income were compared to "economic development," it was found that in those states where taxes were relatively high, economic development had occurred at the most rapid rate. It would appear from this study that high taxes not only fail to deter or retard economic growth but actually foster it.

It can readily be seen that a major problem in the correlation type approach is in attempting to measure the tax burden, and industrial or economic growth. The Steiner Study has been criticized because it fails to "...develop valid measures of either the growth of manufacturing activity or the growth of tax loads on manufacturing corporations."[14] The same criticism may be made of the Executives' Research Committee Study. However, although these studies do not develop precise measures of tax loads of economic growth, they do indicate that economic growth is not necessarily precluded by apparently high tax loads.

A more fundamental and inherent difficulty involved in the correlation approach is the problem of inferring causality from co-variation. From the simultaneous occurrence of high taxes and rapid industrial growth one can only infer that high taxes do not preclude industrial growth. An inference that high taxes caused the growth or vice versa would be questionable. Closely related to this problem is the impossibility of isolating the impact of taxation on industrial growth. Development may occur in spite of the taxes, not because of them. It would be highly questionable to imply that post-war growth in California or Florida was due simply to tax policies; which a simple correlation analysis between taxes and "growth" would indicate.[15]

Questionnaire or Interview Method.[16] If an attempt is being made to discover how important taxes are as a location factor, it would seem that the least difficult method would be simply to ask businessmen how important they consider them. A study by the National Planning Association in 1949 is an example of the questionnaire method.[17] A detailed investigation was made of 88 industrial plants which had recently located in thirteen southern states. Although no attempt was made to numerically rank location factors by their degree of importance, the conclusion was reached that, "In almost all instances, it was clear that companies had carefully compared the tax burdens in different states."[18] Although the magnitude of the taxes was frequently offered as a factor, some significance was also attached to the variation of taxes. Hence, firms seem to be concerned with the certainty of tax costs and not only with the magnitude of the taxes. In addition, some firms viewed low taxes not only in terms of how the firm's cost structure would be affected, but also as an indication of a community's attitude toward business, this latter factor apparently being of some locational significance.

[15] For a complete discussion of the shortcomings of the aggregative-inferential approach to this problem see *Report of the Minnesota Tax Study Committee* (Minneapolis, 1956), p. 119, and Floyd, *op. cit.*, pp. 12-16.

[16] Two questionnaire-type studies which are pertinent to Colorado are discussed in a later section.

[17] McLaughlin and Robock, *op. cit.*

[18] *Ibid.*, p. 107.

In another study, 106 manufacturers who had recently located in New England were interviewed.[19] Company officials were asked to name the "principal factor" which influenced the location of the plant site. While many officials said that "personal considerations" were of prime significance, the author of the study concluded that taxes did not exert a significant influence on the location choice.[20]

Conclusions reached through the questionnaire approach should be accepted with caution because the approach contains several inherent difficulties. A major problem, as is true with all surveys, is that of getting a representative sample. This problem is especially difficult with a survey of manufacturing firms since there are few common characteristics of manufacturers. Another problem is the difficulty of finding categories, or reasons, which are meaningful. For example, the category "personal considerations" may or may not include the factors of taxes or labor. The most difficult problem inherent in the questionnaire method is that answers given frequently do not reflect the actual motivation behind the decisions. Although it may be contended that taxes are important as a location factor if businessmen *think* they are important regardless of their actual significance as measured by an objective standard such as costs, it would appear that costs will overcome unfounded subjective "beliefs" in the long run.

Taxes as Percent of Total Costs Method. This approach assumes that the percent of total business costs accounted for by state and local taxes is indicative of the locational significance of these taxes. Hence, the problem is simply to determine state and local taxes as a percent of total costs. A commonly used method of attempting to solve this problem is to utilize a cost questionnaire. One such study conducted utilized a sample of 612 Pennsylvania firms.[21] Of these 612 firms, 435 reported that state business taxes[22] were one percent or less of total costs. For the total number of firms (612), business taxes represenetd an average of only .55 of one percent of total costs.[23]

A more recent study done in Minnesota, also utilizing a questionnaire but including more state taxes, reached similar conclusions.[24] Using a 600-firm sample of the some 5,000 manufacturers in the State, firms were asked to estimate the percent of total costs represented by state and local taxes. The medians of all industry medians are as follows:[25]

Type of Tax	Percent
Real property	0.67
Personal property	0.80
Corporate income	0.52
Other (state and local)	0.43
Total	2.42

Although these studies clearly point to the conclusion that tax costs are a small percent of total costs, the tenability of the inference that taxes therefore play a small part in the location of industry is questionable. It would appear that the locational significance of any cost factor would be indicated by the differentials in costs which would be incurred in various localities and not simply by the percent of total costs accounted for by that factor. For example, if labor costs were identical in all locations, labor would exert little influence on industrial location even though it might represent a very large portion of total costs. Similarly, taxes would exert little influence on industrial location if they resulted in identical costs in all areas. Therefore, attempts to determine the locational significance of state and local taxes must center around the differentials in tax liabilities which would be incurred in various localities. In addition, the total tax differentials and not simply the state and local tax differentials are significant. As mentioned earlier, the introduction of federal tax burdens into the analysis greatly reduces the magnitude of the differentials and therefore the locational significance of taxation is actually less than would be indicated by viewing the differentials in state and local taxes alone.

Hypothetical Tax Bill Method. Predicated on the assumption that tax differentials between areas are more significant than absolute costs, several studies have attempted to measure the tax costs that would be incurred by an actual or hypothetical firm if it were located in alternate places. In the best known of the studies,[26] hypothetical tax bills were computed for *two* corporations alternatively placed in cities in 19 states, and for *one* corporation alternately placed in cities in four states. The state and local tax bills varied substantially although the

[21]Jesse Burkhead and Donald C. Steele, "The Effect of State Taxation on the Migration of Industry," *Journal of Business of the University of Chicago*, July, 1950. Contrary to most studies done on the importance of taxes as a location factor, this study was not confined to manufacturing.

[22]"Business taxes" were defined as state corporate income tax and the capital stock tax (for domestic corporations) or the franchise tax (for foreign corporations operating in Pennsylvania).

[23]*Ibid.*, p. 168.

[24]Business Executives' Research Committee, *op. cit.*

[25]*Ibid.*, p. 49.

[26]Floyd, *op. cit.*

addition of federal tax reduced the inequality of the tax bills considerably.[27] The study leads the author to conclude that ". . . under certain conditions tax considerations may influence the selection of location for some, but by no means all, types of industrial plants."[28] This conclusion is extremely tenuous considering that only three firms were studied—quite a small sample from which to generalize.

In another study using the hypothetical tax bill method,[29] three hypothetical corporations were constructed on the basis of examining 50 actual corporate financial statements. The tax bills were then computed for these firms in 185 communities in 10 states. It was again found that tax bills varied considerably, although the magnitude of the differentials was diminished by the addition of the federal tax.[30] If tax differentials alone were indicative of the importance of taxes as a location factor, the size of the tax differentials in this study would indicate that taxes were quite significant. However, a very serious limitation on this inference is the implicit assumption in the hypothetical tax bill approach that "all other factors are equal"—which is obviously not true. Until these numerous other factors are taken into account, broad generalizations based on this method should be made with caution.

Studies Pertinent to Colorado

Although the studies discussed above are subject to methodological qualifications, in total they suggest that state and local taxes are less significant as a location factor than is often presumed. However, these studies, being general, do not necessarily apply to a specific taxing jurisdiction. Thus, a particular community may employ a tax which is extremely troublesome to business.[31] A more important possibility is that a community may be attracting the marginal firm for which taxes are, of course, an important location factor.[32] In addition, the influence of taxation appears to be more significant in a metropolitan area which covers several states, such as Metropolitan New York, than for a relatively isolated metropolitan center such as Denver.[33] For this reason, it is desirable to review two important studies which are pertinent to Colorado.

Garwood Study.[34] This study is an investigation of the factors influencing the location of 116 manufacturing firms established in Colorado and Utah between 1946 and 1950. Personal interviews were held with the officials of these firms and the importance of numerous location factors was discussed. The author concludes that the five major factors attracting industry to Colorado and Utah are, in order of importance: (1) markets, (2) materials, (3) labor, (4) available sites and plant facilities, and (5) climate. Concerning the effect of taxes it was found that:

> . . . most company officials had no comment to make on the state tax structure. Many owners had no idea as to the extent of their tax burdens and expressed no concern over any particular tax. Officials of fewer than ten firms had any comment to offer as to the taxes as they found them in their new locations.[35]

Although this study indicates that taxes are quite insignificant as a location factor, it should be remembered that the technique of informal interview and of subjectively evaluating the importance of various location factors may result in some distortion.

Colorado Business Bureau Study.[36] This extensive study was based on personal interview, wherein executives of 253 Colorado manufacturing plants, established between 1948 and 1957, were asked to indicate which of 30 selected factors had strongly influenced their choice; had some influence; or had no influence over their choice of an industrial site. One of the preselected factors was "State and Local Taxes." In reference to this factor, 87.3 percent of the firms interviewed said that the factor *did not* enter into their choice, 8.7 percent said that state and local taxes had "some influence," and only 4.0 percent said that the factor had "strongly influenced" their choice.[37] The 30 selected factors used in the study and the influence exerted by each are presented in Table 4.A2. It can be seen that the factor State and

[29] Pennsylvania Economy League, *The Relative Tax Cost to Manufacturing Industry*: 1957 Revision (Pittsburgh: Regional Industrial Development Corporation, 1957).

[30] *Ibid.*, pp. 34-48.

[31] For example, there is some evidence that removal of a long standing inventory property tax exemption in Baltimore may have had an adverse effect on the community's growth. The exemption has since been restored. See Harison Weymouth, Jr., "Baltimore's Tax Lesson," *Industrial Development*, August, 1958, pp. 69-71.

[32] A direct relationship is frequently presumed to exist between the establishment of industry and the welfare of a community. Such an assumption may be faulty if a community relies on attracting marginal firms for which low wages, tax concessions, and special inducements are mandatory conditions of remaining in business.

[33] A recent study concerning the location of industry within the New York Metropolitan Region reached the conclusion that taxes were contributing to a decentralization trend. See Allan K. Campbell, "Taxes and Industrial Location in the New York Metropolitan Region," *National Tax Journal*, September, 1958.

[35] *Ibid.*, p. 190.

[36] L. J. Crampon and Paul W. DeGood, Jr., *Industrial Location Survey* (Bureau of Business Research, University of Colorado, 1957). Also summarized in L. J. Crampon, "Factors Influencing the Selection of a Plant Site" (Boulder: Bureau of Business Research, Colorado University, n. d.).

[37] Crampon and DeGood, *op. cit.*, p. 69.

Local Taxes was ranked 27th, having been mentioned by 12.7 percent of the firms interviewed.

Although this study is subject to the inherent limitations of a questionnaire type study, it appears to be more reliable than the Garwood Study because the sample was larger, and the basis for attaching relative importance to each factor was somewhat more defensible.

Table 4.A2

Relative Importance of Location Factors 253 Colorado Manufacturing Firms Established between 1948 and 1957

Factor	Percent of responses attributing influence to factor		
	Strong influence	Some influence	Grand total
Availability of markets	44.3	17.0	61.3
Availability of future markets	26.9	23.3	50.2
Over-all growth of state or area	27.7	20.9	48.6
Desirability of living conditions	26.5	17.4	43.9
Availability of raw materials	27.3	15.8	43.1

Summary and Conclusions

Because of the importance of other location factors, state and local taxes apparently play little role in the location of such industries as agriculture, mining, construction, government, communications, transportation, and portions of trade and services. In addition, some manufacturing firms are limited in their choice of a location site and therefore cannot attach substantial importance to taxation. In total these locational restricted concerns probably account for more than half of the total personal income produced in the United States. Other analytical considerations such as the problems of measurement and of shifting and incidence lead to the untenability of the assertion that state and local taxes are a cardinal factor in the location of industry. Several inductive studies, though subject to methodological qualifications, also point in the same direction. Moreover, for the Colorado area it appears that on the basis of such studies numerous other factors have played a more important role in the location of industry than taxation.

In conclusion, on the basis of available evidence the broad generalization can be made that state and local taxes exert a relatively insignificant influence on the location of industry, that a simple direct relationship between a "favorable tax climate" and rapid economic growth does not exist, and that the problem is substantially more complex than is frequently presumed.

CHAPTER V

STATE GOVERNMENT FINANCE

The purpose of this chapter is to present in greater detail than was possible in Chapters III and IV the over-all disbursements' and receipts' picture of state government in Colorado as summarized in Tables 5.1, 5.2, and Chart 5.1. In addition, the State's fund structure is examined with particular attention directed to the question of financing the General Fund including its future expenditure and revenue requirements projected to 1965. In each analysis the period of principal reference covers the post-war years, or from 1946 to 1957 and, where data are available, to 1958.

Total Disbursements[1]

In the interpretation of total state disbursements it is important to distinguish between four board classes: (1) general expenditures, that is expenditures for operations and capital requirements of the State establishment as such, (2) payments of State collected funds to counties and cities, (3) payments for debt retirement (which must be excluded from general expenditures to avoid double counting since general

[1]Unless otherwise noted the discussion in this section is based on Table 5.1.

expenditures include outlays from borrowed funds) and (4) payments into or out of trust funds including the investment of surplus funds and miscellaneous inter-departmental transfers. Expenditures in the last category do not result in any change in the net value of State assets and are included in disbursements as shown in Table 5.1 only for purposes of presenting a complete statement of financial transactions.

General Expenditures.[2] The cost of operating and maintaining the various state departments and institutions including capital outlays amounted in 1957 to $128 million.[3] Of this amount expenditures for education accounted for 21.13 percent, state highways, 45.27 percent,

[2]Includes both operating and capital outlays.

[3]The terms "costs" and "expenditures" are used interchangeably.

Table 5.4 shows the trend of general expenditures since 1946. It will be observed that the total outlay of $128 million in 1957 exceeded its corresponding total in 1946 by 504 percent and that for 1950 by 111 percent. Expenditure increases over these periods have exceeded the rate of population growth as noted by per capita increases of 330 percent and 67 percent for the two periods (1946-1957 and 1950-1957), respectively. However, price inflation was an important factor contributing to the over-all expenditure changes noted. If allowance is made for price change, the "real" per capita outlays for the two periods noted increased at the rates of 147 percent and 25 percent, respectively.

Taking the more current period from 1950 to 1957 as the base of reference it will be observed that per capita expenditures (in uniform 1956 purchasing power dollars) increased from $58.03 in 1950 to $72.54 in 1957, or an increase of $14.51. Of this amount approximately two-thirds was accounted for by enlarged outlays for state highways, while the remaining one-third divided between state institutions (education, penal and eleemosynary) and other State functions.[4]

Payments to Counties and Cities. State payments to counties and cities amounted in 1957 to $110 million[5] which was directed to designated purposes as follows: old age pensions, 52 percent of total; other welfare, 11 percent; public school aid, 21 percent; county roads, 15 percent; and all other, 1 percent (derived from Table 5.1).
