State disbursements to local governments have their principal revenue support in "shared taxes" consisting largely of the highway user taxes; excise taxes (Table 5.5); appropriations from the general fund; and federal grants. For 1957 "shared taxes" and special taxes (sales and liquor) covered 50 percent of total outlays to the counties and cities while general fund revenues and federal grants accounted for 21 percent and 29 percent, respectively. In summary, 71 percent of State disbursements to local government was financed from the State's own revenue sources.[6]

The role of the Federal Government in the local governmental aid picture is largely con-

[4] For a more detailed analysis of expenditure for state institutions see again Chapter III.

[5] This figure, taken from Table 5.1, is $1.3 million less than the total shown in Chapter XX, Table 20.13, which presents in detail all payments to cities and counties. The larger total of this latter tabulation is due in part to a different system of classification than that employed in Table 5.1 and, in part, to the inclusion of certain items not shown in the formal State accounts upon which Table 5.1 is based.

[6] Based on Table 20.13 (Chapter XX).

fined to old age pensions and other welfare payments.[7] This means therefore that State financed aid to the counties includes, in addition to old age pensions (financed by excise taxes), assistance for county highways (financed mainly by the State highway user taxes), and aid to public schools (financed largely from the State's General Fund).

General Expenditures and Payments to Counties and Cities. A more complete procedure showing where the State's money has gone and perhaps a better basis for judging whether or not the public is getting its moneys worth for what appears as an enormous current expenditure total compared with past years may be had by combining general expenditures with payments to counties and cities. The aggregate of these two expenditure groups which amounted to $238 million in 1957 is reclassified by major functions or purposes, as shown in Table 5.6. In this frame of reference it will be seen that welfare payments accounted for 29.43 percent of total expenditures; education, 21.03 percent; highways, 31.26 percent and "all other" 18.28 percent. In summary, over 80 percent of Colorado's state government expenditures in 1957 (apart from debt retirement, and miscellaneous trust fund and transfer payments) were made for three major purposes, namely: welfare, education and highways.[8] Moreover, if outlays for penal and eleemosynary institutions are included as a type of welfare payment this would increase the ratio to approximately 87 percent, thus leaving only 13 percent of the aggregate expenditure total not accounted for by the "big three" functions of the State.

Table 5.6

Combined General Expenditures and Payments to Counties and Cities, by Principal Functions, of State Government in Colorado Fiscal Year, 1957

Function	Amount (thousands)	Percent of total

Table 5.7 shows the trend of combined general expenditures and payments to counties and cities by functions since 1946. It will be seen that the total outlay of $238 million in 1957 exceeded its corresponding total in 1946 by 315 percent and the total for 1950 by 82 percent. However, on a per capita price-adjusted basis the corresponding percentage changes were 70 percent and 8 percent. Popularly expressed it can be said that expenditures of the State for every "man, woman and child" in Colorado in 1957 were—in uniform purchasing power dollars—8 percent greater than they were seven years ago, or in 1950, and 70 percent greater than in the first post-war year of 1946.

A test as to whether expenditures in "real" terms are in line with the realities of enlarged or improved public services and facilities realized would be difficult to make in any event. However, an 8 percent expenditure increase in 1957 over 1950 does not appear to be out of line with obvious gains in the past few years in such services as welfare, education and highways. Nor is the 70 percent increase—from 1946 to 1957—a matter that could be seriously questioned in terms of comparative gains in public services realized over this ten-year period.

Debt Retirement. The third expenditure classification, shown in Table 5.1, is debt retirement which in 1957 amounted to $904 thousand. Since the State does not have a general debt,

[7] For further discussion on federal and state aids see Chapters XIX and XX.

[8] As noted in Chapter III the ratio and subjects included closely approximate that found for combined state and local expenditures.

obligations retired consist essentially of highway bonds or tax anticipation warrants issued for State building purposes.[9]

Trust Fund Payments and Miscellaneous. This category of State outlay includes various payments from trust funds and transfers including investments of State surplus funds. As such they do not affect the value of State assets and, therefore are not pertinent to this analysis.

TOTAL RECEIPTS[10]

Receipts of State government for the fiscal year ending in 1957 amounted in the aggregate to $311 million (Table 5.2 and Chart 5.1). Of this amount $237 million represented "revenue" and $74 million "non-revenue" receipts. Revenue receipts include all money or wealth received under such conditions that they increase the assets of the State government without increasing the liabilities. Principal revenue items include taxes, licenses and fees, department earnings and federal grants. Non-revenue receipts include all other items which are included in State accounts to secure a complete statement of receipts although they do not result in an increase in the net value of the State's assets. Principal among these are receipts for various trust funds (i. e. employment security, state compensation insurance and public employees retirement); receipts from bond issues and matured investments and interdepartmental transfers.

For the purposes of this study it is the changing magnitude and composition of revenue receipts that are of greatest interest. This is so for the reason that these receipts are the principal means by which the general operations of the State are financed including payments to cities and counties.

Taxes. As can be seen from Table 5.8 taxes constitute the larger part of total revenue receipts. Thus of total revenues[11] of $237 million reported for 1957, taxes accounted for 62.28 percent; licenses and fees, 2.85 percent; departmental and other earnings, 9.41 percent; and federal grants, 25.46 percent.

Aggregate state tax revenues in Colorado were, in 1957, approximately three times what they were in 1946, having increased from $49 million to $149 million, or at the rate of 200 percent. For the more recent period from 1950 to 1957 taxes increased from a total of $86 million to $147 million or at the rate of 72 percent.

Since population, prices and personal incomes also advanced sharply over this twelve-year period a closer measure of the changes in the

[9] For full discussion of both state and local debt see Chapter XXI.

[10] Unless otherwise noted the discussion in this section is based on Table 5.2.

[11] The terms "revenue" and "revenue receipts" are used interchangeably throughout the discussion in this chapter as are the terms "taxes," "tax revenue," "tax receipts" and "tax collections."

"burden" of the tax is had by drawing comparisons which allow for each of these factors. As noted in Table 5.9, per capita taxes increased from a total of $40.96 to $87.73 between 1946 and 1957, or at the rate of 114 percent; and from $64.16 to $87.73 between 1950 and 1957 or at the rate of 37 percent. However, if the effects of price increases are eliminated the per capita "real" increases (or the increase in uniform purchasing power dollars, in this case in 1956 dollars) for the two periods were 49 percent and 17 percent, respectively. In other words, the taxpayer on an average-per-person basis was called upon to divert to state government 49 percent more purchasing power (command over goods and services in the private market) in 1957 than in 1946 and 17 percent more than in 1950.

Table 5.9

Further examination of Table 5.9 reveals that State taxes amounted to 4.41 percent of aggregate personal income reported for the State in 1957—a ratio somewhat lower than that shown for 1950.

Comparatively, and as noted in Table 5.10, per capita state taxes in Colorado were, in 1957, below both the general and median average for the eleven Western States. On a per capita basis also, the ratio of Colorado's taxes to personal income was less than the general average as well as the median average of these states.

In drawing conclusions from these analyses it must, of course, be recognized that measures of tax burden based on per capita data are unrealistic in the sense that they do not take into account the distribution of taxes or incomes in any given taxpaying situation.[12] To the extent, however, that they do point to basic relationships it would appear that the over-all burden of state taxes in Colorado has not increased at the rate commonly supposed, but, in fact, could be regarded as having changed only moderately, all things considered. Per capita measures indicate also that Colorado is not out of line with other Western States.

Table 5.10

Tax Structure.[13] Sales, highway user and income taxes constitute the principal source of tax revenue of the State. As shown in Table 5.11 these taxes accounted for 77.95 percent of total tax revenues in 1957. Viewed generally, it is further noted that "consumer taxes" (sales, liquor, highway user, insurance and pari-mutuel) accounted for 67 percent and general property 8 percent of total tax revenues. Accordingly, the State tax structure could be

regarded as being predominantly regressive in nature—a feature which tends to characterize state taxation in the West generally.

General Property Tax. Although receipts from the general property tax, including the specific ownership tax on automobiles, have more than doubled since 1946, no substantial modification of property tax policy for state financing purposes is indicated. Thus, the trend of rates has tended to hold fairly constant with a high of 4.53 mills reported for 1947 and a low of 2.70 shown for 1954. After 1954 the rate was lifted to over 3 mills and in 1956 the levy (collectable in 1957) was 3.56 mills (Table 5.12). This rate was in turn divided into 31 smaller levies made for specific purposes but mainly for educational and eleemosynary institutions.[14] (See Table 7.6.)

Table 5.12

Mill Levy for State Government and Assessed Valuation in Colorado, 1946-1957

Retail Sales Tax. The sales tax (retail and user taxes combined) which, next to the highway user group, is a principal State tax on consumption expenditure brought in revenue totalling $42 million in 1957, or 28.55 percent of aggregate taxes collected in that year. As a part of the sales tax total, the use tax accounted for about $3 million or 2.12 percent of aggregate State tax revenues.

Since 1946 sales tax revenues have nearly tripled in amount but due to the increasing importance of other tax sources their relative position has tended to decline somewhat or from a high of 34.66 percent of total tax revenues in 1948 to a low of 28.55 percent in 1957.

Highway User Taxes. In 1957 the highway user taxes (motor fuel, motor vehicle licenses and the P. U. C. Carrier taxes) brought in $45 million in revenue, or 30.73 percent of aggregate State tax receipts. Total collections from the motor fuel tax amounting to $32 million was net after refunds of approximately $4 million.

[14]State of Colorado, Colorado Tax Commission, *Annual Report 1956*, p. 121.

The public utility carrier tax known as the "ton-mile tax" accounted in 1957 for somewhat over $6 million of revenue as it did in 1956. Prior to the 1954, and before the introduction of the ton-mile tax as now constituted, revenues from trucks had ranged upward from about $1 million in 1946 to $3 million in 1954.

Income Tax.[15] The income tax (individual and corporate combined) is the third largest revenue producer in the State's tax structure ranking next in order to sales and the highway user taxes. In 1957 income taxes after refunds amounted to $27.5 million or 18.67 percent of total tax revenue receipts in that year.

Since 1946 net collections from this tax have increased four fold; yearly increases have been continuous excepting in 1953 and 1954 which possibly reflects the slight recession during a portion of this period.

Other Taxes.[16] Of the remaining tax sources, which in 1957 accounted for 13.92 percent of total tax revenues, the principal individual taxes were the liquor tax, amounting to 3.62 percent of aggregate State tax receipts; the inheritance and gift tax, 3.08 percent; insurance tax, 2.65 percent; the tax on gross income from gas and oil production, 2.64 percent; pari-mutuel receipts, 1.45 percent; and miscellaneous other taxes, 0.48 percent. The gross income tax on gas and oil and pari-mutuel are the only new post-war taxes, other than the gross ton-mile tax, that have come into use since the end of World War II.

Licenses and Fees. The distinction between state income derived from taxes on the one hand, and on the other, that from "licenses and fees" is difficult to make in certain cases. A tax is defined as a compulsory contribution for general public purposes while licenses and fees are ordinarily interpreted as payments exacted as a condition to the exercise of a business or non-business privilege. It may be a flat or graduated rate in which revenue considerations are not, in any event, the primary consideration. For the purpose of this study licenses and fees include, as noted in Table 5.2, revenues derived largely from the sale of fish and game licenses in addition to which are payments exacted for privileges granted or services rendered by the departments of Agriculture, State, and the State Board of Stock Inspection. Included also are auto title fees, penalty assessments and Justice of Peace court fines, licenses of auto dealers and salesmen and payments for inspection stickers on cars.

[15]For a breakdown of individual and corporate income taxes see Chapters XII and XIII.

[16]For fuller description of the minor tax revenue sources see Chapter XVII.

In 1957 the aggregate revenues from licenses and fees amounting to $6.7 million accounted, as noted in Table 5.8, for 2.85 percent of total revenue receipts.

Departmental Earnings and Miscellaneous. Departmental earnings consist of a large number of miscellaneous items such as rents, interest on invested funds (bonds) and income from special services rendered by various State departments. Included also is the account entitled "sale of public lands" which does not, as such, represent income but is included in the category as a convenience in analysis.

Income from departmental earnings, as is equally true of receipts from licenses and fees discussed in the preceding paragraph, is largely dedicated to specific departmental uses and yields little, if any, general revenue as such.

Federal Aid.[17] Total grants and subsidies by the United States Government for welfare, highways, education and miscellaneous other purposes amounted to slightly more than $60 million in 1957, or a figure equal to approximately 41 percent of total taxes collected in 1957. The magnitude of this sum points to the significant role that federal government plays in the affairs of state government particularly in the fields of welfare and highways to which 75 percent of grants were dedicated in 1957.

Non-Revenue Receipts. Non-revenue receipts amounted to approximately $74 million in 1957. Of this amount $27 million represented intergovernmental transfers recorded internally as "receipts" by the departments receiving the funds. Other items included funds secured from the liquidation of bond investments amounting to over $15 million; the sales of bonds, $8 million; and receipts for various trust funds amounting in the aggregate to $24 million.

[17]For fuller description of federal grants see Chapter XIX.

Cash Assets

Colorado's over-all cash balance in the State Treasury at the end of fiscal 1958 amounted to $67 million, a figure which has steadily increased in recent years (Table 5.13). Of this amount slightly over one-half, or $35 million, was deposited in Colorado banks,[18] the remainder being held in the form of U. S. Treasury bills amounting to $21 million, and in other highly liquid forms (including "cash in drawer") amounting in the aggregate to $41 million.

A balance of $67 million (in addition there was also an investment account of $99 million[19]) would at first glance hardly support frequent popular references made in recent months to a "fiscal crisis" in the financial affairs of the State. Whatever foundation such allegations may have in fact, this apparent paradox can, in any event, be better understood by considering the nature of the balance itself.

First, it should be recognized that a balance of a certain size may exist because money has been borrowed. A second and most important consideration is the fact that the balance is an over-all balance, a kind of an average which seems to tell much but in reality tells little. As the financial organization of the State of Colorado may be visualized there exists a large

[18]Banks having custody of State funds as June 30, 1958 were distributed as follows:

Location	*Number of banks*	*Amount of deposit*	*Percent of total*
Denver	7	$19,521,727[a]	55.4
Pueblo	4	1,200,000	3.4
Colorado Springs	6	2,400,000	6.8
All other cities and towns	83	12,094,995	34.4
Total	100	35,216,722	100.0

[a] Of this amount $16,471,722 was on demand deposit and the remainder on time deposit drawing interest.

[19]The investment account is, however, largely dedicated to trust funds. Thus of the total of $99 million invested in 1958, the "Public Employees Retirement Fund" accounted for $56 million. The remainder was divided between the "Public School Permanent Fund" ($22 million), "State Compensation Insurance Fund" ($13 million), and all others ($8 million).

Table 5.13

Cash Assets of State Government in Colorado, Fiscal Years, 1950-1958

Item	1950	1951	1952	1953	1954	1955	1956	1957	1958

assortment of "funds" or pools—nearly 300 in number — into which the revenue stream empties. Each pool is fed as ordained by law or accounting practice, but each in any event, sustains directly or indirectly some State function. Thus it may happen that when the levels of the individual pools are measured some are found to be critically low while others may have a more than an adequate margin to cover needs. The meaning of a state "fiscal crisis" is ordinarily associated with one fund or the so-called "General Fund" which may have fallen short of meeting various demands placed upon it. This could be true despite the fact that the average or over-all level of cash is apparently satisfactory.

Basically the existence and size of any one fund can be traced to extensive State practice of earmarking revenues, the rationale of which is important to an understanding of the fund structure as it presently exists, and certain problems of State finance in which the need for increasing General Fund revenue is currently uppermost in public attention.

Earmarking—Definition and Rationale

Earmarking is a device, used in varying degree in all states, by which governmental receipts are designated by either constitutional or statutory law to finance specifically named functions. Receipts not earmarked are known as "general fund revenues," these being subject to appropriation for various purposes as determined by legislative action or appropriation.

Earmarking is intended to serve one or several of these stated purposes: (1) to implement the benefit or user theory of taxation, (2) to provide incentive or restraint, as the case might be, for a given public activity, (3) to protect a particular program from variations in legislative policy, and (4) to attempt to solve political differences.

The first of these is best illustrated by the taxation of motor fuel and the use of the proceeds thereof. Here the tax is levied on those who presumably benefit from the use of the highways and earmarking guarantees that the revenues from the tax will be used to support the purpose for which the tax was levied. The user principle is further recognized by the practice of refunding taxes to those who buy motor fuel for other purposes than propelling a vehicle over the roads.

Secondly, earmarking is commonly associated with regulatory agencies which collect fees for services rendered. Here the assurance that an agency's income will be used specifically to cover its costs satisfies those groups who must pay the tax or fee, but who otherwise might refuse to do so if the funds were used for the general support of government. Frequently, also, the motive for earmarking is to protect the general (or unallocated) revenue. The legislature may be willing to establish a new agency but is unwilling to finance its operations from general revenue. Related thereto may be the intent to supply either incentive or restraint to agency activity. Thus an agency may be assigned a certain percentage of the taxes it collects. Hence, the more it collects the more it has to work with. On the other hand, earmarking on this basis may restrict activity or force careful husbanding of available income.

Thirdly, earmarking may be designed to provide a governmental activity with a guaranteed source of income with a minimum possibility of change by legislative action. This is perhaps the most common reason for earmarking. The best example in Colorado is the old age pension program which by Constitutional provision is assigned 85 percent of all excise taxes.

Finally, it has sometimes been argued that tax earmarking is an effective means for "selling" a new tax or a higher rate on an old one if the people know where the money is going.

The practice of earmarking has been severely criticized, however, and for a number of reasons among which are the following:

(1) Earmarking tends to fix expenditure programs in perpetuity. Agencies or functions which have taxes or other income earmarked for their expenditures may develop a proprietary interest in the earmarked tax. If all state agencies or functions thought it necessary to secure a private source of tax revenue the state's financial structure would become increasingly rigid. Revision of law to adjust for changing expenditure patterns (or public needs) is slow at best. As a result, much time may elapse before measures are taken to check the dissipation of public funds.

(2) Closely related to the first is the argument that an agency supported by earmarked revenues has little incentive to increase its operating efficiency because its income is assured.

(3) The connection between the yield of a tax and the expenditure for which it is earmarked is ordinarily loose at best. In consequence, certain state activities may be more than adequately sustained while others are unduly curtailed for lack of funds.

(4) Implicit in each of the preceding arguments is the idea that earmarking, in principle, prohibits comprehensive and effective state budgeting, a defect which has been described in a study of Colorado state finance as follows:

> When appropriations are made to meet the needs of the State, consideration must be given to the relative as well as the absolute needs. This consideration of the relative importance of the numerous requests for appropriations cannot be made unless all, or practi-

cally all, of the State's revenue is paid into the General Fund and then made available for legislative appropriation. The general assembly is the policy determining body of the State. It has the responsibility to determine what activities are to be undertaken and to what extent they are to be conducted. Under present conditions, with important items of receipts already dedicated to particular activities statutory or constitutional provision, the legislature is prevented from determining the means of meeting the needs of government.[20]

Earmarking and Fund Accounting. A by-product of earmarking on an extensive scale is a highly complex system of "funds" designed to insure that the various dedicated revenues are properly committed and fully accounted for. The system has been likened to a household arrangement wherein the breadwinner's income is distributed between a series of individual pocketbooks each being labelled according to its special expenditure purpose (i. e., food, rent, clothing, etc.).

Technically, a fund has been defined as a:

> Sum of money or other resources set aside for the purpose of carrying on specific activities or attaining certain objectives in accordance with special regulations, restrictions, or limitations, and constituting an independent fiscal and accounting entity.[21]

As such, a fund will show both receipts and expenditures as well as a resulting cash balance, if any.

For purposes of analyses, funds may be broadly classified into two general categories, namely: revenue funds and non-revenue funds.[22] The former are so designated since they function as accounting entities involving only revenues. And, with the exception of the "general fund," each designated fund serves as a means for controlling the expenditure of revenues dedicated by law in any given case to a specific function. The general fund, on the other hand, is flexible in use as determined by legislative appropriation. Hence earmarking, if carried to an extreme, may squeeze the general fund and the activities it supports to a point where a fiscal crisis may ensue. A crisis such as this tends unfortunately to distort popular thinking on the over-all financial position of a state. Thus, a general fund crisis becomes an over-all state financial crisis with profligate government pointed to as the cause of it all when in fact the real cause may be excessive earmarking—a condition which more than likely has been brought on by electoral decision rather than by administrative policy as such.

In addition to "revenue funds" other funds are ordinarily established to account for non-revenue receipts (receipts which, in the main, do not add to the net assets of the state) such as sinking funds, trust funds and the like. In addition, funds may be established for internal control purposes such as "revolving," "working capital," "clearing" and related but variously named funds.

Earmarking in Colorado[23]

In fiscal 1958 approximately 80 percent of the State's total revenues of $259 million were earmarked. Coincident thereto a total of 190 separate "cash funds" existed for purposes of accounting for revenues so dedicated. Accordingly, the remainder or general fund revenue represented the lesser part or only 20 percent. As shown in Table 5.14 constitutionally earmarked revenues (mainly from the sales and motor fuel taxes) constituted 57 percent of the State's aggregate revenues—a fact that points to the highly permanent commitment of a major portion of state revenue receipts (in this case mainly for old age pensions and highways); while revenues earmarked by statute accounted for 23 percent.

Table 5.14

Impact of Earmarking on Revenues of State Government in Colorado, Fiscal Year, 1958

(Non-earmarked and earmarked revenues identified by funds to which revenues are directed for expenditure)

Revenue	Number of funds	Net receipts (thousands)	Net receipts as percent of total
Non-earmarked revenue:			
General Fund (subject to complete legislative review and appropriation)	1	$ 53,291	20.53
Earmarked revenue:			
Appropriated cash funds (earmarked by statute as to purpose of the receipt but subject to annual legislative review and appropriation for specified purpose)	73	30,339	11.69
Budgeted cash funds (earmarked by statute for a specified purpose and available to agencies on a continuing basis but subject to budget review by Executive Department)	49	15,928	6.14
Restricted operating cash funds (earmarked by statute for a specified purpose and subject to no legislative or executive control)	35	2,182	0.84
Constitutionally established cash funds (earmarked by constitution and subject to no legislative or executive control)	8	148,709	57.30
Building mill-levy funds (created by statute and once obligated is subject to review only at close of building program)	24	9,097	3.50
Total revenues	190	259,546	100.00

[20]Leslie D. Howe, Jr. and Glenn Dinsmore Owens, "A Critical Analysis of the Colorado State Fund Structure" (Unpublished Master's thesis, University of Denver, 1948), pp. XIII-XIV.

[21]National Committee on Municipal Accounting, *Municipal Accounting Statement* (Chicago: rev. ed., 1941), p. 163.

[22]Revenue funds are here defined as those which hold and account for state receipts which add to the net assets of the state and are used for operating and capital expenditure purposes.

[23]Earmarking in this analysis is described essentially in terms of the funds used to account for revenues earmarked rather than by the specific revenues which are committed to specific purposes.

Other Receipts—Total Fund Structure. In addition to revenues other State receipts in 1958 amounted to $106 million which were earmarked or accounted for via a series of 100 separate funds (Table 5.15). In sum, this number plus the 190 revenue funds, or a total of 290 funds, comprised the State's fund structure in 1958. (See Chart 5.2 and Appendix Table 5.A.) From strictly an accounting and reporting point of view this enormously complex arrangement obviously present a challenge to those who must keep the books as it certainly must to the general public whose interest in state finance must be gleaned therefrom.

The General Fund

Colorado's General Fund is currently, as it has been in the past,[24] the most controversial subject of State finance as well as the central problem of legislative attention and concern. Such emphasis seems in a sense to be a contradiction. Basically, the General Fund has become a residual—or a kind of "stepchild"—which is fed only after all the others (earmarked revenue funds) are satisfied. Moreover, General Fund revenue, though sizable, is still a relatively minor part of the aggregate revenues of the State. In fact, revenues received in 1958 by the Highway Fund and the Old Age Pension Fund were each equal to, or even larger than aggregate receipts of the General Fund (Chart 5.2 and Appendix Table 5-A).

Despite this seeming over-emphasis on one specific area of State finance the fact remains that the General Fund stands out among all other funds as the one to be watched and to be talked about and even to be used as political fodder for election campaigns. Why is this?

[24]With the possible exception of the Old Age Pension Fund.

Table 5.15

Fund Structure of State Government in Colorado, Fiscal Year, 1958

(Number of funds, net receipts and ending balance)

Fund	Number of funds	Net receipts (thousands)	Balance 6/30/58 (thousands)
Revenue funds:

The General Fund in Colorado, as is true elsewhere, is the one and only fund over which the General Assembly has unfettered control. Secondly, it is from General Fund revenues that some of the most vital activities of the State are sustained. Lacking adequate guarantees from other sources (earmarked revenues) a large portion of the money needed to finance the State colleges and universities as well as penal and eleemosynary institutions must come from general revenues. Similarly dependent are the schools whose state aid grants must come from this source. It is in this latter area of expenditure that much of the pressure—both fiscal and political—on the General Fund has been felt in the last few years.

Revenues and Expenditures. The trend and pattern of General Fund revenues and expen-

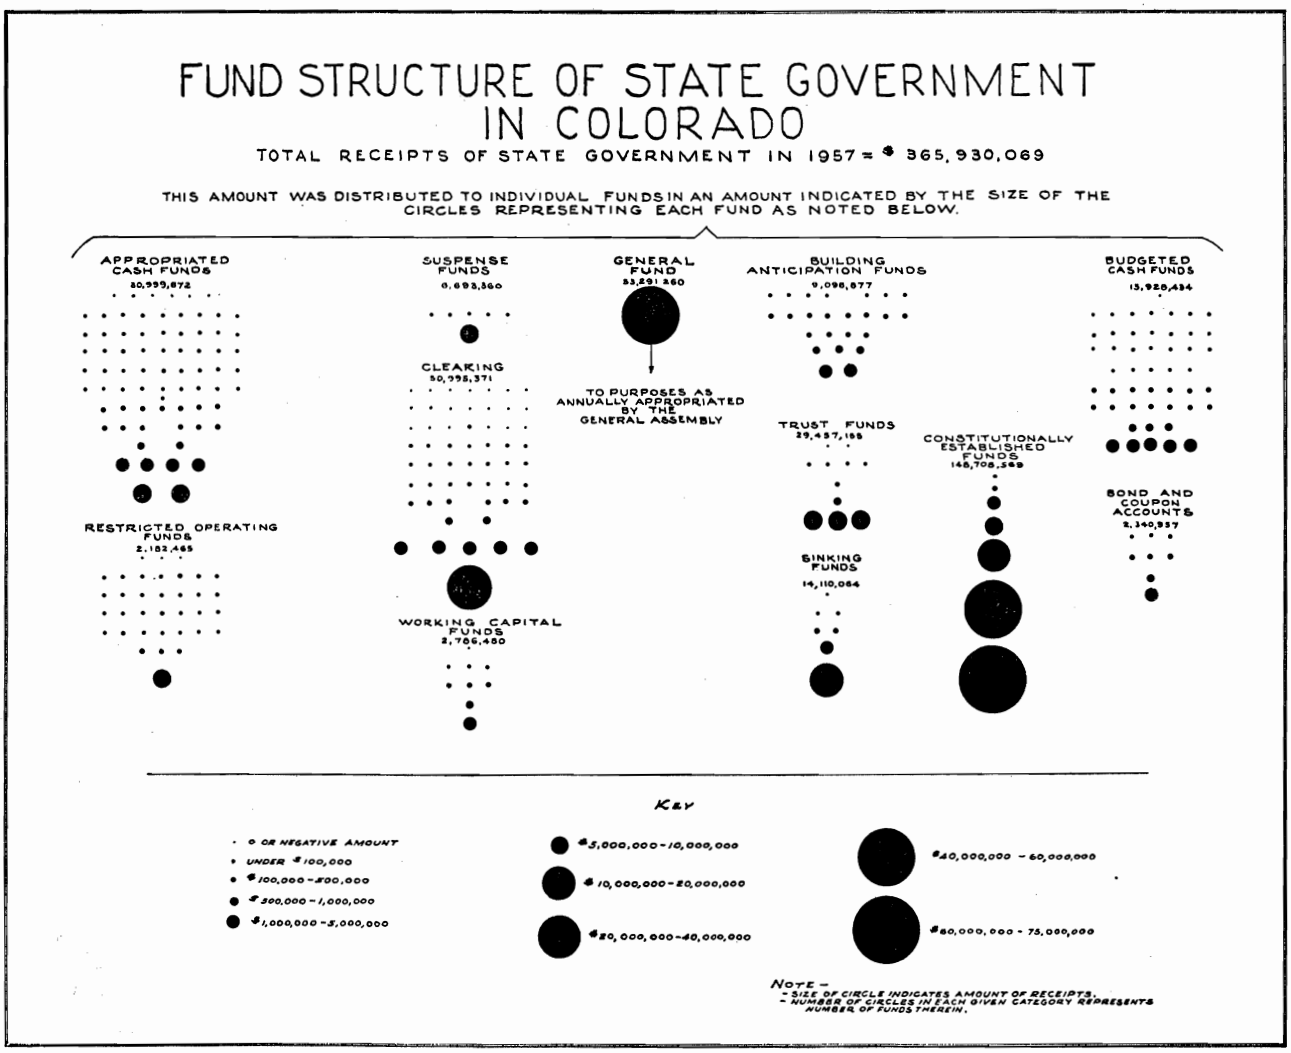

CHART 5.2

ditures presented in Table 5.16 and Charts 5.3 and 5.4 show what the financial pressure has been particularly since 1956. Thus, while total general revenues in 1958 amounting to $53 million exceeded aggregate general revenues in 1956 by $10.1 million this difference was more than offset by a corresponding expenditure increase of $19.4 million.

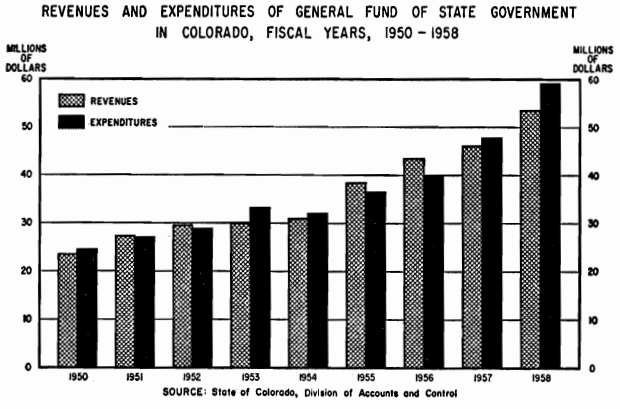

CHART 5.3

Further examination of Table 5.16 shows where the greatest expenditure requirements have developed. Looking first at revenues it will be observed that receipts from the income tax, which in 1958 accounted for well over one-half of total general revenues, increased from $24.9 million in 1956 to $33.9 million in 1958, or an over-all increase of $9 million. This, however, was nearly offset by public school aid alone which increased by $7.8 million. This sizable change came as a result of legislative action taken to implement the School Foundation Act which had been revised in 1957 to provide a higher minimum program of public school oper-

ation.[25] State action to implement this act added $6 million to General Fund outlays in 1957—an amount which will increase as legislative action moves toward its objective of achieving full implementation of the school aid program. Currently the ratio is less than complete or 80 percent.

Added to expenditures for school aid were other increases which, between 1956 and 1958, amounted to $3.5 million for state colleges and universities and $4.1 million for penal and eleemosynary institutions.

In sum, the pressing needs of education at both the public school and higher education levels constitute in the main the basic reasons for the increased demands on general revenue experienced during the past three years. It is here also where future expenditure increases are expected to develop.

General Fund Surplus. Recent accelerated expenditure requirements are reflected in the General Fund surplus which, as shown in Table 5.17, dropped from $19.2 million in 1956 to $11.6 million in 1958. The latter is the lowest reported balance since 1944 when the annual budget was less than one-fourth of what it is at the present time—a fact that points to the obvious and generally recognized inadequacy of surplus and therefore general revenues, as now constituted.

The purpose of the General Fund surplus suggests why its size at any given time serves, in part at least, as an index of the adequacy of General Fund revenue. Normally, the surplus is presumed to serve as a "working capital" or "revolving fund" to cover temporary lags of general revenue receipts behind expenditure. Secondly, surplus is expected to absorb annual

[25] In summary the program provides for classroom units having $5,200 and $4,500 values for school districts, toward which the county contributes the money raised from the 12-mill levy. The State undertakes to furnish the remainder. For further reference to the school aid formula, see Chapter XX.

REVENUES AND EXPENDITURES OF GENERAL FUND OF STATE GOVERNMENT IN COLORADO

CHART 5.4

budget deficits as these may occur.[26] It should be noted that in the second case the over-all level of surplus is reduced whereas in the first case money flows back and leaves surplus intact assuming a current revenue and expenditure balance.

Table 5.17

General Fund Surplus of State Government of Colorado, Fiscal Years, 1940-1959

Year	Accumulated Surplus	Change from preceding year
1940	$ (54,900) [a]	—

Surplus as a "Revolving" or "Working Capital" Fund. General surplus as reported for June 30, 1958 and amounting to $11.6 million, is presumably insufficient to provide, without borrowing, the necessary working capital for the current 1959 fiscal year. This is apparent from 1958 experience which, as shown in Table 5.18, saw a maximum revenue lag in March amounting to $15.2 million. Thereafter accumulated cash revenue flow was accelerated but not, however, at a rate sufficient to catch up with accumulated expenditure. As above noted, the fiscal year-end balance in 1958 was $11.6 million or a figure $5.2 million below the 1957 balance of $16.8 million.

Recognition of the inability of existing surplus to provide necessary working capital to meet future anticipated peak demands caused the General Assembly in 1958 to enact legislation authorizing the temporary transfer to the General Fund of moneys from other funds, but exclusive of constitutionally established funds. This legislation provides also that the moneys borrowed for working capital will be paid back from general revenue in the same fiscal year in which the borrowings occur.[27]

General Fund and Surplus — Current Problems and Issues. The preceding instituted measure to provide working capital has been one of a number of steps recently taken to "hold the line" until new revenue sources could be found to cover anticipated future expenditure demands upon the General Fund. In addition two legislative acts[28] designed to accelerate income tax payments were enacted neither of which, however, provides for an increase in taxes.

The first enacted in 1957 requires that all taxpayers, individual and corporate, shall pay their income tax for the previous year's earnings by April 15, of the succeeding year or be assessed a

[26] Terms such as "deficit" and "balanced budgets" used frequently both in official and public discussion may mean different things to different people. To some a deficit would mean a "current budget deficit" or that expenditures for the fiscal year exceeded revenues and this regardless of the fact that a surplus existed to absorb the deficit. To others, a deficit occurs only when no surplus exists to absorb it and money has to be borrowed. This is what occurred in Colorado in 1940 but has not happened since. Again a deficit may be considered to mean that money has had to be borrowed during the fiscal year for any reason whatsoever. Thus, money could be borrowed to provide for working capital. This would be regarded as a deficit in operations even though revenue and expenditures balanced out over the year. Other than pointing to a possible lack of adequate surplus for working capital purposes such an interpretation of a "deficit" is completely erroneous, since it presumes that borrowing, as such, results in a decline in net worth.

Because of these varying meanings it is important to examine the context in which the terms are used. In this study a deficit could mean either a "deficit for the fiscal year" or one in which such a situation exists only if money has had to be borrowed to cover the deficit. In either event the context will identify the exact meaning intended.

[27] *Session Laws of Colorado*, Chapter 6, First Extraordinary Session, 1958. Pertinent sections of the law read as follows:

From time to time during any fiscal year as orderly treasury management and fiscal procedure may require, and in accordance with the purpose of this act, upon written approval of the governor and the attorney general, the state controller and the state treasurer shall transfer, from any fund not specifically dedicated by the constitution of the State or not specifically exempted by Section 4, of this Act, to the general revenue funds such amounts of money as shall be required to insure prompt payment from the general revenue funds of any warrants drawn pursuant to appropriation made by the general assembly, provided, however, that the state controller shall first certify:

(1) That the general revenue funds have sufficient monies accruing to them in the same fiscal year to retransfer to the original fund all the monies so transferred, that appropriations do not exceed estimated general fund revenue, general cash revolving fund and surplus; and (2) That the cash funds from which the money is temporarily transferred to the general revenue funds has and will have sufficient money to enable it to meet its own obligations during the period prior to the anticipated retransfer from the general revenue funds.

[28] Popularly referred to as "Golden Gimmicks No. 1, and No. 2," the other or "No. 3," being that which permits borrowing from other cash funds.

penalty interest payment.[29] Previous legislation permitted corporations and certain individuals, but not wage earners, to pay past-due taxes over as much as a two-year period. This provision is estimated to have brought into the General Fund about $7 million of past due taxes in fiscal 1958. Without this temporary expedient, surplus at the end of fiscal 1958 would have dropped to around $4 million rather than to the $11 million level as reported.

The second legislative act enacted in 1958—the fiscal results of which will be realized in fiscal 1959—is expected to accelerate the inflow of income tax payments to the amount of $7 million.[30] Under provision of this law all income taxpayers, no matter what their sources of income, are required to pay their taxes as their income is earned. Previously only wage and salary earners had their income tax withheld and these withholdings remitted to the State quarterly. Under this program, all individuals except wage earners and salaried persons are required to make advance estimates of earnings and make quarterly tax payments on these estimates. Thus all taxpayers are put on the same basis.

A complete discussion of the policy of postponing a tax increase goes beyond the scope of this study. However, the principal arguments pro and con are pertinent here to the extent that they describe the fiscal problem of the General Fund as it has developed and as it currently exists.

Basically much of the problem stems from the State's inflexible revenue structure due to heavy earmarking which has put a squeeze on the General Fund. Although memories are short this is what occurred before World War II when the State had to borrow to finance its ordinary housekeeping activities. However, with the outbreak of war, pressure on general revenue was relieved due to the twin facts of increased revenue following upon enlarged employment and income and the forced contraction of State spending because of war time shortages. This was the time therefore to build general surplus which the State proceeded to do as shown in Table 5.17. Beginning with a deficit in 1940, the General Fund had by 1946 acquired a surplus of $11 million. Additions thereafter raised this figure to around $20 million—an average which obtained generally from 1949 to 1956.

The sharp decline since 1956 poses then the question of fiscal management as it relates both to action which has been recently taken but more importantly to policy action needed for the future.

Recent fiscal management policy, which has postponed increased taxation in the face of a considerably reduced surplus and anticipated enlarged General Fund expenditures, finds its support on grounds that new taxes or increased rates on existing taxes should not be introduced until a thorough review of the total tax structure is made. This recognizes that Colorado's tax system is a highly complex thing in which equity in the distribution of the burden has become increasingly difficult to determine and to resolve. Accordingly, to seize quickly upon a new tax or to enlarge the present revenue sources without adequate recognition of what the impact of such action might be on the taxpaying public would be ill-advised at best.

Opposed to this policy has been the argument that borrowing from other cash funds to meet working capital deficiency (an action anticipated in fiscal 1959) is an expensive alternative. Moreover to let surplus run to relatively low levels means that when taxes are increased they must necessarily be lifted sharply to replace surplus besides meeting accelerated current expenditures. It is argued therefore that if an earlier start had been made the tax increase could have been quite moderate with perhaps a gentle upward trend that could be taken in stride.

The particular measures used to bolster the General Fund have also been criticized on grounds that (a) the transfer to the General Fund of moneys borrowed from other cash funds, deprives the State of interest revenue and to that extent such transfer costs money. Moreover the invasion of the private preserves of these funds could hamper their operations and (b) the two acceleration devices used to augment income being "one-shot" affairs are a "snare and delusion" designed to minimize the seriousness of the "financial plight" of the State.

Answer to argument (a) concedes that the General Fund is now inadequate for covering peak working capital needs but raises the question as to whether General Fund surplus should be maintained at a level which would fully cover seasonal requirements. Such a policy, it is held, would lead to excess funds in certain months which would merely add to the State's over-all cash holdings which, in large extent, are earning very low interest—or none at all. It is further pointed out that business firms frequently borrow to cover seasonal cash requirements. If, however, a business did choose the alternative of not borrowing it certainly would not earmark its cash. If such were the case it would go broke in the process. Assuming then that seasonal borrowing by government is in accord with sound financial practice, whether it apply to business or government, what could be more reasonable than to borrow from cash that is earmarked?

In answer to argument (b) it is contended that the legislation enacted to accelerate income

[30] *Session Laws of Colorado, 1958*, Chapter 57.

tax revenue, though designed as expedients to "hold the line," were also forward steps toward achieving greater equity between taxpayers and, as such, would have been enacted sooner or later.

Conclusions. Undoubtedly there is merit in the arguments advanced on both sides of the issues as described. It is clear in any event, however, that apart from their short-run implications—the much maligned "Golden Gimmicks Nos. 1 and 2" have added measurably to the basic effectiveness of Colorado's income tax law and its administration. Similarly, and again apart from its short-run implications, Golden Gimmick No. 3 is sound in principle. Borrowing to cover seasonal working needs is acceptable policy. Whether borrowing from other State funds is similarly acceptable is a moot question but on balance seems appropriate in the absence of a more fundamental reform of the State's inflexible cash fund structure. Such reform would call for a thoroughgoing consolidation of State functions and with it would also come the consolidation of revenues and cash subject to use for general appropriation by the Assembly.

In reference to the policy of delay in increasing revenues — which was, after all, the fundamental issue, not the "gimmicks"—this is now a matter of past policy no longer pertinent unless continued. This then raises the question of what the future needs of the General Fund appear to be and what action has to be taken and when.

Estimated General Fund Revenues and Expenditures, 1959-1965. It is estimated that General Fund revenues during the fiscal year ending 1959 will exceed expenditure (assuming an 80 percent implementation of the School Foundation Act) to an amount that will build up surplus from $11.6 million to $15.1 million.[31] Starting from this base of reference the estimated 1960 to 1965 revenue flow (assuming no change in the general revenue sources and rates) is expected to advance from $58.8 million in 1960 to $87.6 million in 1965. (See footnote references in Table 5.19 for description of estimating bases.)

Turning to the expenditure side of the budget picture from 1960 to 1965 it is first necessary here to recognize that projected totals will vary depending upon the particular assumptions made. Four of these seem most pertinent.

(1) Expenditures assuming 80 percent implementation of public school aid and 100 percent of all other estimated expenditure requirements,

(2) Expenditures assuming 100 percent implementation of public school aid and 100 percent of all other estimated expenditure requirements,

(3) Expenditures assuming 80 percent implementation of public school aid and 85 percent[32] of all other estimated expenditure requirements,

(4) Expenditure assuming 100 percent implementation of public school aid and 85 percent of all other estimated expenditure requirements.

By these assumptions the following revenue and expenditure relationships are indicated. (See also Table 5.19.)

Year	Revenues (thousands)	Expenditures (thousands)	Current surplus(+) or deficit (—) (thousands)
Assumption (1)—80% Implementation of School Aid and 100% of all other Estimated Expenditure Requirements			
1960	$58,856	$ 72,733	$—13,877
1961	64,593	78,516	—13,923
1962	70,016	82,506	—12,490
1963	75,677	86,425	—10,748
1964	81,472	89,993	— 8,521
1965	87,635	93,812	— 6,177
Assumption (2)—100% Implementation of School Aid and 100% of all other Estimated Expenditure Requirements			
1960	58,856	83,223	—24,367
1961	64,593	89,543	—24,950
1962	70,016	93,954	—23,935
1963	75,677	98,320	—22,643
1964	81,472	102,307	—20,835
1965	87,635	106,437	—18,802
Assumption (3)—80% Implementation of School Aid and 85% of all other Estimated Expenditure Requirments			
1960	58,593	65,309	— 6,453
1961	64,593	70,569	— 5,976
1962	70,016	74,139	— 4,123
1963	75,677	77,611	— 1,934
1964	81,472	80,781	+ 691
1965	87,635	84,136	+ 3,499
Assumption (4)—100% Implementation of School Aid and 85% of all other Estimated Expenditure Requirements			
1960	58,856	75,799	—16,943
1961	64,593	81,596	—17,003
1962	70,016	85,587	—15,571
1963	75,677	89,506	—13,829
1964	81,472	93,095	—11,623
1965	87,635	96,761	— 9,126

From these relationships it will be seen that, however viewed, Colorado faces continuing deficits which point to a needed sizable tax revenue increase in the near future beginning perhaps in the next fiscal year ending in 1960.

Estimated Expenditures for New Buildings. Not included in the foregoing General Fund projections are the estimated capital needs—mainly for new buildings including land—as submitted by the various state agencies. As noted in Table 5.20, annual expenditure requirements for these purposes projected from 1960 to 1965 would add to the annual General Fund deficits (as variously estimated in Table 5.19) amounts ranging from $457,000 to $1,580,000 exclusive of the large expenditure total of $19,036,000 projected for 1960. The latter amount covers mainly an addition to the University Medical School.

[31] Estimate by State of Colorado, Division of Accounts and Control.

[32] Past experience indicates that agency requests for purposes other than public school aid have been implemented by appropriation of approximately 85 percent of requested need.

General note: Estimated revenue and expenditure data for 1959 from State of Colorado, Division of Accounts and Control.

Revenue estimates (1959-1965)

1. Income and insurance tax revenues were projected on an annual growth basis of 4.6 percent which is the same as the future growth rate of the State's personal income estimated by John Welles of the Denver Research Institute. (See Chapter 1.)
2. Inheritance, pari-mutuel and "all other" revenues were projected on an annual growth basis of 2.45 percent which is the same as the future growth rate of the State's population estimated by William Peterson of the University of Colorado. (See Chapter 1.)
3. Income tax (gas and oil) revenues were projected on a "no change" basis on the assumption that industry uncertainty warranted no other course.
4. Income from the sales, use and liquor taxes was estimated on the basis of the following analysis:

Year	Number of persons receiving pensions[a]	Annual sub-sistance	Annual total require-ment	Plus medical care	Grand total cost	Less outside income[b]	Sub total	Less OASI[c]	Net cost to State and Federal government	Less federal cost	Net cost to State	85% sales, use and liquor tax[d]	Amount to General Fund[e]
								(thousands)					
1958	54,000	$1,200	$64,800	$ 3,208	$68,008	$ 3,564	$64,434	$ 8,553	$55,881	$23,890	$31,991	$31,991	$ 0
1959	54,250	1,245	67,541	10,000	77,541	3,580	73,961	8,981	64,980	24,194	40,786	44,708[f]	3,922
1960	54,500	1,260	68,670	10,000	78,670	3,597	75,073	10,228	64,845	24,600	40,245	43,325	2,900
1961	54,500	1,260	68,670	10,000	78,670	3,669	75,001	11,551	63,450	24,600	38,850	45,318	6,468
1962	54,500	1,260	68,670	10,000	78,670	3,742	74,928	12,552	62,376	24,600	37,776	47,403	9,627
1963	54,500	1,260	68,670	10,000	78,670	3,817	74,853	13,586	61,267	24,600	36,667	49,584	12,917
1964	54,500	1,260	68,670	10,000	78,670	3,893	74,777	14,656	60,121	24,600	35,521	51,864	16,343
1965	54,500	1,260	68,670	10,000	78,670	3,970	74,700	15,756	58,944	24,600	34,344	54,250	19,906

[a] It is assumed that the number of old age pension recipients will increase until 1960 but will remain constant thereafter. This assumes also no change in the Federal Aid formula of $42.20 per Class A pensioner per month.

[b] Computed at $5.50 per month or $66.00 a year as an average for 1959-1960; thereafter increasing 2 percent a year.

[c] OASI income computed for 1959 as follows: 8 months x 17,150 x $42.11 per month = $5,777,492; 4 months x $45.05 per month x 17,780 = $3,203,956. For 1960 and thereafter 2½ percent increase per year on percentage of Class A-O.A.P. recipients also drawing OASI plus 10 cents per month increase on average benefit from OASI.

[d] Estimated annual increase at rate of 4.6 percent.

[e] Does not include an estimated annual addition of $3.5 million from 15 percent portion of sales, use and liquor tax.

[f] Includes a balance of $3,288,034 carried forward from preceding year.

Expenditure Estimates (1959-1965)

1. Expenditure projections are based on figures representing estimated future needs reported by the various agencies financed in whole or in part from General Fund.

Source: Data for 1958 from State of Colorado, Division of Accounts and Control.

These and the other projected annual requirements were omitted from the preceding General Fund estimates for the reason that they are considered as being highly uncertain both in amount and timing and, perhaps, in the method ultimately to be used for their financing. (A continuing mill levy device as currently employed in most of the building programs of the State might, for example, be an alternative.)

It is becoming apparent that both the State institutions (particularly the state hospital) and the colleges and universities will, over the next five years, require, or at least request, more new buildings than they have reported and as included in Table 5.20. If this is the case, and there is every indication that this is a strong likelihood, and assuming that General Fund financing is to be employed, it is obvious that a "capital budget" program must be developed to "even out" the irregularities of the demands placed on the General Fund. And, even if no further capital needs develop than what have already been

projected, it is clear that a "lumpy" outlay to the estimated amount of $19 million for fiscal 1960 calls for an immediate set-aside of current general revenue in preparation for its financing.

Capital Budgeting from General Revenues. The large subject of capital budgeting goes quite beyond the scope of this chapter. However, it is becoming increasingly evident that Colorado's building program must be projected on a basis wherein the General Fund must necessarily play a larger role than it has in the past. Operationally this would require that the General Fund be divided into two distinct parts or an "operating budget" and a "capital budget." The last is essentially a device for systematically planning both long-term needs and financial means wherein planned programs and priorities are reviewed annually and adjusted by the General Assembly according to conditions as these develop. Capital budgeting permits early revenue planning so that a pay-as-you-go policy can be established for at least a large portion of the capital outlay anticipated.

Table 5.20

[a] Medical school building scheduled for 1960 or 1961.

Source: Expenditure projections are based on estimated future needs reported by the various agencies which are financed in whole or in part from the General Fund.

The inclusion of all building programs of the State under an established capital budget program financed from general revenue would establish a base of planning whereby the entire capital picture of the State could be seen and controlled as a whole. Its ultimate goal would see the elimination of specific mill levies dedicated as now to this and to that with not much over-all judgment possible as to which is more important and why.

From the standpoint of the agencies affected the freezing of revenues (by assigned mill levies on property)[33] as now obtains in large degree has the merit of permitting them to relax. They are certain that the money will be forthcoming thus assuring the completion of their building programs. In further support of such a policy it is argued that building programs cannot hazard the flexibility of year-to-year judgments of the General Assembly on long-term building programs. This, of course, questions the competency of the Assembly (and, indeed, representative government itself) to make sound decisions, a position which can hardly be established on any rational basis.

[33] See Chapter VII.

Summary and Conclusions

A summary review of over-all state government expenditures (including payments to counties and cities) shows that in per capita "real" terms, that is in constant purchasing-power dollars, total State outlay in 1957 was 8 percent greater than in 1950 and 70 percent greater than in 1946. In 1957, also, nearly 90 percent of total expenditures were for three principal purposes, namely, welfare, highways and education.

On the revenue side per capita taxes, also in "real" terms, showed for 1957 an increase of 37 percent over 1950 and 114 percent over 1946. Comparatively, per capita state taxes in Colorado were, in 1956, below both the general and median average for the eleven Western States. Similarly the ratio of Colorado state taxes relative to state personal income was less than the general average as well as the median average of these States.

Colorado's sources of state revenue in 1957 were generally divided between taxes which accounted for 62.28 percent of the total; licenses and fees, 2.85 percent; departmental earnings, 9.41 percent; and federal grants, 25.46 percent.

Approximately 80 percent of the State's revenue is earmarked—a fact which not only explains the existence of 190 "cash" funds (in addition to which there are 100 other funds or a total—cash and other—of 290), but explains also (in a basic sense) the current plight of the General Fund. As a kind of a residual legatee of State revenues, the General Fund is under severe pressure due to growing expenditure requirements in the face of inadequate revenue provision. Projected general revenues and expenditures to 1965 strongly indicate the immediate need for a sizable increase in revenue to avoid future General Fund deficits that existing surplus can no longer absorb.

Appendix Table 5.A

FUND STRUCTURE OF STATE GOVERNMENT IN COLORADO

Statement of Receipts (plus transfers in minus transfers out) and Balances of Individual Funds, Fiscal Year, 1958

(Total number of funds for each classification in parenthesis)

Fund	Receipts (plus transfers in minus transfers out)	Cash Balance 6/30/58
General Fund (1)	$53,291,260	$15,565,120
Appropriated Cash Funds (73)		
Aid to Dependent Children	7,704,550	1,081,599
Department of Revenue 57/58	5,139,616	1,517,871
Game, Cash	4,219,746	2,947,002

CHAPTER VI

ESSENTIALS OF A SOUND TAX SYSTEM

It is a truism that no meaningful measurement of any magnitude, subject or activity can be made without there being some accepted standard or basis of reasonable comparison. A standard may be a "principle" or an "ideal" or condition of desirability serving as a goal toward which action or contemplated action is directed.

In tax policy, as in other policy determination, certain criteria exist for guiding decisions as to what is best. In the following discussion these criteria or "tax principles" are examined as to their nature, scope and applicability. As such the analysis provides a basis or background for subsequent appraisal of Colorado's taxes considered individually and as components of the State's tax structure as a whole.

The Revenue Problem

The financial problems of the state as well as other governmental units are two-fold: (1) determining an essential or desirable level of services and consequently costs; and (2) formulating a suitable revenue system for meeting these costs. It should be recognized at the outset that there are also two approaches to any budget problem, cutting costs or increasing revenue. The basic question as to which course should be followed can only be answered by a continuing review of the needs versus resources relationship.

Governmental needs, unfortunately, like those of any individual or family group are often flexible in only one direction, namely upward. So long as the great majority of individuals who must pay the lion's share of the cost of public functions find it necessary to judge every personal outlay by the standard of what they can afford, the government likewise has a clear-cut responsibility to maintain a reasonable balance between needs and resources. Regardless of the pressing or critical character of the demands for increased public expenditures, a burden of governmental costs which impinges upon the essential personal and business resources of the private economy cannot be justified nor can it be financed in a palatable manner. The notion that government has access to an inexhaustable well of resources from which increments to the social welfare can be pumped in ever increasing quantities and without replenishment may provide a refuge for the reformer, but it offers little solace to the taxpayer.

Consistency of Public Programs and Means of Financing. Assuming that revenue needs have been tailored to the broad limitation of resources, a second major criterion must be considered. The revenue program basically is a means to an end — the attainment of the objectives of the various economic and social functions which the government performs. These objectives are not comparable to those of private enterprise, rather they look to the welfare of the group as a whole and that of the less fortunately situated members in particular. The financing measures employed obviously should be consistent with the social purposes of the public programs involved. Otherwise, the method of financing may nullify these ends in whole or in part. For example, one of the principal goals of public education is to ensure that educational opportunities are available to rich and poor alike and on an equal basis. Quid pro quo or direct benefit financing would clearly defeat this aim by restricting educational advantages to those who could afford to pay the full costs.

Particular Taxes and the Revenue System as a Whole. In the consideration of revenue principles it should be recognized that the effects of a particular tax, although significant, are not conclusive. Each revenue-producing measure must also be evaluated in relation to the system as a whole. Similarly, the revenue system of the state must be considered in the broader context of federal, state and local policies. This is not to suggest that inequitable or discriminatory effects in one quarter may be excused or rationalized by counter-irritants in

another, but rather that one must look at the over-all impact of public revenue measures as a basis of arriving at final judgments concerning any particular aspect of policy.

While the preceding statement of certain aspects of the revenue problem has been couched in general terms, its principal application is to the tax system which supplies the great bulk of governmental revenues. The following analysis of principles will be directed specifically to taxation although it is equally applicable to other revenue sources.

General Requirements of a Sound Tax or Tax System

The payment for public services is at best a painful process, and affects directly or indirectly the well-being of every individual and the profit position of every business organization. Indirect effects of taxation are reflected in changes in prices and incomes and the volume of production and employment. Thus, the distribution of the costs of government through taxation and other revenue measures is of utmost concern to all segments of the economy.

Government must obviously consider these direct and indirect effects of taxation on individuals, business enterprises and the economy as a whole. At the same time, those responsible for the formulation and administration of tax programs must focus their attention on the direct needs of the particular governmental unit. In general, these needs include the adequacy of existing revenue sources to meet current requirements, an essential element of flexibility in the revenue system and the avoidance of excessive administrative costs.

Students of tax policy, as might be expected, have given varied expression to the broad standards which should be applied in the formulation of tax policy. However, there is a general consensus on basic criteria. These may be summarily stated as follows: (1) productivity; (2) equity in the distribution of tax burdens; (3) recognition of the rights and problems of the taxpayer; and (4) adaptability of the tax program to the immediate and long-range needs of the economy as a whole. The question as to the priority or relative emphasis to be placed upon these principles, such as productivity and equity, for example, has been argued by tax economists, but is not of primary interest. Each of the requisites are important; they are clearly inter-related; and they must be interpreted in a relative rather than absolute sense.

Productivity. The primary purpose of taxation is to produce revenue. Specific regulatory or non-fiscal uses of the taxing power are not germaine to this analysis, though it should be recognized that all taxes have an important impact upon individual and group relationships. The problem of productivity is one of meeting immediate as well as future revenue requirements. Specifically, this means that the yield of individual taxes and the entire tax system must be predictable within reasonable limits, and that certain major tax sources be sufficiently flexible in structure and rates to handle the rising costs of government. Both state and local tax sources have been subject to an increasing strain over the last two decades, and there is every evidence that the presures will continue to mount. In the light of this situation, many legal as well as psychological barriers to higher level taxation will have to be removed.

It is often suggested that regularity or stability of tax yields is desirable from the standpoint of the governmental unit. While this idea has merit, no tax is perfect in this respect. More significantly, stability of receipts during a period of recession or depression, which is the time when stability would be desired, is probably attainable only at the expense of unduly burdensome or confiscatory effects upon the taxpayer and a heightening of general deflationary influences.

The revenue capabilities of a particular tax are dependent upon a variety of factors including rates, the general definition of the tax base, exemption practices, the efficiency of tax administration and the psychology of taxpayers. Taxes with a restricted base, such as those on "true" luxury items, very high incomes or exceptionally large estates are necessarily limited in yield regardless of the rates imposed. Similarly, taxes involving excessive costs of administration (10 percent or more) are generally unsatsifactory from the standpoint of productivity as well as the undue burden placed upon the taxpayer.

Equity in Taxation—General Considerations. Equity is a universally accepted goal of tax policy, and has many facets. In general, it is concerned with the way in which the costs of government are distributed among individual and institutional taxpayers.[1] As such it necessarily involves a series of social judgments relative to the existing and future economic relationships between individuals, family groups, business enterprises and other private organizations. More specifically, these judgments pertain to: (1) the type of individual and family income distribution pattern which is believed to be desirable and the tax measures best suited to the promotion of this end; (2) the proper role of business enterprises in the financing of governmental services and the most appropriate tax vehicles for obtaining their

[1]The actual location of the burden or its economic incidence is the consideration in question. The legal incidence of the tax may often differ from the actual incidence due to tax shifting by the person or firm upon whom the tax is originally imposed. The burden conceivably may be shifted forward to the final consumer or backward to the producers of raw materials or the labor force.

contribution; and (3) the desired framework of industrial organization and policy and the tax measures most likely to further this result. The foregoing aspects of the equity problem reflect judgments that are essentially positive in character. Equity in taxation also involves certain negative bases of evaluation. For example, it is generally agreed that discrimination is undesirable unless it is purposefully designed to achieve accepted goals of public policy. In the same vein arbitrary or capricious effects should certainly be avoided.

Some students of taxation in discussing the nature and scope of the equity problem have distinguished two major aspects, namely, vertical and horizontal equity. This approach serves to highlight certain major elements of the problem, and merits attention. Vertical equity is defined to include the elements associated with the distribution of individual and family incomes, in other words, the range of income from the lowest to the highest level. Horizontal equity, in turn, has reference to the relationship of individuals or family groups on the same income level and business enterprises of the same type or class. This approach to the explanation of equity is consistent with this analysis, and may contribute to a better understanding of the over-all problem.

Basic Approaches to Equity Problem. There is general agreement upon the desirability of equity in taxation and the essential aspects of the equity problem. The crucial questions as to the proper approach or approaches to the distribution of tax burdens, and how they should be implemented are naturally subject to varying interpretations. With respect to the first question, two broad theories concerning the distribution of tax burdens are presently accepted and applied with varying degrees of qualification by tax economists and those responsible for the formulation of tax policy. They are the "ability to pay principle" and the "benefits received standard." These theories, it should be noted, involve different and largely inconsistent ideas of tax equity.

While there is undoubtedly a preponderance of opinion favoring the ability to pay doctrine, a limited application of the benefit approach in certain areas of governmental financing is generally thought to be desirable. In addition to these broad standards there are two related concepts which merit special attention, namely, the "proportional versus progressive" issue, and the question of maintaining "economic incentives" or the essential bases of economic expansion in the private economy. In both cases the primary emphasis is usually placed upon the avoidance of allegedly undesirable results occasioned by extreme applications of the ability principle.

Ability to Pay Principle of Taxation. The ability to pay principle is based upon the broad proposition that those who possess income or wealth should contribute to the support of governmental functions in accord with their respective abilities. The obligation to pay arises as a consequence of one's status in the social group, but the actual determination of who shall pay and in what amount is necessarily an individual matter. The social orientation of the ability principle is fundamental, though perhaps it is not always fully understood. In contrast to the benefit standard under which each person or business concern would pay for the full value of services received, the ability approach recognizes the broad social purposes underlying most public programs and calls for a distribution of costs compatible with these purposes.

From the standpoint of either the individual or family unit the ability principle involves a determination of their current economic status (income and wealth), the minimum demands upon their resources for living and other essential costs, and consequently the actual capacity remaining, if any, to make tax payments.

Ability may also be interpreted in terms of the relative sacrifice occasioned or the utility of the income taken by tax payments. As in the case of the capacity to pay concept, these ideas lead to the conclusion that the ability of individuals to pay taxes, as reflected by income, increases progressively after essential costs or uses of income have been met. Thus, the broad implications of the ability principle in the case of individuals are self-evident: persons whose current resources are barely sufficient to meet absolute living or related costs have no taxpaying ability, and should not be required to make a tax contribution; and those whose resources exceed such minimal needs have taxpaying ability which tends to increase progressively in relation to income.

In the case of corporations, which are income-producing and distributing units, the existence of net income obviously reflects taxpaying ability. As the organization is impersonal and often retains a substantial portion of net earnings within the business, the extent of taxpaying ability involved is more difficult to determine. The specific problems encountered are treated in some detail in a later chapter.[2] However, in a broad sense the reasonable cost of owner or equity capital logically must be considered in determining the taxpaying ability of all business enterprises.

Application of Ability Standard. If the ability to pay principle is to be meaningful, it must be capable of fair and effective application in

[2]See Chapter XIII, The Corporate Income Tax.

the tax system. Does it meet this test? The answer must be in the affirmative, though there are many difficulties to be resolved. Net income, both personal and corporate, is generally accepted as the primary measure of ability. Property holdings or accumulated wealth are also said to reflect taxpaying ability, but in varying degree depending upon the nature of the capital and the income realized. In addition, certain economists support consumption expenditure either as a basic or supplementary standard. However, they are in a distinct minority.

Net income is the most realistic measure of ability because it reflects directly the sum of net receipts currently available for tax payments and meeting personal or other essential needs. Certain minimum requirements of the individual or family group are a condition of survival, and should not be encroached upon by government. Tax payments from this essential element of income will further impair the productivity of the persons concerned, restrict the market for consumption goods and probably necessitate the extension of social welfare aids. Similarly, the net income of business concerns must cover a reasonable return on the owner's investment to insure the maintenance of incentives for business expansion. Net income is clearly preferable to gross income as a measure of ability. The latter is either partially or wholly composed of cost elements for which the recipient merely serves as a distributing or transfer agency.

Accumulated wealth or property is a possible source of tax payment. However, such holdings may or may not reflect current taxpaying ability, and if they do it will vary widely in relation to the different types of property, individual properties of the same class and other economic factors. Use of property values as a direct measure of ability, therefore, is certain to produce highly variable results and may well have the unfortunate effect of confiscating such values. The latter consequence, needless to say, is the antithesis of that desired in the application of the ability principle. Two possible exceptions are property transferred at the death of the owner and gifts made during the lifetime of the owner without adequate consideration. Even in these circumstances the transfers would reflect taxpaying ability only to the extent that the sums received were unearned and exceeded the reasonable needs of the beneficiary.

Consumption outlay as a standard of determining taxpaying ability is both unsatisfactory and incomplete. It disregards the relative urgency of the needs being satisfied, and excludes the highly significant and generally productive use of income for saving and investment purposes. Basically, therefore, it involves a negation rather than an application of the ability approach.

Conclusions. The ability to pay principle of taxation is in accord with prevailing concepts of social justice and meets the test of practicality. Net income affords a reasonable and effective measure of taxpaying ability which may be supplemented by property holdings under certain conditions. The income measure logically is subject to the qualifications that the sum required to meet absolute living or other essential costs does not reflect taxpaying ability, and that the taxpaying ability reflected by income in excess of this amount increases on a progressive basis. At the same time, it should be recognized that the ability principle does not provide a complete and precise guide to all questions of tax policy. It does not answer specifically the practical issues as to the degree of progression which should be applied in the case of personal income nor the relationship which should obtain between personal and corporate tax rates. Also, extreme applications of the ability principle may well curb the essential bases of expansion in the private economy.

The Benefit Principle of Taxation. The benefit principle of taxation rests upon the broad proposition that governmental services are of benefit to the private economy and that their cost should be apportioned among individuals and private organizations on the basis of the relative benefits which they enjoy. Basically the theory provides a justification for taxation and a standard for distributing tax burdens. According to this theory the obligation to pay taxes as well as the measure of the amount to be paid is to be determined by the benefits received by the individual or business concern. As everyone is benefitted by public services, it logically follows that everyone should pay.

The general measure of benefits is variously stated as the "value" or "cost" of the services received. In either case cost appears to be the controlling factor. As the costs of particular governmental services are generally known, the problem of allocation is one of reducing these costs to a unit of service basis and then determining the units of service received. In other words, government would operate on a basis comparable to that of a huge, private supermarket with fixed prices for each item.

No one will dispute the basic assumption that the benefits conferred by public services justify the imposition of taxes to pay for them. However, the further assumption that the cost of the varied and complex activities of government can and should be calculated and assessed against each person on the basis of the individual benefits derived involves serious theoretical and practical shortcomings. In the first place, the fundamental concept of the individual's relationship to the government underlying the benefit principle is untenable in modern times. A price or quid pro quo basis of

exchange clearly does not exist between the citizen and the state with respect to most public services. The activities of present day democratic governments are commonly in the interests of general or group rather than individual welfare. Even if it were practical, a pure benefit approach would produce absurd results in the case of broad public programs such as national defense, public safety, education, public welfare and aid to agriculture or other industries.

In addition to this inherent fallacy, no reasonable formula has yet been devised for calculating the benefits to the individual from the important programs noted. Many of these services are essentially intangible in character, and an attempt to personalize their benefits is clearly impractical.

Conclusions. In view of the limitations noted, the proper role of benefit financing is necessarily a restricted one. In fact, it is only in those areas where the government actually functions as a private or commercial enterprise that the benefit principle appears to have a wholly logical application. Public utility services and others which are made available on a direct and sometimes voluntary basis clearly fall in this category. Among the major domestic programs of government today the most significant application of the direct benefit standard is in the financing of roads and streets. Highway users are called upon to pay the bulk of the costs of these facilities, and the owners of urban property bear the primary responsibility for the outlays on city streets. The application of the direct benefit approach in these areas is generally thought to be desirable. However, there are many special problems involved in the determination of relative benefits and in allocating costs. In addition, there are the social limitations arising from the admittedly regressive effects of certain of the taxes employed and the possibility that higher burdens will seriously restrict the use of such facilities by low income groups.

The Problem of Progressive Taxation and Economic Incentives

While the relative merit of progressive as contrasted to proportional taxation has been a perennial subject of debate by those interested in tax policy, the present theoretical controversy is concerned with the equity and desirability of extreme as opposed to moderate application of progressive taxation. From a practical standpoint it involves the use of extremely progressive rates under net income and death taxes, and the relative emphasis to be placed on these taxes as compared to sales, excise and property taxes. Proponents of steeply progressive net income and death tax rates maintain that this policy is a logical and equitable application of the ability principle, and that a substantial modification of the existing inequality in the distribution of income and wealth is also desirable upon other economic and social grounds. Opponents of the policy contend that it is discriminatory and unequitable, that it tends to destroy economic incentives, and that it is a threat to the maintenance of a free enterprise system. They also suggest that the present extremely progressive rates of the federal personal income tax are a major factor contributing to evasion and avoidance problems.

As the question of progression is closely related to the concept of economic incentives an examination of the latter concept is essential to an evaluation of both ideas and the issues involved. The term, economic incentives, refers to the economic stimuli which serve to promote productive activity in a private enterprise system. It encompasses the entire scope of economic rewards for accomplishment or success and conversely the penalties for failure. The concern with economic incentives, therefore, is as broad as the range of economic activity in which the people engage. It involves the economic motivation of the wage earner as well as that of the employer or businessman, the farmer, the professional worker, the financier and even the government employee.

The practical implications of economic incentives in the field of tax policy are equally comprehensive and far-reaching. It is quite evident that the high level of taxation presently needed to support the cost of governmental services substantially curtails the use of income and capital for private purposes. In a broad sense, therefore, it may be said to curb the incentives available in the private economy for all types of economic activity. The urge to increase the consumption level and consequently standards of living through the choices of the individual or family group, the desire to save and invest funds, the goal of expanding one's business or increasing profit margins—these and other individual or private institutional objectives are necessarily delimited by taxation. Equally important, however, are the products of governmental activity which also enhance the national income through the services and goods provided. Although the nature and distribution of these products and services are determined by collective action, they too play a major role in the broad system of motivations which stimulate economic activity.

The basic problem of economic incentives, therefore, is one of combining the areas of individual choices and rewards and social choices and benefits in such a manner as to maximize the level of production and the benefits resulting from the distribution of the product. There is also a secondary problem of balancing the in-

centives and consequently rewards available to various economic and social groups.

Conclusions. A comprehensive evaluation of the complex issues involved in the use of progressive taxation and the related but broader problem of maintaining economic incentives is beyond the scope of this analysis. However, certain broad conclusions are believed to be merited.

A substantial element of progression in the nation's tax structure, achieved primarly through progressive net income taxes, is clearly in accord with the ability to pay principle and presently accepted concepts of social justice. The current level of federal rates on the high bracket personal incomes approaches the point of confiscation, and provides an obvious example of extreme progression. While there are no absolute guides to determine what constitutes an equitable and desirable application of progression, the high bracket tax policy as it now obtains appears to violate both objectives. Certainly, its equity is doubtful; it seriously curbs, if it does not destroy, the incentives of those affected; it places a high premium on avoidance and evasion techniques; and it produces little revenue. On the other hand, it is not a serious threat to the maintenance of the private enterprise system because of its limited impact.

Recognizing the inherent limitations of progressive taxation which approaches the point of confiscation, it is equally clear that the attainment of a substantial element of progression in the over-all structure of governmental tax programs requires a primary reliance upon net income taxes. Death and gift taxes which incorporate progressive rates are of minor significance, and property taxes which embody proportional rates are either proportional or regressive in their effect depending upon the type of property and other factors. All other forms of taxation, with possible minor exceptions, involve varying degrees of regressive effect. Furthermore, all analyses of the combined effect of existing federal, state and local tax programs upon individual incomes indicate a distinctly regressive impact upon the very low income groups. Correction of this intolerable situation clearly calls for a greater emphasis upon "ability" as opposed to "benefit" taxation.

A logical and realistic appraisal of the economic incentives concept as applied to current tax policies leads to similar conclusions. The chief encroachments of existing policy upon the private rewards available for productive activity today are at the lowest and highest income levels. Government should constantly strive to avoid such extreme effects and to maintain a reasonable balance in the impact of tax burdens not only in relation to different income levels but other relationships between individuals or businesses in the same economic category. The broad question as to whether government is costing too much or aggregate tax burdens upon the private economy are too high is not a matter of tax equity, nor is it a problem alone of adequate incentives in the private economy. Rather, it is a fundamental issue as to the proper scope of governmental activity, and is not relevant to this discussion.

Other Principles and Considerations

The Rights and Interest of the Taxpayer. High taxpayer morale is clearly essential to the effective administration of tax laws, wholly apart from the inherent rights of those who support governmental functions. As a minimum, an intelligent concern with the taxpayer's problems requires a continuing effort: to broaden his understanding of the provisions of tax laws; to minimize the expense, inconvenience and interference associated with tax compliance, payment and collection; and to provide for prompt and fair treatment of his claims and complaints. The taxpayer to be sure has reciprocal responsibilities, but the manner in which these are discharged will probably depend in large part upon the treatment he receives at the hands of tax authorities.

Simplicity of the tax laws and certainty concerning the time and amount of payment also are often cited as desirable features of tax policy. While tax problems have become more complex since the days of Adam Smith who first suggested these criteria, they still have a reasonable application. Non-technical drafting of tax legislation and an adequate program of taxpayer education might reduce the demand for the services of tax lawyers and accountants, but they would be a boon to the taxpayer.

Finally, the conscientious taxpayer who pays his tax obligations in full when they are due is entitled to a reasonable assurance that others liable for a tax payment will do likewise. This assurance all too often does not exist, and laxity in meeting tax obligations as well as widespread evasion become the general rule. Such a situation is inexcusable, and constitutes the most flagrant type of inequity in the entire field of tax policy.

Adaptability of the Tax Program to Changing Levels of Economic Activity

The adaptability of tax programs to certain basic needs of the economy as a whole is not a new criterion of tax policy; but since the Great Depression of the 1930's it has been given much greater emphasis and more specific formulation. Particular attention has been directed to the problems of controlling economic fluctuations

(depression and boom tendencies), of combating what certain economists have termed secular stagnation and of preventing extreme inflation during war or defense emergencies. Full employment or some similar expression of economic well-being is now regarded as a major goal of public policy, and fiscal policy, including governmental expenditures, taxation and borrowing, is an accepted instrument for implementing this objective.

The actual or potential role of taxation is an important one both in curbing inflation and combating a threat of economic recession or depression. Increases in the rate or level of taxation serve to skim off excess purchasing power in the private economy and thereby reduce inflationary pressures, while tax reduction makes additional funds available for private expenditures thus tending to offset the actual or anticipated decline in spending, income and employment. Understandably, there is still considerable controversy regarding the relative desirability of across-the-board as opposed to more selective tax adjustments, and the broader issue of the relative emphasis to be placed on taxation as compared to other policy measures.

The principal requirement of the tax program for economic stablization purposes is flexibility both in an upward and downward sense. If tax policy is to make its maximum contribution in this field adjustments must also be made quickly. Needless to say, both conditions are difficult to attain, and must be viewed in a relative sense.

Principles of Taxation and State Policy

The basic principles of taxation have certain special implications in terms of state and local policy. They obviously merit attention at this point, though they will be thoroughly examined in the individual tax chapters. They include: the predominant role of the federal government in tax policy, both in establishing the general tax pattern and in particular areas such as net income and the special excise taxes on liquor and tobacco; the legal and the technical problems of the state by virtue of its limited jurisdiction and constitutional requirements; and certain broad economic considerations that are of special concern to the states.

Role of Federal Government. The primary position of the federal government in virtually all phases of government financing is axiomatic. In view of the magnitude of its revenue needs the choice of federal tax and other sources of financing clearly is the principal determinant of the nature and effects of public revenue programs. In particular, the emphasis placed upon personal and corporate net income and certain sales or excise taxes serves as a possible model for state action, but also may tend to delimit the scope of state policy. Double or multiple taxation of a given tax base certainly must be considered in appraising the equity and productive potential of a given source. However, it is the latter elements that are important, not the duality of use. The alleged saturation of the net income tax base by high federal and moderate state taxes, for example, is a delusion in the light of the accepted merits of this source. Certainly, the use of less equitable tax forms worsens rather than improves the economic effects of a given level of taxation.

Legal and Technical Problems. By virtue of their limited jurisdiction and federal or state constitutional limitations the states encounter a myraid of problems, many of which are peculiar to this level of government. The more significant factors contributing to these difficulties are: the interstate and foreign commerce limitation of the Federal Constitution; the immunity of federal agencies and instrumentalities; the due process requirement of the Fourteenth Amendment (Federal Constitution); specific state constitutional limitations relating to the taxing and borrowing powers; the problem of interstate and federal reciprocity in the granting of tax deductions, exemptions and credits; and the question of uniformity in tax treatment both as to legal concepts and tax burdens. In the formulation of state tax programs the state must also be cognizant of the needs and problems of its local subdivisions. While one might anticipate a similar concern by the federal government with the fiscal requirements of the states, there is little evidence that this consideration is a significant determinant of federal policy.

The State Economy. The nature and magnitude of the state's resources are obviously of basic importance in the formulation of tax programs. Colorado's resources both present and potential were considered in an earlier chapter. These resources obviously delimit in a broad sense the State's capacity to support governmental programs and consequently the level of taxation. Their character also serves to define within limits the appropriateness of certain tax measures. Finally, the broad aim of promoting a fuller and more effective utilization of existing resources highlights the importance of avoiding unduly burdensome taxation upon any segment of the State's economy.

CHAPTER VII

PROPERTY TAX

History of Property Tax in the United States

The property tax is perhaps as old as civilization. It was employed as a direct levy in ancient Greece and Rome and was subsequently introduced in Western Europe as a tax on land area rather than value. The latter type of tax on the value of property came into more general use with the establishment of individual property rights and market mechanisms.

The property tax in America dates back to early Colonial days and its applications were patterned after the English system. It became an important source of revenue for the American colonies, but the nature of the tax varied considerably in different sections. It was first employed by the New England colonies and later spread to the Middle and Southern groups. In New England the typical tax was a composite levy on "faculty," involving a poll tax, an additional amount based upon earning capacity and finally a levy on property. Generally, the tax applied to most forms of real and tangible personal property other than personal possessions not used to produce an income, and values of the different types of property were ordinarily specified in the tax statutes.

There was considerable resistance to the early development of property taxes in the Middle Colonies largely because of the predominance of the Dutch influence. Aside from limited experimentation during emergency periods, property taxes were not generally employed in the South until after the Revolutionary War. The owners of large plantations were able to control legislative policy during this early period, and the primary revenue sources were poll, custom, special excise and license taxes. The emergency created by the Revolutionary War necessitated the adoption of property taxes in Virginia, but it was not until 1850 that the State Constitution required the imposition of uniform and universal taxes on property.

Evolution of State and Local Policies. After the Revolutionary War broad developments in property taxation are readily discernible but specific data on the policies of individual states is very fragmentary. As a general rule, state and local property taxes were extended and consolidated during the period from 1800 to 1860; and they became the mainstay of local and the new state revenue systems. The broad trend was in the direction of a general property levy involving uniform rates on all classes of property. By 1860 uniformity requirements had been incorporated in the constitutions or laws of the great majority of states. The evolution of the tax in Ohio illustrates the general trend. In 1799 a territorial land tax was adopted; other specific forms of real and personal property were subject to the tax in 1825; and in 1851 a constitutional provision requiring a uniform general tax on all types of property was enacted.

The property tax continued to be a dominant element of state and local tax programs in the period following the Civil War, and a reverse trend towards the classification or special treatment of certain types of property appeared. However, the trend towards classification was slow in gathering momentum largely because of the uniformity requirements in the state constitutions. It originated as a consequence of generally unsatisfactory administration of the tax on personal property and the growing complexity of all forms of property as well as property rights. Savannah, Georgia is usually credited with initiation of the modern classification movement by adoption of a classified tax in 1868. It should be noted that the classified tax in contrast to the general levy involves differential treatment of various classes of property largely on the basis of their actual or potential income capacity. The classified form of tax increased in popularity during the first three decades of the present century, but interest in the "reform" has since declined.

In recent decades the importance of the property tax as a source of state revenue has also rapidly declined. This development is a direct result of the adoption of new tax forms by the states, as well as a recognition by state legislators of the primary dependence of local units on this traditional source of financing.

Nature and Types of Property Tax

The property tax as employed in the United States is imposed upon capital values. It is aimed at the wealth itself rather than income or other incidents of the use of property for productive purposes. The base of the tax, commonly market or sales value, is not intended to provide a direct or precise measure of taxpaying

ability, nor is it designed to measure directly the special or general benefits derived from particular governmental services. However, certain applications of the property tax do involve a special emphasis upon the ability factor and income is sometimes employed as a measure of capital value in cases where market or sales value data are not available.

Two principal forms of property tax are employed by state and local governments, namely, the so-called "general property tax" and the classified or differential levies. As the term implies, the general property tax is distinguished by its broad scope and the application of uniform rates to all types of property. As such, it is intended to achieve an equal burden on all classes of property regardless of their use or nature. On the other hand, the classified tax is intended to group property into a number of special categories, and to subject these categories to varying tax burdens depending upon the relative tax-paying capacity which they represent. Administrative considerations have also played a part in the determination of property classifications.

Broadly speaking, the classified tax has taken two forms involving a limited or partial classification and comprehensive classification. In the former instance, all property is grouped into two categories, real estate or tangible personalty and intangibles. Under the limited classification tax a low mill rate is applied (usually 1 to 10 mills) to various types of intangibles and a uniform rate to all other forms of property. In the case of the so-called comprehensive classification plans, a varying number of classes are established ranging from 5 to 21 and a differential burden is imposed on each class. The differential burden is achieved either by varying the tax rate or the percentage of the value base subject to the tax. About 15 states employ the partial classification type of tax as contrasted to 5 states which have comprehensive classification plans.

Another significant modification of the property tax has involved the exemption of intangible property and certain types of tangible personal property, usually household and other personal possessions of a non-income producing character. About one-fourth of the states now exempt intangibles entirely and several states do not tax non-income producing personalty. In both cases the development has been dictated by the administrative problems involved in the assessment of these forms of property and the limited or questionable taxpaying ability associated with such property. As a closely related step, many of the states have adopted special property taxes or various in lieu types of tax in the case of automotive vehicles, the operating property of public utilities and natural resource properties including oil and gas, other minerals and timber lands. In a few jurisdictions, differential treatment also has been applied to other forms of tangible personalty such as merchandise inventories and raw materials. These later developments are also attributable to administrative difficulties and considerations of tax equity.

Significance of Property Tax in State and Local Finance

The property tax, once the wheelhorse of state and local finance, has continued to produce an increasing amount of revenue. However, its relative importance in the nation's tax structure, as well as in the revenue systems of the states, has declined appreciably in recent decades. New forms of taxation at the municipal level have also reduced its importance to these units, but it is still the primary tax source for all forms of local government.

The general trend of property tax collections, both state and local, from 1902 to 1957 is shown in Table 7.1. Total receipts, state and local, which amounted to approximately $4,675 million in 1932 declined during the depression decade, but rose to over $7,367 million in 1950. Collections in 1957 totaled $13,097 million, an increase of nearly 44 percent over the receipts in 1950.

Table 7.1

Significance of Property Tax in State and Local Finance, Selected Years, 1902-1957

	State		Local	
Years	Property tax receipts (million)	Percent of total taxes[a]	Property tax receipts (million)	Percent of total taxes
1902	$ 82	52.56	$ 624	88.64
1913	140	46.51	943	89.72
1922	348	36.75	2,973	96.87
1932	323	17.09	4,353	97.43
1942	271	6.88	4,273	92.95
1946	253	5.08	4,904	92.83
1950	311	3.93	7,056	88.18
1957	479	3.30	12,618	86.95

[a] Unemployment compensation levies were excluded from state totals in computing relationship (1942-1957).

Source: U. S. Bureau of Census, *Historical Review of State and Local Finances*, June, 1948; and U. S. Bureau of Census, *Governmental Finances in the United States, 1922, 1950* and *1957*.

The declining significance of the tax for state purposes is illustrated by the fact that the states obtained 17.09 percent of their total tax receipts from this source in 1932, 6.88 percent in 1942, 3.93 percent in 1950, and 3.30 in 1957. Its relative significance today, as indicated in Table 7.2 varies widely. Nebraska received 32 percent of its tax revenue from property, whereas 1 state reported no collections and 14 others received nominal sums amounting to less than 1 percent of total tax revenue. Colorado's reliance on the property tax, which produced 7.9 percent of state tax receipts, is well above the average.

It should be noted, however, that the State obtained nearly 15 percent of its tax receipts from property in 1942. For the eleven Western States, as shown in Table 7.2, the average ratio in 1957 was 7.49 percent, and for the nation as a whole it was 3.30 percent. The decline of the property tax for state purposes is attributable primarily to two factors, the emergence of other major tax forms and the increasing financial pressures at the local level which have resulted in a deliberate policy of relinquishing the source to these units.

Table 7.2

Significance of Property Tax in State Finance, 1957

States	Property tax revenues (thousands)	Property tas as percent of total state taxes
Alabama	$11,366	4.95
Arizona	14,711	13.74
Arkansas	314	0.25
California	107,653	5.75
Colorado	12,049	7.86
Connecticut	[a]	[a]
Delaware	750	1.68
Florida	7,426	1.98
Georgia	928	0.30
Idaho	2,389	4.71
Illinois	697	0.10

The property tax is still the mainstay of local finance, though it is losing ground in the case of the municipalities and counties. For the country as a whole in 1957 it accounted for about 87 percent of the total local tax bill. This may be compared with 92.83 percent in 1942. The greater part of the decline was attributable to the introduction of new taxes by the cities and towns, which obtained 87 percent of their tax receipts from property in 1942 and about 73 percent in 1953.[1]

Colorado's dependence upon the property tax for local purposes in 1953 was approximately equal to the average for the eleven Western States, 90.1 percent (Table 7.3).[2] The property tax in Colorado was the sole source of locally-imposed taxes for the school and special districts, while the counties obtained 99.5 percent and the cities 70.6 percent of their tax revenues from property levies (Table 7.4).

The significance of the property tax for all units of government, state and local, in Colorado is somewhat above the Western State average, as well as the national average. Colorado's per capita property tax burden in 1953 amounted to $74.40. The average for the Western States was $65.52, while the national average was even lower, $59.22.[3] In relation to total state and local taxes a similar disparity is evident. Colorado obtained 48 percent of the total state and local tax revenue from property as compared with about 44 percent and 45 percent for the Western jurisdictions and all-states averages, re-

spectively. A comprehensive analysis of local property tax burdens in Colorado is presented in Chapter XX, State-Local Relations.

It should be emphasized that the interest of state governments in the property tax is not confined to its revenue implications for state purposes. The structure of the tax is determined by state constitutional and statutory provisions. The state exercises broad controls over its administration and usually administers directly the tax on certain special types of property. Finally, the states are being called on to shoulder a larger and larger share in the financing of local services through tax sharing and other aid devises. The states, therefore, have no choice but to assume a continuing responsibility for the effective and equitable use of this source.

Rationale of Property Taxation

Throughout a long and checkered career, property taxes have not lacked support both on theoretical and practical grounds. At the same time, the equity of the different types of property taxes as well as their administrative deficiencies have been subject to severe criticism. About 30 years ago, one of the leading students of American taxation stated that the:

> general property tax was one of the worst taxes known to the civilized world and so flagrantly inequitable that its retention could be explained only through ignorance and inertia.[4]

The theoretical justification for property taxes rests mainly upon the benefits received and the ability to pay principles. Each basis of support has received considerable attention and emphasis. From the standpoint of benefits received, it is alleged that the property owner is the direct beneficiary of many governmental services as well as a continuing rise in the value of his property resulting from various types of public improvements. From the viewpoint of ability, property ownership is said to involve a distinctive or additional element of taxpaying capacity not reflected by income. In addition to these basic principles, the property tax has substantial justification on practical grounds. The productivity of the tax, its traditional role as a primary source of local revenue and the rapidly growing revenue needs of local governments have exerted an important influence in recent years.

The theoretical merit of property taxation, either as a measure of benefits or taxpaying ability, tends to be obscured by the varying character of the taxes employed, differences in administrative practice and results, and the confused situation concerning the incidence of the tax. It is quite obvious that a uniform tax on all forms of property has different economic implications than the classified tax which involves a differential burden. The fact that intangible property and certain types of tangible personal property usually escape taxation also complicates the problem of analysis. In a comprehensive study it would also be necessary to consider several special types of property tax proposals such as the single tax or a supplemental levy on site values or improvements. It is also quite obvious that the theoretical justification of property taxes cannot be considered apart from the question of incidence. Yet, the incidence of property taxes undoubtedly differs depending upon the form of tax, the nature of property, the use of property and changing economic conditions. While these factors clearly complicate the problem of analysis, they must be considered if meaningful judgments are to be made.

Benefit Bases of Property Taxation. The benefits received concept has two primary facets as applied to the general and classified property taxes. First, certain public services such as police and fire protection and the legal arrangements for maintaining property rights are of general benefit to property owners. Needless to say, the cost of these services is substantial and though the benefits involved are not limited to property owners, the protection they receive is of major significance. The other type of special benefit accruing to the owners of property arises as a consequence of various types of public improvement projects including streets, street lighting, primary and storm sewage systems and parks and recreational facilities. It is commonly assumed that these improvements directly increase property values. Consequently, all or a major part of their cost is usually assessed against the owners of property either through the special assessment device or the property tax.

It is generally recognized that there is a substantial element of validity in these claims of special benefit to property owners. However, the limitations of property ownership as a measure of benefits from such services are also evident. Actually, it is not possible to determine precisely the total incidence of benefits from particular governmental services. For example, what part of the total benefits derived from police and fire protection should be assigned to property owners? Individuals who own little or no taxable property also share directly and indirectly in the protection provided. Similarly, the social gains from various types of public improvements are also very widely dispersed. If an acceptable allocation of benefits could be arrived

[4] Edwin A. Seligman, *Essays in Taxation* (10th Edition; New York: The MacMillan Co., 1952), p. 62.

at with regard to property owners and other groups, the additional problem of apportioning the property owner's share among individual holders must then be resolved. Do all types of property both real and personal, income producing or non-income producing, benefit equally according to their taxable value? Are benefits from the governmental services in question equally distributed in relation to such value as between property holdings of great value and those of small value? The difficulty, if not impossibility, of objective answers to these questions is apparent. Finally, it should be emphasized that property ownership as well as other measures of special benefits are often inconsistent with the ability standard.

Property ownership as a measure of benefits involves the further assumption that the burden of the tax will remain on the property owner. However, in the instance of business and rental property the opposite result is typical. Taxes on these forms of property are usually shifted to the consumer or renter, at least that portion which represents a uniform element in cost of utilization. In these cases, therefore, the purpose of the benefit principle is likely to be thwarted.

Ability Bases of Property Taxation. The ability principle is often said to provide a substantial element of justification for property taxation. This assumption, basically, rests upon the concept that wealth in any form contributes to the individual's capacity to pay taxes. More particularly, there is usually a significant relationship between the amount of wealth that the individual owns and income. While this relationship is apparent in the case of certain types of income producing property, it is not necessarily proportional to value. Furthermore, some forms of property do not produce a cash or material income and there is a great variation in the rate of income from different types of income property. These factors obviously tend to limit and to distort the usefulness of property as a measure of taxpaying ability. Needless to say, inefficient and inequitable assessment practices greatly heighten the basic inequities involved. In view of the fact that all or a substantial part of the tax burden on income property is usually shifted, the ability basis of property taxation appears to fail in its most logical application. The classified property tax attempts in theory to give greater recognition to the ability factor than the general levy. However, this objective is often nullified in whole or in part by inadequate or inappropriate classifications and by ineffective administration. If a differential burden in relation to income is achieved, however, the likelihood of this portion of the tax being shifted is reduced.

It should be emphasized that there are several special aspects of property ownership which may evidence unique or additional taxpaying ability. These special situations include the accumulation of personal fortunes in the form of non-income property and the general appreciation in real property values occasioned by broad economic trends. Vast personal possessions do not produce cash income but they do make possible highly luxurious or conspicuous consumption which is non-essential in character. Some tax economists also suggest that the psychic income derived from such property is a proper object of taxation. The tendency for property values (real estate) to rise in a progressive society is an accepted fact. As these values are a result of social rather than individual action, the advocates of the single tax contend that they represent an unearned increment and consequently are the proper subject of heavy tax burdens. While gains in property values attributable to social progress are characteristic of the American economy, they tend to be capitalized as a consequence of relatively frequent sales transactions. Also, such gains are often illusory in that they may not be realized and may actually disappear as a consequence of social forces which produce declining values. Although these special aspects of property ownership are of limited and in some cases of questionable significance, they still may represent a partial justification of the ability basis of property taxation.

Conclusions on Theoretical Bases. Both the benefit and ability principles provide incomplete if not inadequate justification for the imposition of general or classified property taxes. Property ownership as a measure of benefits from particular governmental services has serious limitations and the varying incidence of taxes on different types of property results in inequitable effects. Property holdings are even less satisfactory as an indication of the owner's taxpaying ability. In the first instance, the measure is incomplete; secondly, it varies as between different types of property and at different periods of time; thirdly, the incidence of the tax remains on the owner in some cases and is shifted in others; and, finally, various features of the structure of the tax as well as the effects of inefficient administration greatly heighten the inherent inequalities. It may be concluded, therefore, that the property tax, both in its general and classified forms, lacks full justification on theoretical grounds. At the same time, it should be recognized that the philosophical bases of property taxation are much stronger than those of retail and general sales taxes.

Practical Aspects of Property Taxation. The most significant elements of strength of property taxation as well as its most serious shortcomings are attributable to practical considerations. The continued use and apparent virility of the property tax, particularly by local jurisdictions, may be readily explained. The property tax is a traditional institution and is so inextricably linked with the entire legal and economic fabric of local government that its abolition would necessitate revolutionary changes. From a financial standpoint, as previously indicated, the property tax produces the lion's share of local revenues. In fact, in most local units of government, it is the only significant source of locally imposed tax receipts. Revenues have also exhibited a high degree of stability which is a matter of major concern to these units of government. While new tax sources are being introduced by cities and counties, they have in no case served as a replacement for the property tax. Finally, the property tax, with all of its deficiencies, is generally accepted by the people as a necessary evil. Like the proverbial wart on one's face, its passing would probably be viewed with great trepidation.

The operative deficiencies of the property tax, associated chiefly with the assessment process, are well known. In the first place, the valuation of property for tax purposes involves many difficult and complex problems. Nevertheless, the administration of the property tax has traditionally been left to local units. This, in turn, has often resulted in unnecessary duplication of administrative units, incompetent and inadequate personnel and antiquated and ineffective methods of property appraisal. Almost every conceivable type of inequity is encountered in the results of the typical assessment process. The escape of certain types of property from taxation and a marked over-assessment of other forms is also characteristic. While most states have been consistent in their efforts to improve administration, the results generally have fallen far short of an ideal solution. Further attention will be directed to the administrative weaknesses of the property tax in the following discussion of the Colorado system.

History of Property Tax in Colorado

The original Constitution of the State of Colorado (1876) provided for the establishment of a uniform system of property taxation. In general, it specified that all property should be assessed at a just value unless its exemption was authorized. The same constitutional provision included 5 specific exemptions: (1) personal property up to a value of $200 for the head of a family; (2) ditches, canals and flumes used by the owners for irrigation purposes; (3) mines and mining property for a period of 10 years; (4) the property of governmental units; and (5) property used solely for religious worship, for schools or for charitable purposes and cemeteries not used or held for private profit.

The Constitution established the Office of County Assessor and provided that the Board of County Commissioners of each county should act as a County Board of Equalization to equalize valuations within the county. It also created a State Board of Equalization consisting of the Governor and 4 other elective state officials. Valuations were to be equalized on the basis of full cash value.

The State General Assembly acting under the above provisions initiated the first property tax law.[5] It provided that the county assessors should be elected for a term of 2 years and they were given the responsibility of assessing all property, both real and personal, within their jurisdictions. It was contemplated that the County Board of Equalization would eliminate inequalities in assessment within the county and that the State Board would equalize assessment as between the different counties.

Needless to say, the principles and procedures set forth in the Constitution and statutes were not fully implemented in practice. County assessors generally lacked the capabilities essential to an effective and systematic discharge of their responsibilities. In addition, the pressures from property owners to keep assessments down soon led to a competitive race by the assessors to reduce their county's share of taxes paid to the state government. These same pressures were exerted to prevent equalization of assessments within the individual counties.

Early Efforts to Equalize Property Assessments. In 1876 the State Board of Equalization detected certain serious inequalities in county assessments and ordered changes in assessments to correct these inequalities. The decision of the Board was questioned in the courts and in 1877 the Supreme Court ruled that the Board did not have power to raise the aggregate valuation of property in the State.[6] Inasmuch as the membership of the Board was ex-officio in character, further attempts to equalize assessments were abandoned during the next two decades.

The depression of the early 1890's put a severe strain upon the tax structure. Property valuations were reduced and tax delinquencies increased to a critical degree. Following several years of relative prosperity, county assessors were still reluctant to raise valuations. As a con-

---

[5]The following summary of the history of the Colorado property tax through 1946 is adapted from a study by Earl C. Crockett, *Taxation in Colorado*, Report No. 3, "The Colorado Property Tax," (University of Colorado, 1947).

[6]People v. Lothrop, *3 Colo. 428* (1877).

sequence, a critical shortage of revenues developed both on the State and local levels. Finally, in 1899, the State Board of Equalization again attempted to achieve partial equalization of assessed values. On this occasion it changed the assessment of certain classes of property in the various counties. The decision was again appealed to the courts and the State Supreme Court ruled that this type of equalization was also unconstitutional.[7] Following this decision the State Board of Equalization adopted the following resolution:

> Whereas, every effort of the State Board of Equalization since its establishment has been invalidated by the adjudication of the Supreme Court, therefore, be it resolved, that in the judgment of this Board the power of said Board to equalize and adjust can only be made effective by constitutional amendment or by legislative enactment specifically designating its powers and directing the method of the performance thereof.[8]

After this declaration the assessment situation, so far as equalization was concerned, rapidly deteriorated.

Legislative Reforms. Starting in 1900 several attempts were made to bring about significant reforms in the administration of the property tax. Governor Thomas appointed a special commission to investigate property tax problems and to recommend solutions. As a consequence of the Commission's report in the year 1900, the State Legislature adopted a new revenue law in the following year, 1901. This law provided for the appointment of a State Board of Assessors to supervise and administer local property assessments, and through the efforts of this agency assessed valuations were increased from $216,000,000 in 1900 to $460,000,000 in 1901. Railroad corporation assessments alone were increased by $89,000,000. These companies refused to pay the higher taxes and challenged the law in the courts. The Supreme Court decision held that the State Board of Assessors did not have the power to raise assessments because county assessors under the Constitution did not have authority outside their respective counties.[9]

A further general revision of the State property tax statutes was adopted by the General Assembly in 1902. This law set forth a detailed procedure for assessing property and provided that all forms of property not specifically exempt under the Constitution were to be assessed annually at full cash value. The new law also provided for assessment of public utility properties by the State Board of Equalization and required annual meetings of the county assessors to discuss common problems involved in the assessment of property at its full cash value. In spite of these provisions it is interesting to note that the county assessors in 1908 agreed to assess all property at one third of its cash value.

The next significant attempt to improve property tax administration was the creation of the State Tax Commission in 1911 by the General Assembly. The Commission was composed of 3 members to be appointed by the Governor for 6-year terms. The Commission was granted broad powers to supervise assessment and to enforce the State laws relating to assessment. The powers of the State Board of Equalization, other than that of equalizing assessments, were transferred to the Tax Commission, including the power to assess public utility property.

In the first year of its operation, the Tax Commission increased the total State property valuations from $422,000,000 to $1,300,000,000. Needless to say, this action resulted in strong local opposition and in 1915 Weld and Denver counties initiated a measure to abolish the Tax Commission. The measure was defeated by a narrow margin, but the Tax Commission thereafter evidenced little enthusiasm for tax reform.

Equalization Efforts from 1912 to 1947. Several significant attempts to achieve greater equalization of property values were made in the period from 1912 to 1947. A proposal to abolish the State Board of Equalization and to place the authority for equalization in the Tax Commisever, two years later, a constitutional amendment was adopted giving the State Board of Equalization the responsibility of adjusting, equalizing, raising or lowering the valuation of real and personal property throughout the State and the valuation of the various classes of property. Once again the amendment required the assessment of property at its full cash value. While this amendment was intended to give the Board of Equalization unlimited powers to equalize assessments, it denied the power to make original assessments. Consequently, the courts have ruled that the Board could not examine the valuation of an individual taxpayer's property.[10]

In the administration of the above powers, the State Board of Equalization has made changes in the assessed valuations certified by the county assessors in all except 11 years of the 33-year period from 1914 to 1947. Decreases in assessed valuations were ordered in each year from 1915 to 1923, from 1924 through 1928,

[10]Boulder County v. Union Pacific R.R. Co., *89 Colo. 110* (1931); also McGinnis v. Denver Land Co., *90 Colo. 72* (1931).

from 1930 through 1933, and in 1940. Increases were ordered in only six years, namely, 1923, 1934 and 1936 through 1939. Thus, the principal effect of the Board's action was to reduce assessed valuations, although property values increased significantly during the period noted. Two special studies of the Colorado property tax system, *A Survey of Colorado State Tax System* by Jens P. Jensen in 1930, and *The Colorado Property Tax* by Earl C. Crockett in 1947, have recommended the abolition of the State Board of Equalization. However, no action has been taken on these recommendations.

Exemption of Intangibles and the Specific Ownership Tax. Two special classes of property were excluded from the general property tax base in 1936. All forms of intangible personal property were exempt from the general property tax and the income from such property was subjected to a special surtax under the State Income Tax Law. This change was occasioned by the difficulties encountered in getting intangible property on the tax rolls and the obvious inequities resulting from partial assessment. Similar problems led to the exclusion of motor vehicles form the general tax base and the adoption of the Specific Ownership Tax on automotive vehicles. This tax required payment of a property tax on such vehicles as a condition of registration and has proved to be highly satisfactory.

State Reappraisal Program of 1947. By the late 1940's it became increasingly apparent that the level of assessment of all property was declining in relation to full cash value. Professor Crockett's study in 1947 reported an estimated increase of 50 percent in the actual value of property during the period from 1913 to 1941.[11] Nevertheless, the assessed valuation of property in the latter year was $179,000,000 lower than in 1913. Also, considering the marked inflation of property values during World War II, the 1946 valuation was still $47,000,000 lower than that in 1913. The State General Assembly, recognizing the critical financial problem, appropriated $100,000 to defray the cost of a state-wide property reappraisal program.[12] The legislation directed the State Tax Commission to undertake the reappraisal of all taxable property during the 1947-1949 biennium.

A Department of Reappraisal was created by the Tax Commission headed by a Director of Reappraisal. The State Tax Commission determined that the reappraisal should be made on the basis of 1941 costs of construction. This action was defended on the ground that the rise in property values during the war years was abnormal and temporary in character. The 1941 levels of value, therefore, were declared to represent "true cash value."

The general procedures involved in the reappraisal plan included the development of uniform assessment bases for all types of property; and the use of county assessors' staffs, subject to the assistance and supervision of state appraisal officers, to carry out the actual reappraisal of property in their jurisdictions. An Assessor's Real Estate Appraisal Manual, covering the approved bases of assessment, was published and distributed to the county assessors. In general, the Manual provided for: (1) the appraisal of buildings on the basis of their cost of reproduction using the 1941 level of construction cost and adjusting these costs for losses of value resulting from depreciation, obsolescence and other economic factors; (2) the valuation of agricultural lands according to their production capabilities; and (3) the appraisal of urban land on the basis of 1941 market value and other pertinent factors.

While the county assessors' offices hired additional personnel and generally undertook to cooperate in the reappraisal program, progress was very slow in some jurisdictions. The General Assembly appropriated an additional $113,000 for the program in the 1949-1951 biennium, but 5 years following the initiation of the program the work was not complete in any of the counties. Consequently, the Legislature directed the Tax Commission to make the reappraisal valuations effective for 1952. Many of the counties were not able to complete the work and a more or less arbitrary expedient was adopted. This measure required that the valuation of all property, which had not been reappraised, be increased by a percentage corresponding to the average increase in value on properties which had been reappraised.

As a result of the new appraisals, property valuations in the State increased from $1,733,000,000 in 1951 to $2,470,000,000 in 1952. While nearly all properties were increased in value, the extent of increase varied widely as between individual properties and various classes of property. There were, naturally, many protests by property owners and considering the methods employed to complete the reappraisal, it is not surprising that some of the protests were found to be valid. Consequently, the General Assembly in 1953 appointed a joint committee to investigate the situation. This committee recommended that special provision be made for review of the 1952 assessments, and a law was enacted permitting taxpayers to petition for review of their 1952 assessments without prejudice until May 1, 1953. The county assessors received numerous requests for review and many adjustments were made.

---

[11] Crockett, *op. cit.*

[12] See Report of Colorado Legislative Council, *Colorado Property Assessment Methods*, 1958, pp. 5-9, for later history after 1946.

As the State Reappraisal Program was concerned primarily with the real property assessed by the county assessors, many property owners contended that their valuations were unfair in relation to the valuations of public utility property assessed by the State. This point of view appeared to have merit as the valuation of real estate under the reappraisal program had increased by over 58 percent from 1951 to 1952, while the assessed value of public utility property was increased by only 19 percent. The Tax Commission had not significantly changed its assessment of public utility property except for a general decision that assessment at 50 percent of value would achieve substantial equalization with local assessments. The State Legislature in response to these criticisms authorized a series of special investigations. Two independent studies by private experts were undertaken in 1953 on a limited basis. The results of these studies indicated that the Tax Commission's valuations were equal to or somewhat above the average for other forms of property.

Developments in Property Tax Policy Since 1953. While it was generally recognized that the state-wide reappraisal program had achieved substantial progress in the equalization of assessed values, later developments indicated that significant disparities still existed. In 1954 the Tax Commission recommended a substantial increase in the valuation of agricultural lands in one county and this action was approved by the State Board of Equalization. Similarly, in 1956, the Tax Commission recommended increases in the assessed valuation of farm improvements in 7 counties. These increases, however, were not approved by the State Board of Equalization. Finally, in 1958, the Tax Commission recommended an increase of $10,000,000 in the valuations of one county and the Equalization Board approved the recommendation. The county involved appealed this decision to the courts and the Supreme Court upheld the action of the Board.

The assessment of non-income producing personal property, including household furnishings and personal effects, has long been a serious problem in Colorado as well as other states. While most county assessors tended to rely largely on individual listing for this form of property, the assessors in several counties had attempted to carry out the annual assessment required by law. The results of the existing practices were obviously inequitable, and in 1956 the people adopted a constitutional amendment authorizing the Legislature to exempt such forms of property. In the following year the General Assembly made this exemption effective.

Recognizing the unsatisfactory status of property equalization as well as the deficiencies in various aspects of assessment procedure, the State Legislature in 1957 authorized two special studies of property taxation. The first was a Sales Ratio Study to be undertaken by the State Legislative Research Council, and the second involved a thorough investigation of Assessment Methods by the same agency. Part I of the Sales Ratio Study and the report on Colorado Property Assessment Methods were completed in December, 1958, and Part II of the former study early in 1959. Certain of the findings involved in these reports are considered in the following sections of the chapter.

Structure of the Property Tax in Colorado

Legal Basis of Property Tax. The legal structure of the property tax in Colorado is set forth in the State Constitution, statutes and regulations of the State Tax Commission. These provisions in turn have been interpeted and modified by numerous court decisions. Some of the decisions of the Tax Commission are in fact extra-legal in character, and the actual practice of tax assessors often bears little or no relation to the basic law or the rules prescribed by the Tax Commission. The status of the law as well as practice under it, therefore, is highly complex and often confused.

Article X of the State Constitution provides the general basis of property taxation as follows:

> All taxes shall be uniform upon each of the various classes of real and personal property located within the territorial limits of the authority levying the tax, and shall be levied, assessed, and collected under general laws, which shall prescribe such methods and regulations as shall secure just and equalized valuations for assessments of taxes upon all property, real and personal, located within the territorial limits of the authority levying the tax; provided, however, that the general assembly may, by law, exempt from taxation household furnishings and personal effects which are not used for the production of income at any time.

The provisions concerning exemption of certain types, uses or users of property, the specific ownership tax on automotive vehicles, the establishment of county and state boards of equalization, the right of the General Assembly to take steps for the equalization of property values, the maximum limit on the mill levy for state purposes, the special classification or exemption of personal property, and the prohibition against relinquishing the right to tax the property of corporations are also set forth in the Constitution. Other important features of the property tax law are contained in Chapter 137, Articles 1 through 11 of the *Colorado Revised Statutes.*

It should be emphasized that the Constitutional provisions generally permit broad discretionary power to the Legislature insofar as

classifying property and assessment methods and procedures are concerned. Exemptions, on the other hand, are strictly defined, and can only be extended or curtailed through the amendment process. The latter feature is probably advantageous as it makes it more difficult for pressure groups to obtain preferential treatment.

Definition of Tax Base. The property tax in Colorado applies to all classes of real and personal property including property rights unless specifically exempt. Tax liability attaches to the property, though the tax assessed is to be paid by the owner or owners. Thus, action to collect overdue or delinquent taxes is taken against the property rather than the owners.

The State Constitution as well as the statutes require that the tax shall be applied to the "full cash value" of the property. This requirement, however, has been honored more in the breach thereof than by observance. County assessors and the State Tax Commision have not been appreciably influenced by it.

Exemptions. Exemptions have significantly narrowed the general tax base in Colorado as well as other states. The specific exclusions authorized may logically be grouped in three categories as follows: (1) those relating to the ownership of the property; (2) those involving the nature of the property; and (3) those related to particular uses of property.

Property owned by the federal government, the State and its local subdivisions is exempt. In the case of the national government the exemption is implicit in the doctrine of intergovernmental immunity,[13] and for other units it is specifically authorized in the State Constitution. Other exempted owners include: banks (personal property only) and county fair associations. In the latter instance the law calls for abatement or refund of taxes imposed, and in practice this is equivalent to exemption. The state and local governmental unit exemption is common to all of the states with certain minor exceptions.

Three important types of personal property are exempt by constitutional provision: (1) intangible personal property; (2) household furnishings and personal effects which are not at any time used for the production of an income; and (3) motor vehicles, trailers and semi-trailers other than those in process of manufacture and held in storage or in stock by manufacturers, distributors and dealers. The exemption of intangibles was adopted at the time the State Income Tax Law was passed, and a special in lieu surtax on the income from intangibles was incorporated in the income tax. This exemption simply recognized a situation which existed in fact, that such property was not being assessed. Over one-fourth of the states follow a similar policy of exempting all or most forms of intangibles, and a large number also exempt particular types of intangibles.

The personal property exemption was authorized by constitutional amendment in 1956, and was initiated the following year by action of the State Legislature. It is limited to household furnishings other than fixtures (items attached to the building) and ordinary personal possessions such as clothing, jewelry, books, etc., which are non-income producing. Incomplete and inequitable assessment as well as a recognition of the fact that such property normally involves little or no taxpaying ability were factors motivating this development. Prior to 1957 a $200 exemption was extended to the head of the household. The majority of the states have the limited sum exemption, ranging from $100 to $500, but complete exemption is becoming increasingly popular.

The exemption of motor vehicles simply substituted a special levy, the specific ownership tax, for the general tax. The change was designed to ensure effective assessment and collection of the tax on such vehicles by linking the tax payment to the registration process. Results have proved to be highly satisfactory, and the practice is employed by a number of other states.

Property, both real and personal, used solely and exclusively for religious worship, for schools not held or conducted for profit, for strictly charitable purposes, and also cemeteries not used or held for profit, is exempt. This type of exemption is universally employed, although its scope in terms of non-religious uses varies.

Other minor special exclusions include: the ditches, canals and flumes owned and used by farmers to irrigate their own land; the residence and land on which it is situated, owned by a church or synagogue and used as a dwelling for a minister, priest or rabbi, up to an assessed value of $6,000; and the increase in value of lands resulting from the planting and growing of trees for a period of 30 years unless the timber becomes mature and suitable for use prior to that time.

While the principal exemptions under the Colorado law result in a substantial reduction of the property tax base, they are generally typical of state practice and have strong support both on theoretical and practical grounds. It should be noted that there are several other special group exemptions which are found in some states such as veterans, owners of homesteads and owners of farm machinery, that are not permitted in Colorado. This fortunate circumstance may be attributable to the fact that a constitutional amendment is required for such favors.

[13] While federal land or other property leased to private individuals or businesses for profit-making activities is not taxed in Colorado, it is doubtful whether immunity attaches to such property.

General Basis and Standards of Assessment. While the constitutional and statutory basis of assessment in Colorado is "full cash value" or "true and full cash value," this has been interpreted and modified by statutory provisions and decisions of the State Tax Commission. The law establishes market value as the general guide to true value, but in the case of property which does not have an ascertainable market value other measures are specified. These measures include the value of the use and the capability of use, together with any other just method of determination. In the instance of corporations, the value of securities (stocks and bonds) outstanding is to be considered, and if other methods are inapplicable the cost of replacement or other just means may be employed. The foregoing basis and standards of assessments do not apply to metalic mineral properties, and the law contains special provisions relative to the assessment of several other types of property including merchandise inventories, public utilities and livestock. In addition to these special treatment situations the Tax Commission has made its own interpretation of the full cash value requirement, and has established specific rules for the assessment of most forms of property under a broad classification plan.

Under the revaluation program initiated in 1947, the Tax Commission in 1951 determined that 1941 construction costs reflected full or true cash values for buildings. This decision has not been questioned in the courts, though the fallacy of the assumption soon became apparent. It constitutes the broad basis of present assessment policy. At the same time (1951), the Tax Commission also established a system of appraising agricultural lands according to their productive capability, and specified the basis of assessment for other types of land. These rules were incorporated in the Assessor's Manual, and became the official basis of assessment under the revaluation program. They have been modified in certain details by later orders of the Commission. In 1958, 88 classifications of real and personal property were established for assessment purposes.

Specific Bases of Assessment; Major Types of Property. The specific bases of assessment, as prescribed by law or Tax Commission decisions, for the major types of property and those presenting distinctive problems will now be examined. Six broad categories are employed; namely, (1) agriculture land, (2) extractive or natural resource lands, (3) situs land, (4) improvements, (5) personal property, and (6) public utilities.

Agricultural Land. Agricultural land may be generally defined as land which derives its value primarily from its use in producing agricultural products or the raising of livestock. There is no specific statutory basis for assessing such land, although the law states that such lands "... shall be valued as a unit with the improvements and water rights located upon them."[14] The policy as set forth by the Commission provides for capitalizing the net income that was produced over a ten-year period on a typical farm under average management. Average net income values are to be calculated for each class or type of land within a homogeneous area. The ten-year period used is from 1933 to 1943. The specific procedures for implementing this policy, as laid down in the Assessor's Manual, are highly complex. It should also be noted that the income period specified includes the trough of the depression years.

Extractive Land. The law distinguishes two classes of mineral property for purposes of assessment: producing mines and non-producing mineral properties. Producing mines are defined as those with gross production in excess of $5,000, and the concept is further limited to mines producing gold, silver, lead, copper or other precious or valuable minerals. Thus, the provision may generally be said to include metallic mineral producing properties. However, iron, coal, asphaltum, quarries and land valuable because it contains other metals, minerals or earth are specifically excluded. To avoid confusion it is generally agreed in practice that tungsten, zinc, molybdenum, vanadium, uranium, tin and beryllium shall also be included under the "producing mines" category.

The law requires that the producing mines shall be assessed at either one-fourth of the gross proceeds or, if the net proceeds are more than one-fourth of the gross proceeds, at the net proceeds. Machinery and surface improvements are to be assessed separately at their actual value.

Non-producing mines or mining claims or possessory rights not classified as producing mines are simply to be assessed at the value thereof, which obviously provides no positive guidance to the assessor. The law does specify, however, that non-producing mines may not be assessed at a greater sum per acre than is assessed against the lowest valued producing mine in the same locality.

Coal lands, whether producing or non-producing, are excluded from the special assessment category. They have been classified by administrative decision of the Tax Commission, and are assessed on a flat sum per acre basis. The Tax Commission has prescribed a special

[14] *Colorado Revised Statutes, 1953*, Chapter 137-12-9.

basis of assessment for producing oil and gas wells; namely, 87½ percent of the value of the product at the well-head. The average price per barrel is used on oil and posted field prices for gas.

Separable or severed private mineral rights on non-producing mineral lands are supposed to be assessed at $1.00 per acre. While there is a relatively small amount of privately owned commercial timber land, by practice it is usually assessed on an acreage basis, the value of the timber being added to that of the land.

Situs Land. Situs land in general is land that derives its value from its actual or potential use as a location for buildings and other improvements and which is neither agricultural or extractive in nature. The statutes do not provide for a specific basis of assessment, but the Tax Commission has decreed that it be assessed at 40 percent of average market value.

In arriving at the average market value attention may be given to rental value, sales of comparable property, income produced and any other factors that may influence value. If there are improvements on the land, the value of the property is calculated as a unit and the replacement cost of the buildings is deducted to determine the value of the land.

The procedures recommended by the Commission in the valuation of situs land are those generally accepted and applied by expert appraisers.

Improvements on Land. Improvements upon land are generally defined as all structures or items of property which are permanently affixed to the land. By statutory definition they also include water rights. There are no statutory provisions relating to the specific basis for assessment of improvements. However, the law requires that they shall be listed and valued separately from the land, except in the case of property used for agricultural purposes. In the latter instance, the law specifies that the valuation shall apply to the entire unit.

As previously indicated, the Tax Commission, in connection with the revaluation program of 1947-1951, prescribed that improvements should be assessed on the basis of 1941 construction costs with appropriate deduction for depreciation and other specific factors affecting the value of the particular property. Additions to the original building are assessed on the same basis. It may be noted that normal depreciation deductions were limited to 60 percent, and that no building should be reduced in value more than 80 percent if it was fully utilized, and 90 percent so long as the building remained standing. While the law specifies that farm land and improvements be valued as a unit, the policy is to obtain unit value by appraising the component elements. Tax Commission policy includes the general concept that the combined assessed value of farm lands and improvements should not exceed the fair pre-inflationary sale value of the property.

Personal Property. The types of personal property subject to the property tax in Colorado may logically be classified as (1) livestock, (2) merchandise and manufacturers, and (3) all other personal property. The assessment of personal property is generally governed by rules laid down by the Tax Commission. However, the law does provide for annual assessment of such property and states that livestock and agricultural or livestock products held in a raw or unprocessed state by the farmer shall not be included within the terms "merchandise" or "manufacturers." The basis for assessing livestock is determined by the Tax Commission and the Colorado Assessors Association, and annual circulars are issued which set forth the recommendations for most classes of personal property including livestock. The recommendations specify the minimum average assessed values per head in the case of livestock.

The general rules pertaining to the assessment of merchandise and manufacturers are laid down in the statutes. They provide that the assessor shall ascertain the average amount invested in such property during the tax year. Owners of merchandise or manufacturers are required to list the sums invested in the property during each calendar month of the year. The actual standard of assessment as recommended by the Commission is 50 percent of the average inventory. As a matter of policy, the so-called average inventory is supposed to include a minimum of two inventories, the opening and closing.

Three methods of assessing other types of personal property including furniture, fixtures, machinery and equipment, are approved by the Tax Commission and are in actual use by assessors. These bases are as follows: (1) conversion of original cost to the 1941 level of construction cost and allowance of annual depreciation, (2) 40 percent of original cost, and (3) 80 percent of book value. The first basis is not widely used because of difficulties involved in its application.

Public Utilities. The rules concerning the assessment of public utilities' properties are set forth in some detail in the statutes. While these provisions specifically designate certain types of utilities, others have been added to the list by judicial and administrative determination. Generally speaking, the following types of services are considered to be public utilities: railroads, airlines, telephone and telegraph, electric power, natural gas, gas pipe line and other pipe lines, domestic water, irrigation, and car lines. The responsibility for assessing such property is vested in the Tax Commission. While the law

requires that the Commission shall fix a value for the entire operating property of each company, it does not specifically indicate in detail how such value is to be determined. The Commission, however, is required to consider the value of capital stock and bonds and any other appropriate evidence of value. Property of a public utility company, which is not used in the operation of its main business, is specifically excluded and is to be assessed by the county assessor of the county in which it is situated.

The statutes further provide for the allocation of a portion of the total value of interstate companies to Colorado on the basis of the proportion of track mileage in Colorado to the total track mileage in the system for railroads, and the proportion of line mileage in Colorado as compared to total line mileage in the system for telephone and telegraph companies. The allocation of the values of such property to local taxing jurisdictions within the State is based upon *main* track mileage for railroads and wire mileage for telephone and telegraph companies.

In determining the value of utility properties the Tax Commission considers three factors: (1) planned account or historical cost, (2) average market value of stocks and bonds for the preceding 12-month period, and (3) capitalization of net operating revenues during a 5-year period. The emphasis upon these factors varies with the type of utility and sometimes as between individual companies. The utility property is then assessed at 40 percent of the value allocated to Colorado.

Assessment Organization. The original assessment of property in Colorado, as in most other states, is vested in the office of the County Assessor. Public utility property which is assessed by the State Tax Commission is the one exception to this rule. There are presently 63 county assessors—62 of them are elected and the assessor in the City and County of Denver is appointed under a Home Rule Charter provision. The elective assessors serve for a 4-year term. It should be noted that the term of office was extended from 2 to 4 years and the salaries of assessors were substantially increased in 1954.

Various qualifications and disqualifications pertaining to the office of the county assessor are set forth in the State statutes, but they are not concerned with the technical capabilities of the candidates. The Colorado State Tax Commission is also charged with certain broad responsibilities concerning the assessment of property. This Commission consists of three members, who are appointed by the Governor under Civil Service regulations, and who hold office subject only to Civil Service laws and regulations. In general, the Commission is required to adopt reasonable rules and regulations concerning the method and manner of valuing real or personal property for tax purposes.

The Commission has the specific duty and power: (1) to supervise the administration and enforcement of all laws relating to the assessment and levying of property taxes; (2) to supervise county assessors, Boards of County Commissioners, County Boards of Equalization and the other officers concerned with the assessment and levying of property taxes with the object of insuring that the assessments are made on a just and uniform basis and at the true and full cash value of the property; (3) to re-appraise property in any county or municipality when in the judgement of the Commission such property has not been assessed at its true and full cash value; (4) to require county assessors to place upon the assessment roll any property which, for some reason, has escaped assessment and taxation; (5) to provide forms of returns to be made by assessors to its office and to formulate and transmit to assessors such instructions as may be deemed necessary or desirable to carry out are provisions of state law; (6) to prescribe uniform procedures relative to the keeping of assessment and tax records; (7) to investigate the activities and methods used by county assessors, county commissioners, county boards of equalization and county treasurers pertaining to the assessment and equalization of property taxes; and (8) to call annual meetings of county assessors and such other meetings as it may deem appropriate.

Thus, the State Tax Commission appears to have adequate authority to supervise and control virtually all phases of county assessment practice as well as the levying of property taxes and the equalization of assessed values of real and personal property.

Collection of the Property Tax. Property taxes in Colorado are collected by the elective County Treasurer. Assessment rolls are certified to this official by the county assessor, and tax bills are transmitted to the owner on the basis of this record. The treasurer also has the responsibility of assessing any property that has been omitted from the tax rolls.

Property taxes for a particular year are due on January 1 of the following year. However, the taxpayer is given an option of paying the tax in two installments on the last day of February and the last day of July, respectively, or one lump sum on April 30 without penalty. In practice, therefore, taxes become delinquent and subject to penalties after the dates specified. Several legal procedures are available to the treasurer for collecting delinquent taxes including: the tax sale of tax delinquent real estate; direct action against personal property involving a distraint order and sale; and suit against the owner to obtain a court judgement. The former methods are most frequently employed. In the case of a sale of real estate, the owner has the right of redemption within a 3-year

period. Taxes delinquent for a period of six years may be cancelled by action of the county commissioners.

Specific penalties in the case of delinquent taxes include interest at the rate of ½ of 1 percent per month plus an additional penalty after August of ⅔ of 1 percent per month on the taxes due. With the exception of the general depression period of the 1930's, no serious problems have been encountered in keeping tax delinquencies within reasonable bounds.

Equalization and Review Machinery. The Constitution makes provision for county boards of equalization and the State Board of Equalization. The county boards are composed of the county commissioners, and their functions are to hear and act upon complaints of individual taxpayers concerning assessments, to order the assessor to supply omissions in assessments and to equalize assessments among the taxpayers within the county. The Constitution requires equalization on the basis of full cash value. The boards meet on the third Monday in July and hearings may extend through July 28.

The State Board of Equalization consists of the Governor, State Auditor, State Treasurer, Secretary of State and Attorney General. It is the duty of the Board to adjust, equalize, raise or lower the valuation of real or personal property and the valuation of any item or items of the various classes of such property. Equalization is to be in terms of full cash value, and the Board has full authority to order any county assessor to change or equalize assessments and correct omissions in assessment. It does not have the power, however, to make original assessments. If the Governor is satisfied that an assessor has willfully failed or refused to comply with the law, he may remove such an assessor by executive order.

It should be noted that it is also the function of the Tax Commission to examine the abstract of assessment for each county, and the Commission may order such percentage increases or decreases in the over-all assessment as to equalize valuations at full cash value.

The Property Tax Calendar. The property tax calendar is a prolonged one extending over the period from February 1 of a given year to August 1 of the following year. Under 1957 amendments the date for initiation of assessment was changed from March 1 to February 1. It should be noted that assessors had requested the January 1 beginning date for assessment as this would permit the use of the end-of-the-year statements for inventories and other taxes. The process of assessment may continue throughout the first half of the year but is normally completed by May 1. The assessor is required to notify each taxpayer whose assessment has been changed of this change before July 1.

The County Board of Commissioners, acting as a Board of Equalization, is required by law to hold hearings between the third Monday in July and the twenty-eighth of July. Immediately thereafter, by August 1, the assessor must file a summary abstract of property assessments in the county, including any changes made by the Board of Equalization, with the State Tax Commission. In actual practice, these abstracts are usually filed between August 1 and August 20.

The State Tax Commission meets to examine assessment abstracts not later than the second Monday in September. If any changes are thought to be desirable the Commission submits its recommendations to the State Board of Equalization.

The State Board of Equalization meets on the third Monday in September and must complete its work within a week. It examines the assessment rolls submitted by the State Tax Commission, and if changes are made to equalize assessments among the counties, it must notify the assessors of such changes and provide an opportunity for a hearing on the changes. The assessor may appeal the decision of the State Board to the District Court of the county of which he is the assessor, and such appeal must be heard summarily.

The State Board of Equalization also determines the rate of the state tax to be collected by the county and this is certified to the County Clerk by the State Auditor along with any changes made in the original assessment.

Not later than October 1 the assessor must declare to the clerk of each town and to the County Superintendent of Schools the total valuation of assessable property within their jurisdictions. The local officials of each town, school and other taxing district, in turn, must certify their respective mill levies for the coming year to the Board of County Commissioners. The latter then certify the combined levies to the county assessor who extends the rates against the valuations and computes and transmits the individual tax as assessed to the county treasurer for collection.

Technically, the property taxes assessed are for the preceding year and are due and payable on January 1. However, the taxpayer is permitted an option of paying one-half of the tax before March 1 and the remainder before August 1, or, payment of the tax in one payment before the last day of April.

Thus, the property tax calendar extends over a period of eleven months in the levying and assessment of the tax and eighteen months before the tax due is collectible in full. Various proposals have been made for reducing the time lag both as respects the levying and assessment of the tax and its collection. However, the mechanics of the administrative process are such that a significant reduction in the time allowed does not appear to be feasable apart from a basic

change in administrative procedures. Inadequate staff in many of the county assessors' offices as well as the cumbersome nature of the equalization procedure are probably the major obstacles to such reform. The changes in the nature of the assessment process suggested in a later section of the chapter would require an overhauling of the assessment and equalization aspects of the tax calendar.

Rates of the Property Tax. The rates of the property tax in Colorado exhibited a gradual rise during the two decades following 1930, declined significantly following the revaluation in 1947-1951, and have increased sharply since 1954. As indicated in Table 7.5 the average aggregate mill levy for all units was approximately 31 mills in 1930; rose to 37.48 mills in 1940; reached a peak of nearly 52 mills in 1951; fell to about 39.5 mills in 1952; and was back to the 52 mill level in 1957.

All governmental units have shared in the increased property taxes levied. However, rate increases in recent years have been most marked in the case of the school districts. Comparing 1953 and 1957 average millage rates, these units showed a 26.5 percent rise, cities and towns 12.7 percent, and the counties 11.8 percent.[15] The fact that the schools have been primarily responsible for current increases is, of course, a reflection of the great expansion in educational requirements and the sole dependence of these units upon this tax source. Many municipalities have deliberately avoided increases in their property tax rates in recognition of this problem, while others have closely approached or attained their maximum mill rate under the State law. The State millage rate of 3.56 mills in 1957, though recently increased for institutional building requirements, is obviously of minor importance in the over-all rate picture. A breakdown of the 1957 levy by purpose is shown in Table 7.6.

It should be noted that there are extreme variations in millage rates on property from one jurisdiction to another. As indicated in Appendix Table 20A, the combined rates for school, county and municipal purposes in the 78 Colorado cities with populations of 1,000 or over ranged from 39.80 mills in Fort Morgan to 99.05 mills in Victor. Levies for municipal purposes varied from 7 mills in Fort Morgan to 30 mills in Erie; total school levies from 19.50 mills in Telluride to 42.80 mills in Littleton; and levies for county purposes from 4.62 mills in Aguilar to 25.05 mills in Victor.

Property Tax Receipts. Property tax receipts (taxes levied) in Colorado as shown in Table 7.5 amounted to over $49 million in 1930, but declined sharply during the trough of the Great Depression and did not regain and surpass this level until 1946. The relatively low yields during the World War II period are surprising in view of the marked inflation in property values and higher millage rates. They were, of course, attributable to the extremely low level of assessment which characterized state practice

[15] See Chapter XX, Table 20.5.

Table 7.5

Average Mill Levy and Property Taxes Levied in Colorado, 1930-1957

Year	Average levy[a] (mills)	State	County	Municipal	County public school	Special school	Total
1930	31.01	$5,710,519	$10,088,346	$ 9,353,494	$ 5,786,907	$18,267,450	$49,206,716
1931	31.19	5,050,622	8,733,128	8,753,895	5,557,516	16,768,640	44,863,801
1932	31.23	4,482,057	7,411,658	7,897,828	5,280,083	14,926,305	39,997,931
1933	33.46	3,745,196	7,229,104	7,236,566	4,802,598	13,779,605	36,793,069
1934	33.49	3,749,125	7,459,086	7,238,172	4,730,441	13,636,177	36,813,001
1935	33.96	3,268,849	7,685,489	7,753,184	4,792,005	13,462,059	36,961,586
1936	34.50	3,316,553	8,179,228	7,948,636	4,830,877	13,863,511	38,138,805
1937	36.67	5,002,024	8,636,312	8,066,232	4,871,440	14,181,968	40,757,976
1938	36.66	4,970,548	8,872,102	7,490,693	4,236,093	14,830,933	40,400,369
1939	37.71	4,906,543	7,454,306	10,274,713	4,099,720	15,285,619	42,020,901
1940	37.48	4,842,379	7,108,136	10,336,038	3,875,593	15,546,956	41,709,102
1941	37.18	4,788,820	7,357,844	10,081,451	3,959,849	15,701,188	41,889,152
1942	35.96	4,657,352	7,003,992	10,215,071	3,763,523	16,139,973	41,779,911
1943	35.74	4,595,903	6,933,872	10,832,754	3,515,417	16,793,520	42,671,466
1944	36.11	4,412,171	6,932,737	11,780,511	3,363,125	17,280,785	43,769,329
1945	38.72	4,267,319	10,164,072	10,121,871	3,520,575	19,139,663	47,215,500
1946	41.51	4,310,125	11,589,498	10,593,681	3,627,850	22,200,351	52,321,505
1947	46.37	6,079,752	13,719,884	11,872,574	3,928,819	26,623,632	62,224,661
1948	47.65	5,866,189	15,682,789	12,823,369	4,199,780	31,309,232	69,881,359
1949	49.06	6,145,150	18,627,911	13,979,322	4,312,045	35,043,391	78,107,819
1950	49.41	6,414,031	18,653,416	14,164,075	4,477,683	37,548,951	81,258,156

during this period. Since 1946 property tax yields have grown significantly on an annual basis. Totaling over $52 million in 1946, they were up to $81 million in 1950; and were slightly more than double the latter figure in 1957 or $163 million.

The preponderant position of the public schools in the utilization of this source is evidenced by the fact that school district and county school levies accounted for nearly 58 percent of the total in 1957. The counties share (other purposes) was 21 percent;[16] the cities—14 percent; and the State's, less than 7 percent. Needless to say, the relative share of all governmental units, other than school districts, in property tax revenues has been declining in the last few years, and this trend may be expected to continue at least until the peak load upon public school facilities occasioned by rising birth rates has been reached.

Property Tax Burdens and Their Distribution by Major Classes of Property. It is evident that the true burden of the property tax is not reflected by millage rates or by the amount of tax receipts. Whereas millage rates increased during the 1930's and the early 1940's receipts were substantially below the 1930 level, and while the aggregate rate fell from 52 mills in 1951 to 39.5 mills in 1952, revenues increased from $90 million to $97 million. The key to the property tax burden situation in Colorado, as in many other states, is assessed valuations, and, more particularly, the relationship between assessed values and the actual market or cost values of property at any particular time. Thus, any judgment concerning property tax burdens and the future potentialities of this revenue source is dependent upon an examination of the trend of assessed valuations and their relationship to current or market values. The former data are readily available on a long-term basis, but the latter information, unfortunately, can only be obtained by intensive research and that available is limited to certain periods and in other respects.

Trends in Assessed Valuations. The general trend in assessed valuations in Colorado from 1870 through 1957 is shown in Table 7.7. In view of the progress of the State's economy throughout this period, the level of assessed valuation reveals some strange results. Throughout the early history of the State assessed valuations manifested a gradual increase from 1870 to 1894. They declined during the remainder of the decade, and this development led to a reappraisal of property which was reflected in the 1901 valuations. The reappraisal resulted in an increase of assessments from $217 million in 1900 to $466 million in 1901 or a rise of 115 percent.

Total Assessed Values in Colorado, 1870-1957

After the reappraisal, however, valuations again declined and were maintained at a lower level until a second reappraisal in 1912. This revaluation produced even more extreme results with the 1913 valuations amounting to $1,307 million, a rise of 209 percent as compared to the previous year. Assessed valuations showed only a minor increase during the next 18 years, totaling $1,586 million in 1930. They decreased by about ⅓ during the depression period and did not regain the 1930 level until 1949.

The most recent state-wide reappraisal of property, initiated in 1947 and completed in 1951, brought about a significant but modest increase in assessed valuations of 42 per cent. Since 1952 a further increase of 21.6 percent has occurred. The total assessed valuation of property in the State in 1957 was $3,151 million.

On the basis of the Jensen and Crockett studies of the property tax in Colorado it seems apparent that assessed valuations have only approached the "full cash value" legal standard on two occasions, namely, 1901 and 1913. The

1947-1951 reappraisal was officially intended to reflect 1941 costs or market values, which were admittedly fractional in terms of actual property values (about 40 percent) at the time the reappraisal was undertaken. Initial results of the Sales Ratio Study indicate that the average ratio of assessment in Colorado at the present time is only about 28 percent.

While it is obviously not possible to determine the precise effect of adherence to the full cash value standard of assessment in recent decades, the 1913 assessed valuations do provide a possible base for estimating such values. Assuming that the 1913 valuations reflected the full cash value standard, the probable level of full cash valuations since that time were calculated using two factors of change; namely, the indices of population and construction costs. The population factor showed an over-all 90 percent increase from 1913 to 1957 and construction costs a four-fold increase. The composite index for certain selected years was then applied to the assessed valuations to arrive at the theoretical full cash valuations presented in Table 7.8.

According to these data, the full cash value of property in Colorado for 1957 would have been approximately $12,280 million rather than the $3,151 million actually assessed. The findings of the Sales Ratio Study indicate a full cash valuation of about $11,250 million in 1957 or approximately $1,000 million less. Consequently, the calculations appear to be reasonably accurate. The significance of the estimated full cash valuations for earlier years may be readily seen by dividing the actual taxes levied into the full cash value base. Thus, the effective millage rates would have been as follows:

Years	Average Effective Mill Levy
1933	16.00
1938	13.50
1943	10.70
1948	9.20
1953	10.90
1957	13.30

Stated in different terms, the annual property tax in Colorado levied by all units of government amounted to: 1.6 percent of full value in 1933, 1.35 percent in 1938, 1.07 percent in 1943, 0.90 percent in 1948, 1.09 percent in 1953 and 1.33 percent in 1957.

While the estimates of the full cash value of property since 1913, and consequently the burden of the property tax as related to such values, constitute rough approximations, it is evident that assessed valuations bore little relationship to the actual value of property. Increases in millage rates and the amount of property taxes assessed, therefore, provide no indication of the actual burden of the property tax. Finally, it is quite clear that the present effective rate of the property tax on the present value of property in Colorado is less than 1.5 percent.

Distribution of Assessed Valuations by Types of Property. The distribution of total assessed valuations by the major classes of property for selected years is shown in Table 7.9. Percentage-wise, in 1957 town and city lots and residential improvements accounted for 38.07 percent of the total assessed valuation; rural land and improvements, including improvements on public lands—13.74 percent; corporation property assessed by the Tax Commission, or public utilities — 11.77 percent; commercial improvements—9.28 percent; miscellaneous properties — 8.37 percent; merchandise — 7.75 percent; timber, oil and coal properties — 4.40 percent; industrial improvements — 4.04 percent; livestock—1.67 percent; and metalliferous mining properties—0.91 percent. Due to a change in property classifications in 1957 the data for earlier years are not strictly comparable. However, there has been a substantial decrease in the relative importance of metalliferous mining properties and livestock throughout the entire period. In contrast, there has been a significant increase in the relative position of timber, oil and coal properties and merchandise inventories since 1941. Finally, the major categories of rural and urban lands and improvements have maintained a relatively stable position since 1941.

Policy Issues and Administrative Problems

General Standard of Assessment. The determination of an appropriate standard of assessment and its consistent application by those

responsible for property appraisal has always been a fundamental problem in the property tax field. State laws in most jurisdictions have prescribed 100 percent assessment in terms of current market or sales value, but Colorado as well as other states having this requirement have generally practiced fractional assessment in widely varying degree.[17]

In spite of the recognized deficiencies in practice, tax experts ordinarily support the full value measure. This support is attributable primarily to the fact that 100 percent of present values provides a more realistic and sounder basis of calculating relative values. In the first place, it is a more readily determinable and understandable base. Secondly, inequities in assessment tend to stand out more clearly, and if they persist are less onerous by virtue of the larger base. Finally, this standard places greater emphasis upon the necessity of keeping assessed values on a current basis, a condition that is essential to equitable assessment. Of course, assessment on the basis of present values does not require the 100 percent base. Thus, there are really two facets of the problem under consideration, namely, the question of 100 percent versus a lower ratio of assessment, and the base to which the percentage factor is applied, or, present values versus values at some earlier period.

The principal objection to 100 percent assessment, which is normally though not necessarily identified with current value, is that it would result in a tremendous increase in the tax base, and thereby open the door to an increase in property tax burdens. Fractional assessment, especially when it is not authorized by law, is also preferred on the ground that taxpayer psychology is generally more favorable and there is less likelihood of individual complaints concerning assessments. In other words, underassessment tends to disguise the true burden of the tax and serves as a cover for various types of inequities involved in the typical assessment process. It will be noted that these considerations have a practical or expediency orientation.

Ideally, there is little doubt that 100 percent assessment on the basis of current values is the best standard of assessment. The advantages claimed for this approach are generally valid. The key element in the standard from the standpoint of equity, however, is the use of current or present values. In a rapidly growing economy, such as that of Colorado, not only the level of property values but the value relationships between individual properties and different types of property are constantly shifting or changing. To ensure wholly equitable results in a relative sense, property would have to be revalued every year, and if assessed values are more than three years behind the current relationship serious inequities are inevitable. Certainly, under the latter circumstances true equalization of assessed values is impossible. The fiction, widely held at various times during the history of property taxation, that there is any true or real level of values other than that presently existing has long since been exploded.[18]

Once present value or the closest possible approximation thereto is established as the general basis of assessment the question of the ratio of assessment may be treated in its proper perspective. While the 100 percent factor is desirable from certain points of view it is not essential to equitable results. Rather, any reasonable ratio uniformly applied will achieve this end. Considering the practical problem which would arise as a consequence of converting the present average assessment ratio in Colorado of around 28 percent to 100 percent, a fractional assessment factor is preferred. As there are marked inequalities in the average ratio as between counties it is not possible to select a factor that would leave existing assessed valuations undisturbed. A 40 percent of present values basis of assessment would appear to be reasonable as this reflects the approximate maximum in terms of existing practice and the effects would not be revolutionary in terms of extending the valuation base in most jurisdictions.

Adoption of such a percentage factor applied to current values as determined by market or cost data, however, should be accompanied by provision for the automatic adjustment of state and local rates to ensure that property tax burdens in the individual taxing units would not be increased or reduced by this action. A constitutional amendment will obviously be required to effect the changes indicated.

Frequency of Assessment. The failure of county assessors to re-assess real property and sometimes certain types of personal property within a reasonable period of time has been a major factor contributing to low levels of assessment, and serious inequities between individual properties and different types of property. Regardless of the reasons for this deficiency, no general standard or basis of assessment will produce satisfactory results unless

[17]Several states have attempted to implement the 100 percent of current values standard in recent years.

[18]It should be noted that the Director of the 1947-1951 State Re-appraisal Program and the State Tax Commission were faced with a two-pronged practical problem, namely, the Constitutional requirement of 100 percent cash value assessment, and the inevitable political and economic repercussions which would have followed an application of this rule to the inflated value structure of the early post-war period. Whether their decision to use 1941 costs was desirable or not is a moot point.

property is re-appraised at relatively frequent intervals. Assessment on present values obviously requires a minimum time lag between the actual date of assessment and the current values situation.

Three years should provide adequate time for a complete re-appraisal of real estate once a sound, equalized assessment is achieved, and this period is not excessive in terms of maintaining a proximate relationship to current values. This change in existing practice would require the institution of a continuing assessment program with one-third of the property in each county being re-assessed each year. A further advantage of the plan is that it would permit the use of full-time staff with some degree of competence in appraisal work. It should be noted that a similar approach is now followed in the City and County of Denver and certain other assessment offices, and the three-year rule as well as continuing assessment is widely used in other states. Personal property should be re-assessed every year due to its fluid character. This is the requirement under the present law, and the rule is actually followed in many jurisdictions.

No serious problems should arise in requiring adherence to the above rules in most jurisdictions. However, some of the counties with sparse populations and limited economic resources to support the assessment and other governmental functions may find the proposed plan of assessment very difficult if not impossible to implement. In the interest of good government in general such counties should be consolidated or re-organized to assure a more adequate tax base. State aid is a possible alternative, but preferably it should be employed as a supplementary measure if necessary after such reorganization has been achieved. The proposal involving state assessment of extractive lands, if adopted, would largely resolve the major assessment problem in certain of the counties falling within the group under consideration.

Specific Bases of Assessment; Problems and Issues. The legal or official bases of assessment for certain types of property as well as the practice of county assessment offices in applying them involve important policy issues and administrative problems. These questions will be considered with reference to the major categories of property drawing heavily on the factual data presented in the Assessment Methods Report of the Legislative Council.

Agricultural Lands. The present method of assessing agricultural land involves the capitalization of net income approach based upon the ten-year average, 1933-1943. As previously indicated, the procedures in applying this method as outlined by the Tax Commission are highly complex.

The desirability of any particular basis of assessment must be appraised in terms of its equity and conformance to the general standard of assessment, its practicality and the actual results achieved. In the first instance the income standard of assessment, though providing a measure of taxpaying capacity, is often inconsistent with market or cost values. It is, of course, wholly inconsistent with the cost or market value basis in the case of non-income properties such as personal homes or residences. Furthermore, its application to only one type of income property is bound to produce inequities. Finally, the present use of average incomes during a base period which included most of the worst depression years of the 1930's is unrealistic and highly inequitable from any point of view. If the income standard is to be used in the future, it certainly should be applied on a current, moving-average base.

The practicality of the income standard in the case of farm land is highly questionable apart from actual results. It requires continuing data on average yields, grazing practices, and basic costs which are generally not available in the form needed by assessors.[19] Farm income records, as in the case of certain other small, independently owned businesses, are notoriously deficient. Furthermore, market or sales value data, although not current in some instances, are generally more accessible and reliable.

A consideration of actual practice and the findings of the Assessment Methods Report reveal that the present method is not being effectively or uniformly applied in the majority of counties; that guess work is often used as a substitute for essential facts; that some assessors have made no attempt to use the method; and that extreme inequalities exist between counties as to levels of assessment for the same type of land as well as different types of land.[20] The Sales Ratio Study tends to substantiate the existence of these inequities, and further indicates a substantial disparity in the average ratio of assessment for agricultural as compared to urban land.[21]

In spite of the considerations noted, the Assessment Methods Report concludes that the present method is the best available. This position is believed to be unwarranted both on theoretical and practical grounds. Market value information is sufficiently accessible to provide a firm basis of assessment for most classes of

---

[20]*Ibid.*, pp. 45-53.

[21]Colorado Legislative Council, *Sales Ratio Study*, Research Publication No. 27, December, 1958, p. 26.

agricultural land in most counties. Under a proper and uniform system of classification prescribed by the State adequate general data on sales transactions for each class of property can be made available to all assessors to supplement the specific information that they have obtained. In this respect, the data provided through a continuing sales ratio study should serve as a general guide to the Tax Commission and individual assessors. Direct use of specific transaction data is not recommended as this might well break down the reliability of the information reported.

It should be emphasized that sales or market value is the principal basis of determining the value of agricultural as well as urban land throughout the United States. Capitalization of net income, if it is used for assessment purposes, is generally employed as only one of several factors in valuing such specialized types of property as public utilities and mines. In the case of these special forms of property, market or sales data, other than the market value of outstanding securities, are seldom available.

Use of sales data as the specific basis of valuing agricultural land does not preclude the employment of such information as may be available on yields, prices and income for the purposes of checking long-term trends in market or sales values.

Extractive or Natural Resource Land. The application of the property tax to mineral and timber lands has always presented a difficult problem to policy-makers as well as tax administrators. Policy-wise the problem is two-fold: (1) of arriving at a basis of assessment which will produce consistent results as compared to other forms of property; and (2) of formulating an assessment policy which will give adequate recognition to the depletable character of such resources. A third facet of the problem, which is of concern to legislators and assessors alike, is the practicality of the assessment plan and its uniform application. Further special complications arise with respect to non-producing mineral lands and immature, growing timber stands.

Several different positive approaches to these problems have been employed by the various states, apart from the widespread practice of gross underassessment by local assessors on a highly irregular and unsystematic basis. These efforts include (1) the adoption of a complex cost-income declining value assessment plan administered by the state, as exemplified by the practice of Minnesota and Michigan; (2) an attempt to achieve scientific assessment based upon the current value of the resource through the use of expert geological data under a centralized state assessment program; (3) the introduction of special assessment bases for certain types of mineral property not related to the capital value of the resource, as in Colorado; and (4) the substitution of a severance tax for the property levy on producing mineral and timber-properties.[22]

The first approach (Minnesota-Michigan) is sound from a theoretical standpoint, but it is highly complex, and would be extremely difficult to apply to the varied types of mineral resources and production situations in Colorado. State administration of this plan would be a must.

The second approach is employed by a number of states with widely divergent results. Use of the current value basis of assessment involves a general determination of the extent of the resource, its quality and its worth as measured by present prices. To avoid possible over assessment the quantity of the resource should be conservatively estimated with annual decreases in the estimated total value as determined by production rates. It should be emphasized that the depletion factor in the case of a mine or oil well is basically no different than the depreciation or obsolesence factor in the case of buildings or other property subject to these influences. While state assessment affords an opportunity to utilize experts and to achieve uniformity in assessment results, these advantages are not assured. Rather they are dependent upon the quality and quantity of the administrative staff, and this in turn requires legislative understanding and cooperation in providing adequate appropriations. The feasibility of this method has been demonstrated under the conditions noted.

The special bases of valuation approach to the assessment of producing mineral lands, such as gross or net product, bear no reasonable relation to the capital value of the resources, and are certain to produce inconsistent and inequitable results as between individual mining properties of the same type and of different types. These effects arise as a consequence of the fact that the value of one year's product of an oil well or mine constitutes a fractional element of the total value of the property, and that there are extreme variations in the productive life of mineral properties. These disparities tend to be greatly magnified under the differential practices of a local assessment situation. The one advantage which attaches to the gross product basis, in particular, is that production and price data can be obtained with relative ease.

The present differential bases of assessing oil and gas, "producing mines" and coal mines are unequal and involve a marked discrimination against oil and gas properties. In actual

[22]See E. H. Plank, *Public Finance* (Homewood, Illinois: Richard D. Irwin Inc., 1958), pp. 519-529.

practice, the 87½ percent of the value of the gross product basis for oil and gas appears to be quite uniformly applied; the provision concerning producing mines, which requires 25 percent of gross product or the net product if that is greater, is operative only in terms of gross product; and a special assessment classification plan established by the Tax Commission for coal lands, which is supposed to produce equalized assessments, has failed to achieve any semblance of uniformity.[23]

The use of the severance tax as a substitute for the property tax on productive natural resource properties has often been proposed, but has seldom been practiced. The great majority of the severance tax states, as indicated in Chapter XIV, employ the tax as an additional rather than alternative levy. Colorado's practice in granting a property tax credit against the severance tax on oil and gas income is one of the exceptions to this policy. In general, the severance tax is said to be preferable to the property tax in the following respects: it is related to the quantity or value of production and cannot become a cumulative charge on the capital value of the property during periods when it is unproductive or production is at a low level; the burden of the tax is more likely to be shifted to consumers; and it is relatively easy to administer in contrast to the admittedly complex and technical problem of determining the capital value of mineral deposits. These alleged advantages of the severance tax, as noted in the later discussion of this source, have considerable merit.

In the light of this apparent preponderance of evidence the failure of most states to utilize the severance tax as an alternative or in lieu levy may be somewhat surprising. However, the reasons for the general policy are quite clear. In the first place, natural resource properties are usually subject to low level or fractional assessment under the property tax. Secondly, they are given preferential treatment under the federal and many state income taxes, particularly as regards depletion allowances. Thirdly, local governments, which are largely dependent upon the property tax, are reluctant to part with a certain, stable source of income, subject to their control, in exchange for one that is less certain and is dependent upon the beneficence of state legislative policy. Finally, state legislatures are looking for additional or new sources of revenue to finance rapidly rising costs, and understandably are less concerned with restructuring tax systems particularly if the gains in terms of equity are open to question. In short, the actual problems associated with the application of the property tax to mineral resources plus the relative advantages of the severance tax as an alternative source are generally thought to be less significant and compelling than the fiscal gains from the property tax plus the theoretical and revenue advantages of the severance tax as an additional levy.

The chief concern in the assessment of nonproducing mineral lands or rights therein is one of ensuring uniformity of assessment in relation to some reasonable measure of value. Low level, if not nominal, assessment, is generally indicated in view of the unproductive status of the property. However, there are marked differences in potential value, and expert judgment is required both in terms of developing appropriate classifications and determining the specific level of assessment for each class. This competence seldom exists on the local level, and uniformity of treatment is virtually impossible of attainment apart from centralized state assessment. As there is relatively little commercial timber production in Colorado, this facet of the natural resource problem will not be examined.

In conclusion, it is evident that the present bases of assessing producing mineral properties involve varying degrees of fractional assessment as related to capital value, and are discriminatory both as between oil and gas and other minerals and mineral properties as compared to other forms of property. Assessment on the basis of the estimated current value of the resource, subject to annual adjustment according to the rate of depletion, is feasible, and is definitely preferred to the gross product method. Centralized state assessment by an expert staff would be essential, but this is desirable in any case to ensure uniformity and consistency of results. Under this approach the general ratio of assessment would be applied, and the assessed values allocated back to the county or counties in which the property is located.

Site Land. The present legal basis of assessing urban land and other land not used for agricultural or extractive purposes according to the market value measure as outlined by the Tax Commission is sound, and will produce equitable assessment if uniformly applied. The latter result, as revealed by the Sales Ratio Study, is not being achieved, but it can be under an effective system of state aid and control over local assessment practices. These conclusions are in accord with the findings and recommendations of the Assessment Methods Report.[24]

Improvements. The general approach to the valuation of improvements in Colorado, namely, replacement costs new minus depreciation or other factors which serve to reduce value, is the most desirable method. Use of 1941 costs, however, is unrealistic and inequitable, and current costs should be substituted. The pro-

[23] *Colorado Property Assessment Methods, op. cit.*, pp. 57-66.

[24] *Ibid.*, pp. 80-81.

cedures established by the Tax Commission for applying the replacement cost measure are also needlessly complex in certain cases, depreciation as well as cost schedules are outdated, and the system of classification for different types of improvements needs overhauling. The statutory requirement that farm lands and improvements be valued as a unit, whereas other improvements are valued separately from the land, is highly questionable. To ensure reasonable consistency of results a uniform policy of valuing all improvements separately and on the same cost basis is essential.

Assessment practice, as demonstrated by the Assessment Methods and Sales Ratio studies, is marked by widespread deviation from the procedures set forth in the Assessor's Manual and extreme disparities exist in the level of assessment as between individual improvements of the same type and different types of improvements both within a particular county and from one county to another.[25] The institution of a uniform basis of assessment, simplified and standardized procedures, and an effective system of state control are the obvious answers to these problems.

Personal Property; Inventories or Stocks of Goods on Hand. The assessment of personal property, by virtue of its varied, fluid and mobile character, is another difficult problem area. Certain classes of personalty, such as merchandise and manufacturing inventories, present theoretical as well as practical difficulties, and the assessment of livestock and agricultural products in the hands of the farmer involves similar considerations. A relatively new type of mobile property, the home or house trailer, also has become a source of chronic headaches to assessors and on occasion to the owners of the homes and trailer parks.

Assessment policy with respect to merchandise and manufacturing inventories has been the subject of continuing controversy in Colorado as well as other states. The owners of such property contend that it is being overassessed relative to other property (50 percent of average investment value); and that the incidence of the tax is highly unequal as a consequence of varying rates of stock turnover. Actually, the fluid character of this type of property makes it very difficult if not impossible to achieve equal treatment as compared to relatively fixed or long-life assets. Farm products in the hands of the farmer and to a somewhat lesser degree livestock are similar in character.

Cost of commodities in inventory constitutes the most logical and feasible basis of assessment. Market value is subject to frequent fluctuations, and would be more difficult to compute on an average basis. Furthermore, the cost basis is clearly preferable from the standpoint of the owners of such property.

Exemption is unacceptable as it would involve a serious discrimination against other forms of property both real and personal, and would substantially reduce the tax base. Possible alternative or in lieu tax approaches, such as gross receipts and value added, could be employed to offset revenue losses. However, they are open to the same type of objections.

The gross receipts base, for example, disregards the average amount of capital invested in stock, and penalizes high rate of turnover concerns. Thus, the gross receipts base fails to equate the tax burden in terms of the value of the capital invested factor which is the fundamental aim of the property tax. The "value added" tax concept is designed to serve as a substitute for a general sales tax on the various stages in the production and distribution of commodities. Specifically, it is intended to limit the tax base on each level to the contribution which that type of business makes to the total value of the product as represented by the consumer price. In other words, its purpose is to avoid a pyramiding of the tax base, and the tax on a tax effect of the general sales tax. To the degree that this aim is achieved it washes out the significant element of capital investment involved in the cost of goods purchased.

The general merit of the cost basis of valuing inventories is further attested by the fact that this is the typical approach in other states.

In applying the cost method, a basic question arises as to whether the total or average amount invested in inventory during the year should be employed. While the latter or average amount is usually fractional as compared to the total investment, it is the generally accepted basis. It should be noted, however, that the average cost measure is computed on purchase cost rather than total cost of goods sold. The determination of the average amount of capital invested in inventory throughout the year presents certain technical problems, but they are not insurmountable. Ideally, this determination should be based upon a 12-month average as recommended by the Tax Commission. However, this is not feasible in all cases, and the Tax Commission rules permit as a minimum the use of opening and closing inventories. Due to the possibility of manipulation, a quarterly inventory minimum requirement would obviously be preferable, and should be feasible except for certain small, independent concerns.

The present percentage assessment factor of 50 percent appears to be high in relation to the average ratio of 28 percent of market or sales value for all types of property. However, con-

[25] *Ibid.*, pp. 87-102.

sidering the fact that the 50 percent is applied to purchase costs rather than cost of sales, and the vagaries of local assessment practice, it is impossible to determine the precise effect of the present policy and its equity as related to the treatment of other forms of property. Under the present circumstances, therefore, there is insufficient evidence to justify a change in the 50 percent rule.

While the Constitution provides that agricultural products, except those in the hands of a retailer, shall not be regarded as merchandise, it does not exempt such property nor does it prescribe a method of assessment. In actual practice, however, these products in the hands of the farmer generally are not assessed. The desirability of exemption is questionable, but it should not be practiced without legal authorization in any case.

The present basis of assessing livestock is unsatisfactory in several respects. In the first place, no definite standard or measure of value is prescribed in the Constitution or statutes (other than full cash value). As a consequence, the Tax Commission with the assistance of county assessors annually determine a schedule of so-called "minimum average valuations" for the various types of animals. It is not known what these recommended values are based on other than the opinions of those participating in their formulation. Secondly, in actual practice these values tend to become standard or uniform bases of assessment, which is not the intent of the Commission and obviously fails to reflect actual differences in value.

A specific measure of value should be established by statute for livestock, and market value is clearly the most realistic. The percentage of assessment should, of course, be related to the general standard to ensure consistency of results.

As mobile homes used on the highways are supposed to be taxed under the specific ownership tax on motor vehicles, this problem will be discussed in that connection. Other miscellaneous types of personal property including office furniture and fixtures, machinery and equipment are assessed on varying bases. The Tax Commission recommends three methods, but the typical approach is 40 percent of cost without conversion to any standard level of cost and without annual depreciation. The results naturally are extremely variable both as between counties and different types of property in the same county. A uniform statutory basis of assessment is obviously required if any degree of equalization is to be achieved. Replacement cost minus depreciation is the most appropriate basis in terms of the recommended current values standard for real property. Replacement costs would also be easier to ascertain than actual costs and average depreciation schedules could be developed and applied in most instances. It is recognized that this basis may be subject to strong opposition from property owners. However, actual cost less depreciation is extremely difficult to ascertain and due to differences in accounting practice a reliance on book values would produce highly variable results. Liberal allowances for depreciation would also provide a means of offsetting possible burdensome effects during the years immediately following the introduction of the replacement cost basis.

Public Utilities; Assessment Problems. The assessment of the property of public utilities is a highly complex and technical problem. While responsibility for assessing such property (used in operations) has appropriately been vested in a state agency, the Tax Commission, it is impossible to evaluate the results of the Commission's policy apart from a comprehensive investigation of all facets of present practice. The Legislative Council Committee on Colorado Assessment Methods, recognizing the enormity of the task, recommended a special study.

There are basically two policy questions to be resolved, namely, the appropriateness of the valuation formulas presently being employed and the effect of the factor used to allocate total valuation to Colorado. A third issue, which is not an assessment problem, concerns the equity of the measures applied in allocating assessed valuations to the local assessing units. In practice there are many points at which the assessment formulae applied may break down, and thus fail to achieve their specific or over-all objectives. Illustrative of the type of questions involved in the assessment problem are the following: what is a proper rate for capitalizing net operating revenue; should the income base be total net earnings on assets used or held for use by the utility; is there any justifiable reason for employing book accounts and if so are they properly defined; is the market value of outstanding securities a reliable factor of measuring present value and is the weight assigned to it reasonable; and should the replacement cost new minus depreciation method, which represents the closest possible approximation to market value, be employed? These are only a few of the more obvious points.

Any investigation of existing policy and practice must deal with broad policy implications as well as techniques if it is to accomplish the purposes intended. Furthermore, any analysis of specific valuation factors will be largely unmeaningful unless it is predicated upon a definite general standard of valuation such as current value, historical cost or capitalized net incomes which is consistent with that used for other types of property. As the former concept of current value measured by market

value or replacement cost is the basis recommended throughout this analysis for most other forms of property it is the logical approach to public utility valuation. Needless to say adoption of this basis would involve a marked change in present policy as well as the results thereof.

Allocation of Public Utility Assessments to Counties. Apart from a declaration of state policy to the contrary, it must be assumed that the purpose of state assessment of public utility property is to ensure effective and equitable assessment results. If this is the sole objective, the allocation of assessed valuations within the State should correspond to the actual location of all types of public utility assets used in the provision of the product or service. In the case of railroads, the main-line track mileage allocation factor effectively negates this result, and bears no relationship to any logical basis of distinction. A case conceivably might be made for distributing part of the assessed values of railroads between the counties on the basis of equalizing needs-resources relationships. However, any similarity between the results of the present factor and these considerations is purely coincidental. Purposeful discrimination directed to recognized fiscal or economic objectives may be defensible under certain conditions, but the present allocation factor is wholly capricious in its effects, and does not meet the requirements of sound policy either in terms of actual location of railroad property or equalization.

Similar questions arise in the allocation of telephone valuations by line mileage, although the effects are not as extreme. The total allocation of state assessed public utility valuations as shown in Table 7.10 reveals the strange situation in which such valuations amount to 9 percent or less of total valuations in 4 of the 5 most populous counties and reaches a peak of 76 percent in Eagle County with a population of 4,700.

Specific Ownership Tax and The Mobile Home Problem. The specific ownership tax has proved to be a highly effective substitute for the general property tax except for the special case of mobile homes. While the 3 percent rate appears to be unreasonable in view of the effective rates of less than 1½ percent on general property, the actual burden of the 3 percent rate is substantially reduced by the established tax value rule. This rule provides that the value for tax purposes is 75 percent of the complete delivered price, and the assessed value for the first year is 70 percent of this amount. Thus, if the total price paid for the new car is used as a measure, the effective burden of the tax in the first year is 1.575 percent. It may, of course, be argued that this is not a fair measure as the market value of the car declines significantly once it leaves the dealer's premises. On this line of reasoning, 80 percent of the sales price would constitute actual value to the owner, and the 3 percent tax applied to 70 percent of this value would involve an effective tax of 2.1 percent which is much higher than for other property. In terms of future policy the burden of this tax should be reasonably equated with that on other forms of personal property, and it should be recognized that the value of a new car in the hands of the owner is not the price

paid to the dealer. Implementation of this policy obviously would require a lowering of the assessment ratio.

The depreciation schedule established under the tax law as indicated in Table 7.11 is somewhat more liberal than actual depreciation during the first six years of the life of the vehicle and less liberal in the 8th and 9th years. However, the discrepancies favor most car owners, and are not serious in their over-all effects.

The State law presently provides for the registration and taxation of mobile or trailer homes under the specific ownership tax, unless they are not to be operated or driven on the highways of the State during the year. In the latter event the owner must apply for exemption and file an affidavit with the county clerk and recorder, and the home then becomes subject to the regular tax on personal property. While all trailer homes are legally subject to a tax under these provisions, the actual result is that they often escape taxation. Those that are exempt from the specific ownership tax may be moved out of the trailer parks during the assessment period; there is insufficient checking to determine their proper tax status; and the assessment practice by county assessors varies widely from one jurisdiction to another. Owners contend that the impact of the tax imposed is inequitable as virtually all household equipment is built-in and, therefore, taxable in contrast to the exemption of movable equipment in regular homes. There is also the question as to whether a distinction should be made between the trailers that are regularly employed as a place of abode and those that are less frequently used for trips and vacation jaunts.

The problem of ensuring the taxation of all trailer homes may best be resolved by employing a single tax method. As registration of such vehicles is required in any instance, and as the specific ownership tax is likely to be more effectively and uniformly applied, this approach is preferred. However, these results are not assured and a special checking procedure should be instituted to compel owners to register. Trailer park proprietors who lease or rent such homes should also be specifically covered. It is not feasible from an administrative standpoint to make a distinction between trailer homes on the basis of use. If this is attempted, it simply opens up another opportunity to evade full tax responsibility.

The alleged inequity of taxing built-in fixtures in trailer homes when movable equipment in regular homes is exempt undoubtedly exists in some cases. A flat percentage of total value allowance based upon the typical relationship would probably be the most appropriate method of coping with this situation as an individual determination of the value of fixtures would not be feasible. It may, of course, be questioned whether the difference in burden is of sufficient magnitude to justify such action.

The Equalization Problem. The history of the equalization problem in Colorado is largely one of inaction both in terms of continuing controls and general re-valuation programs. Three general attempts to equalize assessed values have been made in 1901, 1913 and 1947-1951. Each of these efforts yielded substantial results insofar as the level of assessed valuations was concerned, but each failed to achieve true equalization in many facets of assessment relationships. The last effort was probably the most comprehensive, but its shortcomings, as revealed by the Sales Ratio Study, are all too evident.

Gross under-assessment, as measured by current market or sales values, is prevalent in all counties, but there are extreme variations as between counties. The state-wide average ratio of assessment for county-assessed property was about 28 percent.[26] It should, of course, be recognized that the 1941 level of costs standard applied in the 1947-1951 re-appraisal program is largely responsible for this low level of assessment. More significantly, the average ratios by counties ranged from 14.1 in Jackson County to 40.9 percent in Saguache County. Seven counties had average ratios above 35 percent and eight had ratios below 20 percent. On the other hand, one-third of the counties had ratios falling within a 4 percentage point range from 24 to 28 percent. Among the ten most populous counties the range is from 23 percent in El Paso to 32.2 in the City and County of Denver. It is quite apparent that the State still has a long way to go in achieving a reasonable equalization of assessment levels in the various counties. The over-all average ratios by counties also tend to conceal the actual disparities which exist in several respects. In the

[26] *Sales Ratio Study*, Part One, *op. cit.*, p. 14.

first place, the method of computing the ratios involves an exclusion of the upper extreme 25 percent and the lowest 25 percent of the cases. While this approach is believed to be sound for over-all county comparisons, it obviously excludes the extremes so far as a particular county is concerned. In the second place, the county averages obviously do not show differentials with respect to various types of property or as between individual properties of the same type.

The statewide average ratios for specified classes of urban and rural property as shown in Table VI (Part One) of the Sales Ratio Study reflect an extreme variation—from 37.1 percent for industrial buildings to 16.7 percent for miscellaneous unimproved rural land. Urban residental properties had an average ratio of between 31 and 32 percent while improved agricultural properties were assessed at an average ratio of 25.7 percent. All urban property had an average ratio of 29.5 percent as compared to the all rural ratio of 24.3 percent.

Inter-county comparisons by classes of property, which are presented in Part Two of the Sales Ratio Study, show extreme inequalities. Similarly, the variations within individual counties both as to types of property and particular properties of the same class are often so marked that no semblance of uniformity exists.

Further elaboration of the apparent assessment inequalities would serve no useful purpose. The inequities that exist are critical in nature and all-prevading in scope and they must be eliminated.

Five basic steps are essential in dealing with this problem. First, an equitable and practical standard of assessment based upon current values must be established. Second, specific bases of assessment, consistent with the general standard and feasible of application, must be adopted. Third, uniform procedures of assessment should be prescribed by the State. Fourth, the assessment process must be placed upon a continuing basis with full re-assessment of personal property every year and real estate over a three-year period. And fifth, an adequate system of state control over local assessment practice which incorporates a comprehensive research program, state aid and effective enforcement techniques must be instituted. Equalization of assessment results is essentially a matter of sound policy and procedure, effectively and uniformly applied, and there are no shortcuts or panacea solutions.

The State's Role in Property Assessment and Equalization

The State Tax Commission presently has direct responsibility for the assessment of most forms of public utility property, and it is proposed that this responsibility be extended to extractive lands. In each case the technical difficulties involved in the appraisal process and the impracticality of achieving uniform results under local assessment are the motivating factors. While similar considerations might logically suggest centralized state assessment of all property (Maryland has adopted such a plan) this radical departure has not appeared to be feasible in most jurisdictions. State aid to and supervision of local assessment has proved to be both an appropriate and feasible alternative. The degree of success attained in both the direct assessment and control areas, however, varies widely from one state to another. Although the state government has the economic resources to establish an administrative authority with the necessary power and the quality and quantity of staff required for effective results, all too often this has not been accomplished.

Colorado is a typical example of a state that has created an administrative agency with broad responsibilities to supervise local assessment practice and to achieve equalization of assessments, but has failed to take the steps necessary to ensure an effective discharge of these responsibilities. There are undoubtedly many factors that have contributed to this situation including unfavorable court decisions in the early years, a lack of interest in or appreciation of the equalization problem, local resistance and the lack of effective executive control over the administrative agency involved.

A correction of the administrative problem appears to be essential as a first step in view of the fact that the Tax Commission has adequate powers in most areas. This will require re-constitution of the agency with a single head appointed by and responsible to the Governor. Logically, all aspects of tax administration should be centralized in one agency, namely, the Department of Revenue. Thus, the State's responsibilities in property assessment and equalization would be assigned to a Division of this Department. A second possibility, which is definitely inferior to the consolidation of the two agencies, is the establishment of a separate Department of Property Tax Assessment and Equalization with a director appointed by the Governor. In either case, final appeal to the State Board of Equalization on equalization decisions might well be retained.

Once administrative responsibility is achieved, competent and adequate staff must be provided. Economy in such matters is a delusion, but because there are no citizen pressure groups involved it is frequently practiced, nevertheless.

State Use of the Property Tax Source. State policy in general reflects a marked trend to relinquish the property tax source to local governments. Considering the increasing pressures upon local units to finance essential services and the limited tax resources available to them, this policy is undoubtedly sound. As

indicated in Chapter XX, certain local governments in Colorado, particularly municipalities, face a critical financial problem, and their principal if not only major tax source has already reached the legal or economic maximum. While State withdrawal from the property tax field will not wholly resolve such problems, it would afford substantial relief. Of course, legal rate limits would have to be adjusted to permit utilization of the additional levies.

From the standpoint of the State the loss of revenue from the property tax, some $11.2 million, can be made up from other sources such as the income or severance taxes. Existing millage rate commitments for capital construction extending through 1965 must be met, but after this date such needs can be financed under a capital budgeting program from the General Fund. The present State mill rate for operating purposes can and should be discontinued at the first opportunity.

CHAPTER VIII

RETAIL AND GENERAL SALES TAXES

Since the early 1930's broad based sales taxes have emerged from obscurity to become a leading source of tax revenue for state governments in thirty-three states. The first modern version of a state general sales tax was adopted by West Virginia in 1921. Measured by gross sales the tax applied to retailers, extractive industries and several other types of business enterprise. It was passed to meet a financial emergency, and the relatively high rates on natural resource industries reflected a desire to shift some of the tax burden to this group. Another general tax with a broadened base and increased rates was substituted in 1925. Georgia followed West Virginia in 1929 with the passage of a low rate tax on the gross receipts of retail, wholesale and manufacturing enterprises. However, this act was allowed to expire in 1931.

The Great Depression of the early 1930's triggered an avalanche of new adoptions: Kentucky and Mississippi in 1930; Pennsylvania in 1932; Arizona, California, Illinois, Indiana, Michigan, New York, North Carolina, Oklahoma, South Dakota, Utah and Washington in 1933;[1] Iowa and Missouri in 1934; Arkansas, Colorado, Florida, Idaho, Maryland, New Jersey, New Mexico, North Dakota, Ohio and Wyoming in 1935; Louisiana in 1936; and Alabama and Kansas in 1937.

The great majority of the new taxes applied only to gross sales or receipts at the retail level. However, the Arizona, Mississippi, New Mexico, North Carolina and Washington laws covered other specified businesses, and the Indiana levy was unique, being imposed on the gross income of individuals and businesses above certain flat sum exemptions.

Without exception these taxes were a direct outgrowth of financial crises engendered by the depression. The economy of most of these states was preponderantly agricultural, and farm incomes were hit much harder than industrial incomes. In all cases property and other tax receipts had fallen sharply, and the maintenance of basic programs such as education and the protection of life and property was endangered. At the same time there were imperative demands for increased relief and other welfare outlays. While the combination of special circumstances and pressures varied from one state to another, the sales tax was generally regarded as undesirable because of its allegedly regressive impact upon low-income groups. Despite this inherent shortcoming the tax was believed to be an essential expedient. The influence of the equity consideration was evidenced by the fact that eight states allowed the "emergency" levies to expire or repealed them within a two-year period following their adoption. In the remaining states, however, the tax was retained to meet continued urgent financial requirements for education, welfare and highway purposes.

Since World War II ten more states have joined or re-entered the sales tax fold. Connecticut, Main, Nevada, Rhode Island, South Carolina and Tennessee adopted the tax for the first time; and Florida, Georgia, Maryland and Pennsylvania re-established the levy after a lapse of from eight to twenty years. All of the more recently enacted taxes are limited to retail sales and to all intents are permanent measures.

The great popularity of sales taxes today, amply attested by the developments noted, may be attributed to several factors. In the first place, state revenue needs are increasing and the tax has demonstrated its productivity. Secondly, the base of existing sales taxes is also limited so that their regressive effects are not as significant as they were assumed to be in the early years of their use. Finally, a revolutionary increase in the emphasis upon ability to pay taxation by the federal government in the form of progressive net income taxes has seemed to preclude significant extensions of these taxes by the states and may have lessened the concern with this aspect of equity.

Another development in the sales tax field which has important implications for the states is the increasing use of such taxes by cities and other local units. Following the passage of enabling legislation, 290 municipalities and 38 counties are now imposing the retail tax in California, and its use is spreading in other states. Continued revenue shortages on the local level will undoubtedly accentuate this trend as well as the pressures for other means of meeting local revenue problems. The states have an obvious responsibility to assist their local subdivisions in seeking solutions to their

[1]Oregon also adopted a sales tax, but it was killed by a popular referendum vote.

problems, and local sales taxes are at least a partial answer. Needless to say, local use of sales taxes tends to delimit the possible range of productivity of this source for state purposes. At the same time, it may lessen somewhat the demands for increased state aid. These and other facets of the question will be examined in Chapter XX dealing specifically with state-local fiscal relations.

Types of Sales Taxes

Sales taxes currently in use in the thirty-three states, as shown in Table 8.1, include several broad types of levies. Their general nature and effects identify them with the sales tax family but there are many differences in their scope, the description of the tax base and their legal incidence. The scope of sales taxes or their coverage in terms of type of business affected, ranged from that which covers only the retail concern, or transactions at the retail level, to that which includes virtually every type of business activity (i. e., wholesaling, manufacturing, extractive industries, etc.). Logically, taxes restricted to retail transactions are classified as "retail sales" taxes and those that include transactions involving other concerns as well are classified as "general sales" taxes. In actual practice the latter classification does not tell the full story as some of the levies falling in this class apply only to retail and wholesale transactions while others extend to nearly all forms of business. Another designation often used to differentiate the scope of the tax is based upon the stage or stages in the production and marketing processes which the tax covers. Thus the tax may be referred to as a "single-" or "multiple-" stage levy.

The general description of the tax base provides a second possible basis of classification with three concepts employed, namely, "gross sales," "gross receipts," and "gross income." While gross sales is somewhat less inclusive than gross receipts, this distinction disappears when the term "gross receipts from sales" is used. But even here the term may be linked with the so-called privilege type of tax whose legal incidence is upon the business rather than the consumer. Aside from these ambiguities of terminology, the distinctions are perhaps of minor import.

On the other hand, the use of the term "gross income" to describe the tax base is an entirely different matter. As defined in the Indiana law, this concept includes virtually all individual, business and professional income with no deductions. The Indiana tax, therefore, must be treated as a distinct type, and is grouped with sales taxes only for purposes of convenience in analysis.

Sales taxes are generally regarded as taxes on consumption for the obvious reason that the burden is usually passed on to the consumer. In practice, however, many of the state sales tax laws specifically state that the tax is imposed upon the seller for the "privilege of doing business in the state." Technically, therefore, these levies are "privilege taxes" in contrast to the majority which are specifically or by implication classed as "consumer taxes."

Retail versus General Sales Taxes. Twenty-six of the state sales tax structures, including the Colorado tax, are of the single-stage retail type. Six are general or multiple-stage sales taxes, and the Indiana levy, as previously indicated, is a gross income tax. All of the general sales taxes apply to retail transactions, but the coverage of other businesses varies from state to state. The Michigan, New Mexico, Washington, and West Virginia laws are the most inclusive with retail, wholesale, manufacturing, extractive and specified other activities subject to the tax.[2] The North Carolina tax is limited to retailing and wholesaling, while the Arizona levy includes retailing, wholesaling and extractive industries.

[2] It should be noted that laws in each of these jurisdictions except New Mexico actually involve two taxes, one applying to retail sales and the second to other types of business.

The preponderance of the single-stage retail tax at the state level is significant, and merits special attention. Actually, it is explainable largely on fiscal and administrative grounds. In terms of the dollar volume of sales the tax base is obviously much larger at this level. Also many of the tax jurisdictions have relatively little manufacturing or natural resource industries other than agriculture. Administratively, every additional type of business taxed tends to add to the enforcement problem. Another consideration that may serve to deter use of the multiple-stage form is "tax pyramiding." If several or all of the stages in the production and marketing of goods are taxed, the consumer is faced with a pyramided burden in the sense that he is paying a tax on a tax. Incidently, this effect has undoubtedly been an important factor in causing the multiple-stage states to impose relatively low rates on wholesaling and manufacturing as compared to retail sales. High rates on natural resource industries, it should be noted, are generally motivated by special considerations associated with severance taxation.

Rationale of Sales Taxes

The merit of any tax must be appraised in the light of certain accepted standards both theoretical and practical. In the case of retail and general sales taxes practical considerations rather than conformance to theoretical principles provide the primary justification. In other words, such factors as yield, relative ease of administration, convenience of payment and an apparent lack of acceptable alternatives have assumed a greater weight in policy formation than the adverse effects of the tax upon income distribution.

Productivity. The general revenue producing capabilities of the retail and general sales taxes are a matter of record. They tap the flow of funds in the economy at strategic points both in terms of volume and its measurability. Consumption expenditure, which constitutes the bulk of total outlays in the nation's economy, is the direct target of the retail tax. Inclusion of sales at other specified levels of production and distribution obviously extends the base in the direction of a gross expenditures levy and at the same time increases the volume of retail outlays. While the impact of the retail tax on consumption expenditures is limited by the commodity emphasis (failure to include most services) and by specific exclusions, deductions and exemptions, the tax base is still very large compared to that of other general tax forms. In 1957, for example, the combined base of the personal and corporate income taxes in Colorado was $1,022,771,000 as compared with $2,000,000,000 for the retail sales tax. The assessed value of property was $3,069,112,462 or 153 percent of the sales tax base. From the standpoint of administrative determination of taxable sales, also, the problem is much simpler than for a refined concept such as "taxable net income."

Another aspect of the productivity of a tax which is often said to be advantageous is stability. This feature is desired for the reason that expenditure requirements tend to be flexible only in one direction, namely upward. Thus, stability is actually desired only during a down-swing in economic activity. The retail or general sales tax yields are clearly responsive to changes in the dollar volume of business, and yields fluctuate more than those of the property and motor fuels tax. At the same time, sales tax receipts are relatively more stable than those from the net income taxes. It should, of course, be pointed out that stability of yield during a period of recession or depression is only achieved by inflicting serious hardship on the taxpayer whose ability to pay has declined.

Most forms of tax will produce more revenue by raising rates or broadening the base. However, in the case of the sales tax the mechanics of adjustment as well as the economic issues involved are relatively simple. The rate is uniform and the effect of an increase on yield can be readily ascertained. Similarly, the distribution of the tax burden is largely predetermined or fixed. There are no complex issues such as how an additional burden under the personal income tax is to be distributed among the several income and progressive rate classes. This type of advantage may explain, but obviously does not justify the use of sales taxes.

Ease of Administration. Retail as well as general sales taxes are commonly assumed to be easy to administer. This assumption, if properly qualified, is not without foundation. Viewed in relation to personal net income and property taxes it is undoubtedly valid. On the other hand, no tax is easy to administer if the objective sought is to enforce full tax liability and payment by all taxpayers. The specific problems of sales tax administration are considered in a later section, but effective enforcement requires a comprenhensive office and field audit effort by a large and competent staff.

The advantage which the sales tax has, as compared to certain other taxes, is attributable primarily to the relatively small number of taxpayers and tax returns, the relative simplicity and number of the computations involved on the return, and the availability of substantiating evidence or records for checking purposes. The fact that the seller collects the tax and usually passes the burden on to the buyer may tend to lessen the incentive for evasion,

but experience has demonstrated the fallacy of relying on this influence. Direct costs of administering the retail and general sales taxes as compared to the other major taxes provide some substantiation of the relative ease of administration claim. However, this relationship varies significantly from one state to another, and if a seller's discount is permitted the total expense may exceed that for other taxes.

Incidence of General or Retail Sales Tax. The question of the incidence of a tax is obviously of major importance in determining its economic effects. In the case of the sales tax it is generally assumed that the bulk of the burden falls upon the consumer of the finished product or service. While this assumption is fully merited, the manner in which the tax is shifted and the exceptions to the rule of shifting must be closely scrutinized.

Shifting the Tax. Shifting of the tax to the purchaser is normally accomplished by the simple expedient of adding the tax to the price. Under the Colorado consumer type of tax law this procedure is mandatory, and it is illegal for the retailer to advertise that he is absorbing the tax. These requirements may possibly facilitate shifting of the tax on an individual transaction basis, but they are by no means determinative. A business subject to competitive pressures from untaxed concerns, for example, may lower its price before tax so that the total price including tax is equal to that of its competitors. Thus, the burden is actually on the business, though it appears by casual examination to have been shifted. Other possible methods of shifting the tax should be noted, namely, securing a lower price from suppliers (backward shifting), and lowering of the quality of the product or reducing the quantitative unit in which it is sold. Backward shifting will probably not be considered unless forward shifting is impossible, and it is unlikely that an appreciable number of business firms would be in a position to influence the supplier's price. Likewise, the lowering of quality or quantity are expedients generally not available to the retailer or wholesaler, and involve serious limitations in the case of manufacturers and processors.

The conclusion that retail or general sales taxes are ordinarily passed on to the consumer is based upon objective as well as empirical evidence. The tax is clearly a cost of doing business; the cost is the same for all businesses within a broad category or class; popular psychology is favorable to shifting—it is expected —and the manner of payment is convenient; the demand for most of the items taxed is relatively inelastic; where the purchase condition is elastic, the low rate and amount of the tax is not likely to deter consumption significantly; and the seller's side of the market on the retail level is competitive. Observation of business practice and the views of management reinforce these considerations. The legal requirements in the Colorado law, as previously indicated, also tend to facilitate shifting.

Case of Privilege-Type Taxes. It should be noted that the impact of the tax burden which is subject to shifting upon buyers may be considerably different in the case of retail and general sales taxes which do not require separate accounting and collection of the tax on each transaction (certain of the privilege-type taxes). In these cases each seller determines how he will recover the tax costs, and there are many possible approaches to the distribution of the burden among the various classes of goods sold. Consequently, it would be impossible to ascertain the specific impact of the tax on the consumers of particular goods or services.

Exceptions to General Rule of Shifting. The exceptional situations which may compel the retailer to absorb part or all of the sales tax include the existence of substantial competition which is not subject to the tax or pays a lower tax; particular services or products produced and sold under monopoly conditions; the "customary price" purchase case; and the possible impact of the bracket arrangement on special types of businesses which would make it impossible for them to collect the full tax due. Effective competition of the "no or lower tax" variety is most likely to arise in the case of retailers located close to the state boundary and in the instance of mail order purchases by residents from out-of-state sources. The borderline competition situation is not serious in Colorado as most of the neighboring states have sales taxes with identical rates (all except Nebraska and Texas), and there are very few concentrations of retail business near the border of the jurisdictions which do not tax retail sales. It is impossible to determine the degree to which mail order competition is increased by buyers seeking to avoid the retail sales tax. It will, of course, depend in large part upon the success of the tax enforcement agency in collecting the applicable sales and use taxes. Assuming that there is some loss of business by certain resident firms, tax absorption is highly improbable. In the first place, the merchant is not likely to be aware of the extent of such buying, and adjustment of prices to meet this limited form of competition would ordinarily be more costly than the loss of trade.

Public utility service is the principal area of monopoly operation on the retail level which is subject to the tax. While there is a possibility of tax absorption by high profit concerns, it is

extremely remote. The power to shift is present; regulatory laws anticipate shifting; the sales tax requires it; demand in most cases is inelastic; and actual practice evidences that the tax is shifted.

The customary price situation involving such items as chewing gum, soft drinks and candy bars presents a special shifting problem, particularly if the tax law requires that the tax be collected on the individual transaction. Strong consumer resistance is likely to develop if the price is increased, although this may well be a temporary reaction. The alternative methods of shifting through reducing the quantity of the unit or its quality may be feasible. In fact, both have been tried in response to rising costs in general and the approach has proved to be satisfactory within limits. If an increase in price is the only practical way to shift the tax, the further problem of many of the sales of such items falling below the minimum taxable sum must be reckoned with. Where such items are a major element of total taxable sales tax absorption will undoubtedly occur. However, the conditions postulated are obviously very limited in their application.

Particular versions of the bracket system have also worked a hardship on certain variety stores. Inflation has eliminated part of the problem and modifications of the brackets will generally assure adequate tax collections for such businesses. In any case there are no serious complaints by these concerns under the present Colorado bracket plan.

In general, the special circumstances which may prevent shifting of the state retail sales tax are even less significant in Colorado than in many other jurisdictions. Consequently, there seems to be little reason to question the premise that the great bulk of the tax burden falls on the consumer. At the same time, the inequitable aspects of tax absorption for the relatively small number of firms involved should not be minimized.

The Question of Ability and Benefits Received. It is generally recognized that the retail and general sales taxes do not conform to accepted principles concerning the equitable distribution of tax burdens. They are said to violate in greater or lesser degree the basic elements of the ability to pay theory, and constitute at best a rough and inadequate measure of benefits received. These views presume that the bulk of the tax burden falls upon the consumer and this assumption, as noted above, is generally valid.

From the standpoint of the individual, at least, net income is commonly accepted as the best measure of taxpaying ability. There are a few dissenters who hold that consumption expenditures are the best guide, but this concept completely disregards the obvious difference between essential and non-essential outlays whether for consumption or investment. It is equally clear that the limited consumption expenditure base of the sales tax is not directly related to net income. Total consumption outlays are not proportional to net income, and specific inclusions, exclusions and exemptions tend to widen rather than lessen the disparity in most instances. Secondly, there is no exemption related to minimum living costs for an individual or family group. The typical tax base (including food) does not apply to total net income, but the proportion of taxable income declines rather than increases as income rises. In other words, the burden of the tax as related to net income is regressive. Furthermore, this effect tends to be magnified the greater the number of persons that must be supported by a given income. Finally, the ability principle involves the concept that ability to pay rises faster than income or at a progressive rate. Even with food exempted the retail sales tax only approaches proportionality on the low and medium income levels, and is regressive above this point. Taxation of food makes it regressive throughout all income ranges. Thus, the most serious objection to the retail or general sales taxes is attributable to their burdensome effect upon low and medium incomes and that of large family groups in particular.

It may be argued that the above effects of sales taxes are not significant because they serve to balance or offset in part the steeply progressive impact of net income taxes. Certainly the merit of any tax should be considered in relation to the tax structure as a whole, and the combined effect of all federal, state, and local taxes is the final test. At the same time, it is the component parts that make up the whole, and a more equitable tax should always be preferred over a less equitable form. The over-all effects of the Colorado tax system upon income distribution are examined elsewhere in this study, and they certainly do not merit an attitude of complacency concerning the regressive influence of the retail sales tax.

Differential rates under the general sales taxes, such as the high rates for certain natural resource producers, are open to a charge of inequity, but here again one must look at the total tax burden as compared to other businesses and the comparative burden in other jurisdictions. Further inequities as between taxed businesses may arise as a consequence of varying competitive situations which make it impossible for certain concerns to shift all of the tax.

Expediency. Retail and general sales taxes are usually defended on other grounds, both political and economic. They are said to be politically expedient both by virtue of the ease of payment (a series of small amounts) and the fact that the taxpayer is unaware of the total burden involved. These considerations, particularly the former, undoubtedly influence legislative policy. While convenience of tax payment should be considered, it is obviously not a primary criterion of sound tax policy. The second idea might be termed the "sucker theory" of taxation and has no place in the formulation of a sound tax program.

Another argument frequently employed to support sales as well as other forms of taxation is that there are no acceptable alternatives. Generally speaking, this view reflects a convenient rationalization of the problem. It is suggested that existing revenue sources have already been pushed to the maximum. A new tax, it is assumed, will somehow make the additional burden less onerous. In reality this assumption can only be valid if the new tax is more equitable than existing sources. All taxes must be paid ultimately from current income or accumulated capital, and the desirability of a particular tax must be judged in terms of its relative impact on these resources.

Fiscal Significance of Sales Tax

State retail or general sales taxes are presently the major source of tax revenue in the great majority of the thirty-three states that employ them. As shown in Table 8.2, sales tax receipts in 1957 totalled $3.4 billion or 33 percent of the aggregate tax receipts of these jurisdictions. While the relative significance of the tax ranged from 56 percent in Washington to 18 percent in Maryland, twenty-six of the states obtained more than 25 percent of their revenues from this source. The relative position of the Colorado tax, which produced 27 percent of total tax receipts, is well below the thirty-three state average.

Differences in the relative importance of the sales tax are attributable to a variety of factors including the scope of the tax, exemptions and rates as well as the other tax forms employed by each jurisdiction. The pertinent aspects of these policies will be considered in a later section dealing with the sales tax in Colorado.

Sales Taxation in Colorado

Development and Principal Provisions of Colorado Sales Tax Laws. The Colorado Retail Sales Tax, adopted in 1935 as an emergency measure, was quickly incorporated in the regular tax structure. This was accomplished by a well organized and aggressive Old Age Pension group through an initiated constitutional amendment passed in November, 1936, by a large majority of the popular vote. The amendment incorporated what proved to be the most liberal pension program in the country. The key provisions removed the emergency feature of the sales tax law, and set aside, as of January 1, 1937, 85 percent of all net revenues from excises on retail sales or other purchase transactions, and other excises on storage, use or consumption of any product now or hereafter imposed, for the Old Age Pension Fund. Similarly, 85 percent of certain licenses were also earmarked for this Fund. The existing and future revenue potential of the earmarked taxes was further protected by a requirement that any reduction or loss of revenue through repeal or amendment of these taxes must be replaced by a sum equivalent to their yield in the year preceding such action. Thus, the role of the retail sales tax in Colorado was effectively identified with the State's pension program, and no significant changes in this relationship were made until 1956.[3]

The sales tax law has undergone a series of amendments relating to the structure of the tax and its administration. While the amendments have not been far-reaching in their effects, some are worthy of special mention.

Table 8.2

Total Sales Tax Revenues and Percent of Sales Taxes to Total Tax Revenues, by States, 1957

State	Sales tax revenues (thousands)	Sales tax revenue as a percent of total state tax revenue
Alabama	$74,265	32.33
Arizona	35,325	33.00
Arkansas	35,763	28.55

[3] See section, "Disposition of Sales Tax Receipts," of this chapter.

A series of amendments were adopted in 1939 with the general purpose of strengthening the procedures for assessment and collection of the tax. They extended the scope of the tax lien as a collection device; established the priority of the lien except for mortgages of prior record; provided for an additional penalty of 10 percent on unpaid taxes; and authorized the use of the distraint action in collecting delinquent taxes. In 1943 newspapers were excluded from the definition of tangible personal property; and sales of coal, gas, fuel oil and coke for manufacturing, mining, irrigation and building construction, and telephone and telegraph service, newsprint and printers ink were exempt.

Changes adopted in 1945 extended the tax base to include: intrastate telephone and telegraph service; exchanged property; gas and electric service; and meals and cover charges. A revised bracket system was also established following protests by variety and other retail stores, and a 5 percent discount to cover taxpayers' compliance costs was initiated. Finally, tokens were discontinued as a consequence of difficulties in obtaining materials, heavy losses in circulation and general public dissatisfaction. Revisions since 1945 have been of minor consequence except for the 1956 constitutional amendment relating to the earmarking and use of receipts, which is described in a later section of the chapter.

The Service Tax. The so-called Service Tax was also enacted in 1935. This law in effect broadened the scope of the sales tax to include various services commonly exempt under the retail form. In particular, it applied to professional and personal services including "business, custom, recreational, structural, personal and the professions." Although certain administrative problems were encountered, the measure was very productive. However, increasing opposition developed especially from the professional groups, and the tax was repealed in 1945.

Definition of Taxable Sales. The determination of taxable sales or transactions whether by statute or regulation is by no means a simple matter. Broadly speaking there are three facets of the problem: (1) the nature of the transaction; (2) the level at which the sale is made or the type of business or person making it; and (3) the use to be made of the product or service involved. In defining the nature of the sale or transaction there is a possible choice between the restrictive "closed transaction" concept, the all inclusive "any transfer" provision or an intermediate position.

The consumer-type retail sales taxes are designed to apply only to retail transactions, and the transaction rather than the business involved is the focal point of the tax. The nature of the retail sale must be clearly distinguished. Generally speaking, the definition should be in terms of the purpose or use for which the goods are intended, and the sale of products for purposes of resale would be clearly excluded. However, this does not resolve the case of goods to be used in the production, processing or sale of other goods or services. It is clear that insofar as such goods or services are incorporated in another product a single-stage retail tax should not be imposed. However, a decision must still be made concerning such items as office supplies, utility services and the machinery and equipment used by manufacturers, processors and wholesalers.

The Colorado tax is levied "on the purchase price paid or charged upon all sales and purchases of tangible personal property (and specified services) at retail." The tax is on the purchase or sales transaction; it is to be paid by the purchaser and is collected by the seller. Sales are very broadly defined to include "closed transaction," "installment and credit sales," and "any transfer, exchange or barter, conditional or otherwise... for a valuable consideration...." Casual sales, those made outside of regular merchandising channels, are also taxable with the exception of farm auction close-out sales. Finally, a right to continuous possession of an article through a lease or rental contract which would be taxable if sold outright is also considered to be a sale. Thus, the Colorado law is comparable to those of other jurisdictions employing an "all inclusive" concept of sales, and the revenue implications are self-evident.

Similarly, "sales at retail" are also broadly defined as "all sales made within the state except wholesale sales." This provision is distinctive and somewhat misleading, but is clarified by other related provisions and regulations. Actually, all sales for use, consumption or for any purpose other than resale are considered to be retail sales. However, sales to manufacturing or processing plants where the property becomes an ingredient or component part of the product are specifically exempt. Two other specific exemptions are allowed, namely, containers and other materials used for packaging property for sale or resale, and industrial uses of fuel and power. In effect, therefore, the Colorado tax applies to most purchases for consumption and many sales transactions outside regular retail channels. With the two exceptions noted above, it follows the limited "physical ingredient" exemption rule insofar as sales to business or industrial establishments are concerned.

The Tax Base. The tax base of the Colorado levy (as well as that of other jurisdictions) is substantially modified by a series of specific inclusions, exclusions and exemptions. These provisions encompass a wide variety of transactions, commodities and institutional relation-

ships. Unfortunately, there is little uniformity from one state to another in the use of the classifications noted.

Inclusions. As previously indicated, the primary impact of the retail sales tax in Colorado is upon "tangible personal" commodities or property. It does not apply to real estate, intangible property or water in pipes, conduits and reservoirs. The most important inclusions are the sale of telephone, telegraph, gas and electric services and the serving of meals. Other services such as personal or professional, amusement, lodging, rentals and investment are not taxed. Although of minor significance, purchases of taxable items to be used as gifts, sales to employees, sales on interstate trains and purchases by owners or landlords of buildings to be used by tenants are taxable.

Exclusions. Newspapers are the only specific exclusion of any significance other than the categories of sales or transactions indicated in the discussion of taxable sales.

Exemptions. There are a variety of specific exemptions involving commodities, sales to certain private and governmental institutions and transactions which are not taxable by virtue of Federal Constitutional limitations. The commodity exemptions by category are as follows:

(1) Farm: Auction close-out sales; feed; fertilizer; goats, hogs, horses for breeding purposes, lambs, cattle and sheep; orchard trees; and seeds.

(2) Other: Beer, wines, and liquors; containers, labels and shipping cases; cigarettes and tobacco products other than cigars; fuel and power for direct manufacturing and processing use; motor fuel; and newspapers, newsprint and printer's ink.

It should be noted that the exemption of motor fuel, liquor and other intoxicating beverages, cigarettes and other tobacco products is based on a general provision concerning property taxed under the special excise taxes. Sales of property subject to a Colorado or federal excise of more than 12½ percent are entitled to the exemption.

Sales to four broad classes of institutions are not taxable, namely: Colorado state departments, agencies and instrumentalities; Colorado cities, towns and other sub-divisions; federal agencies, institutions and instrumentalities; and private religious, charitable and eleemosynary institutions when the goods or services are used for such purposes. The exemption of sales to the federal government is required by the Federal Constitution, while the others are matters of policy.

In addition to the federal agencies and instrumentalities exemption noted above, federal constitutional principles restrict the taxation of interstate and foreign transactions and certain sales made on federal military or Indian reservations. A blanket provision of the law exempts all sales which the State is prohibited from taxing under the Constitution or laws of the United States. The specific scope of the exemption is then determined by regulations made in conformity with the latest decisions of the United States Supreme Court. In general, neither import or export transactions which involve the use of an interstate carrier prior to the buyer taking possession of the goods can be taxed. This prohibition is absolute in the case of exports. With respect to imports, however, activities of the seller in Colorado, including a sales agency and a retail or wholesale outlet through which the sale might have been consumated, serve to make the transaction taxable. Purchases outside the State which are not taxable directly are, of course, legally subject to the "use tax." This levy, which is designed to prevent avoidance of the sales tax, is considered in a later section of the chapter.

Sales made on federal lands to private persons are now generally subject to the tax. The exceptions are sales by military post exchanges or commissaries to authorized military personnel, and sales made within an Indian reservation to an Indian who is a registered member of the tribal group.

The policy aspects of Colorado's exemption practice are very strict. Both in number and in scope they represent a relatively limited encroachment on the tax base. With the exception of cigarettes and liquor they are the typical exemptions found in most of the state sales tax laws.

Retail Sales Tax Base in Colorado and Other States. The general definition of a taxable sale or transaction in the Colorado law, as previously indicated, is very broad and inclusive. Similarly, sales for use or consumption to other businesses are generally taxable subject to the "physical ingredient" and certain "direct use" exceptions. In both instances these rules are a logical outgrowth of the basic intent to level a single-stage tax at the retail level. So long as the concept of a retail tax is maintained, therefore, the existing provisions closely approximate a maximum coverage.

In the area of specific inclusions, exclusions and exemptions interstate comparisons are more complex, but nonetheless important. To facilitate this phase of the analysis the more significant aspects of state practice in the thirty-three jurisdictions levying a sales tax are summarized in Table 8.3. No attempt is made to distinguish the specific classifications employed (detailed inclusions, exclusions or exemptions), only their effect.

Commodities. The classes of commodities and specific products excepted from the sales tax in certain states which have an important impact on the tax base are relatively limited. They include food (consumed off premises or on premises); medicine; farm products, feed, seed and fertilizer; liquor; motor fuel; and cigarettes. Of these, food is obviously the major item. Eight states exempt food to be consumed off the premises, but only two exclude restaurant meals. Thus, Colorado's practice of taxing food is in conformity with that of the great majority of states. The situation with regard to medicine (often limited to prescription drugs) is exactly the same. Farm products, excluding seed and feed and breeding stock, are taxable under specified conditions in only thirteen jurisdictions. While Colorado does not exempt farm products as a general category, many specific items are exempt and most types of farm crops sold by the farmer fall within the "sale for resale" exclusion. Sales of feed, seed and fertilizer are exempt under every state sales tax except that of Oklahoma and the gross income tax in Indiana.

State practice varies widely in the case of alcoholic beverages, motor fuel and cigarettes, the products generally subject to substantial special excise taxes on both the federal and state levels. Liquor is taxable in twenty-one states; motor fuel in only five, and cigarettes in sixteen. Colorado, it will be recalled, exempts all three.

Services. The great majority of the states tax one or more types of services, but this is accomplished by specific inclusion. There is no general pattern as to the services covered. Of those shown in Table 8.3, nineteen states (including Colorado) tax domestic gas and electric service; sixteen, admissions; sixteen, motel and hotel lodging; sixteen, including Colorado, communications; eleven, domestic water; nine, transportation; and four, repairs and installation. Other

classes of service such as personal, professional and investment are usually exempt, although a substantial minority include certain personal service activities. The general disposition to exclude services seems to reflect primarily the commodity bias of existing sales taxes, although other factors, such as the existence of special taxes, are also operative in particular cases. Colorado's practice in singling out gas, electricity and communications for taxation exhibits the same lack of logical direction found in most jurisdictions.

Implications of Existing Practices. Certain commodity exemptions as well as the taxability of particular services have important effects upon revenue, the equity of the tax and the administrative problem. From the standpoint of revenue and equity, food is a key item. Normally it accounts for approximately 20 percent of the retail tax receipts. At the same time, exemption of food consumed off the premises largely relieves the regressive impact of the tax on low as compared to average-income groups. The choice, therefore, is clearcut, revenue vs. greater equity. Medicine involves the same conflict of purposes, but the effects are relatively inconsequential.

Sales of farm products by the farmer are usually for resale and such sales logically should be exempt under the retail tax. Direct sales to consumers are of minor import and difficult to check, but Colorado's provision taxing certain of these sales is sound theoretically. The feed, seed and fertilizer exemptions, so far as farmers are concerned, are applications of the physical ingredient and direct-use rules. They are justifiable in view of the single-stage character of the retail tax. Colorado's practice of exempting fertilizer used by farmers in producing crops and taxing lawn use is consistent with the general policy in the great majority of states.

Exemption of alcoholic beverages, motor fuel and cigarettes, which are the "big three" in terms of special excise tax receipts, is designed to avoid further "piling on" of tax burdens. The states all impose substantial special taxes on motor fuel and liquor and the majority tax cigarettes. Considering the heavy federal taxes, the percentage tax burdens range from 60 to 80 percent on hard liquor; 50 to 60 percent on cigarettes; and about 30 percent on motor fuel in many jurisdictions. Colorado's policy is more liberal than that of the majority of states both in exempting all three items, and in making federal as well as state taxes a basis for exemption. Taxation of cigarettes, liquor and motor fuel is profitable revenue-wise, the three items accounting in 1957 for 10 percent or more of the collections in the taxing states.[4] It is defended on the ground that the special excise and retail taxes are independent levies and are justified on distinctive grounds. Needless to say, this is a "keyhole approach" to the question of equity.

The commodity bias of retail and general sales taxes is difficult to explain. Consumer services in general provide as logical a basis of taxation as commodities on both theoretical and revenue grounds. The existence of special taxes on certain utility services or admissions may suggest exemption of these items, and investment services are normally not associated with the consumption process. Apart from these cases in which the reasoning is not conclusive, there are no theoretical bases of exemption other than those that would apply to certain basic commodities. Inclusion of consumption services with specific exemptions for activities subject to special taxes would greatly increase the revenue potential in Colorado and most other states. The administrative problem would be extended, but the present difficulty of checking evasion on services rendered in connection with the sale of taxed commodities would be eliminated.

In conclusion, the breadth of the retail sales tax base in Colorado compares quite favorably with that of other states. The commodity exemptions are those typically found in other states with the exception of liquor and cigarettes. In the services category only three types of public utilities are taxed. While such a limited application of the tax to services is not unusual, this area affords the primary opportunity for enlarging the base of the retail tax. The implications involved in changing the form of the tax to a multiple-stage levy are examined in the concluding section of the chapter.

The Small Sales Problem. The tax treatment of sales which involve a fractional tax liability of less than ½ of 1¢ has always been a troublesome problem. It arises on any sale involving a small fraction of a dollar. If such sales or portions of a sale are exempt, a question of equity is raised. Businesses with a large volume of these transactions may also be injured through failure to collect sufficient tax to cover their percentage tax liability on total taxable sales. On the other hand, collection of a full penny tax on the fractional amounts would obviously be discriminatory and would no doubt result in excess collections by the type of business indicated.

In the early history of the state sales taxes pressure was brought to bear on Congress to mint ½ cent pieces, but to no avail. As an alternative some fourteen states resorted to the issuance of tax tokens. They varied in denomination from 1 to 5 mills, in size, and in the types of materials used. Without exception, however, they soon came to be regarded as a nuisance by busi-

[4]Estimated on the basis of data from selected taxing states.

nessmen and taxpayers alike. Due to heavy losses in circulation, cost of issuing and distributing them also became excessive.

The states that did not use tokens generally resorted to the device of establishing fixed brackets for tax collection, and this plan is now employed in the great majority of sales tax jurisdictions. It ordinarily involves the stipulation of a minimum fractional sum under fifty-cents on which no tax is due, the range under one dollar for a 1¢ tax and the breaking point for collection of additional tax on sums in excess of one dollar. In Colorado with a 2 percent rate, sales amounting to less than 19¢ are exempt; those from 19¢ to 68¢ inclusive, pay a 1¢ tax; and those from 69¢ to $1.18 inclusive, pay a 2¢ tax. Vendors are required to remit a minimum tax of 2 percent on their total taxable sales and any excess over 2 percent that they collect. These breaking points appear to be generally satisfactory from the standpoint of taxed concerns, and there is no desirable alternative to the bracket arrangement.

Interstate Sales and the Use Tax. As previously indicated, goods sold to persons or firms outside the state and delivered by interstate carrier are not taxable by the exporting state. A similar immunity was once thought to apply to such goods in the state of import so long as they remained in the "original package." However, this latter aspect of immunity has been delimited by judicial decision in cases where the seller carries on a regular retail business or maintains a sales office in the state receiving the goods. The use or compensating tax was introduced by Washington in 1935 to meet the general problem of tax avoidance resulting from out-of-state buying by residents. It is now employed by all of the retail and general sales tax states except Missouri, and apart from specific exemptions this makes it legally feasible to tax interstate sales in the state of import.

The Colorado use tax, which follows the general pattern found in other jurisdictions, applies to the "use, storage or consumption" of tangible personal property purchased at retail and not subject to the Colorado sales tax. Use is interpreted as control over the goods. The basic features of the tax including the definition of taxable sales, exemptions and rates are identical to those of the sales tax.

Special exemptions are extended to non-residents who bring property into the State for personal use and who are here temporarily, and who purchased property outside the State for use there and the first and substantial use was outside of Colorado. Automobiles purchased for immediate transportation and use outside the State are not taxed if a temporary transit permit is secured or if the vehicle is registered in another state. Also, automobiles purchased outside the State and brought into the State for use within a period of one year following the transaction are not taxable if the owner can prove that a sales or use tax was paid in another jurisdiction.

The use tax serves to close the legal loophole for avoidance insofar as interstate transactions are concerned. However, enforcement of tax liability is extremely difficult, and there is undoubtedly considerable evasion at best. Another possible effect of the use tax should be noted. While its primary purpose is to ensure payment of a tax on interstate sales, it may result in a double tax under certain of the state statutes. In particular, this may occur unless the use tax is restricted to transactions on which no sales tax has been paid. The Colorado law, as well as those of several other states, does not contain this limitation.

Administrative Organization and Procedure. The Colorado sales and use tax is administered by the State Revenue Department, the central State agency concerned with tax administration. Immediate responsibility for enforcement under the supervision of the Director of Revenue appointed by the Governor, is vested in a special staff consisting of a chief auditor and three office auditors, one of whom works on the use tax.

Field audits for the sales and other taxes administered by the Department are handled by a general staff of revenue agents who operate out of Denver and 4 district offices. Special legal actions are the responsibility of the collection unit of the Department.

Collection and Payment of Tax. The initial responsibility for collection and payment of the sales tax is upon the vendor or seller. Thus, the taxed concern becomes the agent of the State in this phase of administration, and is required to obtain a sales tax license if it does not have a license under the State Store License Act. The situation is somewhat different in the case of the use tax. While out-of-state firms who maintain facilities or solicit orders in the State are required to collect the sales or use tax, where such conditions do not obtain the purchaser becomes liable for payment.

The total liability for collection and payment amounts to 2 percent of taxable sales or more if an excess is collected. In terms of the individual transaction the entire sales price or value of the item sold is taxable except for property taken in trade which is to be resold. Credits are allowed for returned property, worthless accounts and readjustments in price, and either credits or refunds are permitted for overpayment of tax due to errors or cancelled sales. In the special case of credit, installment or conditional sales

the tax must be collected on each payment. If a dispute arises between the seller and the buyer as to the taxability of a transaction, the tax must be collected, and the buyer may submit a claim for a refund.

Businesses liable for tax collections and payments must file returns and remit the tax due on a monthly basis with one exception. If the tax due amounts to less than $20 per month, they may file and pay by the quarter. Each business is given an option of reporting and paying the tax either on the cash or accrual method, but once the choice is made it cannot be changed except by approval of the Director of Revenue.

To ensure an adequate basis of determining tax liability the buisness must keep and preserve for three years all invoices and other official records of goods purchased for resale and suitable records of sales.

As a compensation for its services the business is permitted to retain 5 percent of the tax due and collected. This allowance is very liberal as compared to the practice of other jurisdictions. Only 16 of the states provide for any compensation, and the percentage discounts granted in other states are either 2 or 3 percent.[5]

Enforcement, Delinquent Taxes and Penalties. Sales or use tax payments become delinquent if not made on the final date specified for filing of the return. Special procedures and penalties are provided in the case of insufficient payment, failure to file a return or refusal to file and false or fraudulent returns or statements. In cases of insufficient payment or no return, the taxpayer is given written notice of the assessment and has ten days to pay or request a hearing. Penalties become applicable after the 10 days notice. The penalties are ½ of 1 percent interest per month if no return is filed and a flat 10 percent of tax plus 1 percent monthly in the case of refusal to file. If fraudulent intent is involved, the penalty is 50 percent of tax plus 1 percent interest per month. Fraud also constitutes a misdemeanor punishable by a $1,000 fine and 6 months in jail.

If delinquent taxes plus additional assessments and penalties are not paid, any property of the taxpayer may be seized and sold to satisfy the claim under a distraint order. The law provides that the tax collected be held in trust, and the Revenue Department claims a prior lien on goods, stock in trade and fixtures used in retail business extending over a one-year period. Civil suit may also be instituted. Except in the case of fraud, there is a three-year limitation upon such action.

Sales Tax Rates in Colorado and Other States. The retail sales tax rate in Colorado has remained at 2 percent since its adoption in 1935. As shown in Table 8.4 thirteen states impose a 2 percent rate; Illinois and Kansas—2½ percent; fifteen—3 percent; Pennsylvania—3½ percent; Washington—4 percent; and Indiana—⅜ of 1 percent. Eight of the states which employed the tax on January 1, 1952 have increased their rates since that date, in most cases from 2 to 3 percent.

The constancy of the rate in Colorado is probably attributable to the inflexible earmarking provisions which reserved 85 percent of sales tax receipts for welfare purposes, and the fact that receipts have been more than adequate to pay one of the highest old age pensions in the country. The 1956 amendment has changed this situation in that the overflow (excess of $100 pension, medical benefits reserve and contingency reserve) will go into the General Fund. In view of this new policy and the practice of other states, it is quite evident that the present 2 percent rate in Colorado does not represent a practical maximum. California and Florida both impose a 3 percent state sales tax, in addition to widespread local levies ranging from ½ to 1 percent.

Table 8.4

Source: Commerce Clearing House, *State Tax Guide.*

Consideration of the desirability of a rate increase, apart from the question of need, should be predicated upon a precise determination of the revenue implications for the General Fund, the economic effects of the sales tax, the pos-

[5] Clinton V. Oster, *State Retail Sales Taxation* (Bureau of Business Research, Ohio State University, 1957), p. 94.

sibility of increasing local use and, of course, the alternatives available. These aspects will be examined in later sections of the chapter and other parts of the report.

Colorado Sales Tax Revenues. The general importance of the retail sales tax in Colorado and other states was indicated in an earlier section of this chapter. Particular aspects of its productivity in Colorado, as well as certain comparative data will now be examined.

The long-term trend of sales and use tax receipts, their percentage significance in the State's tax system and the yield of the special services tax during the period of its use (1938-1945) are shown in Table 8.5. Net collections from the sales tax have increased each year since the tax was adopted, except for a slight decline in 1954. The yield of $38,947,392 in 1957 represented an increase of 482 percent over the $6,689,000 received in the second year of the sales tax, 1937. While the rise in receipts has been tremendous considering the constant rate and the fact that the legal scope of the tax base has not been extended, the percentage significance of sales tax collections to total tax receipts varied from a low of 22 percent in 1941 to a high of 34 percent in 1947. It has declined in relative importance since 1947 due primarily to the rapid growth of highway user tax receipts.

Use tax collections have increased more sharply than sales tax collections—from $72,000 in 1937 to $3,122,888 in 1957. This development is largely a reflection of more extensive and effective enforcement efforts as additional experience was gained in administration. While the use tax receipts and consequently the relative importance of the tax fluctuates from year to year, it has averaged around 2 percent of total tax collections since 1946. In relation to total sales and use tax revenues it accounted for a modest but significant 7.4 percent in 1957.

Combined sales and use tax receipts have averaged about 30 percent of total State tax revenues since 1943. Thus, it has been the major single source of State tax collections exceeding the combined yield of the personal and corporate income taxes and closely rivaling the highway user tax group in recent years.[6]

The ill-fated service tax was a good revenue producer in spite of taxpayer resistance and serious administrative problems. It averaged around 4 percent of State tax receipts, and during the eight-year period, 1938-1945 inclusive, service tax yields amounted to 16 percent of total sales and use tax collections.

Analyses of gross sales and taxable sales in Colorado made by the Department of Revenue indicate that allowable deductions slightly exceed taxable sales.[7] The fact that slightly less than one-half of reported sales are taxable demonstrates the limited scope of the retail tax and the crucial character of exemption and deduction policies. While comparisons are subject to obvious qualifications, the ratio of taxable to non-taxable sales in Utah, which has a comparable law, is also approximately 50 percent.

Relative Importance of the Tax in the Western States. The yield of the Colorado sales and use tax as compared to that of the seven other Western States using the levy is considerably below average. As indicated in Table 8.6, in 1957 Colorado ranked lowest or in eighth position,

[6] See Chapter IV, Table 4.7.

in terms of the percentage of total tax receipts derived from the sales tax; eighth in collections per capita; and seventh in the ratio that sales tax revenues bear to total state income payments. The relatively low ratio of sales to total tax revenues is not particularly significant in view of the important differences in sales as well as other general tax practices. Washington and California impose higher rates, and Arizona and New Mexico employ general sales as opposed to the retail levies of the other states. The Nevada, Utah and Wyoming ratios are also above that of Colorado, but not significantly.

A broader thirty-three state comparison of sales tax collections to total revenue shows Colorado in 1957, in twenty-fifth position or well below the median (Table 8.2). The mean average, based on aggregate yields, of 33.44 percent was also well above the ratio in Colorado. These relationships, obviously, are subject to the same qualifications noted above.

The comparatively low per-capita collections and percent of income taken by the sales tax in Colorado are significant from a burden standpoint. They demonstrate very clearly that the sales tax is less burdensome in this State than in any of the other Western States except Nevada. The reasons for this situation apart from the general factors noted are not readily apparent. Further examination of these relationships in two of the neighboring states, Utah and Wyoming, which impose a 2 percent retail tax, provides a partial explanation.

Table 8.6

Retail and General Sales Tax Yield Relationships in Eight Western States, 1957

(Rank of order of states in parenthesis)

States	Percent of total tax revenues	Per capita revenues	Sales tax revenues as percent of personal income [a]
Colorado	27.45(8)	$25.84(8)	1.35(7)
Utah	29.20(5)	28.38(7)	1.65(5)

Average 33 States	33.44	29.89	—

[a] 1956 data are employed.

Source: U. S. Bureau of Census, *Compendium of State Government Finances in 1957.*

In Utah the tax base is somewhat more inclusive (alcoholic beverages and admissions) and per capita incomes are lower than in Colorado. Thus, the higher burden might logically be anticipated. The burden is also higher in Wyoming, however, which has a comparable tax base and per capita income almost equal in amount. The difference in impact, therefore, would have to be accounted for in terms of variations in individual expenditure patterns or the effectiveness of tax enforcement in the two jurisdictions. These illustrations as well as the more general factors noted serve to indicate the limited usefulness of the comparative data and the difficulties inherent in interpreting such information on a meaningful basis.

Costs of Collection. The direct costs of administering the retail sales tax, as shown in State Revenue Department reports, has averaged well under 1½ percent during the last decade. In the early years following adoption of the tax costs were much higher, ranging from 2 to 3 percent. Costs of collection of the use tax have followed a similar pattern, but were somewhat higher until 1957. The combined expense of administration is only influenced in slight degree by the use levy in view of its modest yield.

Table 8.7

Cost of Collection of Retail Sales, Use and Service Taxes in Colorado, 1942-1957

Year	Percent of total tax revenues			
	Sales	Use	Sales and use	Service
1942	2.85	3.75	2.89	8.80

Source: State of Colorado, Department of Revenue, *Annual Reports, 1943-1957.*

While it is difficult, if not impossible, to obtain accurate information on administrative costs in many jurisdictions, the available data indicate that Colorado was close to the median position in 1957. The weighted average collection costs (according to total collections) for twelve states which accounted for almost two-thirds of total sales and use tax revenue in 1955 was 1.47 percent.[8] Costs ranged from a low of 0.85 percent in Michigan to a high of 3.82 percent in Ohio which employs a special collection device of prepaid tax receipts. Otherwise, California's cost of 2.01 percent constituted the maximum in the twelve-state comparison. The declining ratio of administrative expense in Colorado since the adoption of the tax generally parallels the experience of other states.

[8] Oster, *op. cit.*, p. 162.

The direct costs of administration for the retail and general sales taxes compare very favorably with those of other major tax forms. They are also very reasonable in terms of a commonly accepted hypothetical range for a "good tax," namely, 2 to 5 percent. To be realistic, however, the retailer's discount should be added to state costs. This results in a total cost for Colorado of approximately 6.5 percent. Other states making such allowances are less liberal, and their total costs with the exception of Ohio are still below 5 percent.[9]

The most significant question concerning the cost of administering the sales tax in Colorado and elsewhere is whether the expenditure of funds and effort is sufficient to maximize revenues and to minimize evasion. Low cost may well mean ineffective administration accompanied by heavy revenue losses and serious inequities between taxpayers. While it is very difficult to evalute administrative accomplishment, this problem is examined in a later section of the chapter.

Source of Sales Tax Receipts. The source of sales tax collections as to types of business and geographical area is of concern both in policy formulation and administration. Such information is also of value to businessmen and to others interested in general economic trends. From a policy standpoint it is essential to know how the burden of the tax is distributed among various classes of goods and services, and this requires a detailed breakdown of collections by type of business. Similarly, in checking tax returns for possible evasion the availability of such data makes it possible to develop typical ratios of taxable to tax-exempt sales for each class of business. The interest of business groups in sales trends on a local as well as a statewide basis requires no elaboration.

The State Revenue Department maintained a comprehensive series of collections by business classes and by county through 1954. Since that date the breakdown by types of business is not available, but its resumption is planned in the near future. Using four representative years from 1942 to 1954, Table 8.8 shows the trend of collections by broad categories of business. As might be anticipated, the food group far outranked other classes, and remained virtually constant at an average of approximately 26 percent. In the earlier years general merchandise ran a close second, but has steadily declined in relative importance from 22 percent in 1942 to 16 percent in 1954. This change is largely attributable to the growing importance of automobiles and automotive products which increased from about 13 to nearly 17 percent. Other categories of business exhibiting substantial gains were: lumber and building products; manufacturing, trading and jobbing; and furniture. On the other hand, clothing and unclassified retail businesses showed declines. The fact that less than 1 percent of collections are presently derived from professional and personal services is, of course, a result of the general policy of excluding the major service activities.

The trends cited may logically be expected to continue. Their significance with reference to possible changes in exemption policy, as well as the burden of the tax on income groups, is examined in the concluding parts of this chapter.

Table 8.8

Sales Tax Receipts, by Type of Business, in Colorado, Selected Calendar Years, 1942-1954

Business classification	Percent of total tax paid			
	1942	1946	1950	1954
Food group	26.28	27.71	25.20	26.43
Automotive group	12.89	13.17	18.89	16.69
General merchandise	22.67	22.67	18.01	16.47
Lumber and building	6.94	6.16	8.09	8.85
Mfg., trading and jobbing	5.99	5.56	6.49	7.91
Public utility	6.61	4.79	5.22	6.07

Total	100.00	100.00	100.00	100.00

Source: State of Colorado, Department of Revenue, *Annual Reports*, for the indicated years.

The relationship of tax collections from independents, chain stores and foreign corporations, as depicted in Department of Revenue data, does not reveal a significant long-term trend. While the proportion of taxes collected from chains increased from 16.9 percent in 1950 to 19.8 percent in 1956, the comparable ratio in 1943 was 19.1 percent.[10]

Specific data are not available indicating the impact of the sales tax on large and small firms. However, it is evident that the bulk of sales tax collections are obtained from a relatively small proportion of the total number of concerns filing returns. It is estimated currently that 30 percent of the taxed businesses file on a quarterly basis which means that their tax liability ordinarily amounts to less than $20 per month.

The data on sales tax collections by counties are incomplete, showing only the taxes paid by "independent outlets." These collections in 1957 accounted for two-thirds of the total. They reveal, as might be expected, a high degree of concentration of sales tax revenues. Denver City and County alone produced over 40 percent of the total sales tax revenues from such outlets; three counties, Denver, El Paso, and Pueblo,

[9]Ibid. pp. 94 and 162.

[10]State of Colorado, Department of Revenue, *Annual Reports*.

paid in over half or 54.77 percent; and the ten most productive counties (add Jefferson, Arapahoe, Boulder, Mesa, Weld, Larimer and Adams) accounted for nearly four-fifths. Allocation of chain store sales would probably magnify rather than lessen the concentration indicated.[11]

Disposition of Retail Sales and Use Tax Revenue. Colorado's most important general source of tax revenue has been dedicated to welfare purposes since 1936. A constitutional amendment adopted in that year earmarked 85 percent of net retail sales and use taxes, state liquor taxes and licenses and any other excises which might be adopted at a later date for pension purposes. The remaining 15 percent was set aside for other welfare programs. A prior deduction of 5 percent for tax administration by the Revenue Department was authorized, and in practice 5 percent has also been reserved for the administration of the welfare programs. In terms of the proportion of State tax receipts involved, both actual and potential, and the liberality of the old-age pension grants which resulted, this action was unparalleled.

While the earmarking arrangement appeared to dedicate all of the revenues from the above sources to welfare purposes, there has been a small surplus available for General Fund use. This surplus arose as a consequence of the fact that the funds reserved for "other welfare" functions and for administrative expense were not fully utilized. In the years immediately preceding the new earmarking amendment adopted in 1956 General Fund transfers normally amounted to about 8 percent of net sales and use collections. Coincidentally, the total excise tax transfers accounted for approximately the same percentage of total General Fund receipts.[12]

The earmarking formula was significantly altered by the 1956 amendment, but the immediate effect was to extend the scope of benefits to the State's dependent aged. The amount of funds to be used for welfare purposes from the sources noted is now determined by certain specified needs as follows: (1) the payment of a basic $100 per month pension (subject to adjustment on the basis of changing economic needs and is now $105); (2) the creation and maintenance of a new $5,000,000 stabilization fund to ensure payment of prescribed pension benefits; and (3) the provision of a maximum of $10,000,000 a year to meet the cost of a new medical care program for pensioners. The 5 percent authorizations for tax and welfare administration were not changed.

It is impossible to determine the precise effect of the new provisions on the General Fund. The $100 pension requirement is a minimum and rising costs of living have already resulted in a $5 increase. The number of persons eligible for State pensions has been relatively stable in recent years and may actually decline in the future as a consequence of the expanded coverage of the federal plan. However, this situation obviously involves an element of uncertainty. The cost of benefits under the new medical care plan which is to be inaugurated in 1958 is also indeterminate, but cannot exceed $10,000,000.

Estimates made in 1956 indicated that a small but increasing surplus would be available for General Fund use in the early 1960's. Actual developments to January 1, 1958 have been more favorable than anticipated. In addition to payment of the minimum pension, the $5,000,000 contingency reserve has been established and some $4,000,000 has been placed in the medical care fund. Assuming no further increase in the $105 pension rate and on the basis of projected sales and excise tax collections, the Budget Office estimates that there will be a substantial increment to the General Fund in 1959. A somewhat smaller sum will be available in fiscal 1960, but this is expected to increase significantly in subsequent years.

General revenue projections and General Fund relationships are dealt with in another section of this report. However, it is evident that the retail sales and use tax receipts will become an increasingly important source of general financing in the near future. This will be the case under existing provisions of the tax and welfare laws. If the tax rate is increased or the base extended, all additional revenues should be available for General Fund purposes.

Enforcement of Sales and Use Tax Liability: Problems. Enforcement of full tax liability against all those who are legally liable for payment is one of the basic objectives of tax policy. While this degree of attainment is impossible, there should be a continuing effort to strengthen the assessment and collection process. The reasons for concern are self-evident. Evasion means loss of revenue as well as inequities between taxpayers. Furthermore, the existence of evasion, even though it may be of minor significance at a particular time, breeds more evasion. The key questions in the case of the sales and taxes and other self-assessed levies are: (1) do all persons or businesses subject to the tax file returns; (2) is the information presented in the return complete and accurate; and (3) are the taxes assessed collected promptly and without discrimination. The relative simplicity of the sales and use tax provisions appear to justify a concentration of administrative effort on preventing evasion rather than avoiding possible overpayments.

---

[11] *Ibid.*

[12] State of Colorado, reports of Division of Accounts and Control, October, 1957.

The effectiveness of tax administration obviously involves many intangible elements such as the spirit of the organization, individual staff attitudes and the psychology of the taxpayer group. While these matters are highly important, they cannot be measured objectively. The following analysis of the sales and use tax administration, therefore, must necessarily be incomplete and fall short of the conclusive judgements which a more intensive investigation would permit.

Enforcement Procedures and General Results. The basic requirement of a store or sales tax license is the technique for ensuring that businesses or individuals subject to the tax file returns. Enforcement of the license provision concerning the sales and use tax is the primary responsibility of one staff member in the office audit division of the central office. Typical methods of checking the establishment of new businesses and dissolutions or bankruptcies are employed. However, there is no systematic back-checking to determine whether licensees actually file returns.

Returns received in the mail room are "batched" by type of tax and sent to the proving section. There they are checked for arithmetical errors and obvious irregularities. If no errors or irregularities are detected, the great bulk of sales tax returns are then filed. Use tax returns are sent to the Office Audit Section and are briefly reviewed by an experienced auditor. Irregular returns are also sent to this section for appropriate action. There are three auditors in the office audit staff. One is concerned with the use tax and one with the refund problems involved in the case of certain types of transactions and institutions.

Field audit investigations of sales and use tax liability are carried on by the staff of the General Field Audit Section. This unit also is responsible for income, motor fuel and ton-mile audits. The staff consists of four chief auditors or audit supervisors, twenty-three revenue agents and two staff auditors. Many of the audits performed cover income, sales and use taxes. Consequently the number of agents devoting full time to sales and use tax audits can only be approximated.

Field agents and auditors assist the central and district offices in advising taxpayers during the period preceding April 15, and two agents were assigned as district office supervisors for approximately a full year in 1957. Also, two agents were assigned solely to ton-mile and fuel tax work. The net effect of these arrangements is to reduce the number of agents available for income, sales and use tax investigations to about 18.4. Considering the total number of audits performed by tax, it appears that about 12 of the field staff devoted full time to sales and use tax investigations. If the three office auditors are included, the Revenue Department has 0.352 percent of an auditor for each $1,000,000 of tax collected.[13]

The field staff performed 383 sales and 719 use tax audits during the 1957 fiscal year. These 1,102 audits represented about 3 percent of the total sales and use tax licenses. (No out-of-state audits were conducted, and there is no interchange of information with other states.) Additional sales tax assessments amounted to $69,127 and use taxes to $133,099 or a total of $202,227 in 1957. Thus, each field agent was responsible for additional assessments of $16,800. Collections are normally somewhat less than assessments, but, as might be anticipated, the relationship may vary significantly in particular years. It should be noted that the assessment totals indicated do not include interest or other penalties. In fact, there is no general record of such penalties.[14]

A highly significant phase of any field audit program is the manner of selecting taxpayers' returns for audit. The practice followed in the case of the sales tax is largely fortuitous. Questions concerning the income tax often provide the basis for the investigation. Use tax audits are often initiated by the office auditor who scans these returns. As previously indicated there is no comparable check of sales tax returns by the office audit section. Thus, irregular returns and those involving certain types of statutory refund claims constitute the only regular or continuing basis of office referral in the case of the sales tax.

Field audit reports are reviewed by the audit supervisor and appropriate action is taken. Usually, this involves a ten-day notice of deficiency assessment with interest (½ of 1 percent per month). The taxpayer is given an opportunity to be heard. Subject to possible adjustments of the assessment, the claim goes to the collection section if not paid in the prescribed period. The principal collection technique is the distraint order, a direct proceeding against the taxpayer's property. The Department claims a prior lien position on the ground that the taxes collected and due are in the nature of a trust. While this appears to be a logical assumption, it has not been validated by court action.

Conclusions: Sales and Use Tax Administration. The foregoing analysis of sales and use tax enforcement is based on information supplied by Colorado Department of Revenue staff officers. Any inaccuracies in interpreting the data are the responsibility of the author; and

[13] State of Colorado, Department of Revenue, Field Audits Division estimates.

[14] *Ibid.*

inadequacies are generally attributable to the fact that certain information was not available.

In general, the sales and use tax enforcement effort appears to have significant elements of strength as well as important limitations. The general competency of the staff and their dedication to the job to be done is not subject to question on the basis of the information available. Field audit reports give evidence of a thorough and comprehensive investigation. Finally, field-audit results, in the case of the sales tax, indicate a substantial, but not critical evasion problem. This indication must be viewed in the light of the scope and selectivity of the audit program. Use tax audits generally are very productive, but this situation is typical in view of the inherent complexities of administration involved.

Certain limitations of the enforcement program are self-evident while others are merely suggestive. It should also be emphasized that nearly all the deficiencies are either directly or indirectly an outgrowth of the limited staff available for office and field investigation. In view of the importance of this factor it merits primary consideration.

There are no fixed guides for determining the number of professional staff required for effective results. However, there are several logical bases of judgment including: the practice of other states which are generally thought to be leaders in sales tax administration; the adequacy of the procedures followed in terms of accepted standards; and the productivity of the audits conducted. Using California, Ohio and Michigan for comparative purposes, the relative number of auditors per $1,000,000 of tax collections is as follows:[15]

California	1.50
Ohio	.97
Michigan	.73
Colorado	.35

California has the most comprehensive audit program of any state and the highest ratio of auditors. However, a recent study by the State Board of Equalization indicates the desirability of additional audit effort in the case of certain types of returns. In addition to a high ratio of audit staff, Ohio employs the special pre-paid tax receipt method of collection which is designed to secure the cooperation of the buyer in the collection process. While Colorado's staff ratio is less than half that of Michigan, it was recently recommended that 150 more auditors be employed in the latter state. In terms of the proportion of taxpayers' records audited in 1957 the 1,102 audits represent only 3 percent of the total. This fractional degree of coverage, which is even lower considering only sales taxes, can hardly be said to provide an adequate deterrent to evasion.

Staff limitations are equally apparent in certain crucial aspects of audit procedure. In the initial phase of enforcement following the clerical proving process, an office check of each taxpayer's return by experienced auditors at least once a year is highly desirable. To aid in this process and to enable the office audit staff to give a reasonable direction and emphasis to its work, the returns should be sorted and classified prior to this check. In addition to the under-payments and over-payments that may be detected, the office audit provides a meaningful though not exclusive method of selecting returns for field investigation.

A systematic approach to field-audit investigations, either through a selective screening process occasioned by office audits or a recognized method of sampling, is a minimum requirement. The saturation method in which all taxpayers' records would be subject to audit over a period of 3 or 4 years is a desirable alternative. California is the only state whose methods approach this objective. (The program of the City and County of Denver is designed to achieve this result.)

As a further evidence of understaffing there is a marked paucity of information on various aspects of the sales tax picture which makes certain types of policy and administrative analysis impossible. Examples of the lack of data include: no breakdown of tax collections by type of business since 1954; no analysis of tax collections by size of business since 1954; no record of specific exemptions or deductions claimed since the years immediately following the adoption of the sales tax law; and no cumulative account of interest or other penalties imposed.

Sales and use tax audits are presently very productive. There is no reason to believe that an expanded effort would yield diminishing returns. In fact, a more selective, systematic approach might well produce greater returns. Without exception the experience of other states which have expanded and strengthened their audit programs has been highly successful. The field audit section has suggested that the number of agents be increased from 23 to 30 for best results. This would probably make 3 or 4 additional staff available for sales and use tax work, but would fall far short of the minimum requirements for the type of program outlined above.

Economic Effects of Retail Sales Tax

The economic effects of retail sales taxes fall logically into two categories, direct and indirect. Direct effects are primarily a resultant of the incidence of the tax or the ultimate location

[15] Oster, *op. cit.*, pp. 163-164; also, Ronald B. Welch, *The Sample Sales Tax Audits Program*, California State Board of Equalization, Division of Research and Statistics, February, 1954.

of the burden. However, the obligations of the retailer to collect and pay the tax are also a direct consequence of the levy. Indirect effects include such factors as the impact of the tax on the level of expenditures or business activity, changes in consumption patterns and the propensity to consume and the possible implications arising from the unequal or discriminating influence of the tax as between different businesses. In analyzing these effects of the tax, its impact upon individual or family incomes, on the one hand, and business enterprises, on the other, will be stressed.

Impact of the Retail Tax on Individual and Family Incomes. The allegedly unfavorable effect of retail and general sales tax upon the incomes of low and medium income groups is, as previously noted, the primary objection to this form of tax. The extent of its regressive influence and the seriousness of such effects are the chief points at issue. Needless to say the first question can only be answered with reference to a particular tax, the definition of taxable sales and the special inclusions, exclusions and exemptions involved. The problem of analysis is complicated by the lack of complete data on consumer incomes and consumption patterns on a state basis. However, there have been many studies relating to national and particular state taxes. Their results are not conclusive in certain respects and do not pertain directly to the Colorado law, but assuming a broad-based tax they all indicate a substantial regressive effect upon the very low income groups.[16] There are two sources of primary data concerning consumer incomes and consumption patterns in Colorado and the Western Region. Both will be employed in estimating the effects of the Colorado tax. The second question concerning the significance of possible regressive influences is obviously a matter of judgment, and will be approached from that standpoint.

The two sources noted above are a Census Bureau analysis of family incomes and expenditures in the Denver Area in 1948, and a comprehensive national survey of consumer expenditures in the United States (including the eleven Western States) conducted by *Life* Magazine in 1957. In both cases the sample used was selective but limited. The concept of income employed was cash or money income.

The impact of the Colorado tax on various income groups based on the Census data is shown in Table 8.9. Comparing the lowest and highest income classes, the effect appears to be markedly regressive. Excluding the $1,000 and below class, there is still a substantial element of regression throughout except for the $4,000 to $5,000 class.

Table 8.9

Estimated Effect of Colorado Retail Sales Tax by Income Levels

(Denver Area Income and Consumption Data for 1948)

Income Category	Income	Sales tax liability	Percent of income paid in tax
Under $1,000	$ 467	$ 20.26	4.34
$1,000—2,000	1,621	25.06	1.55
2,000—3,000	2,632	38.18	1.45
3,000—4,000	3,471	46.68	1.34
4,000—5,000	4,378	61.36	1.40
5,000—6,000	5,415	68.16	1.26
6,000—7,500	6,695	83.09	1.24
7,500–10,000	8,509	103.74	1.21
10,000 and over	14,514	103.54	0.71

Source: Computed from basic data on income and consumption patterns in Denver Area, Bureau of Census study, presented in U. S. Department of Labor, *Monthly Labor Review*, Volume 69 (July-December), 1949.

Similar though less extreme differentials in burden are indicated using the recent *Life* study of income and consumption patterns in the Western Region. The effect of the Colorado 2 percent tax is regressive throughout the entire income range, but the differential between the lowest and highest income categories is much less than indicated by the Census data (Table 8.10). It should, of course, be noted that the lowest category of income shown in Table 8.9 of $1,000 and under is not included in the analysis based on the Western Region data. Excluding the $1,000 and less income class, the effects shown are strikingly similar.

Table 8.10

Impact of Colorado Retail Sales Tax by Income Levels

Income category	Computed[a] average income	Tax liability according to Colorado law	Percent of income paid in tax
Under $2,000	$1,500	$ 25.99	1.73
$2,000—$2,999	2,500	38.25	1.53
3,000— 3,999	3,500	51.62	1.47
4,000— 4,999	4,500	56.59	1.26
5,000— 6,999	6,000	64.50	1.07
7,000— 9,999	8,500	76.31	0.90
10,000 and over	13,000	103.99	0.80

It is quite evident that the Colorado retail sales tax as presently constituted imposes a heavier burden on the lower income groups or is regressive in its effects. It is equally clear

[16] U. S. Treasury, Division of Tax Research, *Considerations Respecting a Federal Retail Sales Tax*, Hearings on Revenue Revision, 1943, Ways and Means Committee, 78th Congress, 1st Session, Table 1, p. 1166; James W. McGrew, "Effect of a Food Exemption on the Incidence of a Retail Sales Tax," *National Tax Journal*, December, 1949, Tables 1 and 2, pp. 365-366; Donald C. Miller, "Sales Tax Progressivity Attributable to a Food Exemption," *National Tax Journal*, June, 1951, pp. 148-159; and R. A. Musgrave, "The Incidence of the Tax Structure and Its Effects on Consumption," *Federal Tax Policy for Economic Growth and Stability* (Papers submitted by panelists to the Joint Committee on the Economic Report, 84th Congress, 1st Session, Washington, D. C., 1955), pp. 96-113.

that the taxation of food is a major factor influencing the economic impact of the tax. The data in Colorado indicate that the exemption of food consumed off the premises would substantially relieve but not eliminate regressive effects in the low- and middle-income ranges. On the basis of the money-income measure these results are consistent with those of studies undertaken in other states.

Another relationship is indicated by the data in the Colorado as well as by other studies, namely, that the burden of the tax is greater for a large family than a small one within any particular income range. This effect is a logical expectation in view of the greater living cost requirements of such families for the items subject to the sales tax. Finally, it should be noted that the results of the studies shown are subject to important shortcomings. In the first place, the data employed are incomplete and in particular instances may not be fully representative. Secondly, the cash-income measure employed in these analyses does not produce wholly meaningful results either for the "under $1,000 or $10,000 and over" categories. In the case of the "under $1,000" group very few individuals or families actually live on this amount, and in the latter category which lumps together all incomes of $10,000 or more the results are obviously not representative for very high-income receivers.

The regressive effect of the Colorado retail sales tax should be evaluated in terms of accepted principles of equity in taxation, considering its impact upon the entire tax system of the State and the Nation. Needless to say, this is a large order. The ability to pay principle, involving a progressive tax burden in relation to net income, is undoubtedly the most widely accepted standard both in terms of theoretical and popular support. Considering the evidence cited, the nature of the tax base and the fact that specific exemptions are not extended to the lower income groups, the sales tax obviously does not conform to this standard. The basic issue, therefore, becomes one of determining whether its unfavorable effects in terms of income and size of family are adequately offset by other elements of the tax structure. Primarily, this is a matter of judging the relative impact of the progressive personal and corporate net income taxes, on the one hand, and the regressive impact of the retail sales and similar levies on the other. As this broad question of balance is dealt with elsewhere in the report further discussion at this point would be repetitious.

Effect of Retail Sales Tax Upon Business. Generally speaking, the retail sales tax is not regarded as a serious deterrent to business expansion either of established concerns or new enterprises. This view is probably attributable primarily to the fact that the burden is usually shifted to the consumer. Certainly, this is an important consideration to the individual business even though it does not take account of indirect or long-range influences. Other aspects of the tax that may be considered advantageous are: that it applies to all businesses within certain broad categories; the rate is proportional or equal; the amount of the tax varies directly with business volume whereas the property tax or real property tax, for example, are relatively fixed; and the tax is collected on each day's business and is normally remitted on a convenient, monthly basis. In exceptional cases the businessman may also be favorably inclined towards the tax by virtue of excess collections.

Tax Absorption. The inequities and other unfavorable direct effects of the tax insofar as business is concerned are associated with its incidence and the compliance problem. The special circumstances, as indicated in the discussion of incidence, which make it impractical or undesirable to shift the tax obviously involve an inequitable and discriminatory burden on the business affected. The existence of direct competition from concerns not subject to the tax is the most serious situation and it cannot be wholly avoided. Merchants located close to the Nebraska and Texas borders are potentially subject to this pressure, but fortunately there are no cases of large towns in immediate proximity to places of comparable size across the State line. The other states bordering on Colorado all impose a 2 percent retail tax so there is no present reason for concern in these areas. Further exceptions to the rule of shifting generally involve only partial tax absorption and these effects are limited to a fractional element of the total businesses taxed.

In certain analyses of state retail sales taxes considerable stress is placed upon the distribution of tax payments according to the size or other characteristics of the businesses taxed. While this information is interesting and may be useful in some respects, it does not throw any light on the problem of equity or burden as related to the businesses taxed. For example, the fact that businesses reporting total sales in excess of $50,000 per year pay a very high percentage of the total sales tax confirms the importance of such firms in the retail field, but there is no basis for suggesting that they pay too much or too little.

Compliance Burden. The expense entailed by the taxed concern in collecting the tax, keeping adequate records, filling out and filing tax returns and dealing with questions that arise concerning tax liability and payment is a direct and substantial burden. While compliance costs of varying significance are encountered under all forms of taxation, the role of the retailer or other taxed entity in the case of consumer-type

sales tax is somewhat different than that of the ordinary taxpayer. In the first place, the legal as well as actual incidence of the tax is upon purchaser or consumer. The businesses whose sales are subject to the tax are acting as tax collectors rather than taxpayers. This situation is not unique as employers have a similar responsibility to withhold personal income taxes. However, the fact that such responsibilities are not unique in the case of the sales tax does not justify a policy of disregarding the costs involved. Secondly, the evidence available indicates that the burden of compliance is somewhat greater than that encountered in other situations where the business is acting as a tax collector rather than a taxpayer.

In an individual case-type study Professor James W. Martin estimated average compliance costs for the sales tax at 2.3 percent.[17] This investigation as well as other sources indicate an extreme variation in such costs for different types of business. The highest costs generally arise in those firms which have a large volume of small sales and those in which exempted sales constitute a major portion of total sales. It should be noted that the privilege form of retail or general sales tax presents a different problem in two respects. In this instance the business is the legal subject of the tax, and if the taxed concern is permitted to choose the basis of distributing the tax burden compliance costs will probably be much lower. Thus, the justification for compensating the taxed business is not as strong as for the consumer-type levy.

Colorado and thirteen other sales tax jurisdictions have recognized the compliance cost burden by providing percentage discounts related to the amount of the tax due. The discounts range from 2 to 5 percent, Colorado alone permitting the maximum. In the remaining states, seven grant a 2 percent and six a 3 percent allowance. Two other states permit retailers to retain any excess tax resulting from the breakage points under their bracket plans. The latter arrangement is obviously subject to criticism as the specific results of the bracket formula are difficult if not impossible to calculate for many businesses, and if they can be computed the amount of the allowance would vary widely for different types of operation.

The policy of compensating taxed concerns for special collection service costs is believed to be sound. The amount that should be allowed in the case of the consumer-type retail tax cannot be precisely determined considering the great variation in indicated compliance costs. However, the 5 percent discount under the Colorado law is very liberal, and a reduction to 2 or 3 percent appears to be defensible.

Secondary Economic Effects. The indirect or secondary effects of the retail sales tax can be readily identified in general terms, but are difficult if not impossible to measure. Perhaps the most important aspect of these effects is the impact of the tax upon consumer purchasing power and prices. Broadly speaking, the tax increases the price of taxed goods and services thereby reducing consumer capacity to buy in terms of goods, at least in the short-run. As the bulk of the tax burden involved in higher prices tends to fall upon the low and medium income groups the sales tax is commonly assumed to have a significant deflationary influence.

While all taxes tend to involve some deflationary effect on the private economy the assumption of a marked deflationary effect in the case of the sales tax is highly questionable. The initial rise in prices occasioned by a new tax or increased burden of existing levies actually inflates prices and thereby deflates private purchasing power. Any deflationary impact on prices to which these terms are ordinarily applied will be a resultant of subsequent effects of the tax. To a considerable degree the initial rise in prices provoked by the tax will be offset by a general round of price and wage increases providing that the economy is in a healthy or expanding state. The expenditure of the sales tax revenue by the government also tends to maintain or increase the flow of funds in the economy unless the receipts are used to retire bank-held debt. Thus a deflationary influence on prices would only arise if the general rise in wages and prices resulting from these factors was insufficient to maintain consumer purchasing power at the previously existing level. This result would be a certainty if the general economic climate were deflationary, and would eventually force a decline in prices.

The influence of the retail sales tax on prices, therefore, involves both inflationary and deflationary potentials. The balance or net impact will be determined largely by the general state of the economy, and will tend to accentuate rather than counteract the existing trend.

Another aspect of the impact of the retail sales tax on business is its possible effect upon consumption patterns and consequently the relative volume of sales both of taxed and untaxed items. Certain shifts in consumer buying habits especially as between taxed and untaxed goods or services may logically be anticipated. It seems reasonable to assume that the immediate increase in cost of essential goods and services occasioned by the retail tax would be reflected in reduced outlays for non-essentials, both taxed and untaxed. Needless to say con-

[17] James W. Martin, "Costs of Administration: Examples of Compliance Expenses," *Bulletin of the National Tax Association*, April, 1944, p. 203.

sumer attitudes rather than absolute requirements are controlling. As attitudes vary on particular items the specific character of the probable change in buying habits cannot be ascertained. The shifts that do occur may well be temporary if the secondary effects of the tax tend to offset the initial loss of private purchasing power. In the area of governmental spending, which is made possible by sales tax revenues, it is quite evident that the pattern of consumption differs from that of the individual. Basically, it is non-personal in character and tends to correspond generally to that of private business except that labor and other services generally assume a more significant role.

Summary: Future Role of Retail Sales Tax

Revenue Potential. The retail sales and use taxes offer excellent potentialities for financing future State needs. On the basis of existing provisions there should be substantial transfers to the General Fund after 1960. Major contributions, however, will be dependent upon changes in the tax base and/or rates. Such changes, if they are deemed advisable, obviously should be tempered by considerations of equity. State policy also must be cognizant of the implications of probable extensions of local use.

The chief possibilities of broadening the retail tax base are: the withdrawal of the exemption on motor fuel, liquor and tobacco; and the inclusion of various services such as amusements, personal service activities, commercial lodging, automobile and miscellaneous repairs. Changing the form of the tax to a general levy covering wholesaling, manufacturing, processing, etc., is another significant possibility. The principal offsetting change, which is commended on grounds of equity, is the exemption of food.

Estimates of the effect of these changes upon revenues in 1957 are shown in Table 8.11. The estimates concerning services are believed to be conservative as they are based upon sales by enterprise classes rather than total service sales. Revenues from motor fuel are predicated upon reported gallonage under the fuel tax at an assumed average of 30¢ per gallon; liquor and tobacco receipts are related to general consumption data, the latter on cigarettes only; and the effect of a food exemption is based on actual experience under the existing levy.

Taxation of the three special excise commodities would have added about $6,238,000 or 12 percent to the 1957 collections. The four types of services would have increased yields by $4,725,000 or over 10 percent. The revenue effects of changing the form of tax from a retail to general levy obviously will depend upon the definition of taxable transactions and rates. No specific estimate is presented in view of the wide range of possibilities. Another aspect of the present law that may merit attention from a revenue standpoint is the 5 percent vendor's discount. As previously indicated this allowance is exceptionally liberal, and might reasonably be lowered to 2 or 3 percent. The former change would have increased yields by roughly $1,300,000 in 1957.

Table 8.11

Estimated Effect of Changes in Tax Base and Rates on Yield of Retail Sales and Use Taxes in Colorado

Change	Estimated yield (1957 base)	Estimated decrease
Food exemption		
All food		$10,428,485
Food consumed off premises		8,408,287
Removal of exemption		
Motor fuel	$3,315,000[a]	
Liquor	1,723,000[b]	
Cigarettes	1,200,000[c]	
Total	6,238,000	
Inclusion of:		
Amusements	1,384,000[d]	
Personal service enterprises	1,252,000[d]	
Lodging: Hotels, Motels and Camps	1,094,000[d]	
Automobile and other repairs	995,000[d]	
Total	4,725,000	
Rate increases		
½ of 1 percent	10,248,660 (sales and use)	
1 percent	21,293,321 (sales and use)	
Reduction of Vendor's disc. to 2%	1,300,000	

[a] U. S. Bureau of the Census, *Census of Business, 1954*, Vol. II, "Retail Trade Area Statistics," Tables 6-4 and 6-5.
[b] See Chapter IX.
[c] See Chapter XVIII.
[d] U. S. Bureau of the Census, *Census of Business, 1954*, Vol. VI, Tables 6-4 and 6-5.

Exemption of all food to be consumed on or off the premises would have reduced tax collections by approximately $10,428,000 in 1957 or 26.4 percent. A limited exemption confined to food to be consumed off the premises would cut receipts by about 21.3 percent, and this is the form that the exemption usually takes.

Proportional effects may reasonably be anticipated from a ½ of 1 percent or 1 percent increase in sales and use tax rates. As related to 1957 taxable sales and use transactions the increase in revenue would have been $10,646,660 and $21,293,321, respectively.

Economic Implications of Policy Changes. The revenue potentialities through broadening the sales tax base and/or increasing rates are obviously excellent. The desirability of such action is another matter. Taxation of motor fuel, liquor and cigarettes under the retail sales tax is a debatable policy. All three are taxed by the federal government; and the State also imposes special excises on motor fuel and liquor. Proponents maintain that the special taxes have an independent justification wholly apart from

that of the general-type tax. However, this position appears to be in conflict with the basic concept that tax policy and tax burdens should be viewed in the aggregate. The real issue would seem to be whether these commodities are presently subject to sufficiently burdensome taxes in relation to other products and alternative tax base. The answer is not clear-cut. Moral considerations may be used to justify even a prohibitive level of taxation on liquor and to a lesser degree, tobacco. In the case of motor fuel it should be recognized that the existing level of taxation is only merited in terms of the special user relationship, and the rates will undoubtedly rise to meet growing costs. Imposition of a general tax under these circumstances seems to be a case of adding "insult to injury."

Taxation of the services noted will not appreciably alter the economic impact of the retail tax, and there are no compelling reasons for exclusion of these transactions. There is also a definite trend to include such activities in other sales tax jurisdictions.

The exemption of food purchased for consumption off the premises would substantially relieve the regressive effect of the tax on low- and medium-income groups. However, the heavy revenue losses which would be involved may preclude such action at the present time and under constitutional provisions the loss would have to be made up by sales or excise increases on other goods or services. If sales or excise rates are increased at some future date, the possibility of implementing this reform should be thoroughly explored.

Assuming an urgent need for revenue, the policy issues involved in increasing the rate of the sales tax are clearly defined. The sales tax will produce the revenue, and the burden of the Colorado tax, per capita and in relation to income payments, ranks eighth among the eight Western State levies. At the same time, the sales tax does not conform to the ability principle, and actually hits the low- and medium-income groups harder than the higher-income classes. The decision to be made, therefore, is whether there are alternative sources, which are more acceptable from the standpoint of equity.

In the area of administration a more systematic and vigorous enforcement would undoubtedly produce a net increase in tax yields, and by lessening evasion would also reduce inequities as between taxed concerns. The most striking example in government of the old adage "penny wise and pound foolish" is provided by so-called economies in appropriations for tax administration. Such practice may be further characterized as a "tax subsidy to the tax evaders."

The General versus Retail Sales Tax. Adoption of a general sales tax covering retailing, wholesaling, manufacturing and processing and extractive industries other than agriculture would substantially increase yields even if moderate rates were employed in the case of non-retail activities. However, there are several serious objections to this form of tax. In the first place, it has a pyramiding effect upon the burden of the tax. Secondly, the total tax burden involved varies as between types of business and individual enterprises of the same class depending upon the degree of integration which exists in the production and distribution process. Finally, the administrative problem is enhanced through increasing the number of taxpayers and the necessity of distinguishing the nature of the new activities taxed for the purpose of applying differential rates. The existence of a substantial special severance tax on the oil industry in Colorado would also raise a question as to the appropriateness of imposing a general levy on this field of production. In view of the broad criticisms noted, a change to the general form of sales tax does not appear to be desirable.

CHAPTER IX

ALCOHOLIC BEVERAGE TAXES

A special excise tax is levied on the consumption of alcoholic beverages by the Federal government, all 48 states, the District of Columbia, and numerous municipalities. Public revenues in the form of excise taxes, license fees, import duties, and profits from state operated stores exceeded $4 billion in 1956. Of this total, $3,085 million was collected by the Federal government; $921 million by the states; and $91 million by local governments.[1]

States vary in considerable detail in the degree of control exercised over the sale of alcoholic beverages. Broadly classified, however, they fall into two groups. Thus, states which regulate the sale of alcoholic beverages by licenses and permits are considered license states, and states which have control over some phase of the marketing of alcoholic beverages are considered monopoly states. Most of the latter confine their operation to the sale of packaged liquor and allow private concerns to operate "on-sale" establishments, but there are, however, certain exceptions.

The Federal government and all license states (29 in number) levy a tax on distilled spirits, malt beverages, and wines. All of the non-license (monopoly and "dry") states levy a tax on malt beverages[2] and many of the monopoly states subject spirits and wine to an excise tax, generally as a percent of the retail selling price.

Trends in Consumption of Alcoholic Beverages in the United States

As can be seen from Table 9.1, per capita consumption of alcoholic beverages in the United States has historically been subject to marked fluctuations. These fluctuations are due to changing social attitudes, changing levels of national income, occurrence of national crisis and numerous other factors. In the middle of the 19th century per capita consumption of distilled spirits reached a total of 2.24 gallons annually, a rate that has not been reached since. By 1915, consumption declined to an annual per capita rate of 1.26 wine gallons.[3]

Following the repeal of prohibition, consumption of spirits occasionally neared or exceeded the pre-prohibition level; generally, however, consumption was less. In 1956, annual per capita consumption of spirits was 1.13 gallons. Per capita consumption of beer increased from a modest 1.58 gallons in 1850 to 18.4 gallons in 1915. Post-prohibition consumption of beer has tended to be lower than the 1915 rate; the trend being downward since 1950 or from 17.26 gallons in 1950 to 15.99 gallons in 1956. The consumption trend for wine has been less erratic than has the trend for spirits and beer consumption. With the exception of the prohibition era, the consumption of wine increased fairly steadily from 1850 to 1950, reaching, in the latter year, a per capita high of .93 gallons. Since that time the rate has declined slightly.

Table 9.1

Per Capita Consumption of Alcoholic Beverages in the United States, Selected Years, 1850-1956

Year	Spirits (gallons)	Malt liquors (gallons)	Wines (gallons)
1850	2.24	1.58	.27
1870	2.07	5.31	.32
1915	1.26	18.40	.33
1930	.08	0.00	.03
1940	1.02	12.58	.66
1945	1.22	18.86	.73
1950	1.02	17.26	.93
1951	1.23	16.97	.87
1952	1.00	16.94	.85
1953	1.10	16.79	.90
1954	1.12	16.68	.86
1955	1.07	16.13	.89
1956	1.13	15.99	.89

Rationale of the Tax

A tax levied on the consumption of alcoholic beverages can reasonably be classified as a sumptuary excise since the traditional rationale for imposition of the tax has been to discourage the consumption of a product deemed undesirable by society. Liquor (as well as tobacco) has been considered detrimental to consumers

[1] Distilled Spirits Institute, *Public Revenues From Alcoholic Beverages* (Washington, D. C., 1957), p. 7.

[2] Oklahoma and Mississippi collect excise taxes on beer. They are nevertheless considered "dry" states because Oklahoma prohibits the sale of beverages in excess of 3.2 percent alcohol and Mississippi prohibits the sale of beverages in excess of 4 percent alcohol.

[3] Consumption data are usually understood to be in terms of a wine gallon which is a regular 128-ounce gallon. Tax rates, however, are often expressed in terms of a proof gallon which is one gallon of hundred proof (50 percent alcohol) liquor. Hence, a gallon of 200 proof liquor, which would be pure alcohol, would be two proof gallons.

and society but not "sufficiently objectionable to require outright prohibition."[4] If high taxes are to discourage consumption of a product, the assumption must be made that the tax which is levied on business firms will be shifted, at least in part, to the consumer in the form of higher prices, and that higher prices will discourage consumption. In view of the substantial revenues that have been derived from liquor taxes it would appear that consumption has not been significantly discouraged. It is, of course, impossible to say how much consumption would have occurred had the tax not been imposed.

Closely related to the sumptuary rationale is the reasoning that society incurs a "social cost" due to the consumption of alcoholic beverages and a tax should therefore be imposed to reimburse society for this cost.[5] In addition to providing a basis for the imposition of a tax on liquor, this concept also affords a justification for the imposition of dealer license fees. This is because the liquor industry is presumed to result in a greater social cost than most other industries. The fees are also considered to be justified on grounds that they provide operating revenue to cover costs of the control authority.

If consumption taxes are to be used by a taxing authority, it is often contended that luxuries—and liquor is presumed to fall within this category—should be taxed at a higher rate than necessities. A distinction between luxuries and necessities, however, is usually a manifestation of an individual's personal tastes rather than being founded upon a rational definitional base. The difference of opinion over luxuries and necessities has led to the contention that luxury taxes are arbitrary and discriminatory because they use personal-taste patterns as the basis of the distribution of the tax burden—an allocational method of questionable merit.

The most common indictment made against liquor taxes is that they are regressive, that is, a higher proportion of income is taken from the lower rather than the higher income groups. An additional regressive factor is the use of specific rates in the taxing of alcoholic beverages. This results in the consumer's incurring the same dollar tax burden irrespective of the selling price of the beverage.

Although the regressivity of the liquor tax is partially offset by the tendency for greater consumption in the higher income groups, it is generally agreed that the tax is regressive. Granting this regressivity, however, it has been argued that if the tax system is viewed in total it remains progressive since the regressive liquor tax is more than offset by the progressive income tax. Implicit in this justification is the belief that the income tax, by itself, is excessively progressive.

Consumption taxes, such as the liquor tax, are subject to the charge that there is a distortion in the allocation of resources which is not present when a tax such as the income tax is imposed. Although this indictment is valid, re-allocation of resources is the purpose of the tax since it is designed to discourage the consumption of liquor. An unexpected distortion may result however, because consumers may not curtail their purchases of liquor but instead curtail the purchase of the so-called necessities in order to meet the higher prices of liquor. However, if the purpose of a liquor tax is simply to yield revenue, the indictment of the tax on the score that it distorts resources is relevant as well as valid. Closely related to this charge is the contention that the tax system should not be used as a vehicle for influencing society's consumption patterns.

The sumptuary effectiveness of a tax will depend on the availability of substitutes for the product in question, that is, the price elasticity of the demand for the product. Contrary to this necessary elasticity, consumption of alcoholic beverages appears to be somewhat unresponsive to changes in price.[6] Although this characteristic is undesirable from a sumptuary viewpoint, it is quite desirable from a fiscal viewpoint because higher prices effected through the imposition of a tax will not result in curtailed purchases and contraction of the tax base and therefore tax revenue.

The consumption of alcoholic beverages also tends to be unresponsive to changes in aggregate income. Hence, the taxation of alcoholic beverages results not only in a lucrative but also a relatively stable source of revenue.

The liquor tax tends to have a greater deflationary impact than the income tax. If a certain amount of revenue is taken from consumer spending, the deflationary effect will be greater than if the same amount of revenue is taken from income, i.e. both spending and savings. However, the extent to which a liquor tax could act as an anti-inflationary force would be of minor significance.

---

[4]John F. Due, "Federal Excise Taxation," *Bulletin of the National Tax Association*, December, 1947, p. 67.

[5]If it were possible to estimate the social cost resulting from the consumption of alcoholic beverages it would undoubtedly be considerable. A survey made in Denver in 1953 revealed that about 70 percent of the cases handled by the Denver police court involved charges of drunkenness. About 20 percent of the traffic court cases were for drunken driving. "The cost to the city of apprehending and identifying the defendants, of trying the cases and of incarcerating convicted offenders, is considerable." Budget and Personnel Office, City and County of Denver, *Financing Municipal Government in Denver* (Denver, 1956), p. 172.

[6]Although numerical estimates of elasticity are subject to methodological qualifications and are often of questionable value, the price elasticity of the demand for alcoholic beverages has been estimated at between minus 1.0 and minus 1.5. See J. P. McKenna and F. M. Boddy, "How Bad Are Liquor Taxes?", *Proceedings of the National Tax Association* (Louisville, Ky., 1953), p. 31.

It has been argued that consumption taxes broaden the tax base and therefore create a tax awareness which results in a check on extravagant government expenditures. Just the opposite effect appears to be true of liquor taxes, however, since they are levied indirectly and "hidden" in the price of the product. Although this taxing technique results in a tax unawareness, and possible extravagant expenditures, it is desirable from the standpoint of being relatively "painless" and therefore politically popular as well as meeting the test of convenience. This ease of payment also results in administrative ease, especially on the federal level where the tax is levied on manufacturers. Evasion of the tax through illegal production is considered the major administrative problem of the liquor tax.[7] This problem appears to be due more to the high federal rate than to the nature of the tax itself.

History of the Tax

Federal Liquor Tax. The Federal excise tax on distilled spirits was first levied in 1791 and was the "first form of internal duty laid in the United States."[8] Enactment of the duty was met with considerable hostility and led to the famous Whiskey Insurrection in 1794 in which President Washington ordered 13,000 militia to the scene of disorder. Suppression of the insurrection was considered to be the first sign of the emergence of a sovereign federal state.

An inadequate yield, excessive collection costs, and continued hostility to the tax, resulted in the repeal of the first liquor excise in 1802.[9] However, the liquor excise was again imposed during the War of 1812 but was repealed in 1817 after President Monroe, in his message to Congress, recommended the repeal of all internal taxes.

Alcoholic beverages were not subject to a tax from 1818 until 1862, when an excise tax was again imposed. Continued rate increases by Congress and failure to include floor stocks in the tax base resulted in legislative profiteering and the notorious "Whiskey Ring."

The anti-liquor movement led from extensive state-local option laws to state prohibitory laws and finally to the Eighteenth Amendment which prohibited the "manufacture, sale, or transportation" of intoxicating beverages. The effect of National Prohibition on the consumption of alcoholic beverages is debatable,[10] but the effect on liquor tax collections is certain since revenue fell from $483 million in 1919 to $9 million in 1932 (Table 9.2).[11]

Table 9.2

Federal Liquor Tax Revenues and Rates Selected Years, 1895-1956

Year	Total liquor tax revenues (millions)	Liquor tax revenues as percent of total tax revenues	Prevailing rate (per proof gallon)
1895	$ 112	34.5	$1.10
1900	183	32.3	1.10
1910	209	30.9	1.10
1919	483	9.4	6.40
1932	9	0.0	6.40
1935	411	10.8	2.00
1938	568	9.7	2.25
1940	624	11.6	3.00
1942	1,084	8.5	4.00
1944	1,618	3.7	9.00
1946	2,526	5.7	9.00
1948	2,255	4.9	9.00
1950	2,219	5.4	9.00
1952	2,549	3.7	10.50
1954	2,783	4.1	10.50
1956	2,921	4.4	10.50

Bureau of the Census, *Continuation to 1952 of Historical Statistics of the United States, 1789-1945*, p. 38; data for 1954 taken from U. S. Bureau of the Census, *Statistical Abstract of the United States, 1955*, pp. 350, 357, and data for 1955-1956 taken from U. S. Bureau of the Census, *Statistical Abstract of the United States, 1957*, pp. 363-368; rates for 1895-1932, Tun Yuan Hu, *The Liquor Tax in the United States 1791-1947*, Appendix II, and 1935-1956 rates taken from Distilled Spirits Institute, *Annual Statistical Review, 1957*, pp. 4-5.

In early 1933, legislators, carrying out campaign promises, first amended the Volstead Act by declaring that alcoholic beverages of no more than 3.2 percent alcohol were non-intoxicating and therefore not prohibited. Following this action a repeal amendment was passed by large majorities and sent to the states for ratification. In December, 1933, the required number of states ratified the amendment and the "noble experiment" joined other national prohibition attempts and became history.[12]

---

[7]See the roundtable discussion, "The Federal Whiskey Tax Rebellion," *Proceedings of the National Tax Association* (Louisville, Ky., 1953), pp. 3-40, for a complete discussion of the extent of illicit liquor traffic in the United States.

[8]Tun Yuan Hu, *The Liquor Tax in the United States, 1791-1947* (Graduate School of Business, Columbia University: New York, 1950), p. 11.

[9]The tax yielded only $3.6 million in its 10 years of operation and over $1 million was expended in suppressing the Whiskey Insurrection. The wide dispersment of taxpayers resulted in a collection cost of about 20 percent over the 10-year period. See Hu, *Ibid.*, pp. 30-32.

[10]One estimate places the per capita consumption rate in 1930 at approximately one-third of the 1914 level. See Department of Justice, "Possible Production of Illegal Liquor in the United States for the Fiscal Year Ending June 30, 1930," (Senate Document No. 3.7, 71st Congress, 3rd Session), Vol. I, pp. 117-47. Another study reached the conclusion that prohibition decreased liquor consumption by approximately one-third. See Clark Warburton, *The Economic Results of Prohibition* (Columbia University Press: New York, 1932), p. 260.

[11]A tax was imposed on the production of alcohol which was for non-beverage use during prohibition.

[12]For an economic interpretation of the prohibition movement see Louis M. Hacker, "Rise and Fall of Prohibition," *Current History*, 36:622-73, 1932.

Although the liquor control problem became the responsibility of the states following repeal, the federal government continued to obtain large sums of money from the taxation of alcoholic beverages. As can be seen from Table 9.2, increased rates were a contributory factor in the trend of increasing liquor tax collections. Rates were increased from $2 per gallon in 1935 to $10.50 per gallon in 1952. The resulting revenues increased from $411 million in 1935 to $2.9 billion in 1956. The liquor tax occupied an important position in federal finance at the turn of the century, accounting for approximately thirty-three percent of total tax revenues (Table 9.2). In recent years the liquor tax has become relatively less important, accounting for only 4.4 percent of total tax revenues in 1956.

State Liquor Taxes. Prior to adoption of the Eighteenth Amendment, states, counties, and municipalities collected considerable amounts of revenue from the imposition of liquor license fees or occupation taxes but the field of excise taxation was left to the federal goverment. As noted above, when the Twenty-First Amendment was adopted, liquor control became a state problem. Extensive use of excise taxes by the states quickly followed. Many license states, anticipating repeal of the Eighteenth Amendment, had removed state constitutional restrictions and established liquor control systems prior to repeal. When ratification of the Twenty-First Amendment was announced on December 5, 1933, the sale of all alcoholic beverages became legal and a tax was immediately imposed in thirteen license states. Following the imposition of a tax in these states in 1933, 5 more license states adopted a liquor tax in 1934, 6 more in 1935, 3 more between 1936 and 1939, and finally the last one in 1949. The year of adoption of the tax by the various states as reported in the Distilled Spirits Institute, *Annual Statistical Review, 1957,* is summarized below:

1933		
Arizona	Delaware	New Jersey
California	Indiana	New Mexico
Colorado	Maryland	New York
Connecticut	Massachusetts	Rhode Island
		Wisconsin
1934		
Florida	Kentucky	Minnesota
Illinois	Louisiana	Missouri
1935		
Arkansas	Nevada	South Dakota
Nebraska	South Carolina	Texas
1936		
North Dakota		
1938		
Georgia		
1939		
Tennessee		
1949		
Kansas		

Hence, 25 of the 29 license states which presently impose an excise tax on alcoholic beverages adopted the tax between 1933 and 1935.

Although twenty-eight states adopted the license system of liquor control when prohibition was repealed, seventeen states elected the monopoly method of liquor control while three states remained "dry."[13] The adoption of monopoly systems by certain states can be explained partly in terms of their nearness to Canada where this form of control was in use. As can be seen in Chart 9.1, of the states bordering Canada only 3 did not elect the monopoly control method, namely North Dakota, Minnesota, and New York. The pattern of liquor control systems established in the 1930's has remained unchanged. No license states have become monopoly states, although this change has occasionally been suggested, nor have any monopoly states become license states.[14] With repeal of the Eighteenth Amendment and the adoption of excise tax systems in numerous states, liquor taxes and license fees became an important source of revenue for state and local governments. The revenue obtained by the states from this source amounted to approximately $.5 billion in 1942, $.8 billion in 1950, and over $1 billion in 1956.[15]

Liquor Tax in Colorado—Revenue Trends. In 1932, the Colorado electorate approved a Constitutional Amendment which repealed previous liquor laws and legalized the sale of alcoholic beverages, subject to the U. S. Constitution. In August, 1933, the legislature enacted a hastily drawn liquor control act. Hence, with the ratification of the Twenty-First Amendment to the Federal Constitution,[16] the sale of alcoholic beverages became legal in Colorado and an excise tax was immediately effected.

Revision of defective provisions of the 1933 liquor control law was undertaken in 1934. Numerous inconsistencies in the 1933 law led to its repeal and the enactment of a completely new law in 1935. The "Liquor Code of 1935" remains the law under which liquor traffic is controlled in Colorado.

Revenues from Colorado liquor taxes increased from 1936 until 1946 (Table 9.3). Although revenues from this source decreased in 1950 they were near the 1946 level in 1957. It can be seen in Table 9.3 that spirits have tended to increase in importance, beer has remained

[13]Kansas remained "dry" until 1949 at which time it became a license state.

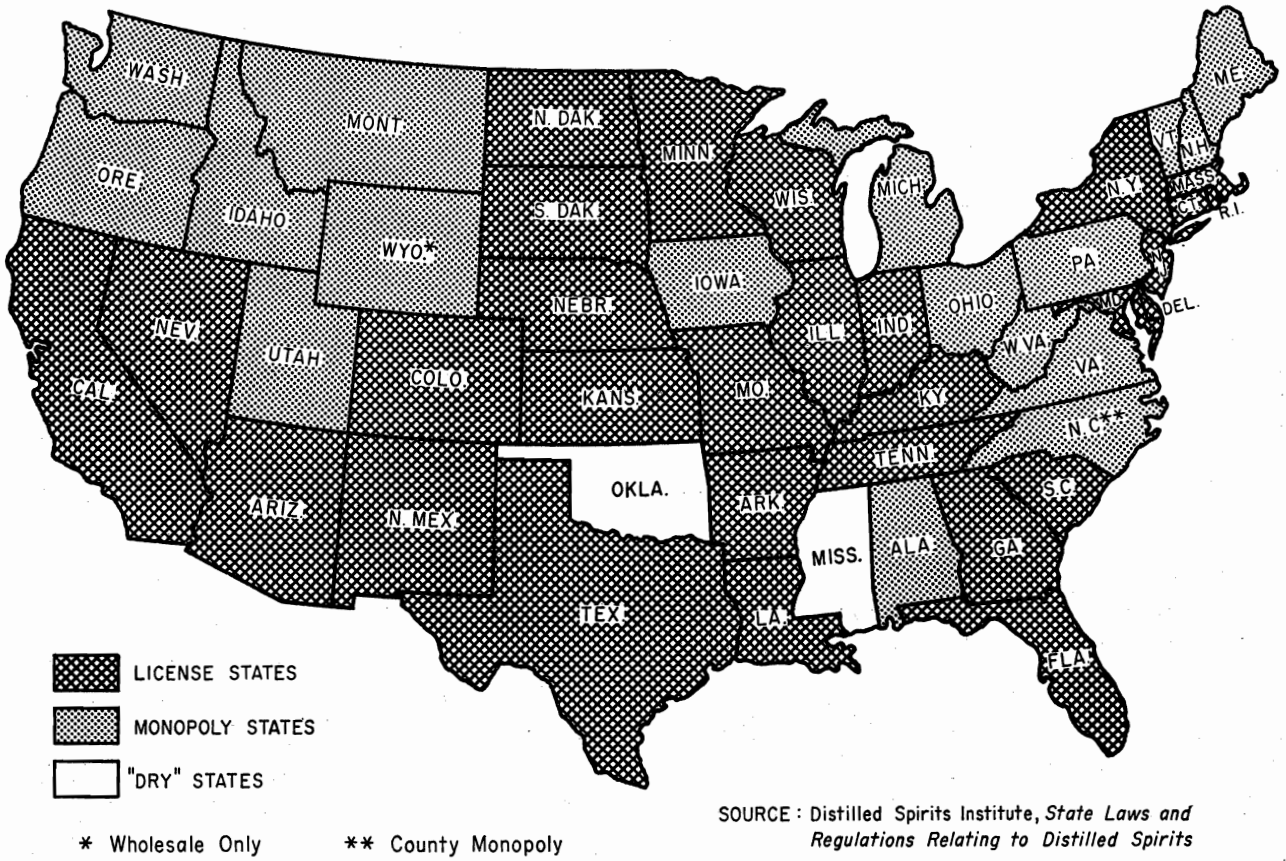
[14]A more complete discussion of the monopoly method of liquor control will be found in a later section of this Chapter.

[15]Distilled Spirits Institute, *Public Revenues, op. cit.,* p. 7.

[16]Colorado was the twenty-sixth state to ratify the Twenty-First Amendment. The vote on the ratification question was 133,906 in favor of repeal and 63,089 against it. See Hal Hagen, "Liquor Control by the Colorado License System" (Unpublished Master's Thesis, Colorado University, 1948), p. 55.

LIQUOR CONTROL SYSTEMS IN THE UNITED STATES

1957



SOURCE: Distilled Spirits Institute, *State Laws and Regulations Relating to Distilled Spirits*

CHART 9.1

fairly stable with the exception of the immediate post war period, and wine has tended to decline in importance.

Prior to 1936, thirty-five percent of the liquor revenue was apportioned to the general welfare fund, 60 percent to the General Fund, and 5 percent to the State Licensing Authority for administrative expenses. Revenue from locally issued licenses were retained locally.[17] With the adoption of a 1936 constitutional amendment, however, 85 percent of all revenues collected from liquor sources was earmarked for the Old Age Pension Fund.

Source: Unpublished report, State of Colorado, Department of Revenue, "Alcoholic Beverages—Tax Revenue and Consumption in Colorado," p. 3.

Total per capita revenue from taxes on alcoholic beverages reached $3.54 in 1946 (Table 9.4). Since that time the per capita burden of each type of alcoholic beverage has followed a general downward trend.

Table 9.4

Per Capita Revenue from Alcoholic Beverages in Colorado, Selected Calendar Years, 1941-1957

Year	Spirits	Beer	Wine	Total
1941	$1.61	$.31	$.21	$2.13
1945	2.71	.42	.20	3.33
1946	3.54	.45	.27	4.26
1950	2.40	.46	.19	3.05
1955	2.12	.40	.17	2.69
1956	2.26	.39	.17	2.82
1957	2.17	.37	.16	2.71

Source: Unpublished report of the State of Colorado, Department of Revenue, "Alcoholic Beverages—Tax Revenue and Consumption in Colorado," p. 4.

Per capita consumption of alcoholic beverages in Colorado reached a peak in 1946 which has not been reached since. It can be seen from Table 9.5 that per capita consumption of spirits and beer has increased since 1941 but 1946 remains the highpoint. Recent per capita wine consumption has been below both the 1941 and 1946 levels.

Table 9.5

Per Capita Consumption of Alcoholic Beverages in Colorado, Selected Calendar Years, 1941-1957
(gallons)

Year	Spirits	Beer	Wine	Total
1941	1.01	10.20	.92	12.13
1945	1.69	14.05	.89	16.63
1946	2.21	15.04	1.20	18.45
1950	1.50	15.16	.89	17.55
1955	1.32	13.49	.82	15.63

Use of the Tax by Colorado and Other States

Since license states and monopoly states are not comparable, the following discussion will be confined to license states. Monopoly states will be discussed in a later section of this Chapter.

Liquor revenues are collected by the states in the form of an excise tax on the sale of alcoholic beverages and license fees (discussed in a later section) levied on liquor manufacturers, wholesalers, and retailers. In addition to these two forms of revenue, 16 of the 29 license states include alcoholic beverages in their sales tax base.[18] It can be seen from Table 9.6 that this inclusion results in a substantial yield in some states, especially California and Illinois. A total of approximately $34.6 million was collected in 1956 or an average per capita amount of $1.34. These amounts do not include collections from five states for which data were not available.

Of the 13 license states which do not presently include alcoholic beverages in a sales tax base, 9 do not have a sales tax. Therefore, there are only 4 license states which have a general sales tax and exclude alcoholic beverages from the sales tax base—Colorado, Florida, North Dakota and South Dakota.

The common practice of including alcoholic beverages in the sales tax base as well as subjecting it to a special excise tax would seem to be inequitable on the grounds of double taxation. However, since taxes are paid out of income it is the effective aggregate rate on a given commodity, not the number of taxes levied on the commodity which is significant. In most states where alcoholic beverages are included in the sales tax base, the combined effect of the two levies is usually taken into consideration when establishing an excise tax rate.[19] For this reason comparison of rates and burdens between states is more meaningful if the sales tax yield of alcoholic beverages in the various states is taken into consideration.

Table 9.6

General Sales Tax Revenues from Sale of Alcoholic Beverages, Eleven License States, 1956[a]

State	General sales tax revenues (thousands)	Per capita revenues	Sales tax rates (percent)
Arizona	$ 1,100	$1.04	2
Arkansas	1,000	.55	3
California	50,800	3.78	state 3 local 1
Connecticut	2,925	1.31	3½
Georgia	3,953	1.06	3
Illinois	16,992	1.80	2½
Kansas[b]	917	.44	2
Maryland	2,425	.86	2
New Mexico	1,665	2.04	.125—2
Rhode Island	800	.97	2
South Carolina	1,983	.84	3
Average	—	1.34	—

[a] Indiana, Louisiana, Missouri, Nevada and Tennessee also collect revenues from the inclusion of alcoholic beverages in the sales tax base. Mississippi, a "dry" state, includes beer in the sales tax base and collected over $1 million from this source in 1956.
[b] 2% Retail Liquor Sales Enforcement Tax applicable to alcoholic beverages over 3.2 percent alcohol.

Source: Distilled Spirits Institute, *Public Revenues from Alcoholic Beverages, 1956*, pp. 11, 16-61.

The common charge of regressivity made against alcoholic beverage taxes is somewhat mitigated if liquor is included in the general sales tax base. However, the extent to which the regressivity of a high excise tax can be mitigated by a low sales tax is, of course, slight.

In terms of revenue producing considerations, inclusion of liquor in the sales tax base has much to commend it. If a specific rate is utilized,

[18] Seven of the 17 monopoly states also include alcoholic beverages in their sales tax base. This inclusion yields an estimated $18 million, or an average per capita collection $.84. See Distilled Spirits Institute, *Public Revenues, op. cit.*, pp. 11, 14-15.

[19] Don E. Dickey, *Alcoholic Beverage Taxation in Florida* (Florida Citizens' Tax Council: Tallahassee, 1956), p. 16.

increased revenues are due either to increased consumption, increased rates, or both. However, if a general sales tax is used, revenues will increase not only with increases in consumption or rates but also with increases in the price level.

An estimate of the potential revenue which could be effected by inclusion of liquor in the sales tax base in Colorado will be discussed in a later section of this Chapter.

Alcoholic beverages manufactured locally are often taxed at a lower rate than beverages imported into the state. Michigan and Missouri have even been able to enforce an embargo on the importation of liquor from certain states.[20] It would seem that such interference with interstate commerce would violate the commerce clause of the U. S. Constitution. However, the Twenty-First Amendment has been interpreted as superseding the commerce clause—"Each state is a sovereignty in its own right."[21] The wisdom of permitting this clause to be ignored may be questionable but nevertheless, "state trade barriers with regard to liquor are legal practically without limit."[22]

Tax Rates and Revenues in the States. The various alcoholic beverage tax rates in each of the license states is shown in Table 9.7. The average liquor tax rate for the 29 license states in 1957 was $1.59 per gallon. Colorado's rate of $1.60 per gallon was nearly identical to the average rate for the 29 states, but slightly above the median rate. It can also be seen that Minnesota employs the highest rate of $2.75 per gallon while South Dakota employs the lowest rate of $.75 per gallon. Eleven states employ a higher rate on spirits than Colorado while seventeen states employ a lower rate.

Wine rates, follow the general pattern of alcoholic beverage tax rates, and are graduated according to alcoholic content. A distinction is frequently made between light wine and fortified wine. Generally, light wine contains less than 14 percent alcohol and fortified wine more than 14 percent alcohol.[23] Wine of more than 24 percent alcohol, which is unusual, is taxed at a higher rate or it is taxed under the same rates as spirits. The average rate for light wines in 1957 was $.29 per gallon, while the median rate was $.20 per gallon (Table 9.8).

Table 9.7

Alcoholic Beverage Tax Rates: 29 License States, 1957

State	Spirituous liquor (per gallon)	Wine[a] Light (per gallon)	Wine[a] Fortified (per gallon)	Beer (per gallon)
Arizona	$1.20	$ .36	$ .36	$.075
Arkansas	2.50	.75[b]	.75[b]	.156
California	1.50	.01	.02	.020
Colorado	1.60	.12	.24	.030
Connecticut	1.00	.10	.10[c]	.032
Delaware	1.15	.35	.35	.065
Florida	2.17	1.00[d]	1.40[d]	.240
Georgia	1.00[e]	.20	.50[f]	.300
Illinois	1.02	.15	.40	.040
Indiana	2.08	.40	.40	.088
Kansas	1.00	.15	.40	.100
Kentucky	1.28	.50	.50	.081
Louisiana	1.68	.11	.21	.323
Maryland	1.50	.20	.20	.030
Massachusetts	2.25	.30	.30	.065
Minnesota	2.75	.22	.66[g]	.071[h]
Missouri	.80	.02	.10	.020
Nebraska	1.20	.20	.55	.040
Nevada	.80	.15	.25	.030
New Jersey	1.50	.10	.10	.033
New Mexico	1.30	.28	.28	.050
New York	1.50	.10	.10	.033
North Dakota	2.50	.50	.60[i]	.160[i]
Rhode Island	2.00	.20	.20	.034
South Carolina	2.72	.90	.90	.375
South Dakota	.75	.15	.30[k]	.073[l]
Tennessee	2.00	.70	.70	.110
Texas	1.41	.11	.22	.140[m]
Wisconsin	2.00	.10	.20	.032
Average	1.59	.29	.39	.098
Median	1.50	.20	.30	.065

[a] For purposes of this table, light wine is wine containing not more than 14 percent alcohol and fortified wine is wine containing more than 14 percent alcohol. Wine classifications for tax purposes vary among states.
[b] Domestic wines, 5 cents.
[c] Over 21 percent alcohol, 25 cents.
[d] Manufactured in Florida; light wines, 20 cents, fortified wines, 30 cents.
[e] $.50 if manufactured in Georgia.
[f] Domestic only. Light foreign wine $1, fortified foreign wine $2.
[g] 21 percent to 24 percent alcohol, $1.32.
[h] Less than 3.2 percent alcohol, $.035.
[i] 21 percent to 24 percent alcohol, $.80.
[j] Over 4 percent alcohol, $.20.
[k] 21 percent to 24 percent alcohol, $.60.
[l] Plus 10 percent of receipts for sale thereof.
[m] Malt liquor over 4 percent, $.165.

Source: Compiled from Commerce Clearing House, *State Tax Guide, All States*, pp. 3521-3584.

The median rate is probably a more meaningful measure of central tendency, since several states such as Florida, South Carolina, and Tennessee have extremely high rates which distort an arithmetic average. Colorado's rate of $.12 per gallon for light wine was substantially below the median rate of $.20 for the 29 states. Although fortified wine is often taxed at a higher rate than light wine, occasionally it is taxed at the same rate. The 29-state average rate for fortified wine was $.39 per gallon, and the median rate was $.30. Again the median rate seems to be a more meaningful measure of central tendency. The median rate of $.30 per gallon was 25 percent greater than Colorado's rate of $.24 per gallon.

Beer rates vary widely from a high of $.375 per gallon in South Carolina in 1957 to a low of $.02 in California. A few unusually high rates

[a] Based on population estimates of the U. S. Bureau of the Census as of July 1, 1956 as presented in *Survey of Current Business*, August, 1957.

[b] States which include alcoholic beverages in their sales tax base.

[c] Includes alcoholic beverages in sales tax base, but data are not avail-

Source: Adapted from U. S. Bureau of the Census, *Compendium of State Government Finances in 1956*, pp. 11-12, and Distilled Spirits Institute, *Public Revenues from Alcoholic Beverages 1956*, pp. 14-15.

From a viewpoint of comparative rates on alcoholic beverages, Colorado's rate on spirituous liquor would seem to be comparable to other license states. However, Colorado's rates on light wine, fortified wine, and beer appear to be substantially below the average rate for the license states and considerably below the median.

In the case of alcoholic beverage taxes, an interstate comparison of tax rates is not necessarily indicative of the relative liquor tax burdens among the states since some states, as mentioned earlier, include alcoholic beverages in the sales tax base.

It can be seen from Table 9.8 that several states collected substantial revenues from taxes on alcoholic beverages in 1956. In terms of per capita collections, exclusive of sales tax revenue from liquor, Florida had the highest rate, $9.18, while Missouri had the lowest rate, $1.40. Colorado's per capita rate of $2.70 was substantially below the average per capita rate of $3.60.

Interstate comparison of relative tax burdens tends to be more meaningful if per capita collections reflect the revenue from alcoholic beverages due to the sales tax, as well as from the liquor tax. On this basis Colorado's rate of $2.70 was considerably lower than the average for the license states, $4.11. This low rate ranked Colorado 26th, only three states having a lower relative burden.

Further examination of Table 9.8 shows that the fiscal significance of the liquor tax varied widely from state to state in 1956—from 10 percent of total tax revenue in Florida to 2 percent in New Mexico. Colorado's liquor tax collections amounted to approximately 3 percent of total tax revenue which placed Colorado somewhat below the average of 4.6 percent for the 29-license states.

In summary, Colorado's tax burden is below the 29-state average if total liquor taxes on a per capita basis are compared. If sales tax collections due to liquor sales are included, Colorado is substantially below the average. In addition, the liquor tax in Colorado is of less relative importance in the over-all revenue structure than is the case in most of the 29 states.

Administration of the Tax in Colorado. Excise taxes on alcoholic beverages and license fees are administered in Colorado by the Liquor License Division, which is under the Secretary of State. Prior to 1941, the enforcement and revenue collecting functions were performed by one agency. Since that time, however, the revenue collection function has been performed by the Revenue Department, while the Liquor License Division is responsible for administration of the Colorado Liquor Code as well as the Colorado 3.2 Beer Act. The latter agency maintains a daily perpetual inventory of alcoholic beverages within the State and is therefore able to determine the alcoholic beverages which are subject to the tax. This separation of enforcement and collection functions appear to be quite effective.

Collection costs incurred by the Liquor License Division have been approximately 4 percent of total collections.[24] This ratio compares favorably with the hypothetical 2-5 percent criterion of a "good tax." The costs incurred by the Revenue Department however, are not included. These costs appear to be small since most of the administration of the liquor tax is performed by the Liquor License Division.

One of the major administrative problems associated with the liquor tax is the evasion encouraged by high rates. The most common form of evasion is illegal production which appears to

[24] Colorado Liquor License Division, *Annual Report, 1957*, p. 4.

be largely confined to the southeastern United States, and is of little significance in Colorado.[25]

The purchase of out-of-state liquor made in order to take advantage of lower tax rates proposes an additional evasion problem. For example, it is reported that some purchases of liquor are made in Iowa by Minnesota residents in order to avoid the higher tax in Minnesota.[26] Because of rates in surrounding states and the geographical location of municipalities in Colorado, this problem does not appear to be of significance in the State.

From a viewpoint of state revenues the most serious form of evasion is bootlegging or the sale of alcoholic beverages on which there has been no tax paid. The propensity to engage in illicit liquor traffic is strengthened by high tax rates. An effective method for eliminating extensive bootlegging is the stamping requirement used by Colorado and 32 other states whereby stamps are purchased by liquor dealers and affixed to the bottles. A field investigator is then in a position to check a given inventory to see that the tax has been paid.[27] An alternative administrative procedure which could be adopted in Colorado would be to utilize a reporting system of enforcement similar to that presently used in the case of beer. Such a system would result in some savings to the State and would relieve merchandisers of the expense involved in purchasing, affixing, and cancelling the stamps. It should be noted, however, that a system appropriate for beer may not be appropriate for spirits. For example, the State tax on a case of beer is less than $.07, while the tax on a case of spirits amounts to $4.80.

Colorado Municipalities. License fees are collected from liquor retailers in Colorado by both the state and municipalities in which the vendors are located. Prior to 1936, license fees were collected locally and also retained by the localities. However, in 1938, the Supreme Court held that the Old Age Pension earmarking amendment, passed in 1936, applied to locally collected liquor license fees as well as to state license fees. Hence, 85 percent of the license fees collected locally for the State became earmarked for the Old Age Pension Fund. Colorado municipalities now retain only 15 percent of the state license fees they collect.

Having lost this source of revenue, but still faced with costs associated with the sale of alcoholic beverages, several municipalities levied an occupation tax on liquor retailers.[28] In 1949, this type of ordinance was held not to be in conflict with Article XXII of the Constitution, which provides for exclusive state control of alcoholic beverages, as long as the ordinance was for revenue purposes and not for regulatory purposes. Since that time numerous municipalities have adopted an occupation tax on liquor dealers. In 1954, Colorado municipalities collected approximately $127,000 from this source.[29]

A Colorado municipality presently has the right of local option, that is, the legal ability to exempt itself from the state liquor law thereby effecting a "dry" municipality. Although many other states grant local option provisions to other governmental jurisdictions such as counties, Colorado's local option extends only to municipalities. Attempts have been made in Colorado in the past to have local option extended to counties, election wards, and precincts but without success. There is undoubtedly some fear that local option will be used as a vehicle for state prohibition as it was in the period immediately preceding national prohibition.

Beer of no more than 3.2 percent alcohol is exempted from local option provisions on the grounds that it is non-intoxicating. Although it is legally non-intoxicating, it is nevertheless denied to persons under 18 years of age.

Use of Liquor Licenses by Colorado And Other States

Historically, the issuance of liquor licenses has been for the purpose of offsetting the costs incurred by governments in exercising control over the liquor industry. The "special benefit" nature of non-tax revenues is especially applicable to liquor licenses and has been well summarized by William H. Anderson.[30]

> It can be considered, therefore, that the principal distinction between non-tax revenues and taxes lies in the degree of *general benefit* as contrasted with *special benefits.* The charges may be called taxes when the general benefit is the outstanding feature, and they may be referred to as non-tax revenues when the special benefit is most significant.

---

[25]In 1953, 93 percent of the stills and mash seized by the Federal government were in states south of the Ohio River and east of the Mississippi River. See McKenna and Boddy, "How Bad Are Liquor Taxes?",*op. cit.*, p. 36. See the same volume for statements by representatives of the liquor industry that illegal production is widespread and not confined to the southern states.

[26]E. B. Schmidt, "Selective Sales Taxes," *Proceedings of Conference on State and Local Tax Systems* (Laramie, Wyoming, 1957), p. 70.

[27]H. C. Wilson of the Liquor License Division reports that the Colorado stamping requirement has been quite effective in curtailing the sale of liquor on which the tax has not been paid, and that abandonment of the requirement would create a serious enforcement problem.

[28]For a sample ordinance levying such an occupation tax see Hal Hagen, "Municipalities and Liquor License Fees," *Colorado Municipalities,* April, 1946, pp. 63-66.

[29]Colorado Municipal League, *Selected Non-Property Revenues of Colorado Cities and Towns* (Boulder, 1955), pp. 3-5.

[30]William H. Anderson, *Taxation and the American Economy* (Prentice-Hall, Inc.: New York, 1951), p. 489.

Licenses, in addition to being used to obtain revenue to cover costs of administration, are often used to control the number and character of licensees as well as to encourage local manufacture of alcoholic beverages.

One of the problems associated with the licensing of liquor retailers is the resulting restriction of licenses issued. This restriction is due to the pressures exerted by the liquor dealers, who desire to achieve a partial monopoly position, and by those groups and individuals who wish to avoid having liquor dealers become ubiquitous.

If it is in the public interest to restrict the number of liquor dealers, the inevitable consequence is the accruing of a monopoly profit. Although this monopoly profit, effected by the government, presently accrues to the liquor dealers, it could reasonably be argued that this profit should accrue to the state to be enjoyed by the general public. This shifting of the monopoly benefits to the general public could be achieved in one of two ways. The first, and the one most difficult to achieve, would be for the government to adopt a monopoly control system. The second alternative would be the adoption of substantially higher license fees (replacing the present system) which would have the effect of reducing the number of liquor dealers—an objective which is presently achieved by legal requirement. A slight alteration of the second method would be to issue licenses on a competitive basis, that is, licenses would be issued to the highest bidders. This technique, of course, has the inherent danger of collusive bidding.

Although the present situation of allowing monopoly profits to accrue to the liquor dealers does not seem equitable to the general public, it is somewhat mitigated by the lack of knowledge as to the extent of monopoly profits realized.

License fees vary substantially in the states since the objectives for issuing the license vary. Higher fees are usually paid by distillers than by wholesalers. Wholesalers in turn usually pay higher fees than retailers. Off-sale liquor stores generally enjoy a lower rate than on-sale establishments. Because of this wide variation in license fees, a valid interstate comparison is extremely difficult. In addition, there is wide difference in the types of licenses issued. Some states, such as Colorado, issue licenses which allow the retailer to sell only 3.2 percent beer. Many states do not distinguish between so-called "light" beer and regular beer.[31]

Another example of dissimilar privileges applying to licenses is the prohibition in some states of an on-sale dealer making package sales. Even if a valid interstate comparison of license fees could be made, the desirability or usefulness of such a comparison is questionable.

If one state is to be compared to another, it would have to be assumed that the two states had similar motives, that is, one was not encouraging the liquor industry while the other was restricting it. Likewise, it would have to be assumed that costs within the states were not dissimilar if license fees were levied to support the cost of regulatory agencies. Or, if a state wishes to use its license system as a source of revenue or as a vehicle to capture monopoly profits, it must measure its license system in those terms rather than using the rates in other states.

Colorado's 1957 license rates are shown in Table 9.9. Since the fee for "off-sale" retailers was only $200 annually and the fee for "on-sale" retailers[32] (hotels and restaurants) are only $350, there is little evidence that the State is attempting to capture monopoly profits.

Table 9.9

Alcoholic Beverage License Rates in Colorado, 1957

Type of licensee	License issued by State	License issued by locality[a]
A. Alcoholic Beverages		
Brewery or winery	$ 250	—
Distiller or rectifier	1,000	—
Beer wholesaler	500	—
Wine or spirits wholesaler	1,000	—
Retailers and drug stores	50[b]	$150
Railroad cars	25	—
Hotels and restaurants	25	325
Clubs	25	100
B. Beer and Wine Only		
Hotels & restaurants	$ 25[b]	$150
Resort hotels	200	—
C. 3.2% Beer Only		
Manufacturers and wholesalers	$ 100	—
Retailers	25[b]	$ 25

[a] 85% of license fees collected by municipalities and counties accrues to the State.
[b] If establishment is not located within a locality, an additional fee is collected.

Source: Commerce Clearing House, *State Tax Reporter: Colorado, 1956*, pp. 3591-92.

The object of Colorado's license fees seems to be that of covering costs incurred by the State liquor authority. Costs incurred by the Liquor License Division in 1957 were approximately $202,000 while license fee collections by the State were $219,000.[33]

[31] "Light beer" is the result of the modification of the Volstead Act by Congress prior to repeal of prohibition. It was held that beer of no more than 3.2 percent alcohol was non-intoxicating and could therefore be sold. Several states took this reasoning out of the context of the times in which it originated and held that since 3.2 percent beer is legally defined as non-intoxicating, it could be sold to minors between the ages of 18 and 21. Colorado and only six other states have taken this position.

[32] When prohibition was repealed it was hoped that the return of the old time saloon could be avoided. Some states, such as Colorado, prohibited by law the issuance of a license to saloons. Licenses in Colorado are issued to "restaurants." To contend that neither "saloons," "taverns," nor "bars" exist in Colorado is a matter of definition.

[33] *Annual Report of the Liquor License Division, 1957*, p. 3.

The Monopoly Method of Liquor Control

The philosophy of the Volstead Act rested on the contention that the consumption of alcoholic beverages in any form, of any strength or quality, was detrimental and objectionable, if not actually sinful.[34] As the unenforceability of complete national abstinence became apparent, a theory of neutrality replaced the prohibition philosophy. When the problem of liquor control was turned over to the states, this position of general neutrality was evidenced by most states' allowing the sale and consumption of alcoholic beverages but at the same time determined not to allow return of the saloon with its accompanying social problems.[35]

Some states, more determined than others to avoid the problems of the pre-prohibition days, adopted the monopoly method of liquor control. The reasons for adoption of a monopoly system by 17 states are numerous, and the fear of some states that if a license system were adopted a change-over at some future date would be impossible appears to have been well founded. The pattern of liquor control was rigidly established in the 1930's; all of those states adopting the license technique have retained it and all of those states adopting the monopoly technique have retained it. The only change in recent years was the change-over by Kansas in 1949 from a dry state to a license control state. The advantages claimed for the monopoly method of control are primarily of a social control nature but revenue considerations are often significant. It is claimed that the monopoly method can better maintain the marketing of alcoholic beverages in a climate of neutrality, even though the control in most monopoly states extends only to operations of package liquor stores.[36] It is argued that the monopoly method can establish neutrality by removing the profit motive inherent in the license system, and by exercising strict control over the number of licenses issued, the hours of sale, the extent of advertising, pricing policies, and the quality of merchandise.[37] Another advantage appears to be the more effective control of under-age drinking. Michigan, for example, requires that all persons between the ages of 21 and 25 secure an age identification card which must be shown when intoxicating beverages are purchased. The license system has in some cases been able to achieve as effective a control as the monopoly system and there seems to be some agreement that, ". . . as to the effectiveness of monopoly control measures, no definite conclusion can be drawn."[38]

The revenue considerations involved in the monopoly system of liquor control are less subject to disagreement than the control considerations. The greater revenues received by the monopolies have been observed by numerous writers, and it has been pointed out that these revenues are often the result of public profit motive replacing profit motive and a policy of neutrality thereby being ignored. Greater revenues do not necessarily imply that the state is encouraging the consumption of alcoholic beverages, however. If a policy of attempting to capture monopoly profits is followed, substantial revenues would be effected. Another possible reason is that monopoly systems may be able to control bootlegging more effectively and therefore secure greater tax receipts.

Interstate comparisons between monopoly states and license states are somewhat difficult to make but the average per capita revenue for the monopoly states in 1956 was about $8.00 while the average per capita revenue for the license states was only about $4.25.[39]

The adoption of a monopoly system of liquor control by a license state involves numerous problems, the least of which is that it has never been done before. Nevertheless, it has been advocated, it has fiscal advantages, and it may permit more effective liquor control.

The scope of this study does not permit a complete analysis of the desirability, or possibility, of Colorado's adopting a "quasi-monopoly" control over the distribution of alcoholic beverages. This omission, however, should not be interpreted as opposition to adoption of such a system. Considering the possible advantages of the monopoly system and the magnitude of the problem, further study of this system would undoubtedy be of value.[40]

Possible Changes in Colorado

Excise Tax Rates. The present excise tax rate of $1.60 per gallon on distilled spirits in Colorado is almost identical to the average rate of

---

[34]Hal Hagen, *Liquor Control By the Colorado License System*, *op. cit.*, pp. 16-17.

[35]Franklin D. Roosevelt in the repeal proclamation in 1933, asked the states not to allow the return of the saloon either in its old form or in some modern guise. "Since this time the saloon has been returning under a new guise, the tavern." Hagen, *Ibid.*, p. 8.

[36]Some of these states, however, prohibit the sale of alcoholic beverages for consumption on the premises. It has been suggested that the term "quasi-monopoly" would be more appropriate for this type of liquor control. See Roy and Gladys Blakey, *Sales Taxes and Other Excises* (Public Administration Service: Chicago, 1945), p. 96.

[37]For a complete discussion of the monopoly method of liquor control see Blakey, *ibid.*, pp. 96-100; Jacob B. Taylor, *The Monopoly Liquor Control: An Appraisement, After Seven Years* (National Alcoholic Beverage Control Association: Columbus, Ohio, 1941); Glenn D. Morrow and Orba F. Traylor, *State Liquor Monopoly on Private Licensing* (Frankfort, Kentucky, 1940); and J. E. Eubanks, *Ben Tillman's Baby: The Dispensary System of South Carolina* (Augusta, Georgia, 1950).

[38]Morrow and Traylor, *ibid.*, p. 6.

[39]Computed from Distilled Spirits Institute, *Public Revenues*, *op. cit.*, pp. 16-63.

[40]The Minnesota Tax Study Committee recommended the consideration of a monopoly system at the wholesale level if additional revenues were needed. *Report of the Minnesota Tax Study Committee* (Minneapolis, 1956), p. 602.

$1.59 per gallon and is slightly above the median for spirits in the 29 license states. If comparability with other license states is to be the criterion, Colorado would be unjustified in increasing the tax rate on spirits at the present time.

In comparison with the license states, Colorado would be justified in increasing the present tax rates on light wine, fortified wine, and beer.

The present tax rate on light wine in Colorado is $.12 per gallon. This rate is considerably below the median rate, which is a more meaningful measure of central tendency than the average rate, for the 29 license states of $.20 per gallon. If Colorado were to increase the tax on light wine from $.12 per gallon to the 29-state median rate of $.20 per gallon, it is estimated that light wine tax collections would be increased by approximately $25,000.[41]

Colorado's tax rate on fortified wine (over 14 percent alcohol) was $.06 below the median rate of the license states in 1957. If Colorado were to increase the tax rate to the median rate of $.30 per gallon, fortified wine tax collections would be increased by approximately $55,000.

Wine rates in Colorado are graduated according to alcoholic content, wines of less than 14 percent alcohol being taxed at a rate of $.12 per gallon, and wines containing over 14 percent being taxed at $.24 per gallon. If Colorado increased the wine tax rates in order to be comparable with the median rate in the license states, the difference in rates would not be as extreme. If light wine were taxed at $.20 per gallon and fortified wine at $.30 per gallon, the higher proof wine would carry only a 50 percent higher rate whereas it presently carries a 100 percent higher rate. Nevertheless, the rates would still be graduated according to alcoholic content and any graduation is somewhat arbitrary in nature.

Colorado's present rate of $.03 per gallon on beer is less than half the median rate of $.065 per gallon in the 29 license states. If rates were increased it would undoubtedly be more convenient simply to double the present rate than to increase the rate to $.065 per gallon. If the $.03 per gallon rate on beer were doubled to $.06 per gallon, it is estimated that beer tax collections would be increased by approximately $625,000.

In summary, total tax collections would be increased by approximately $700,000 if excise rates on wines and beer were increased in the manner discussed above. The bulk of these increased revenues would be due to the increased tax rate on beer.

License Fees. An interstate comparative analysis is of little significance in the case of license fees, since license privileges and objectives in collecting the fees are not comparable. Some states collect fees to offset costs of the license authority, others impose license fees for revenue purposes, while others attempt through the license device to either encourage or discourage the liquor industry.

Colorado's license system is somewhat involved since license fees are collected both by the State and by municipalities which remit 85 percent of the collections to the State. It does not appear that the State should receive 85 percent of the license fees collected locally since localities incur a substantial cost due to the sale of alcoholic beverages. This apparent injustice is somewhat mitigated by the fact that many municipalities have imposed an occupation tax. In addition, it would be difficult to pass a constitutional amendment which would probably be needed to alter the present system.

That portion of the license fees collected by the State appears to be motivated by the desire to offset the costs incurred by the Liquor License Division. Therefore, as long as costs are exceeded by revenues there is little reason to increase the fees. If the objective should change to one of attempting to capture the monopoly profit created by the State in restricting licensees, an increase in rates would be warranted. The demand for liquor licenses appears to be somewhat inelastic at the present fee level, and any increase would probably cause revenue to be enlarged in nearly the same proportion as the fee increase. If rates were raised high enough, however, the number of licenses demanded would begin to decrease. The number of liquor dealers would, therefore, be restricted by the high fees and, in addition, the State would be collecting substantial revenues. The level to which fees would have to be raised to achieve the desired number of licensees would have to be found by trial and error, that is, increase fees until the desired number of licensees is reached. If there were insufficient applicants to adequately fulfill the needs of a community, the fees could be lowered.[42]

One effect that would probably result from this approach would be to encourage competition, the effects of which are usually desirable.

[41] Estimates of potential revenues are based on 1957 data contained in the *Annual Report of the Liquor License Division, 1957*. See an earlier section of this chapter for a complete interstate comparison of tax rates on alcoholic beverages.

[42] An implicit assumption in this type of argument is that the incidence of the license fee rests largely with the dealer. Such an assumption is not beyond question. If the total fee is shifted forward, it simply becomes an additional tax on the liquor consumer.

In the case of liquor retailing, however, it is occasionally argued that severe competition often results in intemperance.

Inclusion of Alcoholic Beverages in the Sales Tax Base. Of the 29 license states, 20 have a general sales tax. Of these 20 states, 16 include alcoholic beverages in the sales tax base. The four license states which exempt alcoholic beverages from the sales tax base are Colorado, Florida, North Dakota, and South Dakota.

Estimating the potential revenue if Colorado were to include alcoholic beverages in the sales tax base is somewhat difficult, but it appears that this modification would increase the sales tax collections by $1,550,000 to $1,875,000[43].

[43]Arizona, Maryland, and Rhode Island impose a 2 percent general sales tax and include alcoholic beverages. It can be seen from Table 9.7 that per capita collections in 1956 by these states were $1.04, $.86, and $.97, respectively. Assuming consumption patterns are somewhat comparable in these states and Colorado, potential revenues can be estimated using each of the above per capita rates and the estimated Colorado population for 1959 of 1,801,000, and using Arizona's per capita collection rate, Colorado collections would be $1,873,000. Using Maryland's rate, collections would be $1,548,000, and using Rhode Island's rate, collections would be $1,747,000. Using the average rate for the three states of $.957, Colorado collections would be $1,723,000.
Population estimate for 1959 is from William Peterson, *A Critical Survey of Several Forecasts of the Population of Colorado*, State of Colorado, Department of Natural Resources, July, 1957, p. 31.

Sales Tax at Wholesale Level. A possible procedure would be to levy a sales tax on alcoholic beverages at the wholesale level. Different percentages would be used for different types of beverages. For example, the rate for beer could be 6 percent; for wine, 9 percent; and for spirits, 12 percent. An advantage of such a system would be that it would lessen, to some degree, the regressivity of the liquor tax. While it is difficult to determine the effects of such a procedure, the State could collect additional revenue of between $2 million and $2.5 million. A similar amount of revenue could be collected if a flat rate of approximately 10 percent were used.

Summary. In summary, the above rate changes and inclusion of alcoholic beverages in the sales tax base would yield the following revenues:

Increase light wine rate from $.12 per gallon to $.20 per gallon	$ 25,000
Increase fortified wine rate from $.24 per gallon to $.30 per gallon	55,000
Increase beer rate from $.03 per gallon to $.06 per gallon	625,000
Include alcoholic beverages in sales tax base	1,723,000
Total	$2,428,000

CHAPTER X

HIGHWAY USER TAXES

The United States has the most highly developed network of rural and urban roads in the world, and the number of vehicles, as well as the volume of traffic using these facilities, is constantly increasing. As of 1955 improved highway and street mileage totalled 3,418,214 miles, and there were 62,760,000, motor vehicles which traveled an estimated 603,434,000,000 miles.[1] In contrast to the policy for other transportation media, the responsibility for construction and maintenance of these facilities is borne by government. Needless to say the problem of financing is a tremendous one, and is growing in magnitude each year.

Nature and Development of Highway User Taxes

The principal burden of administering and financing modern highway and road systems has fallen upon the states with substantial assistance from the federal government. State policy has assigned the lion's share of the cost to the owners of motor vehicles through the medium of the so-called special benefit or user taxes. City streets have continued to be primarily a local responsibility financed largely by the property owner.

The special user tax approach involves two major types of levies, namely, motor fuel and vehicle license or registration taxes. These taxes are universally employed by the states and by a limited number of cities. The federal government also taxes motor fuel on a special benefit basis. A third form of tax involving a special or additional burden on certain classes of commercial carriers is now used by twenty-nine states. In addition, there are a number of special charges imposed by the states on vehicle owners or operators. They include operator's and chauffeur's licenses; certificate of title or transfer fees; caravan fees; administrative services charges; tolls; and fines for traffic violations. Municipal parking meter charges constitute another minor, but not insignificant, method of extracting revenue from the vehicle owner.

Registration Tax. Registration of motor vehicles was initiated in 1901 by New York and became universal in 1915 with the adoption of the Louisiana law. While the original purpose of registration was regulatory, that is, to protect the citizenry from the dangers to body and limb caused by the mechanical monsters, and to provide an official record of ownership, revenue potentials were soon recognized and utilized. The development was gradual until the 1920's, but since that time changes in the base and rate as well as increases in the number of vehicles have occasioned rapidly rising yields.

Graduated licenses relating to some physical characteristic of the vehicle such as weight, horsepower or capacity were first introduced in 1913, and the concept of the license charge as a special tax on highway use was directly associated with this action. Some jurisdictions also included value or age factors which reflected the property tax approach, but perhaps also contributed to the tax or revenue function of the license.

Later developments in the use of the registration tax have tended to delineate its function as a member of the special user tax family to one of measuring the impact of different types and weights of vehicles on highway costs. In addition to the "relative damage to the roads" concept this tax is thought to afford a convenient means of assigning certain basic elements of highway cost attributable to the individual vehicle regardless of its special characteristics.

Motor Fuels Tax. Oregon introduced the first gasoline tax in 1919, and in the short period of one decade all of the other states had followed suit. The fuel tax quickly assumed its present role as a measure of highway use or vehicle travel. Technical complications arose as new types of fuel and engines were developed, but most of these problems have been resolved by extensions of the tax base to all forms of fuel used to propel motor vehicles on the highways. There is still a question, however, as to the desirability of differential rates for certain of the special fuels now employed.

Special Carrier Taxes. The third type of special user tax, often termed a third structure levy, which applies to specified types of property and passenger vehicles, is a development of the last three decades. The intent of these levies is to impose an additional burden upon commercial or business carriers who use highway facilities for profit-making activities. In earlier years these taxes were regarded as payments for special benefits received, but they are presently defended as a means of assigning the additional

[1] U. S. Bureau of Public Roads, *Highway Statistics, Summary to 1955*, 1957.

elements of highway costs attributable to such vehicles. Colorado introduced a special ton-mile and passenger-mile tax on common carriers in 1927, and there are now twenty-nine states that employ some form of additional tax on certain broad classes of commercial vehicles. The tax base varies widely including ton and passenger miles, weight or capacity, mileage, gross receipts and flat fees. Variations exist also in respect to the level of rates imposed. Generally speaking, the states which levy substantial third level taxes impose low rate license charges, and vice versa.

Productivity of Highway User Taxes

Highway user taxes are obviously a major element in the tax systems of the states at the present time. They produced over four billion dollars in 1957 or nearly 29 percent of total state tax revenues (Table 10.1). The motor fuels tax, in the aggregate, out-produced the registration and other special taxes by more than a 2 to 1 margin, accounting for 19.5 percent of total state tax revenues as compared to 9.4 percent for the other levies. Since World War II, the relative importance of the former tax has gradually increased. The percentage significance of the user taxes in Colorado, 29.7 percent, is slightly above the 48-state average.

There is marked difference in the relative significance of both types of taxes from state to state. In the case of the motor fuels tax the range in 1957 was from a low of 9.2 percent of total tax revenues in New York to 40.6 percent in Nebraska. The proportion of total revenues derived from the motor fuels tax was below the aggregate average of 19.5 percent in nineteen states and above it in twenty-nine. Twelve of the twenty-nine higher yield states derived more than 25 percent of their total tax revenues from this source. A much greater variation existed in respect to registration and operator's license revenues. Their percentage significance ranged from slightly over 2 percent in Alabama to over 22 percent in New Jersey. Six states, five of which are in the South, obtained less than 5 percent of their tax revenues from this source, while seventeen derived 12 percent or more. Colorado was slightly below the aggregate average of 9.4 percent.

Rationale of Special User Tax Financing

The Theoretical Problem. The special user tax approach to financing highways and roads is generally accepted by the people, and the taxes employed have generally kept pace with the rapidly rising cost of the facilities. These levies, motor fuel, license and special carrier taxes, represent the most significant application of the direct benefit principle of taxation in the nation's tax structure. Quite logically, the bulk of the revenue produced is earmarked for highway purposes.

Table 10.1

State Motor Fuel and Registration Tax and Operator's License Revenues, 1957

State	Motor fuel revenues		Registration tax & operator's license revenue	
	Amount (thousands)	Percent of total taxes	Amount (thousands)	Percent of total taxes
Alabama	$ 63,473	27.63	$ 4,956	2.14

Source: U. S. Bureau of the Census, *Compendium of State Government Finances in 1957.*

The general concept that those who benefit directly from the use of highway and road facilities should bear the primary responsibility for their cost is simple and logical. It also appears to be equitable and desirable. What could be more appropriate than a policy which assesses the costs against those that benefit directly from their use?

While few have questioned the basic assumptions of this policy, it does lose some of its apparent logic in actual application. Further investigation reveals significant theoretical as well as practical limitations. Why single out this governmental function for financing via the direct benefit approach? Why not finance public education in the same manner? Is the ability

to pay standard of apportioning tax burdens invalid as applied to highways and roads?

Assuming that these questions can be answered satisfactorily (if one is committed to the benefit approach), the inherent problem of measuring the benefits must then be resolved. While the immediate and primary benefits of highway and road facilities are said to accrue to the user group, non-users certainly also derive substantial general or indirect benefits from this highly important segment of the nation's transportation system. What is the relative importance of the two types of benefits, and does it vary according to the nature of the facility (interstate, state and county roads)? Another related benefit issue arises in the case of city streets which are not a part of the national or state highway network. In the past another group of "direct beneficiaries," the property owners, have borne the bulk of these costs, usually through the special assessment device. This practice, which may appear to be inconsistent with the user tax policy, involves the obvious question as to whether a different basis of financing is justified and desirable.

Once the proper scope of user or other benefit bases of financing has been determined, the highly significant problem of calculating relative benefits for the various classes of users must be dealt with. This difficulty is avoided, though somewhat arbitrarily in the case of the property owners' liability for street costs, by using a front foot or total value of property measure. In the case of the user group it is generally assumed that benefits are coincidental with the costs occasioned by each class of users, or that costs constitute the only practical general measure of benefits. The final step in the implementation of the special user tax approach, therefore, is the selection of one of more indices of use which will reflect most accurately the cost responsibility of all classes of users.

In seeking a satisfactory answer to the questions and problems involved in the highway user tax field, it should be recognized that such issues are not unique. The solutions adopted must necessarily lean heavily on subjective judgment tempered by a full consideration of practical obstacles. Any other view of the situation is both unrealistic and indefensible.

Is the Special User Tax Approach Justifiable? Three basic propositions constitute the foundation of highway user taxation as presently practiced. First, by asuming responsibility for the construction and maintenance of motor transportation facilities the government has embarked upon a public service undertaking comparable in many ways to the public utility services commonly provided by private enterprise. Cost of service financing, therefore, is assumed to be appropriate and desirable. Second, it is often assumed by students of tax policy that a limited application of the benefit principle is desirable. And, finally, the user taxes are highly productive and meet the other practical requirements of a sound tax.

The suggested parallel between the provision of motor transportation facilities and other transportation or public utility services is certainly valid in some degree. However, the generality and diversity of use factors in the case of motor transportation involve broad economic and social implications that differ both in nature and degree. The fact that government has undertaken responsibility for providing these facilities tends to broaden and extend the use pattern as well as the scope and incidence of benefits. Given this development a strict cost of service approach to financing becomes inappropriate unless one is prepared to deny use to those who can not pay their share of the cost and to disregard general benefits not directly related to use. Neither of these courses is acceptable from a policy standpoint. The level of user charges should be tempered by a concern for their social impact, and the significance of general or indirect benefits logically must be considered in formulating the revenue program. In the case of commercial users the fact that other private modes of transportation have received substantial governmental subsidies should also be recognized.

While strict private utility financing is obviously unsound as applied to the highway and road function, the user approach is believed to have merit within the broad limits suggested. The service being performed is different than public education, for example. In the latter case the broad social objectives and the generality of the benefits sought are paramount. Cost financing, even if limited in its scope, would tend to nullify or defeat these ends.

The general idea that the benefit principle of financing governmental services should be given some place in the nation's tax structure is supported on several grounds. Popular versions suggest that "everybody benefits—everybody should pay," or "those who benefit should pay." Benefit taxes are also recommended as a balancing factor to offset allegedly extreme applications of the ability to pay principle embodied in the steeply progressive federal personal net income taxes. In general, these concepts do not strengthen or detract from the case for special highway user tax financing. The everybody benefits—everybody pays idea is not consistent with the second or direct benefit approach which is reflected in highway user taxation. Judgments as to the proper role of direct benefit financing logically must be based upon the nature and objectives of the particular function, as well as the impact of the taxes involved upon the tax structure as a

whole and the distribution of burdens thereunder. Insofar as the latter situation is concerned, it should be recognized that existing tax policies involve many levies which are defended on grounds of benefit or certainly are not in accord with the ability to pay principle. The best evidence available also indicates that the total tax burden now involves an element of regressive effect comparing the very low and medium income groups. The bias to be overcome for these groups, therefore, is a regressive not a progressive one.

Broadly speaking, the practical aspects of highway user taxation are very favorable. Both the fuel and registration taxes are, as previously noted, highly productive. Effective administration has generally been attained, and the costs are not excessive. The time and method of payment is convenient, and taxpayer psychology is generally good. Special taxes on commercial carriers, depending largely on the tax base, may present certain problems. Weight-distance levies, which are probably best suited to the purposes of this form of taxation, are not easy to administer, the compliance problem is complex, and there is strong opposition by the carrier group. At the same time, effective enforcement is feasible and results in substantial yields.

In conclusion, the special motor vehicle owner tax approach to highway financing is believed to be sound within the limits suggested. Tax burdens should not be so heavy as to seriously penalize or restrict the use of groups whose ability to pay is limited. Also, non-users who derive substantial general benefits or other types of special benefit, should contribute a reasonable proporation of the costs through other forms of taxation.

Responsibility for Highway, Road and Street Costs. Determination of the proper share of the cost of highway, road and street costs to be borne by the user and non-user groups is obviously a highly complex problem. While various theoretical proposals have been advanced, they are either unrealistic or fall short of providing the precise guides needed for policy decisions. Current practice, which assigns somewhat more than half the costs to motor vehicle owners, appears to be largely fortuitous. Certainly, there is no consensus of opinion concerning a given ratio or even range of responsibility.

The difficulties inherent in the problem do not merit an attitude of complacency or indifference. As a point of departure, it is generally recognized that the provision of good highways and roads and comparable facilities in urban areas are integral parts of the over-all problem. So-called farm-to-market roads serve as feeders to state and national highways in the same sense that streets in residential areas channel traffic into arterials, throughways or freeways. Broad decisions concerning financing, therefore, should be predicated upon the total cost of all facilities.

Three of the proposals for allocating costs between motor vehicle owners and other groups merit attention, namely, the "added expenditure," "differential benefit," and "predominant use" concepts.

Added Expenditure Concept. The added expenditure notion suggests that all costs incurred as a consequence of the advent and growth of motor vehicle travel be assigned to this user group. Considering the fact that other uses have virtually disappeared, this proposal sponsored by the railroads would throw the great bulk of the burden on the vehicle owner group. It also conveniently disregards the substantial governmental subsidies extended to other forms of transportation.

Differential Benefit. The differential benefits idea proposes that costs be allocated in accordance with the ratio of special benefits to motor vehicle owners, which have arisen since the inception of motor vehicle travel, to general benefits not associated with such travel. It arrives at approximately the same result as the added expenditure approach, and is equally unacceptable. In each case, the basis of the calculation is a situation that existed over 50 years ago. However, the obvious misconception involved is the idea that highways and streets have significant values which are not a function of use by motor vehicles. Aside from occasional use by pedestrians, bicycles and other foot-propelled devices, which do not require this type of facility, all benefits derive from actual or potenial use.

Predominant Use. The predominant use concept distinguishes two primary purposes of road and street facilities: (1) access to property or local service to residents, and (2) motor vehicle transportation. Once again both purposes are served by use, and the use is predominantly by motor vehicles. While this proposal does not provide a measure of the relative importance of the two uses, it does suggest that the basis of allocating costs among users should be related to the principal use involved for each facility.

Conclusion. The proposals for cost allocation considered do not resolve the problem of determining relative benefits and assigning costs between the direct users who own and operate motor vehicles and those who derive general or indirect benefits from such use. These groups, it should now be apparent, are not separable, but over-lapping in character as motor vehicle owners are recipients of both types of benefit. In view of this situation and

the widespread incidence of motor vehicle ownership there is a logical basis for assigning well over half the costs to the direct use beneficiaries. The essential limitation upon this approach, as previously indicated, is to avoid a level of taxation upon certain groups of motor vehicle owners which will substantially curtail their use. Further studies of the economic impact of the taxes employed are needed to ascertain what this suggested maximum is. Assuming that a reasonable ratio can be established, the next step is to formulate specific techniques for assigning the pre-determined cost responsibilities to the general beneficiaries and the motor vehicle owners.

How Should General or Indirect Benefit Costs Be Apportioned? Considering the broad incidence of the general benefits from highway and street facilities, a broadly-based revenue source is logically required. The property, sales or net income taxes or perhaps a combination of two or more of them are the obvious alternatives. Property has borne the brunt of city street and often rural road financing. In the case of streets, particularly those in residential areas, the special assessment device is commonly employed, and for the rural roads not in the state or national networks a mill levy on property is typical. The charge against property for such purposes, whether special or general, is justified on the basis of the special benefit enjoyed. The benefits are generally identified as providing convenient access to the owner's property, and thereby increasing its value. Thus, the special assessment or the property tax becomes a means of measuring another form of special benefit, rather than general benefits which accrue to all.

Both of the other major tax forms—sales and net income—have similar limitations as instruments for apportioning costs based upon general benefits. The general or retail sales tax is directed at consumer expenditure, and, though everyone pays, the amount paid is not a complete reflection of benefits. Net income taxes are highly selective, and are intended to measure ability not benefits. It follows, therefore, that none of the general taxes presently in use provide a realistic and comprehensive measure of general benefits. More significantly, even if such a tax could be developed it would undoubtedly be in serious conflict with the ability to pay principle.

Considering the additional fact that the special taxes on motor vehicles are not related to ability, one may reasonably conclude that the remaining element of costs should be met by taxes which have an ability emphasis or at least are not inconsistent therewith. Within limits the property tax serves the desired objective. Property ownership gives some evidence of taxpaying ability. At the same time, the owners derive substantial benefits from highway and street facilities. However, there is an obvious limitation upon the tax load which may be equitably imposed on property. No tax should be pushed to the point that it confiscates capital or the income therefrom. In attempting to avoid such effects net income taxes are the logical and most acceptable source.

Allocating User Costs Among Various Classes of Vehicles. The proper allocation of the highway and street costs assigned to motor vehicle owners among the various types of vehicles is a crucial and certainly the most troublesome problem in this field of taxation. The broad factors which should be considered in assigning costs are generally known and accepted by students of highway financing problems. They are: the requirement of adequate facilities to accommodate a given number of individual vehicles; the extent of the use factor; and special elements of wear and tear on the facilities associated with the total weight of the vehicle (vehicle and load) and its distribution (by axles or tire surface). In other words, there is the "readiness to serve" factor, a function of the number of vehicles; relative use, as reflected in miles traveled; and relative damage, which is attributable primarily to aggregate weight and its distribution. While these elements of the cost problem suggest a basis of differentiating costs, they do not provide the specific measures for determining actual allocations by vehicle groups. It may be suggested that the attempt to distinguish separable cost factors is superficial in that they are all inter-related. While the relationship is self-evident, the breakdown permits greater selection or refinement in the choice of tax bases. Also, the results of this approach are not subject to criticism if the combined impact of the taxes employed is in conformity with reasonable standards of individual and group taxpaying capacity.

Readiness to Serve. The accommodation or readiness to serve aspect of cost, as previously indicated, may logically be attributed to the existence of the vehicle. The fact that there are a specified number of vehicles to be accomodated is the primary determinant. Costs of right of way and certain basic elements of planning and engineering, traffic safety and administrative expense are illustrative of this element. The width requirement on highways and streets is also largely controlled by the number and size of vehicles to be accommodated.

The extent of these costs cannot be precisely determined. However, the incremental cost plan of apportioning the burden among vehicle groups does provide a feasible method of assignment, and will be considered in later analyses of specific measures. In general, the type of cost under consideration seems to merit a uniform

charge on each type of vehicle. Differences in the size of vehicles logically would affect such costs, and might be reflected in a heavier charge for large trucks and buses. In any case, the registration or license tax is an appropriate means of recovering these costs. The level of rates or the relative emphasis to be placed on this element of cost can only be determined by subjective judgment. It is generally agreed, however, that these costs, and consequently the revenue to be collected, are secondary to the relative use and weight elements.

Relative Use. Use of highway and street facilities is commonly thought to be the major factor influencing costs, although vehicle weight and weight distribution are the principal factors differentiating the costs occasioned through use by the various types of vehicles. Fuel consumption is highly regarded as a measure of relative use. Although there are significant variations in mileage per-gallon-of-fuel for vehicles of the same class and as between classes of vehicle, these differences are usually not reflected in fuel tax policy. In addition to the administrative problems inherent in a complex differential rate structure, the uniform tax per gallon generally results in a higher tax per mile on the heavy vehicles. The bias of the tax, therefore, is in the right direction. Special fuels and types of engine, diesel in particular, present a different problem as mileage per gallon varies substantially for vehicles of the same weight depending upon whether they use regular or special fuels and are powered by combustion or diesel-type engines. Scientific data indicate a substantial miles-per-gallon advantage on special types of fuel used in private passenger cars, and savings of from 30 percent to 70 percent for commercial vehicles equipped with diesel engines.[2]

Considering the limited use of special fuels other than diesel, it may be expedient to disregard this element of discrimination. In the case of diesel fuel, however, the degree of variance as well as the importance of the use appear to justify a differential rate — a matter considered in the subsequent analysis of motor fuel taxes.

Damage Factor: Weight and Its Distribution. The relative damage factor, which is commonly thought to be a peculiar function of weight and weight distribution, presents the most difficult and certainly the most controversial problem of cost analysis and apportionment. As a practical matter, the specific problem is one of determining a reasonable base or bases for assigning the additional costs occasioned by weight and its distribution. Vehicle ownership and use are taxed directly under the registration and fuels taxes. It must be recognized, however, that costs caused by weight and its distribution are also a direct outgrowth of use.

Three specific approaches to this cost problem are currently being used or are under consideration. They are, (1) the graduated weight measure, either in aggregate or by axle; (2) the weight and distance or ton-mile basis; and (3) the incremental cost method. Other bases of taxation are being used in the case of commercial carriers including gross receipts and flat fees, but they are obviously not intended to measure relative damage. It should be emphasized at the outset that any one of the three approaches to distributing the costs involved would produce equitable results if the full facts concerning the contribution of the different vehicle groups to costs were known. These data, unfortunately, can only be obtained through a series of long range, controlled use studies made under varying physical conditions. The relatively few pilot investigations that have been conducted serve to confirm the general proposition, which is self-evident, that heavy truck and bus traffic requires higher cost facilities and substantially increases maintenance expense. In view of the deficiency in basic data the approach adopted will inevitably involve a large measure of subjective judgment, and will therefore, be subject to criticism on more or less logical grounds.

Major Allocation Problem: Costs Attributable to Weight and Weight Distribution. An analysis of the three approaches, within the broad limitation noted, logically should be directed to the primary elements of strength and weakness, both theoretical and practical, of each method. Of course, such an evaluation presumes the existence of certain criteria which are either generally accepted or stand the test of reasonableness. While these criteria may be stated in various ways, the following points are believed to be crucial:

(1) Does the approach or measure adequately reflect the differential elements of cost, namely, weight, weight distribution and use?

(2) Does it provide a specific base or bases for determining the actual tax burdens of different vehicle groups?

(3) Can the taxes involved be administered effectively and at reasonable cost?

(4) Are there undesirable effects in actual application which could be avoided by one of the other methods?

Graduated Weight Basis. The graduated weight measure will be considered first in view of its relative simplicity and the fact that it is most widely used. It involves a classification of vehicles by weight categories. The basis of

[2]See Report of Highway Planning Committee, *Colorado's Highway Needs and Highway Financing*, October, 1950, III, pp. 18-23, and motor fuel tax analysis.

classification should be and usually is gross weight, which may be defined as empty weight plus an average load or empty weight plus an assumed maximum load. Further refinement is achieved by relating the total weight to the number of axles thus reflecting the distribution factor. The number of weight classes to be employed is a matter of judgment, and should be based upon engineering data or opinion as to meaningful differences in terms of cost.

The graduated weight method as defined above affords a convenient and understandable approach to the weight and weight distribution aspects of cost. The measure involved is specific and is adaptable to a differential taxing policy. It is also comparatively easy to administer, and both collection and compliance costs are minimized in relation to the other alternatives.

On the other hand, this method involves an average or hypothetical measure of vehicle loads. In other words, it does not reflect actual loads carried. More significantly, it disregards actual use, and the weight factors apart from use are rather unmeaningful. Of course, this deficiency may not be too important in the case of large commercial carrier operations where vehicle use approaches a maximum. The degree of discrimination against certain small or irregular operations and other types of carriers, however, it is likely to be very great. This type of inequity, it should be noted, is merely reversed by extending lower rates to particular classes of carrier, such as all contract or all private.

Another fundamental weakness of the graduated weight method is that it does not provide a measure of the actual differential tax burden to be imposed upon vehicles in the various weight classifications. Thus, this basic aspect of policy formulation is dependent at best upon admittedly incomplete data as to relative damage. Even though the most informed engineering opinion is consulted, the result is likely to be very conservative in terms of the share of costs assigned to the heavy commercial vehicles.

Weight Distance or Ton-Mile Basis. The weight-distance or ton-mile concepts reflect an obvious extension of the graduated weight basis. In short, they combine the basic weight and use factors. While the two ideas vary in specific application their basic purpose is identical. The weight-distance standard logically would seem to include the ton-mile basis. However, as actually employed in Oregon and several other states, it involves two independent measures of tax liability: (1) the gross vehicle weight or axle weight category which is based on an assumed average or maximum, and (2) the number of miles traveled. Rates per mile are then graduated according to the ascending weight classes. In the case of the ton-mile method the measure is a composite of the actual gross weight and of the vehicle and load mileage traveled, namely, the carriage of one ton a distance of one mile. The principal difference in the nature of the two concepts, therefore, is that actual rather than assumed weight is the basis of the ton-mile calculation.

Both the weight-distance and ton-mile approaches are preferable to the graduated weight method as measures of cost. The motor fuels tax does little more than provide a general index of use without regard to the differential aspects of costs resulting from use by the heavy classes of vehicles. Inclusion of an additional use factor, therefore, is highly desirable. The average weight of load assumption involved in the weight-distance method is clearly inferior to the actual load carried basis and will inevitably produce certain inequities. However, it avoids the problem of keeping and verifying individual haul records by vehicle in the case of trucks and buses, which are necessary under the ton-mile plan. Minor variations in load by private passenger cars and small trucks or busses may, of course, be disregarded, This requirement of the ton-mile approach is its principal advantage and at the same time its most serious limitation.

Obtaining and checking mileage data also presents a difficult problem in the instance of certain types of vehicle and operations. In particular, it is infeasible for private passenger cars; it is almost impossible for small irregular private or contract carriers; and it requires special enforcement procedues for regular intrastate and interstate operators. From a practical standpoint the fuel tax provides an adequate measure of use for passenger cars and other small vehicles. Also, in relating over-all burdens by vehicle group, an average mileage may be assumed. Typical weight and mileage assumptions also may be made for the types of private and contract carriers noted. Exemption is a possible but obviously inequitable alternative. Ports of entry and regular checking by the highway patrol are essential to cope with interstate vehicles, and field inspection is required for all regular route operations.

The weight-distance and ton-mile approaches, particularly the latter, do provide feasible methods of differentiating costs attributable to the various classes of vehicles. They also afford specific bases for the imposition of differential tax burdens. However, there is nothing magical about the ton-mile approach. The greater damage to highways resulting from use by heavy vehicles may or may not be in proportion to ton-miles. It must be recognized that this basis of vehicle taxation like the others considered is founded upon an assumed relationship; it can neither be established nor disproved with the information presently available.

Incremental Cost Approach. The incremental cost method of allocating user costs, has received considerable support on theoretical grounds, and has recently been the subject of special studies in several states.[3] In general, the incremental cost approach starts with the presumption that costs are segregable in terms of number of vehicles, vehicle travel, traffic volume and weight use elements. All costs are assignable on the basis of the particular type of facility and the relative use by different classes of vehicles. This feature is distinctive and is thought to be more realistic than the ton-mile approach which is not concerned with the specific type of facility. The primary attribute of this method, however, is the way in which construction costs occasioned by weight are calculated. As a first step the cost of a "basic road" to accomodate a typical low weight vehicle, passenger cars and light trucks for example, is determined. Secondly, the additional costs required to construct roads that will handle the traffic of the successive classes of heavier vehicles are then estimated in accord with the best engineering and cost data available. Each vehicle class beyond the first or basic category is then assigned its special element of cost plus a proportionate share of the cost for preceding classes. This approach, it should be noted, does not cover maintenance or other non-capital outlays. They still must be apportioned on other bases.

Once the incremental cost relationships have been established by weight groups for different types of facilities, the actual costs are calculated for each weight group according to a uniform measure. The measure selected in two of the most recent studies was axle miles.

The incremental cost method, as previously noted, has received broad support on theoretical grounds. It undoubtedly would have been more widely used except for the lack of essential data and the complexities of the computational and cost assignment problems. A realistic appraisal of its merit is equally difficult. The alleged theoretical desirability of the approach hinges upon the fact that it employs a cost accounting technique and actual travel data as a basis of cost allocations. Thus, it appears that the scientific method has been substituted for guesswork. While appearances are not wholly deceptive in this instance, it is axiomatic that the results of any problem-solving technique are no better than the basic asumptions which underlie it. If the incremental cost method is to produce more equitable results, the judgments made must be more realistic and this, in turn, requires improved techniques and/or more adequate data. Does the incremental cost approach meet these tests?

The two key questions to be resolved as previously indicated are: (1) the relative proportion of total user costs to be assigned on a per vehicle basis, a use or traffic volume basis and a weight and weight distribution basis; and (2) the specific allocation of weight costs by vehicle groups. The incremental cost method does not contribute directly to a solution of the first question. While travel data for different classes of vehicles are made available, the relative importance of the true basic cost elements still has to be estimated. Needless to say the decision at this point is crucial, and there is no reason to suggest that it will be materially affected by use of the incremental cost approach.

The incremental technique of apportioning weight costs appears to be logical and equitable. However, it too is dependent upon certain basic assumptions. The "basic road" concept for an assumed category of "basic vehicles" is hypothetical not actual. Why should the basic vehicle for which this hypothetical road is designed be required to contribute on a weight basis? Perhaps they are already paying their share on a per vehicle and use basis. More significantly, how are the limits and number of different weight groups to be determined? Adequate facts are not available to ascertain the relative damage to existing highways occasioned by the different classes of vehicles. Are they available to determine differential costs of construction for vehicles in ascending weight classifications? Finally, in view of the fact that existing highways and roads are built to varying standards and specifications, is there any reasonable relationship between the actual ratio of wear and tear by these groups of vehicles on the highway facilities presently available and the differential cost of construction ratio for the theoretical highways employed in the incremental cost analysis?

The foregoing questions should serve to illustrate the dependence of this aproach upon judgements that are largely if not entirely subjective in character. At the same time, the method represents a noble attempt to apply scientific techniques to the problem. It calls for the utilization of the best data and brains available, and thereby creates a favorable climate for advances in knowledge. However, unless its limitations are recognized and each step in the analysis is subject to searching scrutiny, the results may be just as arbitrary as those of alternative approaches.

Ross, *Financing Highway Improvements in Louisiana*, Division of Research, College of Commerce, Louisiana State University, 1955; *An Incremental Cost Analysis Based Upon the 10 Year A. S. F. Proposed Highway Program*, Public Administration Service (Chicago, 1954); and D. F. Pancoast, *Allocation of Highway Costs in Ohio by the Incremental Method*, Ohio Department of Highways, 1953.

Conclusions Concerning Cost Allocation Bases. Summarizing the discussion of the cost problem and the principal approaches thereto, the following conclusions are inescapable. None of the methods considered provide answers that are sound and equitable per se. This result is inevitable until the full facts concerning cost responsibility become available through controlled use research. In other words, there are no short-cuts or panaceas. Meanwhile, the weight-distance (axle and ton-mile) or the incremental cost methods are defensible, but arbitrary or inequitable effects in either case cannot be wholly avoided. Informed judgment as well as broad policy considerations external to the particular approach may dictate modifications in both cases. Certain of the general policy guides merit special emphasis at this point. The total tax burden assigned to different vehicle groups should be determined and subject to review in terms of avoiding tax loads that will seriously penalize or curtail use by any class of user. The economic impact of user taxes on the owners of private passenger cars and on the competitive position of the motor transportation industry are the specific elements of concern. Another factor merits attention wholly on grounds of expediency. Few if any states, regardless of equity or logic, can afford to impose taxes on any significant group of users that are revolutionary in terms of average national or regional burdens.

History of the Special User Taxes In Colorado

Colorado's development of highway user taxation reflects a high degree of pioneering effort and effective leadership in nearly every action initiated and policy formulated with respect to this important source of revenue.

Motor Fuels Tax. Colorado enacted in April, 1919, a 1¢ per gallon tax on gasoline, kerosene and other fluid substances derived from petroleum when used for power purposes in propelling motor vehicles[4] (distillate, crude oil and other residual or unrefined products were specifically exempt). This action followed that of Oregon by only a few weeks, and the statute was one of the four adopted in this year.

Requirements of a rapidly expanding highway system and the general productivity and popularity of the tax led to three successive rate increases in the 1920's (2¢ in 1923, 3¢ in 1927 and 4¢ in 1929).[5] The definition of taxable fuel was also frequently revised to take account of new developments in basic as well as compounded or blended products. There was agitation for further increases in the early 1930's, but, except for a temporary (6 months) 1¢ rise for relief purposes in 1934, the 4¢ a gallon rate was maintained until 1947. In 1943, however, new measures were adopted which applied the regular rates to so-called "special fuels" including diesel and liquefied petroleum gases.[6] This action, it may be noted, preceded the rapid growth in the use of such fuels during the next decade.

The highways of the nation including those in Colorado were in a sad condition at the end of World War II. To meet these needs and to match higher federal aid grants, the fuel tax rate was raised to its present level of 6¢ in March, 1947. The increase was to have expired on June 30, 1953, but the legislature passed a revised statute including the higher rate in that year.[7] This act constitutes the present basis of fuel taxation.

Registration Tax. Colorado inaugurated the registration of motor vehicles in 1913.[8] The law provided that each vehicle must be licensed annually and required payment of fees ranging from $2 for motorcycles to $10 for vehicles with horsepower ratings above 41. In 1919 the base was changed and trucks were separately classified.[9] All vehicles except trucks were taxed on the general basis of ½ of 1 percent of the original cost price. The minimum fee was fixed at $5 and value reductions of 30 and 20 percent were permitted for five-year old and eight-year old vehicles, respectively. The principle of rate graduation based upon carrying capacity was applied to trucks and trailers. Fees ranged from $10 for a one-ton truck to $50 for a 5-ton; and $25 for each additional ton over 5. Trailers of 1- to 2-tons were taxed at $10 and $5 for each additional ton.

The Motor Vehicle Department was established in 1931, and significant changes were made in the license taxes for all vehicles except trucks.[10] The basis of licensing private passenger cars was changed to manufacturer's shipping or net weight. Tractors not used exclusively for farming were subject to a rate based upon carrying capacity. Finally, a minimum fee of $10 plus $1 for each seat over 9 was imposed on regular buses, and a similar but lower rate on school buses. In 1933 the legislature enacted for relief purposes special fees based upon the value of vehicles. However,

these fees were invalidated by the courts. House trailers and coaches were licensed in 1947 on the basis of carrying capacity, but at nominal rates.[11]

The next important steps in the development of the registration or licensing structure were taken in 1955 following the report of the Highway Planning Committee.[12] This agency, established by executive order in 1949, undertook a comprehensive study of the State's highway and road problems including existing and long-range needs, the financing problem and the division of responsibility for highway facilities between the state and local units. The final report recommended the ton-mile and passenger-mile bases of taxing inter-city trucks and buses, supplemented by nominal license fees. These proposals with minor changes were adopted by the legislature, and constitute the present taxing system.

Special Motor Carrier Taxes. Colorado was also one of the first states to impose special or additional taxes on certain types of commercial carriers. Motor vehicles hauling passengers or freight for hire in competition with the railroads were brought under public utility regulation in 1915[13] and special taxes on common carriers were inaugurated in 1927.[14] In addition to the regular registration fees, trucks were charged 5 mills per mile on each ton of freight carried and buses one mill per mile on each revenue passenger. Other trucks and trailers including contract and private were also subjected to higher taxes, but this legislation was repealed two years later and the taxes collected were refunded. The intent of the legislature to put a special tax on the commercial vehicles as compensation for use of the public highways was clearly defined.

Further legislation aimed at so-called "private carriers" was adopted in 1931.[15] Private carriers (other than common) were grouped in two classes: A—those operating over established routes or between fixed termini, and B—those not operating as in A and including carriage of own property to consignees for compensation. Class A were taxed on the same basis as common. Class B "permit taxes" were imposed upon carrying capacity: $50 for vehicles of 1-ton or under, and $25 per ton for each additional ton. Farm vehicles and school buses were excluded.

Rates of taxation on property-carrying vehicles were reduced twice during the depression period but the bus tax remained unchanged. In 1935 the 5 mill tax was cut to 3 mills[16] and in 1937 it was lowered to 2 mills.[17] Carriers transporting their own property to consignees were excluded from the operation of the Private Carrier Act in 1935, and special rules concerning vehicles carrying owned or leased property sold or to be sold in furtherance of a private commercial enterprise were embodied in the Commercial Carrier Act of that year.[18] The general revision of 1955, previously noted, provides the framework of the present system.

Taxation of Motor Fuels In Colorado

Specific Purposes of Motor Fuels Tax. The taxation of the fuel used to propel motor vehicles on the highways or streets in Colorado actually involves two levies. The first applies to regular fuel, primarily gasoline, and the second, to special fuels including those used in diesel-powered vehicles and liquefied petroleum gases when used in motor vehicles. The broad role of the fuels tax in the special benefit or user tax system is to measure the relative use of motor transportation facilities provided at public expense. Extent of use is thought to be a major determinant of benefits and also costs.

While these broad generalizations concerning the purposes of fuels taxation have not been seriously questioned it is quite evident that they leave much to be desired as practical guides to policy formulation. Gallons of fuel consumed do not provide a wholly accurate measure of miles traveled by vehicles of the same type, and as between classes of vehicles the differentials are extreme. The variations in mileage per gallon of fuel for private passenger cars are considerable, but the great majority of such vehicles would probably fall within a 12 to 20 miles range. In the case of trucks and other heavy vehicles miles per gallon decline significantly as weight increases. In a given weight class for large trucks and buses diesel fuel generally is more effective than gasoline. The actual studies undertaken naturally involve some difference in specific results due to the varying conditions involved. However, the following

data taken from the recent North Dakota incremental cost analysis are illustrative.[19]

Type of Vehicle	Fuel	Gross Weight (pounds)	Miles per gallon	Gallons per ton mile
Passenger Car	Gasoline	3,000	16.6	.0323
Truck	Gasoline	8,000	13.8	.0284
Truck	Gasoline	24,000	7.2	.0176
Truck	Gasoline	60,000	3.7	.0111
Truck	Diesel	60,000	5.5	.0074

The basic policy question raised by such evidence is whether a uniform rate policy for all types of users and different types of fuel is justifiable. The fact that fuel consumption is greater for the heavier vehicles is often said to be appropriate in view of the greater damage to the roads caused by such vehicles. However, recognition of this general relationship does not resolve the problem of equity involved. If the fuels tax is to be used as a basis of distributing costs attributable to weight as well as use, it obviously should be related to some reasonable over-all measure of such costs. Also, the aggregate tax burden of each class of vehicle should be related to its total cost responsibility. As previously indicated, the ton-mile and incremental cost approaches are commonly thought to be the most acceptable methods of cost allocation. While the uniform rate fuels tax does involve a substantial differential burden based upon weight, fuel consumption and consequently the tax burden does not increase in relation to ton miles. Similar though somewhat lesser disparities are evident under the incremental cost measure of responsibility. The estimated distribution of the fuels tax burden by classes of vehicles is shown in a later section of this chapter. In view of the obvious inadequacies of the fuels tax as a basis of allocating highly complex weight cost elements it would be ridiculous to attempt to employ the tax for this purpose. At the same time, it is obviously unfair to disregard the differential burden of the tax in terms of weight.

The differential impact of the uniform rate tax in terms of the type of fuel used is another matter. Diesel-propelled vehicles, as well as those using certain other special fuels, presently enjoy a substantial tax advantage both in relation to use and weight. The extent of the advantage according to the best data available averages around 50 percent and there is no justification for continuing such a discrimination.[20]

With the qualifications indicated the motor fuels taxes provide a highly effective and acceptable instrument for enforcing a major portion of the highway users' tax responsibilities. Receipts have grown rapidly and are highly stable in terms of the effect of changes in the level of economic activity. This form of taxation is also relatively easy to administer, with the exception of the special fuels levy. The problem in the case of special fuels, particularly liquefied petroleum gases, is attributable to the fact that motor vehicle use is an infrequent and relatively unimportant element of total consumption. Finally, public psychology has been surprisingly favorable to the fuels taxes in spite of the rising burden involved.

The economic impact of the fuels taxes upon various income groups is an often neglected but important aspect of policy formulation. While these and other effects are relevant to the general question of justification they are considered in a later section of the chapter.

The Tax Base. The definition of taxable fuels under the Colorado statute distinguishes two categories of fuel, namely, so-called "motor fuel" and special fuels. The former, motor fuel,

> . . . means and includes gasoline, casing-head or natural gasolines, benzol, benzene and naptha and any liquid prepared, advertised, offered for sale, sold for use or used, or usable in internal combustion engines for the generation of power. It does not include kerosene oil or kerosene distillate, except when advertised, offered for sale, sold for use, or used, alone or blended or compounded with other products, for the generation of power in internal combustion engines for the propulsion of motor vehicles upon the public highways.[21]

Thus, the first types of fuel noted, gasoline, etc., are included without reference to use in motor vehicles, and the second, kerosene and kerosene distillate, only when used in motor vehicles on the highways. In general, the legal description of motor fuel is all inclusive and nontechnical in character.

Special fuels including diesel and liquefied petroleum gases, however, are not taxable under the above definition. They are presently taxed under special provisions as follows:

> An excise tax of six cents (6¢) a gallon is hereby imposed on *any liquid* used as a fuel in a diesel-powered vehicle within the State of Colorado, and . . . all liquefied petroleum gases used in a motor vehicle within the State of Colorado, except when such fuels are used in the operation of farm vehicles on farms or ranches.[22]

Exemptions, Credits and Refundable Uses. While the definitions of motor and special fuels are very broad, the typical exclusions involving

[19] North Dakota Cost Allocation Study, *op. cit.*, p. 70.

[20] See Highway Planning Committee, *op. cit.*, pp. III-18 to III-23.

[21] *Colorado Revised Statutes, 1953*, Ch. 138-3-1.

[22] *Ibid.*, Ch. 138-3-2-(3).

governmental and non-highway uses and credits for special purposes are provided. In addition to the exceptions noted in the general definition, there are two exemptions involving federal and state use which are handled by exemption certificates and permits. Sales to the U. S. Government and its agencies in single deliveries exceeding 300 gallons are subject to the exemption procedure. Payment of tax is technically required on sales in lesser amount but the tax is refundable. These sales are non-taxable by virtue of federal constitutional principles. Use of fuel for State purposes in State-owned vehicles is exempt by regulation under a statutory provision relating to use by state and local subdivisions.

Other excepted uses require payment of the tax, but are subject to refund or credit under stipulated procedures.[23] These uses include virtually all non-highway purposes as follows: stationary gas engines; motor vehicles operating on fixed rails or not operating on highways; farm vehicles, implements and machinery when used for agricultural purposes on farms or ranches; motor boats; airplanes and aircraft; cleaning and dyeing; and other commercial uses not involving use of the highways. Taxes are also refundable on use by towns, cities, counties or other local governmental units in vehicles owned and operated by such units.

Refund claims for the above uses are subject to the specific limitations that they must involve 20 gallons or more, the fuel must be used before filing of the claim and the claim must be filed within 6 months after the fuel is used. Special provision is made for refunding or crediting of tax in the case of lots of fuel of 500 gallons or more which is lost or destroyed while in the hands of a distributor. Finally, there is an allowance of 2 percent of the motor fuel received to the distributor to cover losses in transit and unloading and the costs of collecting and paying the tax. The distributor, however, must give one-half of this allowance to the retailer.

Use of Fuel Not Taxed to Distributor. A use tax is imposed on motor fuel, except diesel fuel, used in the State for propelling motor vehicles on the streets or highways or imported into the State for use or sale in cases where a licensed distributor has not paid and is not liable for payment of the tax.[24] Amounts of fuel in excess of 20 gallons brought into the State in the fuel tank of a motor vehicle are also subject to the use levy. As diesel and other special fuels are taxed to the user they are not covered by the use tax provisions.

[23] *Ibid.*, Ch. 138-3-3.

[24] *Colorado Revised Statutes, 1953*, Ch. 138-3-2-(2).

Comparison of Tax Base in Colorado and Other States. Colorado's practice of granting full exemption or refund rights for non-highway uses of fuel is in conformity with the special user principle of taxation, and reflects the practice of the large majority of states and the federal government. Exemption of governmental uses including federal, state and local units is also the general rule.

In spite of the theoretical considerations involved and the weight of state practice there has been a definite trend during the last two decades to limit or deny the exemption or refund privilege on non-highway uses of motor fuel.[25] The encroachment varies from full taxation to various specific limitations.[26] Three states, including Utah and Wyoming, have abandoned the exclusion of non-highway uses entirely and *eleven* other jurisdictions have restricted the exemption or refund status of particular non-highway uses. In most of these jurisdictions, also, something less than the full tax is refunded on the favored uses. The non-highway uses most frequently subject to partial or full taxation are aviation and other non-agricultural. A number of states do not exempt use of motor fuel by their local subdivisions, but this is not a new development. Colorado changed its policy to include all local use in 1953. Prior to 1953 the exemption was limited to publicly owned vehicles used in the construction, repair and maintenance of streets and highways.

Extension of the tax base by including either partially or wholly non-highway uses of motor fuel is defended as a practical expedient. It substantially increases tax yields, and at the same time eliminates the serious administrative problem of checking and controlling tax refunds. It is also suggested that the refundable uses are relatively inconsequential; that the costs of preventing evasion are virtually prohibitive; and that the special user tax approach involves many imperfections in addition to the fact that it falls far short of meeting the total costs of highways and streets. It should be noted that the State Highway Planning Committee's Report of 1950 supported the existing policy of exemption.

The merit of the exemption versus taxation question logically must be evaluated in terms of the broad criteria or purposes of the special user tax system. Certainly the present level of fuels and other taxes on the user groups could not be justified on other grounds. An expediency solution to special issues or problems arising in

[25] Special fuels are not involved as the taxable use in the exceptional situation.

[26] Federation of Tax Administrators, *State Gasoline Tax Refunds Amounts and Procedures*, Research Report, No. 40, 1955.

the application of any generally accepted form of tax also leads inevitably to a negation of the basic goals or objectives of the tax. Within this broad frame of reference the policy of taxing non-highway uses of motor fuel is believed to be inacceptable. Furthermore, the practicality of effective control of the refund problem has been demonstrated. While substantial outlays are required, the total costs of fuel tax enforcement are still relatively low.

The argument that non-highway uses are relatively inconsequential and, therefore, the impact of the tax upon such users may be disregarded obviously involves a questionable basis of judgment. Quantitatively, the uses in question average around 12 percent of total consumption which is hardly insignificant.[27] The inequity occasioned by a policy of taxation however, is the major concern. Surely, the extension of the base of this special users' tax to uses which are wholly inconsistent with the purposes of the tax cannot be passed over as being unimportant. Furthermore, while it is impossible to achieve perfection in the structure and application of any tax, the objective of sound public policy is to eliminate or reduce elements of inequity, not to introduce new ones.

Legal Impact of Fuels Tax. The distributor who first receives "motor fuel" in the State after it has left the refinery or other point of origin is liable for payment of the tax on such fuel. If the distributor is also the refiner, the latter is primarily liable. The amount of fuel taxable is determined by the invoice covering the transaction subject to the allowance of 2 percent for losses in handling and costs of collecting and paying the tax. Fuel received which is sold outside the State is not taxable, or if a tax has been paid, it is subject to credit. Colorado practice in taxing the first distributor who receives the fuel in the State is typical, and obviously delimits the enforcement problem by reducing the number of taxpayers.

The use tax, which supplements the motor fuel tax, is payable by any person who uses such fuel or imports it into the State for use or sale in cases where a licensed distributor has not paid or is not liable for the tax. For purposes of tax liability such persons are considered to be distributors.

In contrast to the legal incidence of the motor fuel tax, the owners or operators of motor vehicles powered by diesel fuels and liquefied petroleum gases are primarily liable for payment of the tax. Dealers selling special fuels, however, are licensed and the law requires that they must fully account for and report all fuel sold. Failure to do so may make the dealer liable for payment of the tax. While many states follow the reverse policy of making the dealer directly responsible for payment, the weight of opinion is almost equally divided as to the desirability of the two approaches.

Rates of Fuels Tax. Fuels tax rates for the 48 states and the District of Columbia as of January 1, 1958 are shown in Table 10.2. The Colorado rate of 6¢ per gallon on motor and special fuels is currently employed by the largest number of states (19). The 6¢ per gallon rate is slightly below the median average with 12 jurisdictions levying lower rates and 17 higher. Four states, however, impose a 6.5¢ rate. The range is still considerable from 3¢ in Missouri to 7.58¢ in Oklahoma. There has been a sharp rise in fuels tax rates in recent years. Thirty-two states increased their rates from 1945 to 1951, and 29 have raised rates in the last six years.[28] In view of projected increases in highway expenditures further rises may logically be anticipated.

A growing number of states are imposing a differential rate on diesel and certain other special fuels. In most of the eleven jurisdictions involved the additional tax is 2¢ per gallon, but several use a 1¢ or 1.5¢ differential (Table 10.2). There are also two states, Kentucky and Virginia, that impose a 2¢ additional tax on fuel used by certain types of commercial carriers. The latter practice reflects the application of a weight distance or incremental cost measure of relative responsibility which generally leads to higher taxes on the heavier classes of vehicles.

Motor and Special Fuel Tax Receipts. The rise in Colorado motor fuel tax receipts since the adoption of the tax law in 1919 is shown in Table 10.3. It is an almost unbelievable record, though the experience has been duplicated in other states. While successive rate increases in 1923, 1927, 1929 and 1947 have had a significant effect, they are overshadowed by the impact of the increasing number of vehicles and miles traveled. During the first decade, 1920 to 1930, rates were tripled and net revenues increased by 1,098 percent. From 1930 to 1940, although this was the period of the Great Depression and the rate was not changed (except for one year), receipts increased by nearly 36 percent.

There was a slight decline in receipts in the trough of the depression years 1932 through 1935, but the staying power of the tax was amply demonstrated considering a decline of about 50 percent in the national income. Revenues rose by 150 percent in the decade from 1940 to 1950 with only a 20 percent increase in rates. Again, there was a fall in receipts during the

[27] See Table 10.3.

[28] Federation of Tax Administrators, *Tax Administrators News*, Public Administration Service.

war years of approximately 25 percent (1944 compared to 1942) attributable on this occasion to the stringencies of gasoline rationing. Since 1950 revenues have increased by more than 57 percent.

As a consequence of the remarkable growth in fuels tax collections, the levy has assumed a predominant position in the highway user tax field, and by 1950 had become a major source of State tax income. In relation to total highway user tax receipts, fuels tax revenues reached a peak of 85 percent in 1953. Since that year its relative position has declined slightly to 82 percent in 1957.[29] The decline is attributable to the rapid rise of collections from the ton-mile tax on "for hire" carriers. Following an upward revision of rates in 1955, receipts from the latter levy have more than doubled. The important role of the fuels tax in the State's total tax structure is also impressive. It accounted for about 45 percent of State tax receipts in 1930[30] and 25 percent in 1940. It maintained this approximate position from 1948 until 1954, and has declined slightly in the last three years, the 1957 ratio being 22 percent (Table 10.3).

Special fuels tax receipts are included in the total collections shown in Table 10.3. While they are a relatively minor factor in the overall picture, revenues have more than tripled in the last seven years. Collections amounted to $1,665,884 in 1957 as compared to $505,131 in 1950.[31] Increasing use of such fuels as well as a somewhat greater emphasis on checking returns are undoubtedly the major reasons for the rapid rise in receipts.[32]

[32] As all special user tax receipts are earmarked for highway and related uses, their disposition is considered following the discussion of the individual taxes.

Influence of Refunds and Exemptions on Collections. Refund policies with respect to non-highway uses of motor fuel have had a significant impact on motor fuels tax collections since 1927. In the early period following the adoption of the fuels tax, refunds ranged from 1 to 4 percent of gross collections. Although not specifically mentioned in the law until the 1927 Act, refunds were granted on application. The low rates of the tax were probably another factor contributing to their minor character. After 1927 refund allowances as indicated in Table 10.3 steadily increased in importance (excluding small declines in certain depression years), reaching a peak of over 19 percent of gross collections in 1945. The rise during the war years from 13 percent in 1942 to 19 percent in 1945 was a direct reflection of the decreased use of fuel for taxable private uses. Refunds declined in percentage significance in 1946 and 1947, though increasing in absolute amount. Substantial increases followed in 1948 and 1949 reaching a new high of nearly 20 percent in the latter year. Lack of administrative staff and consequently enforcement effort was probably a major influence in these years. Since 1949 intensified administration has sharply reversed the trend, refunds dropping to 11 percent in 1957. This reduction was achieved in spite of the fact that refunds to municipal governments were extended to all municipal uses of fuel in 1955.

Agricultural use accounts for the bulk of refund payments, 78.3 percent in 1954.[33] Governmental use, including state highway, counties, cities and towns, is the next most important, accounting for 9.2 percent. Industrial and contractors use ranks third, 7.8 percent; and aviation fourth at 4.1 percent. Rail and all other amount to less than 1 percent. If all aviation fuel had been handled on a refund basis in 1954, total refunds would have been increased by one-third.[34]

It should be noted that the refund totals do not include certain exempted fuel uses or the 2 percent allowance to distributors (1 percent to distributor and 1 percent to retailer) for evaporation and collection expense. The principal elements of exempted use on which a tax is not paid are bulk sales to the federal government and state agencies and aviation fuel. The tax on aviation fuel was generally handled on a refund basis in early years, but is now commonly exempted due to the distributor status of most of the outlets. On a gallonage basis in recent years the total exempt fuel averaged around 8 to 10 percent. The two percent allowance must be added to this figure to arrive at the tax free total.

[33]State of Colorado, Department of Revenue, *Annual Report*, 1954. Refund data are not available since 1954.

[34]State of Colorado, Department of Revenue, *Annual Reports.*

While the refund provisions under the Colorado law are very liberal, the present proportion of refunds and exemptions to gross collections is believed to be high. The institution of regular field inspection would undoubtedly be very productive from a revenue standpoint.

Cost of Collecting Fuels Tax. The costs of administering fuels taxes in Colorado are relatively low. During the past decade, as indicated in Table 10.4, they have ranged from less than ½ of 1 percent to .77 percent of total fuels taxes in 1957. The rise in costs in 1957 reflects a change in the record-keeping system, and the effort devoted to office checking of refund claims. Approximately one-half of the 2 percent allowance to distributors and retailers should also be regarded as a collection expense. Total costs, therefore, are well under 2 percent.

Low administrative costs per se do not indicate effective administration. While administrative procedures are generally sound, increased emphasis upon field audits and the special fuels tax in particular would undoubtedly yield significant returns. Increased outlays, therefore, should be contemplated. These as well as other facets of administration are treated in the section on administrative practices and problems.

Administration of Fuels Tax. The fuels tax law requires the filing of returns and payment of tax on a monthly basis by the distributors of motor fuel, users of motor fuel on which a tax has not been paid by a distributor, and the users of special fuels in motor vehicles.

Each distributor or user liable for filing a return and payment of tax must obtain a license.

Dealers or sellers of special fuels must also obtain a license, and are secondarily liable for payment of the tax if it is not paid by the user. They are required to keep a permanent record (at least three years) of all sales of special fuels. Several special types of informational or supplemental reports are required of distributors of motor fuel, and carriers of motor fuel on Colorado highways must report all pertinent facts concerning such shipments.

In the case of failure of a distributor to file a return and to pay the tax due, or if false or misleading information is submitted with or without the intent to defraud, the distributor upon notification by the Department of Revenue is subject to a penalty of 10 percent of the tax due plus interest at the rate of 8 percent per year. The penalty may be waived at the discretion of the Director if the tax is paid within 10 days of notification (much longer in practice). The distributor by law is designated as a trustee of all taxes collected, and the Department of Revenue has attempted to maintain a prior claim to such funds. Users are subject to similar penalty and interest payments on delinquent taxes, and establishment of intent to evade constitutes a misdemeanor punishable by a fine of $1,000 and a jail sentence (county jail) of not more than one year.

Jeopardy assessments may be made in cases where delay will prejudice collection, and a distraint warrant may be issued against the goods or property of the tax debtor. Public sale of such assets may then be held in not less than 10 days or more than 60 days following notification and publication or posting of such notice. The lien procedure may also be used though it is generally less effective.

The statutory requirements and procedures summarized above are comprehensive and provide an adequate legal basis for effective enforcement. While this aspect of administration is important, the final test lies in the area of enforcement procedure and the personnel available for this activity.

Administrative Organization and Staff. The initial and primary phases of the motor and special fuels tax administration are the responsibility of the Motor Fuel Section of the Division of Taxation of the Department of Revenue. This section is under the direction of a Supervisor and Assistant Supervisor. The other professional staff consists of 4 auditors (3 grade II and 1 grade I), five audit clerks and an administrative secretary who supervises the audit clerks. This staff is concerned solely with the office processing and auditing of returns as field investigations are carried on by the general Field Investigation Section. In addition to tax and informational returns the Motor Fuel Section processes all refund claims.

Office Checking and Audit Procedures. The general organization of the section's work and the procedures followed may logically be divided into three categories, namely, motor fuel tax returns, special fuels tax returns and refund claims.[35] Each motor fuels tax return (some 280 per month) is verified and subject to an individual check by the 4 auditors, with assistance from the supervisors, on a monthly basis. This audit cannot be comprehensive except for the returns which involve questionable items. Basically, the office audit is a process of checking the return against the data received from the various informational reports.

The special fuels tax returns are verified for mathematical accuracy by the machine operators and clerical staff. Nearly 15,000 special fuel permits were issued in 1956 so the volume is considerable. For practical purposes there is no follow-up on these returns, either office audits or field investigations.

Refund claims, which must be accompanied by invoices of fuel purchased and equipment schedules for certain contractors, commercial, and industrial users, are checked by the 5 audit clerks under the supervision of the administrative secretary. The checking process involves a totaling of the gallonage and examination of invoices and equipment schedules. As the number of claims filed exceed 50,000 per year the time spent on the individual claim is obviously limited. While applicants for refunds are legally required to keep complete records there is no general field inspection service to follow through on these provisions.

Field Audits. The field audit effort on fuels taxes is extremely inadequate. The equivalent of only 164 man-days time is devoted to this purpose.[36] Some 59 audits were made in 1957. Additional taxes of $24,831 were assessed and $11,534 was collected. Considering the fact that the equivalent of slightly over half-time for one field agent was spent on these audits, the assessments were substantial.

It should also be noted that there is little time devoted to an important aspect of fuel consumption, namely, that of interstate carriers. The administrative staff suggests that the large companies generally cooperate — some 50-odd file reports each year. By inference the others may or may not be paying a fair share of taxes in Colorado. A similar situation exists in the case of special fuels—the taxes paid in are accounted for. In the case of carriers subject to the ton-mile tax the information obtained in checking tax liability for this levy would be very helpful in validating fuel tax returns if it could be used.

---

[35] All information concerning the Section's activities was obtained from the Supervisor and Assistant Supervisor.

[36] Data supplied by the Head of the Field Audit Section.

Strengthening Fuels Tax Administration. There are several specific aspects of fuels tax administration that should be strengthened including the size and grade of staff. The handling of special fuels tax returns is obviously mechanical and incomplete. Establishment of a limited field inspection service for refunds is also imperative, and further effort should be directed to the checking of tax liability in the case of interstate carriers.

The need for an approximate doubling of the office audit staff and a comparable expansion of the field investigation force is indicated. Supervisory staff also suggest the desirability of higher classification auditors and the specialization of field agent activities.[37]

Tightening of enforcement along the lines noted should yield substantial results both in terms of revenue and tax equity. At least this has been the experience of every state, in which such conditions have prevailed, following the extension of enforcement efforts.

Fuels Tax Policy Issues. While the area of motor fuels taxation in Colorado does not involve major policy problems of a distinctive nature, there are several questions that merit attention. They include the tax free status of certain uses and users of fuel, the equity of the present uniform rate on gasoline as related to diesel and other special fuel and the economic impact of the fuels taxes on the incomes of individual, non-commercial users. Increasing federal encroachment upon the fuels tax base is also a significant problem.

Tax Free Uses and Users of Motor Fuel. The exclusion of non-highway uses of motor fuel either through exemption or refund procedures presents a clear-cut policy issue. The question, as previously indicated, is one of equity versus revenue. Exemption of sales of fuel to the federal government is dictated by constitutional immunity. The same practice with respect to state and local government use is wholly a matter of policy, and the policy is generally thought to be sound.

There is obviously no theoretical justification for extending the scope of the motor fuel tax to non-highway uses. The special use or benefit relationship provides the sole justification for a tax of this magnitude upon this product. Furthermore, the fact that non-taxation of other uses creates administrative problems and that widespread evasion is suspected does not alter the theoretical relationships involved.

The revenue implications of taxing non-highway uses require little elaboration. Refunds currently amount to about 11 percent of gross collections and the aviation fuel exemption added to this figure would mean a total loss of revenue due to non-highway uses of 14.6 percent of gross collections or about $5,307,873 for 1957.

Differential Rate on Diesel and Other Special Fuels. The desirability of a differential tax rate on diesel and other special fuels was examined in an earlier section of the chapter, and it was concluded that a differential burden is justified. Available evidence indicates an average fuel saving of approximately 50 percent, but there is considerable variation depending upon vehicle type, weight and other factors. The additional taxes on such fuel presently employed by nine states range from 1 to 2 cents per gallon. Actually, the 2¢ differential is conservative, and should represent a minimum with the existing general rate of 6¢ per gallon. Adoption of the additional rate would increase revenues from special fuels by about one-third, but the impact on total fuels tax collections would not be too significant.

Economic Impact of Motor Fuels Tax on Individual Users. The general public acceptance, which the fuels tax enjoys as a method of highway financing, has apparently led to an attitude of indifference concerning its economic effects upon the individual owners of private passenger cars. This situation is in direct contrast to the well organized, highly vocal commercial carrier group who oppose any attempt to increase its tax burdens. While there are no specific data showing the impact of the fuels tax on the incomes of non-business or commercial users, it is quite evident that the flat rate tax has a regressive effect. The decreased mileage obtained by heavier cars, greater mileage traveled and ownership of two or three cars commonly associated with rising incomes are not sufficient to offset the higher income factor. Regression is probably most marked comparing the very low and medium income categories and, of course, the very high income groups as related to the low and medium levels. The importance of the fuel tax burden to the typical $5,000 per year income family may be simply illustrated. Such a family normally drives about 10,000 miles per year, and pays about $50 tax to the state and $25 to the federal government. This burden may be compared with an estimated state sales tax payment of $68 for the $5,000 to $6,000 income group. In the light of these relationships and the rising rates of state and federal taxes further attention should be directed to the specific effects of the motor fuels tax on low- and medium-income groups.

Federal Encroachment on Fuels Tax Base. The recent doubling of federal rates on motor fuel and adoption of the special benefit approach to financing federal highway outlays raises

[37] Three of the four auditors are grade II.

anew a serious problem of federal-state revenue relationships. The paramount position of the national government in the field of individual and corporate income taxes and other special excise or sales taxes, the growing revenue problems of state and local governments, and increasing federal aids are all evidence of the basic fact that the revenue capabilities of the subordinate units are of primary concern. While Congress may find it convenient or expedient to invade this and other fields pioneered by the states, this action is wholly unjustified in terms of the over-all revenue needs and resources of the units involved. The regressive impact of the fuels tax lends further weight to this conclusion. State protests in the past have apparently had little effect, but perhaps more vigorous action by the states will eventually demonstrate the fallacy of the federal government doling out increasing aid with one hand and taking away state tax resources with the other.

Registration Tax, Operators' Licenses and Other Motor Vehicle Fees In Colorado

The broad purposes of the vehicle registration tax as an element of the special highway user tax structure were considered in an earlier connection. Other than the traditional object of identifying vehicles and vehicle ownership, its principal functions today are to measure the "readiness to serve" aspect of costs and the relative damage to facilities by the different types of vehicles. Weight and its distribution by axles or tire surface are thought to be the chief differential factors contributing to costs, both construction and maintenance. Graduated taxes in relation to weight, therefore, are the general rule.

Registration taxes also serve to distinguish the economic nature of use, that is, commercial (for hire), other private and public. This end, though not associated with the basic purpose of measuring cost responsibility, is incorporated in all state registration and carrier tax systems. It apparently involves the social judgment that those using public facilities to realize a profit should pay an additional tax for the privilege. The additional burden may also be intended to equalize in part the competitive advantage which motor carriers are often said to enjoy through having a roadbed provided at public expense. While these concepts call for the inclusion of all types of business and income-earning uses, in actual practice, the higher tax is imposed (with minor exceptions) only on common and contract carriers. A further departure from the underlying theory is very common—farm trucks being favored over other private carriers. Differential use factors cannot be a justification for these discrepancies as there is no measure of use involved in the typical registration tax structure. Public use in one form or another is ordinarily given preferential treatment. The reasons are familiar but unrelated to the primary purposes of the registration tax.

The value of the vehicle is also often reflected in registration tax practice, particularly with respect to private passenger cars. Here again, this element has no connection with the generally accepted goals of the tax. In some cases, however, the registration charge includes a property tax equivalent, and in this instance a value or age factor makes sense. Collection of the property tax as a separate charge at the time of registration, which is Colorado's approach (specific ownership fee), takes advantage of an effective administrative technique, and should avoid confusion concerning the nature of the two taxes.

Specific Bases of Registration Tax: Colorado and Other States. The specific bases for registering motor vehicles vary as to type of vehicle, vehicle use and user categories. There is also great diversity in practice from one state to another. In fact, the variations are so great that inter-state comparisons become exceedingly difficult. In relation to the bases of registration three broad classes of vehicles will be distinguished: private passengar cars, trucks and buses.

Private Passenger Cars. Private passenger cars in Colorado are licensed according to "shipping weight," three categories being employed. This concept of weight is roughly equivalent to net, empty or unladen weight, and is the most popular factor for this class of vehicle. However, an increasing number of jurisdictions are using a flat or uniform fee on the ground that the differential in weight for such vehicles is not sufficient to be meaningful from the standpoint of cost responsibility. It also simplifies administration and record-keeping in some degree. Other bases employed include: horsepower, which is not a reliable indicator of weight; and combinations of weight and age or value. Either the present basis of net weight or the uniform charge are the preferred bases of registration for these vehicles.

Trucks or Property-Carrying Vehicles. In the case of trucks or property-carrying vehicles, Colorado uses empty weight for all categories. Practice in other jurisdictions reflects a predominance of this factor and gross weight.[38] The latter concept, which obviously is more directly indicative of cost responsibility, is variously de-

[38] Commerce Clearing House, *General State Tax Law Service*, 1958.

fined as empty weight plus a maximum load or an assumed average load. A preference for gross weight per unit accompanied by an axle differential is indicated in the states that do not impose a special or additional tax on commercial carriers, and thirty jurisdictions now use the gross weight factor as compared to fourteen using empty or unladen weight. Rated capacity is still employed in a few jurisdictions, although it bears little relationship to loads actually carried.

Colorado licenses trailers and semi-trailers separately from trucks and truck-tractors, and this practice is widely followed, especially by the states using a net weight factor. The gross-weight basis logically calls for licensing of the combination as a single operating unit, and this is the general rule. It should be noted that different bases may be employed in registering farm trucks and/or light trucks. Colorado does not use a distinctive base, and the practice is on the decline with differential burdens being reflected in the rate schedules.

In terms of the broad principle that registration taxes should reflect relative damage or cost responsibility gross weight per axle is clearly the most appropriate basis of licensing medium or heavy weight trucks.[39] Similarly, combinations should be registered as units rather than by their component parts. Differential bases of registering trucks (other than panel or pickup) are discriminatory and should be avoided. The combined effect of the empty weight basis of registration and the ton-mile tax, which involves gross weight and mileage factors for common and contract carriers, is to give private carriers an additional advantage as compared to a gross-weight basis of registration.

Buses. Colorado registers buses, both commercial and other private, according to seating capacity. This factor does not adequately reflect weight, particularly empty weight. A combination of empty weight and seating capacity or gross weight is more commonly employed, and is preferable for the reasons previously cited in the case of trucks. The private carrier facet of the problem is not significant because seating capacity does reflect in part relative gross weight, and there is little private carrier activity in the case of buses.

Registration Tax Rate Schedules. The registration tax rate schedules in Colorado, as well as other states, are complex in character. The degree of complexity may be visualized by comparing the following schedules of Utah and Wyoming (Tables 10.5, 10.6, and 10.7) with that of Colorado. Seven basic classifications according to type of vehicle or vehicle use are employed in the Colorado schedules, and some states have more. There is no semblance of uniformity from state to state in the primary classifications and further variations exist on sub-classes, such as the number of axles factor, and the special classes, including city, inter-city and interstate. Needless to say, the rates imposed also cover a broad range.

Table 10.5

Colorado Motor Vehicle Registration Tax Rates, 1958

Class of Vehicle	Fee charged
Passenger cars	
2,600 lbs. and under (shipping weight)	$ 5.00
2,600 to 4,500 lbs.	5.00 plus 15¢ per 100 lbs.
over 4,500 lbs.	7.85 plus 60¢ per 100 lbs.
Inter-city trucks and truck tractors[a]	
Under 4,500 lbs. (empty-weight)	8.75
4,000 to 4.500 lbs.	8.75 plus 75¢ per 100 lbs.
over 4,500 lbs.	17.50
Trailers and semi-trailers	
Under 1,200 lbs. (empty-weight)	2.00
1,200 lbs. and over	5.00
Farm trucks and truck-tractors[b]	
Under 4,000 lbs. (empty-weight)	7.00
4,000 to 10,500 lbs.	7.00 plus 45¢ per 100 lbs.
over 10,500 lbs.	36.25 plus $1.05 per 100 lbs.
Intra-city trucks, truck-tractors[c]	
Under 4,000 lbs. (empty-weight)	7.00
4,000 to 10,500 lbs.	7.00 plus 75¢ per 100 lbs.
over 10,500 lbs.	55.75 plus $1.75 per 100 lbs.
Buses (seating capacity)	
9 seats or less	20.00
over 9 seats	20.00 plus $1.00 per seat over 9.
School buses (private)	
25 seats (juvenile) or less	15.00
over 25 seats	15.00 plus 50¢ per seat over 25.

[a] Inter-city travel subject to ton-mile tax, or if within radius of 10 miles
[b] of city regular fees plus 25 percent.
Owned by farmer or rancher and used for transporting own products or goods.
[c] Vehicles, excluding farm, which are not subject to ton-mile tax.

Source: Commerce Clearing House, *Colorado State Tax Law Service.*

Colorado's motor vehicle tax rates are shown in Table 10.5. The rate on private passenger cars reflects a moderate weight differential and is comparable to that of other jurisdictions which employ a weight factor. The weight basis of licensing this type of vehicle, while not essential from the standpoint of the relative cost concept, does permit a higher charge and consequently increased revenue from the heavier cars as compared to the flat fee method.

In the registration of property-carrying vehicles, trucks and combinations, the Colorado schedule distinguishes three primary classes of vehicles and one special class. The primary classes are: (1) Intra-city trucks and truck-tractors which are not subject to the ton-mile tax and includes private carriers other than farm; (2) inter-city trucks and truck-tractors

[39] In the case of panel and pickup trucks load is not a highly significant factor, though a uniform base is logical.

subject to the ton-mile tax which includes most common and contract carriers, and (3) farm trucks and truck-tractors when owned by the farmer or rancher and used for transporting his own products. A final special category is provided for trailers and semi-trailers.

Table 10.6

Utah Registration Tax Rates, 1958

Class of Vehicle	Rate charged
Private passenger cars (not for hire)	$ 5.00
Vehicle transporting persons for hire or transporting property[a]	
6,000 lbs. or less (gross weight)	$ 7.50
6,001— 9,000	15.00
9,001—12,000	25.00
12,001—15,000	35.00
15,001—18,000	50.00
18,001—21,000	65.00
21,001—24,000	80.00
24,001—27,000	100.00
27,001—30,000	120.00
30,001—33,000	140.00
33,001—36,000	160.00
36,001—39,000	180.00
39,001—42,000	200.00
42,001—45,000	225.00
45,001—48,000	250.00
48,001—51,000	275.00
51,001—54,000	300.00
54,001—57,000	325.00
57,001—60,000	350.00
60,001—63,000	375.00
63,001—66,000	400.00
66,001—69,000	430.00
69,001—72,000	460.00
72,001—75,000	490.00
75,001—over	520.00
Trailers and semi-trailers not otherwise registered	5.00
House trailers	5.00
Non-resident operators of 2 or more vehicles in interstate commerce[b]	
25,000 lbs. or less (gross weight)	½¢ per mile
25,000—45,000	1¢ per mile
45,000—60,000	1¼¢ per mile
60,000—above	1½¢ per mile

[a] Combinations are registered as a unit.

[b] May be permitted to pay the milage tax in lieu of above gross weight tax.

The tax schedules involve the customary differential in favor of farm trucks. However, heavy farm trucks pay a substantial registration tax which increases at $1.05 per 100 lbs. over 10,500 lbs. In the other two classes of trucks and truck-tractors there is a combination of the intra-city and inter-city distinction and the type of carrier (common, contract and private) concept. This type of classification is employed by other states, but the type of carrier basis is more widely used. In the tax schedules a direct relationship to the ton-mile tax is self-evident. Whereas, inter-city or specified commercial carriers are often taxed at a much higher rate than intra-city or private, the reverse policy is followed in Colorado. Furthermore, the level of registration tax rates for the vehicles subject to the ton-mile tax is understandably very low in relation to those of other states which do not impose a heavy additional tax on such vehicles. Thus, an interstate comparison of rates of the registration tax alone is wholly unmeaningful.

Two use categories of buses are distinguished for registration tax purposes: (1) school (private); and (2) others which includes all for-hire and private other than school. The rate is substantially higher for the non-school, and this is the customary practice. Again, however, the level of rates for the for-hire non-school, in particular, is fractional as compared to that of states which do not impose the special passenger-mile tax on this class of users.

While there is no point in attempting to make specific interstate comparisons of registration tax rates, the over-all problem of user tax burdens by visual, use, and weight categories is treated in a later section of the chapter. Some indication of general burdens is also afforded by the per capita-yield data presented in Chapter IV, Table 4.8.

Table 10.7

Wyoming Registration and Special Carrier Tax Rates, 1958

Vehicle Classes	Rate charged
Passenger cars (9 pass.) Busses (7 pass.)	$ 7.50
Motorcycles	2.50
School buses	5.00
Buses, trucks, trailers, house trailers and semi-trailers	
1,000 lbs. or less (empty weight)	1.00
1,001—3,500	7.50
3,501—4,500	10.00
4,501—5,500	15.00
5,501—6000	20.00
over 6,000	30.00
Common contract and private carriers conpensatory fees[a]	1.00
Freight and express—gas	
Less than 4,000 lbs. (empty weight)	5.00
4,000—6,000	10.00
6,000—7,000	15.00
over 7,000	1½ mills per ton-mile
Freight and express, butane or propane	1½¢ mills per ton-mile plus 5¢ per gallon
Freight and express, diesel	1½ mills per ton-mile plus 7¢ per gallon
Passenger—gas	1 7/10¢ per mile traveled
Passenger—other fuel	2½¢ per mile traveled

[a] Municipal or city are excluded.

Yield of Registration Tax, Operators' Licenses and Other Fees. Collections from the registration tax and related licenses and fees during the period from 1941 to 1957 inclusive are shown in Table 10.8. Registration receipts have increased steadily, except for the World War II years. At the same time, the relative importance of the tax in the State's tax system has declined from 7.4 percent of total tax revenues in 1941 to 4.7 percent in 1957. A similar decline is evident in the position of the tax in the highway user tax program. The absolute increase in revenues, it should be emphasized, is attributable to the growing number of vehicles licensed rather than a higher burden per

vehicle. In fact, the average tax per vehicle has remained at virtually a constant level since 1945 (around $7.50), and is only slightly higher than in 1941 ($6.60).

Operators' and chauffeurs' licenses, as might be anticipated, are of minor significance. While these receipts have increased on a long-term trend basis, they vary from year to year and have always been less than 1 percent of total tax receipts. The other special fees in the order of their importance in 1957 are as follows: certificate of title—$256,552; permit and inspection—$80,173; and Public Utility Commission general revenue—$42,494.[40] They totalled approximately $380,000 or about ¼ of 1 percent of total State tax collections in 1957.

Table 10.8

Revenues from Registration Tax, Operators' Licenses and Miscellaneous Fees, Colorado 1941-1957

Year	Registration tax revenues	Operators' licenses revenues	Other miscellaneous revenues	Total registration and other	Percent of total tax revenue
1941	$2,440,767	$ 91,585	$101,517	$2,633,869	7.44
1942	2,447,745	113,265	85,949	2,646,959	7.10
1943	2,365,051	135,807	83,925	2,584,783	6.50
1944	2,265,591	81,433	74,885	2,421,909	6.04
1945	2,324,583	119,540	77,031	2,521,154	6.15
1946	2,625,103	163,000	86,685	2,874,788	5.87
1947	2,958,518	127,567	123,715	3,209,800	6.56
1948	3,383,868	163,407	135,659	3,682,934	5.00
1949	3,655,483	170,338	167,481	3,993,302	4.91
1950	3,954,298	162,830	203,779	4,320,907	5.04
1951	4,287,197	178,699	229,672	4,695,568	4.89
1952	4,468,163	243,807	338,640	5,050,610	4.97
1953	4,911,056	175,616	295,892	5,382,564	5.05
1954	5,083,585	298,755	371,907	5,754,247	5.23

Administration and Costs of Collection. The administration of the tax and certain other related provisions of the Motor Vehicle Code is "farmed out" to the counties, and they are compensated for this service. Procedures are subject to State supervision and appear to be satisfactory. The State Department of Revenue has recently installed data processing facilities which are available to the counties, and fifteen counties have made arrangments to use this service in 1959.

The costs of administering the registration tax in recent years has averaged around 6 percent of receipts.[41] In view of the somewhat complex procedures and record-keeping involved this percentage factor is probably not excessive, though some states have a lower cost ratio.

Policy Issues Concerning Registration Tax. There are no serious problems or policy issues with reference to the registration tax as such. However, the inter-relationship of this tax and the special ton- and passenger-mile tax involves several important theoretical and practical problems which will be considered in the concluding section of the chapter. It should be noted that the question of reciprocity in the registration of interstate vehicles is not a significant problem in Colorado. In the first place, the Colorado law provides for full reciprocity on an individual state basis, and, secondly, the registration tax on for-hire trucks and buses is nominal in amount by virtue of the imposition of the ton- and passenger-mile tax.

Special Commercial Carrier Taxes In Colorado and Other States

Nature and Use of Special Commercial Carrier Taxes. The imposition of special or additional taxes on certain classes of commercial carriers has become increasingly popular during the last three decades. These taxes have taken various forms, and differ markedly in terms of their relationship to other user taxes and their overall effects. Consequently, there is some confusion as to the nature of the taxes and the terminology employed to describe them.

Basically, the so-called special carrier taxes are designed to impose a higher or additional tax burden on certain commercial carriers. In most instances they are limited to "common" and "contract" carriers which operate on an inter-city or inter-state basis, but there are some exceptions. While the purpose of levying a differential burden on these types of commercial carriers is self-evident, the policy approaches to this end are diverse and complex. The simplest method in terms of the tax structure is to incorporate the additional burden in the registration tax classification and rate schedules. This approach avoids a special or so-called third structure tax (in addition to registration and fuel taxes), but may not achieve the degree of refinement desired in terms of use-weight factors. Thus, the fact that a state does not impose a special or third tax on for-hire carriers does not mean that these carriers are escaping a differential burden. The alternative approach of levying a special tax permits a wide choice of tax bases and tends to highlight the apparent purpose involved.

However, the use of a special or third structure tax may also be illusory in terms of the relative tax burdens involved. Two elements of current state practice in certain jurisdictions may tend to disguise the real burden situation. In some states, as in Colorado, the registration tax for the vehicles subject to the special levy is nominal in amount, and in others the special tax

carriers are subject to the regular registration taxes. Several jurisdictions also have in lieu provisions in their laws which complicate the actual burden situation.

Special or additional taxes on certain commercial carriers are presently employed by 29 states. They vary significantly in scope, the nature of the tax base and rates. With a few exceptions they apply to licensed "for hire" carriers of property and passengers. Generally speaking, they do not include private or intra-city carriers. It should be noted that the 29 taxing states, as shown in Table 10.9, do not include the jurisdictions which have special taxes on interstate carriers only, nor those which have special levies in lieu of registration taxes. However, the "in lieu" tax states are shown separately.

Of the 29 states, seven use a mileage base; eight impose the tax on graduated weight; eight use a gross receipts measure; three, including Colorado, utilize ton and/or passenger miles; and three levy a flat rate of $10 or more per vehicle. Inclusion of the flat rate taxes is subject to question as most states impose nominal flat fees per vehicle on P.U.C. licensed carriers. However, the $10, or more charge is distinctive, and merits mention.

Three of the special in lieu taxes (in Illinois, Maryland and Mississippi) are in lieu of registration taxes, and each of the typical tax bases are represented. Connecticut's gross receipts tax on common carrier buses is in lieu of all other taxes, and the mileage tax in Florida is in lieu of property taxes. It should be noted that several states, including New Mexico, Idaho, and Oklahoma, have repealed ton-mile taxes in recent years; and the Utah tax was held to be unconstitutional. The action of the former states may be attributed primarily to administrative problems and strong carrier opposition.

Carriers Subject to Colorado Ton- and Passenger-Mile Taxes and Tax Base. The Colorado ton-mile tax upon property-carrying vehicles applies to all inter-city, non-farm trucks, truck tractors, trailers or semi-trailers, or combination thereof operated on the public highways and having an empty weight in excess of 4,500 pounds. If such vehicles, operating primarily within the limits of a city, city and county or town, are also used on an inter-city basis, the owners must pay the ton-mile tax on this portion of their travel. A further exception is made if the vehicle is only used intra-city and within a radius of ten miles of the city. In the latter case, the vehicle owner must pay an additional registration fee amounting to 25 percent of the regular fee, and is not subject to the ton-mile tax. Thus, the Colorado ton-mile levy is imposed on for-hire and private carriers which meet the inter-city, non-farm requirements.

The tax is imposed on a differential basis. That is, the ton miles represented by the empty weight of the vehicle times miles traveled in Colorado are subject to a 8-mill tax, and the ton miles reflected by load carried times miles traveled in Colorado are taxed at 2 mills.[42]

The Colorado passenger-mile tax applies to all vehicles carrying passengers for hire on the public highways of the State except intra-city buses, taxicabs and limousines and school buses owned by a school district. The actual number of revenue passengers carried times the miles traveled is the base for imposing the one-mill tax.

[42]The Director of the Department of Revenue may upon his own motion or the request of the vehicle owner or operator determine an average load for the vehicle which is then used as a basis for computing the load factor.

Table 10.9

Classification of States According to Tax Base Used for Special Commercial Carrier Taxes,[a] 1958

Tax Base					
Mileage	Gross receipts	Graduated weight	Ton - or passenger-mile	Flat fee[b]	In Lieu other taxes[c]
Alabama	Arizona	Iowa	Colorado	Georgia	Connecticut[e]
Idaho	California	Nebraska	Oklahoma (pass. mile)	Indiana	Florida[f]
Michigan	Louisiana	Rhode Island	Wyoming	Kansas	Illinois[g]
New York[d]	Montana	South Carolina			Maryland[h]
North Dakota	North Carolina	South Dakota			Mississippi[i]
Ohio	Pennsylvania	Tennessee			
Oregon	Texas (Contract)	Washington			
	Virginia	West Virginia			

[a] These taxes are additional levies on licensed for-hire carriers of passengers and property unless otherwise indicated.
[b] $10 or more per vehicle.
[c] These taxes are in lieu of registration or other taxes as indicated and apply to one or more categories of licensed vehicles. In lieu features applying only to interstate or unlicensed carriers are excluded.
[d] Property carriers only.
[e] Gross receipts on common carrier buses (all other taxes).
[f] Mileage (ad valorem).
[g] Mileage-weight (registration).
[h] Passenger-mile and graduated weight (registration).
[i] Gross receipts, graduated weight or ton-mile (registration).

Rates of Special Commercial Carrier Taxes: Colorado and Selected States. Considering the differences in the nature of special commercial carrier taxes and their relationship to other highway user taxes, rate comparisons are of limited value. The summary of rate schedules under the mileage, gross receipts and ton- and passenger-mile taxes shown in Table 10.10 indicates some degree of uniformity in burden. In the case of the mileage taxes the rates range from 1 to 48 mills, and are graduated on the basis of weight, seating capacity or axles. The rates in North Dakota and Oregon reflect the maximum which may equal or exceed 3¢ per mile (Oregon's schedule goes to 4.8¢ on Class A carriers). It should be noted that motor fuel taxes may be credited against mileage taxes in Oregon.

The rates of the gross receipts taxes exhibit less variation, ranging from ½ of 1 percent to 2½ percent with the exception of the 6 percent levy on the gross revenue of property carriers in North Carolina. Montana's rate of ½ of 1 percent on the gross operating revenue of common and contract carriers constitutes the minimum levy.

Among the three states shown in Table 10.10 using the ton- and/or passenger-mile tax, the Colorado rate on vehicle load of 2 mills is the maximum. Considering their over-all effect, however, the Wyoming rates are comparable to those of Colorado. The graduation noted in the instance of mileage taxes is, of course, built-in in the case of the ton- and passenger-mile levies.

Table 10.10

Selected Special Commercial Carrier Tax Rates By States, 1958

State	Coverage: type of carrier	Tax base	Tax rates
	A. Mileage Taxes		
Alabama	Passenger	Graduated (seating capacity)	¼-1¢ per mile
	Freight	Per axle	¼-⅛¢ per mile
Idaho	Passenger and freight (over 16,000 lbs. gross weight) [a]	Graduated (gross weight)	5.25-12.35 mills additional (other fuel)
Michigan	Passenger	Graduated (seating capacity)	1-2 mills per mile
	Freight	Graduated	3-4 mills (tractors) 1-3 mills (trucks)
New York	Freight only	Graduated (gross weight)	6-35 mills per mile
North Dakota	Freight	Graduated	1.5-3¢ per mile
Ohio	Trucks and combinations	Graduated (axles)	½¢-2½¢ per mile
Oregon	Four categories (A, B, C, D)	Combined weight	1.5-48 mills per mile (Class A: Gas)
	B. Gross Receipts Taxes		
Arizona	Passenger	Gross receipts	2.25 percent
	Property	Gross receipts	2.50 percent
California	For hire	Gross receipts	1.50 percent [b]
Louisiana	For hire	Gross receipts	2.00 percent
Montana	Common and contract	Gross operating revenue	0.50 percent
North Carolina	Passenger	Gross revenue	1.50 percent
	Property		6.00 percent
Pennsylvania	Intra-and Inter-state	Gross receipts	0.80 percent
Texas	Contract	Gross receipts	2.42 percent
Virginia	For hire (inter-city)	Gross receipts	2.00 percent plus 0.20 percent
	C. Ton-or Passenger-Mile Taxes		
Colorado	Freight (inter-city)	Ton miles	0.8 mill for vehicle, 2.0 mills for load
	Passenger (inter-city)	Passenger miles	1.0 mill
Oklahoma	Passenger (inter-city)	Passenger miles	0.5 mill
Wyoming	Freight & Express [c]	Ton miles	1.5 mills

[a] Also farm and non-commercial over 24,000 lbs. gross weight.
[b] Total taxes and licenses not to exceed 2 percent of gross receipts
[c] Passenger carriers are subject to a mileage tax of 1 7/10¢ per mile for gas and 2½¢ for other fuels.

Receipts of Ton - Mile and Passenger - Mile Taxes in Colorado. The ton-mile and passenger-mile taxes on inter-city for hire, property and passenger carrying vehicles, respectively, have been an important factor in the highway user tax picture since their inception. Revenues, as indicated in Table 10.11, show a gradual increase each year from 1941 to 1954 (1945 and 1946 excepted). Also, receipts in 1957 are more than double the 1954 collections. Thus, the tax has shown a marked increase in relative importance both with respect to the tax system as a whole and the highway user tax program since the 1955 revisions. The 1957 receipts from this source also exceeded those from the registration tax for the first time. It should be noted that the collections shown in Table 10.11 are gross revenues. Refunds are ordinarily not significant (less than 1 percent), though they amounted to $297,850 in 1956, the first year following the passage of the revised tax law.

Since 1955 the cost of collecting the ton- and passenger-mile taxes has averaged around 3 percent. This is a reasonable cost factor, and compares favorably with the general tax sources. The most important consideration, of course, is whether the tax is being effectively administered.

Administration of the Ton- and Passenger-Mile Tax. The Ton-mile Section of the Taxation Division of the Department of Revenue is directly responsible for administering the special commercial carrier taxes. This unit has had 12 (authorized) auditors and 3 audit clerks in addition to the director. It is concerned solely with office audits. Field audits are the responsibility of the general field investigation staff of the Department of Revenue. Port-of-entry and state patrol officers also assist the ton-mile section in obtaining information to check tax liability.

Table 10.11

Revenues from Ton- and Passenger-Mile Taxes Colorado, 1942-1957

Year	Revenues	Percent of total tax revenues
1942	$ 821,515	2.20
1943	1,042,042	2.62
1944	1,125,519	2.81
1945	1,081,529	2.64
1946	1,101,763	2.25
1947	1,304,625	2.22
1948	1,459,662	1.93
1949	1,711,452	2.11
1950	1,909,729	2.23
1951	2,337,719	2.43
1952	2,555,692	2.52
1953	2,867,209	2.69
1954	2,908,285	2.64
1955	4,508,893	3.60
1956	5,666,241[a]	4.08
1957	6,344,257	4.31

[a] Refunds amounted to $297,850 in this year following the changes in the law in 1955, and are deducted from gross collections.

Source: State of Colorado, Department of Revenue, *Annual Report.*

In general, the administrative procedure for the ton-mile tax involves a dual system of reporting. Each carrier subject to the tax is required to file comprehensive reports of its operations and tax liability on a monthly basis. Port slips showing basic data on each vehicle are collected by port officials and similar information is obtained by the state patrol on all vehicles checked. The information on the patrol and port slips is then cross-checked against carrier reports. There are some 16,000 active ton-mile accounts, and around 200,000 port and 50,000 patrol slips are received each month. Needless to say the volume of paper work involved is tremendous, and the unit is about 2 months behind in its audit work.

A penalty of 50 percent of the tax due plus 1 percent interest per month is provided in the case of fraudulent returns, and 1 percent interest monthly if no return is filed. While the fraud penalty is seldom applied, the ton-mile section takes strong measures in cases of an underpayment of tax. An under-payment discovered in one month is checked out for two additional months, and if the discrepancy is maintained the carrier is billed on a percentage basis for three-years back taxes. If the carrier protests the assessment, he has the option of bringing his records in for a complete audit or paying for the cost of a field audit. Needless to say, the above practice usually gets results.

The enforcement procedures in the case of the ton-mile tax appear to be basically sound. However, they are adapted primarily to the interstate carriers. While the state patrol slips and other supplementary measures provide a reasonable check upon intra-state operators, it is recognized that some evasion exists. The problem of enforcement for this type of operation is also complicated by the exclusion of intra-city and metropolitan licensed vehicles (which operate within a ten-mile radius of a city) and intensified enforcement effort is undoubtedly required in this area. On the whole, additional audit staff appears to be highly desirable. Each auditor, on the average, pays his salary in one month of audit work. If maximum results are to be achieved, it is also essential that the ton-mile tax unit be permitted to use several of their specialized staff for field investigations. Very few field audits are conducted by the general field investigators, and there is a considerable lapse of time between the request for an audit and its performance.

Disposition of Highway User Tax and Fee Receipts

All highway user tax receipts in Colorado are earmarked by constitutional provisions for highway, road and street purposes. The motor and special fuels tax revenues along with registration fees, operators' licenses and special carrier taxes are placed in the special Highway Users Tax Fund, after the administrative expense for each source has been deducted. Two additional elements of administrative outlay are then deducted, that of maintaining motor vehicle inspection stations and the cost of the state highway patrol operation. The inspection station expense amounted to .7 percent and the highway patrol 5 percent of net revenues in 1957.

The remainder of the fuel and other earmarked revenues is distributed to the State Highway Fund, County Road Funds and cities and town (for street purposes) on a 65, 30 and 5 percent basis, respectively. The City and County of Denver, by special provision, receives only its proportion of the city share.

The allocation of the county and city and town shares to individual units is based upon two formulas. Twenty percent of the county total is distributed according to "rural motor vehicle registrations" and the remaining 80 percent on the basis of the adjusted mileage of open and used rural roads. In the case of cities and towns, the two factors are reversed with 80 percent being distributed according to "adjusted vehicle registrations,"[43] and the other 20 percent in relation to the mileage of open and used city streets.[44] The necessary computations in the application of these formulas are made by the State Highway Commission staff.

[43] The gross registration factor is weighted on a graduated basis from 1 to 12, depending upon the number of registrations.

[44] For actual distribution of receipts to counties and cities see Chapter XX.

State Sharing of User Funds with Local Governments. State policies concerning the distribution of funds among the three units of government have been subject to continuing attack by municipalities. They contend that their share should be increased primarily on two grounds: (1) the share which they receive is only a fractional element of their contribution; and (2) the arbitrary and distinctive methods of financing streets employed in earlier periods are no longer realistic or equitable. Denver officials have charged outright discrimination in that the consolidated city and county is denied the larger county share.

The critical financial problems of most Colorado municipalities certainly merit a thorough review of their claim for a larger share of highway user taxes on theoretical as well as practical grounds. The basic concept of rural highway and road versus city street financing has undergone significant changes since the establishment of state highway systems. Initially, it was assumed that the two types of facilities served different purposes and should be financed by distinctive methods. In particular, state highways being general use facilities should rely on receipts from user taxes, and the cost of city streets whose use was limited largely to city residents should be met by special assessments or property taxes upon the "primary beneficiaries." The same line of reasoning suggested that the cost of secondary rural roads should be met largely from property taxes. This approach worked no serious hardships in the early days of limited motor vehicle travel. As the number of vehicles and mileage traveled increased students of highway finance sought to clarify the theoretical basis of public policy. Although specific interpretations varied, the broad principal of predominant use became the accepted basis of public policy. It called for a classification of facilities according to their primary uses, general or through traffic, on the one hand, and, access to property, on the other. In practice this meant that the state highway system should be supported by the special user taxes and other facilities by taxes or assessments on property-owners. While the theory obviously placed minor rural roads in the same category as city streets (not a part of the state highway system) and required state financing of all state highways, it was some time before the states assumed full responsibility for financing state highways within municipal boundaries.

The rapid growth of vehicle and traffic volume starting in the late 1920's was paralleled by the extension of state highway system mileage primarily in rural areas. Thus, the states assumed increasing responsibility either directly or through state aid for financing rural roads. Increasing federal aid for designated primary systems greatly facilitated this development. The states, however, generally continued to restrict aid to municipalities to primary federal-state highways until the period following World War II. During the last decade and a half a combination of factors has served to fundamentally alter the character of motor vehicle travel, the nature and cost of the facilities required, and, consequently, the problem of financing them. The facts are common knowledge. The long-term urbanization trend under the impact of phenomenal population growth has occasioned an almost unbelievable expansion of urban areas, and municipal boundaries. The bulk of motor vehicle travel both private and commercial is now concentrated in our cities and surrounding urban communities, the vehicles continually increase in size and horsepower, and the resultant problems of traffic congestion and control which are greatly augmented by increasing state and interstate traffic have created a literal nightmare for city administrations. Quiet city streets of the so-called access type are rapidly being transformed into arterials, throughways, freeways, and traffic interchange problems formerly handled by the relatively simple, one level cloverleaf are now being converted to two, three, four and five level street stacks. While these and other changes are being made as quickly as possible, needs have far-outdistanced improvements. Traffic bottlenecks are increasing, and the primary obstacle is inadequate municipal sources of financing.

It is obvious that a policy which denies cities and towns a substantial and increasing share of motor vehicle tax funds is inacceptable on theoretical grounds and wholly unrealistic in terms of the practical problems involved. First, the predominant use principle requires that a large and constantly increasing part of urban facilities be classified as general rather than access, and that state financing be provided on the same basis as for general use facilities outside municipal boundaries. Second, state aid is presently being extended for certain rural roads that are primarily access in character. Equity also clearly dictates uniformity in this phase of state policy. In short, so long as the type of use and nature of benefits principle is employed as a basis of financing policy, there is no justification for applying it in a discriminatory manner. From a practical standpoint, also, the most crucial technical and financial problems of developing and maintaining adequate motor transportation facilities are centered in the urban areas. Interstate or through traffic may be diverted around or to one side of the cities and towns to lessen congestion and save time for the tourist, although the urban economy may suffer. However, a state highway program and policy which disregards the needs of the majority of motor vehicle owners and the

major portion of traffic volume is clearly unsound. Such action is even more flagrant when this same group of urban users is paying the lion's share of the cost of a system financed by special user benefit taxes.

Earmarking of Highway User Revenues for Highway Purposes. The question of earmarking highway user tax revenues for highway purposes does not present a serious problem in Colorado. All such funds are dedicated to highway and related uses. While students of governmental finance have often questioned the desirability of earmarking as a general practice, the great majority now accept its application in the highway field as a special case situation. Both the nature of the service function and the special benefit basis of financing employed are thought to justify the exception.

In contrast to the general policy of earmarking, a small number of states have directed a portion of user tax revenues to other uses such as education and welfare. This practice has naturally occasioned violent criticism by special user groups. The crux of the situation, however, is whether the total expenditures of the state on highway, road and street facilities is less than, in balance with, or exceeds user tax collections. Only in the first instance where total expenditures are less than user tax receipts is there any real or net diversion. This condition, it should be noted, actually exists in a small minority of the states which practice diversion.

Highway User Tax and Fee Burdens

The earlier discussion of the theoretical aspects of special user taxation focused attention on the controversial allocation of costs problem. The primary issues from a practical standpoint are to determine how the user tax load should be distributed among various types of vehicle, vehicle weight and use groups, and to select the most appropriate tax measures for implementing this objective. While decisions on the relative burden issue should be predicated upon the broad concepts of relative damage or cost and perhaps nature of use, the actual evidence concerning the damage factor is incomplete and provides a general rather than specific policy guide. Additional controlled-use studies are essential to a wholly objective solution of this aspect of the problem. Another major obstacle to sound policy judgments has been the lack of adequate data concerning the specific effect of particular tax measures on various user groups and, more significantly, the over-all impact of user tax policy in individual states. The latter deficiency has prevented interstate comparisons on a comprehensive basis.

Source of Data on User Tax and Fee Burdens. In 1955 the Bureau of Public Roads of the United States Department of Interior initiated an ambitious, nation-wide research project designed to clarify the distribution of user tax burdens under existing state laws.[45] The Bureau defined the broad terms of the study and the procedures to be employed, and directed the state highway authorities to make the analysis on the basis of 1956 tax policies. While the details of research methodology are not pertinent to this discussion, scientific sampling procedures were required in the absence of actual data.

In general, the study plan called for a breakdown of total user tax and other charges on a uniform gross weight schedule basis. Vehicles were further classified as to: (1) visual groupings (single unit trucks, combinations, buses, etc.); (2) nature of use (for hire, not for hire, farm, other); (3) type of fuel used (gasoline, diesel and other); and (4) number of axles. The number of vehicles in each weight category was indicated, and the average miles traveled for most types of vehicle, use, fuel, axle, and weight categories were presented in separate schedules.

The Colorado State Highway Department, Division of Research and Statistics, completed the research project in 1957, and the results were made available to the Governor's Tax Study Group. Considering the obvious importance of the information, the chief executives of the other ten Western States were requested to supply copies of their reports for purposes of comparative analysis. Nine jurisdictions complied with this request, namely, Arizona, California, Idaho, Montana, Nevada, Oregon, Utah, Wyoming and Washington. However the reports from two states, Utah and Montana, were incomplete and not readily adaptable to a meaningful comparison of burdens by specific vehicle, use and weight categories.

The first phase of this analysis is concerned with a summary of the distribution of special user tax burdens in Colorado, and the second deals with interstate comparisons. It should be emphasized that the basic data in the individual state reports are subject to certain limitations. The Colorado study is one of the best, but the sampling procedures employed, though scientifically designed by the Bureau of Public Roads, do not necessarily produce valid results in individual weight categories which only include a few vehicles. Therefore, one must look at the trend of costs for a particular class rather than the individual weight categories to obtain a wholly accurate picture. In the case of interstate comparisons, the necessary data are often not available in some of the states. With these qualifications the data employed in this analysis are believed to constitute a sound foundation for burden comparisons, and they represent a major advance in the factual information available for the formulation of user tax policy.

[45] Motor Vehicle Classification, *Section 210 Study*, Federal Aid Highway Act of 1954.

Distribution of Highway User Tax and Fee Burdens in Colorado

Tax and Other User Payments; Major Vehicle Groups. The distribution of highway user tax burdens in Colorado for 1956 is shown in Tables 10.12 and 10.13. User tax and fee payments by type of charge for the major vehicle groups are summarized in Table 10.12. Total user tax and other payments of the 819,143[46] vehicles registered in Colorado in 1956 amounted to approximately $45,632,000. The owners of private passenger cars (611,886 vehicles) accounted for the bulk of total payments or 63 percent. The 157,286 single unit trucks (all major uses) were responsible for 19.3 percent of the total; the 6,763 combinations (all major uses) 16.2 percent; and the 1,803 buses 1.5 percent. The 26,369 for hire vehicles, which include generally the inter-city common and contract carriers of property and passengers, accounted for 21.8 percent of the total as compared to 78.2 percent for the not-for-hire or private vehicles. The latter relationship of 22 to 78 percent is particularly significant in view of the controversy concerning the present responsibility of the two groups for highway financing in Colorado.

The predominant role of the motor fuels tax in the total tax and fee burden for most categories of users is strikingly portrayed in Table 10.12. Other taxes and fees exceeded fuel tax payments only in the case of for-hire single unit trucks and combinations. For private passenger cars motor fuels taxes represented 80 percent of user payments; registration fees slightly over 12 percent; and other fees about 7.6 percent. In the case of single unit not-for-hire trucks, motor fuel taxes constituted 69.2 percent of total payments; registration fees 22.6 percent; and other fees 8.2 percent. The division of the user tax payments for single unit farm trucks presents an interesting variation. Motor fuels taxes represented only 61.2 percent of the total; registration 29 percent; and other fees 9.8 percent. This is in spite of the fact that registration rates for farm trucks (above the minimum weight) are lower than for the other private carriers. For farm combinations the distribution of the user burdens is closer to a reasonable expectation, the motor fuels tax accounting for 75 percent of the total. However, other not-for-hire combinations show a much higher fuel tax ratio of 88.7 percent.

[46] See footnote, Table 10.11.

[a] Trailers, which are separately registered are generally included as part of a combination unit, and special mobile equipment are excluded. Consequently, 40,816 registered vehicles do not appear in the total number of vehicles indicated.

[b] The total allocation of user payments shown represents 99.9 percent of actual net collections in calendar 1956.

[c] The for hire category includes vehicles subject to the special ton- or passenger-mile taxes.

[d] Not for hire vehicles include all of those which are not subject to the ton- and passenger-mile taxes other than farm and publicly-owned vehicles.

Source: Adapted from Motor Vehicle Classification, *Section 210 Study*, Federal Aid Highway Act of 1956.

In the case of for-hire vehicles, which are subject to the ton- or passenger-mile taxes, the special tax payments, as might be anticipated, are a major element of the total burden. However, there is a considerable variation in the relative importance of the ton- and passenger-mile tax payments, from 68.8 percent for combinations to 37.1 percent for single unit trucks. In the instance of for-hire buses, the special tax accounts for 41.5 percent of the total payments. The markedly higher ratio of the ton-mile tax payments for combinations, is, of course, attributable to the greater relative importance of the load factor and the higher rate on this element (2 mills as compared to .8 mill on empty vehicle weight).

Distribution of User Tax and Fee Burdens by Specified Classes of Vehicle. A further breakdown of special user tax and fee burdens by specified vehicle classes, showing total user taxes, percent of total user payments, average costs per vehicle and average cost per mile is presented in Table 10.13. These data highlight the relative distribution of user tax burdens in Colorado by all major vehicle classes including visual, type of use, fuel consumed and number of axles. The picture is necessarily complex, but certain broad patterns are evident, particularly in the average cost-per-mile data. The average costs per vehicle, which have been employed in earlier analyses of user tax burdens, do not correspond directly to the more meaningful cost per mile measure, but there is some degree of correlation.

The over-all range in costs per mile for all classes of vehicles and uses is extreme, from 3/10¢ for diesel-propelled farm combinations (semi-trailer, four-axle units) to 5.2¢ per mile for gas-propelled for-hire combinations, (truck-trailer, four-axle units). As there were only 12 vehicles involved in the lowest cost group, the results are open to question.[47] Therefore, the 6/10¢ per mile average cost for private passenger cars and not-for-hire, gas-propelled, two-axle, single-unit trucks may well represent the actual minimum.

For-Hire Combinations. For-hire combinations, as might be expected, were subject to the highest costs. The average cost per mile within this broad group of vehicles ranged from the maximum of 5.24¢ to 2.4¢. The larger, heavier types of combination, such as truck-full-trailer, tractor semi- and full-trailer and five-axle semi-trailers, in the order indicated, were taxed more heavily than other units. Generally speaking, the gas propelled units paid more than the diesel, though several classes were on a par. Average costs per vehicle for the entire for-hire

[47] The individual vehicles travelled an estimated 41,000 miles each; so the fuel tax was either under-stated or evaded.

Grand total	778,327	45,631,814	100.00	—	—

[a] Trailers, which are separately registered are generally included as part of a combination unit, and special mobile equipment are excluded. Consequently, 40,816 registered vehicles do not appear in the total.
[b] The total allocation of user payments shown represents 99.9 percent of actual net collection in calendar 1956.

Source: Adapted from Motor Vehicle Classification, *Section 210 Study*, Federal Aid Highway Act of 1956.

combination group show a much broader range from $4,601 in the case of diesel-propelled, truck-full-trailer, five-axle units to $449 in the instance of gas-propelled, semi-trailer, three-axle units. Differences in the average cost per vehicle factor, not otherwise reflected, are attributable basically to variations in miles travelled.

For-Hire Buses. For-hire buses in Colorado rank second in burden as measured by cost per mile. The cost range for these vehicles overlaps the lower level of for-hire combinations costs. Buses using fuels other than gas or diesel are subject to a 3.2¢ per mile burden; gas propelled, 2.9¢; and diesel propelled, 1.8¢. The advantage of the diesel-powered units is obviously very marked. Average costs per vehicle follow the same pattern with a $989 maximum for the "other" fuel units and a $672 minimum for the diesel units.

For-Hire, Single-Unit Trucks. Broadly speaking, the for-hire single-unit-truck group is third highest in costs per mile. The range is very wide from a maximum of 2.6¢ per mile to a minimum of 1.2¢. Various classes of not-for-hire and farm combinations, as well as not-for-hire single-unit trucks, overlap this cost spread. No differential as between gas- and diesel-powered units is discernible. The overlap in the case of combinations is not surprising as the ton-mile tax on for-hire single-unit trucks is not the primary burden element for the latter vehicle group. The high cost shown (2.6¢ per mile) for farm single-unit, three-axle trucks is not logical, and is attributable primarily to the low miles travelled assumptions for this and certain other classes of farm vehicles.[48] Average costs per vehicle for the for-hire single-unit trucks varies from a high of $676 (diesel two-axle) to a low of $111 (gas-two axle).

Not-for-Hire Combinations. Not-for-hire combinations are next in line, with costs per mile ranging from 2¢ to 9/10¢. The larger, heavier types of unit generally are in the higher cost brackets, though there are some exceptions. The heterogenous character of the vehicles involved in this classification is undoubtedly a major factor in explaining the wide cost spread.

The weight categories and number of vehicles in each weight category have a more significant impact on costs for this group of vehicles as there is no ton-mile tax.[49] Mileage assumptions are also a significant element affecting costs for these vehicles.[50] Average costs per vehicle for this group range from a high of $903 to a low of $84.

[48]See Colorado Motor Vehicle Classification, *Section 210 Study*, Federal Aid Highway Act of 1956, Table E-1-1.

[49]See Table 10.13.

[50]Colorado Motor Vehicle Classification, *loc. cit.*

Other Classes of Vehicles. Not-for-hire buses, gas-powered, occupy an intermediate position in terms of cost per mile, or 1.6¢. The average cost per vehicle is $77. The various classes of not-for-hire and farm trucks fall in the medium and lower cost ranges from 1.6¢ to 6/10¢ per mile. Not-for-hire, diesel-powered, two-axle units pay the maximum and the not-for-hire, gas-propelled, two-axle units, the minimum. Average costs per vehicle vary from $413 to $41. Private passenger cars, as previously indicated, reflect the practical minimum of 6/10¢ per mile, with an average per vehicle cost of $47.

The following comparative analysis of user tax and fee burdens in Colorado and other Western States, which shows costs by individual weight categories, will bring into sharper focus the burden differentials in Colorado.

Comparison of Highway User Tax and Fee Burdens In Western States

Basis of Comparison. Interstate comparisons of highway user burdens present a difficult problem by reason of the variations in types of tax, tax bases and rates employed. Individual tax relationships are not particularly meaningful unless they can be adapted to a uniform measure as in the case of the fuels taxes. Even then it is the over-all burden, rather than particular components, that is significant. The Bureau of Public Roads Study reports from the individual states generally provide the basic data needed on total burdens. Once the total taxes and fees paid by a particular type of vehicle, devoted to a given use, consuming a certain type of fuel and with a given number of axles is determined, an average tax per vehicle can be computed. However, the average tax per vehicle basis of comparison is deficient because it does not take account of differences in average miles travelled which affect motor fuels tax liability. The comparative analysis of user burdens, therefore, is in terms of costs per mile.

Basically, the study covers eight Western States including Colorado. In particular instances, however, data in certain states were either not available or not comparable, and in such cases a smaller number of states are involved. To highlight the relative burden position of Colorado, the textual tables and analysis stress the average cost per mile, the cost in Colorado and the cost in Colorado as a percent of the average. The number of states involved in the computation of the average for each category and the jurisdictions whose costs are definitely higher or lower than those of Colorado are also indicated. It should be noted that the cost data for individual states from which the burden relationships were calculated are shown in Appendix Table 10-A.

Single-Unit Trucks, For-Hire — Gas: Cost Comparisons. The cost relationships of Colorado and the other Western States in the case of single-unit trucks are presented in Table 10.14. In the for-hire, gas-propelled two- and three-axle vehicle classes Colorado's costs per mile are well below the average in all weight categories. The range of Colorado's cost for the two-axle group is from .7¢ to 1.6¢ per mile, and from 1.7¢ to 2.7¢ per mile for the three-axle group. Average costs in the Western States, on the other hand, vary from 8/10¢ per mile to 2¢ for two-axle vehicles, and from 2.4¢ to 4.6¢ for three-axle vehicles. It will be noted that Colorado costs per mile as well as the average costs are substantially higher for the three-axle vehicle group.

On an over-all basis, costs for two-axle vehicles are substantially higher than those of Colorado in California, Oregon, Washington and Wyoming, and are lower than Colorado's cost in two states, Idaho and Arizona.[51] The relationship for the three-axle group is substantially the same.[52]

Single-Unit Trucks, Not-for-Hire—Gas: Cost Comparisons. In the instance of not-for-hire, gas-propelled single-unit trucks Colorado costs per mile are again well below the average in most weight categories. The only exceptions are in three of the lower weight two-axle classes for which Colorado's costs are equal to the average. The discrepancy between Colorado's cost and the average widens appreciably in the heavier two-axle weight categories and in the three-axle group as a whole. For the latter group Colorado's costs range from ¼ to ½ that of the average. As indicated in Table 10.14, the cost in Colorado remains virtually constant throughout the two-axle group, while the average cost increases progressively in relation to weight. For the lower weight three-axle vehicle categories Colorado's costs actually decline, while the average costs tend to increase throughout the entire weight range.

For the two-axle grouping, costs in California, Oregon, Washington and Wyoming are substantially higher than in Colorado, and those in Arizona and Idaho are approximately the same as in Colorado.[53] In the three-axle group costs are higher in all of the other states than in Colorado.[54]

[51] Appendix Table 10-A.
[52] *Ibid.*
[53] *Ibid.*
[54] *Ibid.*

Single-Unit Trucks, Farm—Gas: Cost Comparisons. The cost relationships in the case of single-unit, gas-propelled farm trucks are substantially different, particularly in the three-axle group. While Colorado's costs are somewhat less or about average for the two-axle farm vehicles, they are above average for most of the three-axle group. However, the marked difference for the three-axle class is attributable primarily to very low mileage assumptions, and the limited number of states for which comparable data were available. Of the three other states included, Idaho, Oregon and Washington, only Idaho's costs were lower than those of Colorado for both the two- and three-axle group.[55]

Single-Unit Trucks, For-Hire-Diesel: Cost Comparisons. Comparable cost-weight categories of the single-unit, for-hire, diesel-propelled trucks are strictly limited. This is attributable to the relatively small number of such vehicles, and varying uses in the different states. However, in the three-axle group Colorado's costs are substantially below the average. Costs are generally higher in California, Nevada and Wyoming, and lower in Arizona and Idaho.[56] Costs in Colorado, it may be noted, are slightly lower for the heavy diesel-propelled for hire trucks than for the gas-propelled.

Single-Unit Trucks, Not-for-Hire-Diesel: Cost Comparisons. In the case of single-unit, not-for-hire, diesel-propelled trucks Colorado's costs range from ½ to ⅔ those of the other states. Costs are higher than those of Colorado in 5 states, California, Nevada, Oregon, Washington and Wyoming; lower in only one state, Arizona; and about the same in Idaho.[57] There is little difference in Colorado's costs for the single-unit, not-for-hire gas-propelled as compared to the diesel-propelled trucks.

Summary: Single-Unit Trucks—Cost Comparisons. Generally speaking, the user tax and fee costs per mile for single-unit trucks in Colorado are well below the average in the Western States. The one exception is the case of certain farm vehicles, and for this type of use comparative data were limited to a maximum of 4 states and mileage assumptions in Colorado were exceptionally low. The differential in Colorado favoring all other use categories of single-unit trucks is most marked in the case of not-for-hire vehicles, and gas-propelled in particular.

semi- and full-trailer units. Costs for all of the for-hire combinations in Colorado show a significant progression in relation to weight.

In the case of not-for-hire combinations, Colorado's costs are markedly below the average, and for the gas-propelled units Colorado's costs are virtually constant in relation to weight. The latter situation is in sharp contrast to that of most other states whose costs show a progressive trend as weight increases. Comparable data generally are not available for the truck full-trailer and tractor semi- and full-trailer units both gas and diesel. The information is also limited to a few weight categories in the case of diesel-propelled tractor semi-trailers.

Although meaningful interstate comparisons cannot be presented in the case of farm combinations, it should be emphasized that costs in Colorado are very low in most categories. Typically, they are about the same as for the not for-hire vehicles.[69]

Buses, For-Hire—Gas and Diesel: Cost Comparisons. Colorado's costs in the instance of for-hire, gas-propelled buses are generally below average, except for the three highest weight categories (22,000 to 27,000 lbs.). There is a marked progression of costs in Colorado throughout the entire weight range. In the instance of for-hire, diesel-propelled buses Colorado is well above the average, except for one weight category. Data in Colorado and most of the other states are spotty and the bases of comparison are limited.[70] Typically, the costs for the diesel-propelled buses in Colorado are not as high as for the same weight gas-propelled vehicles. Although comparative data for the not-for-hire gas-propelled buses are not shown in Table 10.14, Colorado's average cost of 1.6¢ per mile is very low in relation to those of other states.[71]

Private Passenger Cars: Cost Comparisons. The costs per mile for private automobiles in Colorado are exactly equal to the average (7 states) or 6/10¢ per mile. Three other states, California, Nevada and Oregon, have the same cost figure; Washington is higher with 7/10¢ per mile; and Arizona and Wyoming are lower with 4/10¢ and 5/10¢ per mile, respectively. Comparable data are not available for these vehicles in Idaho.

Conclusions: Highway User Burdens In Colorado

The foregoing analysis of highway user burdens in Colorado and in most of the Western States obviously does not provide all of the answers to the burden problem. It does provide certain broad facts essential to intelligent policy formulation. First, it is apparent that Colorado's charges on the for-hire carrier group are not excessive in relation to the average for the Western States considered. For this type of carrier the costs per mile in Colorado vary from about 25 percent below average to 25 percent above, and there are relatively few categories that are above. Those categories for which Colorado's costs are above average are predominately the larger, heavier vehicles.

Second, it is equally clear that user charges in Colorado are abnormally low in the case of not-for-hire and farm vehicles. Colorado's costs per mile range as low as 21 percent of the average, and the disparity tends to be greatest in the instance of the heavier classes of not-for-hire vehicles. For several types, as noted earlier, Colorado's costs are actually constant or regressive in relation to weight. Considering the practice of other Western States, the low level of Colorado's charges on the not-for-hire and farm vehicles appears to represent the most serious deficiency in State policy. Needless to say, this situation bears out the contention that for-hire vehicles are subject to discriminatory burdens in relation to other use categories.

Finally, it should be recognized that the Bureau of Public Roads Study Project in Colorado, as well as in other states, involves a significant beginning in actual burden analysis. Further research is necessary to fill in certain gaps in the basic data and to validate the results for specific categories of vehicles which appear to be questionable. Although these cases do not affect the general burden pattern, the soft spots in the data should be firmed up.

Other Highway User Tax Policy Problems

The earlier discussion of highway user tax policies in Colorado and the burden analysis clearly demonstrates that there are many important problems yet to be resolved in this field. In addition to the questionable aspects of present policy in the sharing of user receipts with local units, there are significant issues relating to the structure of the tax and fee system and the distribution of user burdens among various classes of users. There is also the practical consideration of the future revenue potential of user charges.

Tax Structure and Burdens. The principal problems concerning the effects of Colorado's user tax system are associated with the registration and special carrier taxes. The ton- and passenger-mile tax, as well as alternative levies on the commercial carrier group has been the focal point of controversy in Colorado and in other states. The attempt to impose any form of differential burden upon the industry has resulted in strong opposition from the well-organized and liberally-financed carrier associ-

[69] See Table 10.13.
[70] Ibid.
[71] See individual state reports.

ations. The present basis of registering not-for-hire and farm trucks and combinations and the rate on diesel fuel as compared to gasoline are further elements of concern.

The Ton-Mile Tax. Specifically, the motor carrier industry has charged that the ton-mile tax in Colorado is inequitable and discriminatory, that it is driving interstate operators out of the State and that the tax cannot be effectively enforced. The fact that a number of states have abandoned this form of tax is cited as additional evidence of its allegedly undesirable character. Needless to say, these are serious criticisms, and merit careful scrutiny.

The equity of the ton-mile tax is dependent basically upon the degree to which the tax conforms to accepted principles of user taxation. In other words, does this tax, used in conjunction with other user taxes and fees, result in a reasonable allocation of user burdens? From a theoretical standpoint the answer is clear. The tax does permit a substantial graduation in burden related directly to both the damage and use concepts. Potentially it distributes the burden more equitably than alternative levies such as mileage or gross receipts taxes which only consider one element of user responsibility (mileage), or are not related directly to either the damage or use factors (gross receipts). If the rates of the tax are not excessive and if the burden upon the carriers subject to the levy is properly correlated with that of other user groups, the results are not subject to question.

Recognizing the theoretical merit of the tax, what are the actual results of the present ton-mile tax in Colorado? As indicated in the burden analysis the impact of the tax occasions a marked element of progression in burden throughout the weight ranges for all classes of for-hire vehicles. Graduation of the burden is undoubtedly desirable. However, the present differential in rates as between the empty vehicle and vehicle load produces a maximum burden that is somewhat above the Western State average for some vehicles in the heaviest weight categories (gross weight). Although Colorado's policy may be defensible in terms of over-all burden, adjustment of the differential as well as the maximum mill levy would remove any reasonable basis of criticism.[72] The precise adjustment in rates which is needed to accomplish these ends should be determined by the research staff of the Highway Department, and no appreciable loss in revenue would be involved.

The most serious inequity in the economic impact of Colorado's user tax system at the present time is the extremely low costs for most classes of not-for-hire and farm trucks and combinations. The extremely preferential treatment accorded these types of use and vehicles cannot be justified. These vehicles are employed in business and profit making activities, though perhaps not as intensively as the for-hire group. A cost differential of from 25 to 30 percent would appear to be reasonable, and Colorado's policy might appropriately be adjusted to conform to this guide as well as the practice of the majority of Western States.

In general, the charge that Colorado's ton-mile tax is driving commercial carriers out of the State does not appear to be merited on the basis of relative burdens. However, Colorado's costs are high and if alternative routes through lower cost states exist in the case of east-west transcontinental hauls some re-routing is a logical expectation. At the same time, it should be recognized that the conditions under which this action is likely to be profitable are limited, and profits are the primary determinant of business policy. From a factual standpoint there is no indication in the records of the Ton-Mile Section that any traffic has been diverted from Colorado following the passage of the 1955 tax law. With the adjustments in burden previously indicated, therefore, Colorado may well disregard possible future claims of commercial carrier groups that the State's user tax burdens are excessive and tend to drive business out of the State.

The ton- and passenger-mile taxes are relatively difficult to administer, but they can be effectively enforced at a cost that is not excessive. Checking of weights and routes by the ports of entry and by the State Patrol accompanied by periodic inspection of carrier records are the keys to such enforcement. Colorado is presently relying on port of entry and Patrol plus carrier reports. This procedure is reasonably satisfactory, but an emphasis upon inspection of carrier records is highly desirable. An expansion of office as well as field inspection staff is indicated.

Registration and Fuels Taxes. The base of Colorado's registration tax on not-for-hire and farm trucks and combinations should be changed from empty to gross weight. The empty weight concept is unrealistic and is inconsistent with the ton-mile base in the case of for-hire, intercity vehicles. It also contributes to the present undesirable burden differential between these user groups. Such a change would be in accord with the practice of the majority of states, and would facilitate the adjustments in burden recommended in the discussion of the ton-mile tax.

An additional rate on diesel fuel amounting to approximately one-third of that on regular fuel or 2¢ per gallon is believed to be highly desirable. This would offset the conservatively

[72]Existing evidence concerning the precise relationship between the weight and weight distribution factors and damage is incomplete. A specific evaluation of burden relationships upon this basis, therefore, is infeasible.

estimated advantage in terms of miles per gallon enjoyed by the users of such fuel. It should be noted that the burden analysis in Colorado does not provide a firm basis for conclusions concerning diesel as opposed to gas-powered vehicles. While the differential indicated favors diesel-propelled vehicles, limited type individual vehicle studies are required in this type of problem situation and provide the basis for the foregoing recommendation.

Revenue Potential of Highway User Taxes And Fees

Past experience suggests that the revenue potential of the user tax system is excellent. Receipts will undoubtedly increase substantially on an annual basis under existing provisions of the tax laws. Certainly, the continued growth of all phases of motor transportation must be assumed. If user payments fail to keep pace with rising costs, rate increases generally may be expected to produce proportionally larger yields. However, broad policy considerations involving the economic impact of particular taxes and user taxes as a whole do suggest certain limitations. In particular, the burden of individual user taxes or user financing in general should not be pushed to the point of denying or seriously restricting the use of facilities by any class of socially beneficial user.[73] The burden of fuel and registration taxes upon the owners of private passenger cars, for example, tends to be regressive and may well be approaching the point at which curtailed use is encountered.

Recognizing these limits, which cannot be precisely defined, the future revenue potential of the user tax system is still substantial. In particular, there are several changes in Colorado's present user tax system which are desirable per se that would produce significant increases in current revenues. Adoption of a reasonable schedule of rates based upon gross weight for not-for-hire and farm vehicles would produce at the minimum around $1,600,000 per year.[74] Tighter enforcement of existing taxes, especially in the case of motor fuel tax refunds, the special fuels tax, the fuels tax in the case of interstate carriers and the ton-mile tax would be highly productive as judged by the experience of other states. The imposition of a differential rate on diesel fuel would result in a minor increase in revenue but is essential on grounds of equity. The suggestion that the ton-mile tax rate differential be adjusted would not appreciably affect the total yield of the levy.

An increase in the rates of the motor fuels tax obviously offers the greatest return from a revenue standpoint. A 1¢ per gallon rise in the present 6¢ rate would produce in excess of $5,000,000 in net collections. In view of the rates in adjoining states and the economic effect of the tax on no-business users this action does not appear to be desirable at the present time.

[73] Highway use logically should be restricted to sizes and weights of vehicles that the facilities are constructed to handle.

[74] This assumes an approximate doubling of existing rates which would fall far short of achieving the suggested burden differential between these users and for-hire group.

CHAPTER XI

INSURANCE TAX

The special nature and function of insurance companies has caused such enterprise to be generally subjected to tax treatment which is different in important respects from that afforded other business institutions. The first state to impose an insurance tax was Connecticut which, in 1816, placed a six percent levy on the capital stock of all insurance companies operating in the State. New York followed in 1824 with a 10 percent tax on the gross premiums of foreign fire insurance companies (companies organized out-of-state) and by the time of the Civil War a special tax on insurance companies was common to all states. This system of special taxes continues to the present time.

Some of the early features of insurance tax legislation have been largely discarded. For example, the early tendency to exempt domestic companies from the tax has almost disappeared. In states where this provision did not originally apply, the frequently used differential rate favoring domestic over foreign companies has also been reduced in importance.

On the other hand, certain features have been generally retained of which the use of gross premiums as a basis of the tax is the most important. The adoption of gross premiums rather than net income as the tax base is explained by the difficulty of ascertaining net income for certain types of insurance carriers. In the case of life insurance companies particularly, there is the difficult technical question of what constitutes the required legal reserve to be maintained and therefore the allowable deduction from gross income. Moreover, in the case of mutual companies, difficulty arises in determining taxable net income where the receipts in excess of necessary expenses and additions to reserves are redistributed to policyholders in the form of reduced rates and/or dividends.

Another of the early features of insurance tax legislation which continues to be a part of present day law in most states is the so-called "retaliatory" clause. In effect this feature tends to equalize the rate of tax levied upon insurance company premiums by the various states. For example, if the rate were increased in Colorado, while Washington had lower rates, the retaliatory provisions of the law would take effect and the tax paid on business written in Washington by Colorado companies would be increased, although competing companies domiciled elsewhere would continue to pay the lower tax rate.

Legal Status of Insurance Taxes

A legal question in early tax legislation was whether the insurance business was a valid subject of taxation by states since such business could be considered interstate commerce.

In 1869 in the case of Paul v. Virginia the U. S. Supreme Court held that the insurance industry was local business and subject to state regulation.[1] Similarly, in 1931 the Court held that insurance was not commerce, either state or interstate, and could be taxed by the states without violation of the federal constitution.[2] In 1944, however, the Court ruled that the insurance business was a matter of interstate commerce subject to the federal anti-trust laws.[3] As a result of this decision it was feared by some states that laws which discriminated against foreign companies would be found unconstitutional. The McCarren Act of 1945, however, clarified the rights of the states by providing that state taxation of insurance companies was legal if it did not conflict with federal policy, even though the insurance industry was interstate commerce.[4] Also, in 1946, the U. S. Supreme Court upheld California and South Carolina insurance laws which imposed higher tax rates on foreign companies.[5]

Rationale of Insurance Taxes

Insurance taxes were first sanctioned in order to cover costs of operating insurance departments. Insurance commissioners required trained personnel and it was considered equitable for insurance companies to bear the burden of these costs. Currently, however, the costs

of insurance departments tend in most states to be much less than the amount of insurance taxes collected.

The development of insurance taxation as a source of general revenue, that is taxation to bring in revenue over and above costs of administration, has been opposed on a number of grounds. It is claimed, for example, that the tax, because of shifting, results in higher insurance costs to the public. This in turn tends to deter savings—in the nature of life and annuity contracts. Accordingly, so the argument runs, public welfare expenditures must necessarily increase to fill the gap. It is also pointed out that the tax is regressive in that it places a heavier burden on the lower income groups which are, in relation to personal income, relatively large holders of life and annuity policies. It is further contended that if a levy on gross premiums is not shifted, double taxation results since it is usual for insurance companies to be subject also to the general property tax. An additional objection is raised by certain types of insurance carriers, notably mutual companies and fraternal and benevolent societies who feel that since they are allegedly non-profit enterprises they should be free of taxes. This objection has apparently carried much weight since most states now grant exemptions to organizations of this type. Finally, insurance taxes are opposed on the grounds that they discourage the development of the industry in the state (if domestic companies are taxed) or drive it to more favorable tax climes.

Proponents of the insurance tax answer these arguments point by point. The criticism that the tax decreases savings is declared to be inconsistent with the claim that the tax is shifted. If, as opponents charge, the tax is passed on to the consumer (buyer of insurance) then savings in the form of life insurance will not be affected. If, on the other hand, higher premiums cause a large decline in the amount of insurance purchased, then savings in the form of life insurance will decline. But total community savings need not be reduced since other forms of savings exist.

Closely related to the foregoing and bearing upon the opposition argument that insurance taxation will drive up relief roles and welfare expenditures, proponents of the tax raise the following questions: (1) Will people who depend on welfare spending be influenced by a change in the price of insurance? (2) Would potential policyholders actually be deterred from buying insurance even if the price went up? In addition to raising these questions proponents point out that historic data show little significant correlation between the movement of welfare expenditures and insurance sales.

In reply to the claim that the tax is regressive, supporters of the tax hold that this may in fact be the case but counter with the observation that the insurance tax is no more objectionable on this score than a host of commonly used sales taxes.[6]

On the question of double taxation it is further observed that insurance companies are, in effect, largely exempt from the property tax. This follows from the fact that the assets of insurance companies are intangibles, in the main, and in many states such property is exempt from the general tax. Moreover, the double tax argument is regarded as entirely without force when the opposition contends, as they do, that the burden of the tax is borne by the policyholder since this admits ability to shift the tax elsewhere.

Despite efforts to either eliminate or reduce insurance tax rates state legislatures generally have remained adamant. The two major reasons for the retention of the tax have rested on the practical consideration of revenue need as well as on grounds of equity. In respect to the latter, it has been generally recognized that unlike most business enterprises insurance companies pay no other form of sales tax, nor do they pay an income tax as a rule. Moreover, their property tax is usually very low. Under these conditions a special levy has appeared as an appropriate compensatory tax equalizing the tax burdens between the insurance industry and other industries. Finally, the insurance tax is indirect and can easily be disguised in higher premiums.

Insurance Taxation in Colorado

A special tax on insurance companies in Colorado dates from 1883 when a levy of 2 percent was placed on net premiums; this was changed in 1885 to a levy on gross premiums. The stated purpose of the tax was to cover costs of regulating the insurance business. The act provided that additional assessment could be made upon individual companies in proportion to the volume of their Colorado business should proceeds of the tax be inadequate to cover regulatory costs. Alternately, excess tax receipts were to be turned over to the school fund until 1885 and thereafter to the general fund. This latter provision currently applies with the exception of receipts from taxes on foreign fire underwriters which are paid into the Fireman's Pension Fund.[7]

The excess of tax receipts over administrative costs raised the question of the legality of an

---

[6] Adequate data are not available on insurance holdings by income groups. One tax study group has suggested that insurance purchases increase more than proportionately to income, and that an insurance tax is therefore less regressive than other types of sales taxes. State of New York, Temporary Commission on the Fiscal Affairs of State Government, *A Program for Continued Progress in Fiscal Management*, Vol. 2, 1955, pp. 275-277.

[7] State of Colorado, *Session Laws*, 1883, and 1885.

insurance tax as a revenue measure. The issue was decided in the case of the Colorado National Life Insurance Company v. Clayton, when the State Supreme Court held that the intent of the law was to provide funds for operating the insurance department (first established in 1907) and that tax collections in excess of the amount necessary for that purpose did not invalidate the law.[8]

General Provision of Colorado Insurance Law. All insurance companies doing business in the State unless expressly exempted are subject to a 2 percent tax on gross premiums collected or contracted for on policies of insurance covering risks within the State. Specifically the law reads as follows:

> All insurance companies doing business in the state shall pay—a tax of two per cent on the gross amount of all premiums collected or contracted for on policies or contracts of insurance covering property or risks within this state—after deducting from the gross amount of such premium the amount received as re-insurance premium on licenses in the state, and in the case of companies, other than life, the amount paid to policyholders as return premiums. - - [9]

In addition to the premium tax, insurance companies pay to the State various fees and charges as listed in Table 11.1.

Exemptions. The law expressly exempts from the tax certain types of insurance companies which include:

> All fraternal and benevolent associations—organized under the laws of this state and doing business in this state, and all purely mutual fire insurance companies organized and operated under the laws of this state.[11]

Tax exemption applies in full also to all companies, not otherwise exempt, whose assets consist of 50 percent or more of approved property in the State.

> If any company shall have 50 percent or more of its assets invested in bonds or warrants of this state, or of any county, city, town or district of this state and other property within this state in which said company is permitted by law to invest its funds, then said company shall not be required to pay the tax herein provided.[12]

An amendment of this provision specifies that a domestic type company may satisfy the 50 percent investment requirement by having the same proportion of its total reserves invested in Colorado as its Colorado business (measured by the face value of policies outstanding in the State) bears to its total business or outstanding policies.

> If any domestic type insurance company shall have and keep deposited in banks and trust companies within this state and otherwise invested, as required by law, in securities in this state, such a proportion of the companies entire reserves as the outstanding policies in Colorado are in proportion to all of the company's outstanding policies, the company shall to all intents and purposes be deemed to have 50 percent of its assets invested in banks, warrants and other properties within this state.[13]

This provision makes it possible for domestic companies to qualify for tax exemption if less than one-half of their assets are invested in Colorado. This could happen in cases where a domestic company had a larger part if its business (outstanding policies) in states other than Colorado. This, in fact, currently exists in the case of three Colorado companies which are tax exempt. (See Table 11.2.)

It is obvious that the purpose of these provisions is to exempt from the tax all domestic companies since foreign companies would have great difficulty in meeting the 50 percent requirement. In practice all domestic companies take advantage of these provisions while no foreign company does.[14]

[a] Not all domestic life companies are included in this tabulation but those that are accounted for over 95 percent of the total assets of domestic life companies in 1958.

Source: Data reported by individual companies.

While tax exemption is important to the individual companies the loss of revenue to the State on this account is small compared with what it would be if foreign companies were also exempt. Thus, as shown in Table 11.3, the 37 domestic insurance companies (exclusive of fraternal and benevolent association and domestic fire insurance companies which are otherwise exempt) received $15.3 million or 7 percent of total premiums paid in Colorado in 1957. In the life insurance business only the comparable ratio was 10 percent.

Other Taxes on Insurance Companies. Aside from the gross premiums tax no taxes other than the general property tax can be levied on insurance companies. Specifically the law states that the gross premiums tax:

> shall contribute all taxes collectible under the laws of this state—and no other occupation tax or other taxes shall be levied or be collected from any insurance company by any county, city or town within this state, but this law shall not be construed to prohibit the levy and collection of state, county, and municipal taxes upon the real and personal property of such.[15]

Fiscal Importance of Tax. As noted in Table 11.4 state revenues from the insurance tax increased from $1,075,138 in 1946 to $3,903,118 in 1957. For the same period per capita collections increased from $ .90 to $2.33. Insurance tax revenues in relation to personal income in-

creased from .08 percent to .12 percent. Thus, a rather marked increase in per capita collections has had only a modest impact on personal income.

Although the insurance tax, which in recent years has accounted for about 2.5 percent of total tax receipts of the State, is clearly a minor source of revenue it is important to recognize that these revenues are unincumbered because they flow directly into the General Fund. In 1957, insurance taxes represented slightly over 7 percent of total General Fund revenue, a ratio which could readily spell the difference between a deficit or a surplus in this vital area of the State's financial operation.

Area Comparisons

Western State Comparisons. Table 11.6 summarizes the status of each of the eleven Western States relative to the nature of insurance tax base, companies covered, exemptions and tax rates. Unless otherwise noted the following discussion relates to all forms of insurance sold in this group of states and to data in Table 11.6.

Tax Basis, Rates and Exemptions. Each of the eleven Western States, with the exception of Oregon in the case of domestic companies, uses gross premiums as the principal basis of its insurance tax. Oregon taxes the net income of its domestic companies but uses gross premiums as the basis for taxing its foreign companies. California, in the case of marine insurance, taxes profits as does Utah. Deductions allowed for gross premiums typically include return premiums, premium cancellations, dividends and amounts received as reinsurance premiums.

Nominal tax rates in the eleven Western States range from a high of 3 percent in Idaho to a low of 1 percent in Arizona and Washington. In practice, however, the nominal rate may be quite different from the effective rate due to rate schedules that vary by types of companies and to varying exemptions. Thus, in Arizona and Washington a higher rate applies to foreign than to domestic companies while in Oregon, as already noted, taxes gross premiums of foreign companies but levies on net income in the case of domestic companies. Montana's rate structure is complicated by a classification scheme in which rates differ in accordance with the size of the insurers' gross premiums as well as by type of business. In addition, some states have the retaliatory feature while others do not. Included among the former are Arizona, Colorado, Montana, Oregon, Utah and Washington.

Exemption policy differs in important respects between the Western States as is equally true for all states in the nation. Thus, Colorado is one among four Western States that grants tax exemptions in whole or in part if a specified portion of a company's assets are invested in the state in question. Colorado law allows full exemption to any company if 50 percent or more of its total assets are invested in the State. Idaho reduces its rate from 3 to 1 percent for companies which have 25 percent of their gross assets in securities and first mortgages within the State. New Mexico and Montana also apply a lower rate to firms having a certain specified amount of their assets invested locally.

Exemptions are sometimes given in whole or in part to mutual companies—a non-profit form of business enterprise in which receipts in excess of costs and reserve allowances are presumably returned to policyholders. In practice, exemption of mutuals is highly selective and lim-

Table 11.6

Insurance Tax Structure, Eleven Western States, 1957

State	Type of taxable insurance companies	Base	Rate (percent)	Exemptions[a]
Arizona	Foreign	Gross premiums	2.00	Fraternal benefit societies; title insurance companies; domestic benefit insurers; domestic hospital and medical service corporations; some surplus line brokers.
	Domestic	Gross premiums	1.00[b]	
California	All	Gross premiums	2.35[c]	Fraternal benefit societies; charitable and benevolent associations; agricultural nonprofit cooperative associations; some surplus brokers; withdrawn insurers.
Colorado	All	Gross premiums	2.00[d]	Fraternal benefit societies; domestic mutual fire insurance companies; mutual employers liability associations; mutual benefit associations; benevolent societies; also all companies with 50 percent of their assets invested in Colorado securities.
Idaho	All	Gross premiums	3.00[e]	Fraternal benefit societies; domestic fire insurance companies; non-profit medical, surgical and hospital corporations.
Montana	All	Gross premiums	2.25[f]	Fraternal benefit societies; stock and mutual life insurance companies; mutual rural insurance companies; assessment life insurance companies.
Nevada	All	Gross premiums	2.00	Fraternal and labor insurance companies protecting members and families only; some surplus brokers; land value insurance companies.
New Mexico	All	Gross premiums	2.00[g]	Fraternal benefit societies.
Oregon	Foreign	Gross premiums	2.25[h]	Fraternal benefit societies; domestic benevolent companies except for some casualty companies.
	Domestic	Net income	varies	
Utah	All	Gross premiums	2.25[i]	Fraternal benefit societies; some county mutual fire companies; non-profit hospital service benefit associations; cooperative life insurance associations.
Washington	Foreign	Gross premiums	2.00	Fraternal benefit societies; benevolent associations; title insurance companies.
	Domestic	Gross premiums	1.00[j]	
Wyoming	All	Gross premiums	2.50[k]	Fraternal benefit societies.

[a] Although it is not always specifically noted, medical and hospital associations are apparently exempt from all taxes except real estate under the nonprofit, benevolent classification.

[b] Surplus line brokers pay 3 percent; underwriters covering workmen's compensation and occupational diseases pay 2 percent, both on the base of gross premiums.

[c] Ocean marine carriers pay 5 percent of underwriting profits on business in State; surplus line brokers pay 3 percent less 3 percent of returned premiums.

[d] Surplus line brokers pay 2 percent of net premiums, as applies also in the case of inter-insurance receipts.

[e] Rates reduced to 1 percent if 25 percent of assets are invested in State.

[f] Rate is 1.25 percent if gross premiums are less than $5,000 and 2.25 percent if more than $5,000; also rate is ¼ of 1 percent additional on gross premiums of fire insurance companies. Rates reduced for any company which has 50 percent or more of its capital stock invested in the State.

[g] Rate is ½ of 1 percent if 50 percent of assets are invested in New Mexico.

[h] Foreign marine companies pay 5 percent of underwriting profits on business in State; all fire and auto insurance companies pay a fire marshall tax of ½ of 1 percent in addition.

[i] Surplus line brokers pay 3 percent; marine companies pay 5 percent of apportioned underwriting profits.

[j] Ocean marine companies pay an additional ¾ of 1 percent.

[k] Annuity companies pay 1 percent of gross premiums; companies not authorized to do business in the State pay 5 percent.

Source: Commerce Clearing House, *State Tax Guides, 1957.*

ited. Colorado goes perhaps as far, if not farther than any Western state by exempting domestic mutual fire insurance companies, employers mutual liability associations and mutual benefit associations. Every Western state exempts fraternal and benevolent associations.

Finally, all the Western States, with the exception of Nevada, expressly exempt insurance companies from one or more of the major taxes, particularly the corporate income tax. Utah is unique in expressly exempting insurance companies from all other forms of state taxation.[16]

Comparative "Tax Burden" and Revenues. Because of differences in rate schedules and exemptions, no precise determination can be made as to whether, on the average, one state imposes a heavier tax burden than another on insurance companies operating within its boundaries. It would appear, however, that Colorado's tax is more lenient than the average for the eleven Western States. Thus, Colorado's nominal rate of 2 percent on both foreign and domestic companies is equal to that of two states, New Mexico and Nevada, but below that of five other states, Idaho, Wyoming, California, Montana and Utah. Also Colorado's exemption policy, which eliminates all domestic companies from the premiums tax base, appears to be relatively liberal.

Western States	—	2.35	2.32	0.12
United States	—	2.51	2.94	0.12

Source: U. S. Bureau of the Census, *Compendium of State Government Finances*, 1957; and U. S. Department of Commerce, *Survey of Current Business*, August, 1958.

As seen in Table 11.7, Colorado's per capita collections from insurance companies amounting to $2.23 in 1957 was below the Western average of $2.35 as well as the national average of $2.51. Similarly, Colorado's collections as a percent of personal income amounting to .11 percent was below both the Western and national average of .12 percent.

Comparison Between All States. Because of the great variation in provisions of insurance tax laws a complete comparative analysis of insurance tax policies covering all forty-eight states would run to considerable length and go quite beyond the scope of this report. However, some insights into certain state policies may be had by confining the review to life insurance companies and the rates at which they are taxed. Table 11.8 presents for all states the tax rates applicable to both life and annuity policies of foreign and domestic companies. Highlights of this tabulation may be summarized as follows:

(1) For foreign life companies all 48 states levy a tax on gross premiums on life insurance but only 27 states tax annuities. The rates on life insurance vary from a low of 1.75 percent to a high of 4 percent. The prevailing rate which is 2 percent is found in 27 states.

(2) For domestic life companies 34 states levy a tax on gross premiums on life insurance and 22 states tax annuities. As in the case of the tax rate for foreign companies the prevailing rate is 2 percent.

Of the 14 states that do not tax the gross premiums of domestic life companies the majority reach the companies by other means such as a tax on gross or net income and by a tax on capital stock.

(3) Virtually all of the states (30 out of 34) that have a corporate income tax exempt insurance companies from this tax if a gross premiums tax is used.

(4) Eleven states (Alabama, Colorado, Florida, Georgia, Idaho, Louisiana, Montana, New Mexico, Oklahoma, South Carolina, and Texas) make some tax concession if companies have a designated percentage of their assets invested in the state. Colorado is the only state in the group which goes as far as to permit complete exemption on this account.

Should Domestic Companies in Colorado Be Taxed?

One particular feature of the Colorado insurance tax law which calls for re-examination is the existing tax exemption of domestic companies made possible by their compliance with the 50 percent investment rule. As earlier noted this exemption is not applicable in practice to foreign companies.

Table 11.8

Premium Tax Rates Applicable to Foreign and Domestic Life Insurance Companies in United States, 1957

State	Foreign Companies		Domestic Companies	
	Life insurance	Annuities	Life insurance	Annuities
	Rate in percent			
Alabama	3.00[a]	1.00	0.50	0.50

West Virginia	3.00	1.00	3.00	1.00
Wisconsin	2.00	0.00	[u]	[u]
Wyoming	2.50	1.00	2.50	1.00

[a] Foreign company rates reducible to a minimum of 2 percent. Reduction at rate of .10 of 1 percent for each 1 percent of assets invested in Alabama securities.
[b] Tax waived if 50 percent or more of assets are invested in Colorado securities.
[c] No tax after 1960.
[d] Some reduction permitted if regional home office is in Florida.
[e] If 25 percent of assets are invested in State the rate is 1.25 percent; if 75 percent the rate is .50 percent.
[f] Rate reduced to 1 percent if 25 percent of assets are invested in the State.
[g] Tax on capital stock.
[h] Subject to gross income tax.
[i] Tax reduced by one-third if one-sixth of total assets are invested in State.
[j] Only annuities issued after July 31, 1943 are taxable.
[k] An annual tax of 5 mills is paid upon each dollar of capital and surplus not to exceed $50,000.
[l] Differences between ad valorem taxes up to $20,000 and one-half of foreign company rate.
[m] May deduct whatever tax is already paid if 50 percent of capital stock is invested in State.
[n] Maximum taxable premiums limited to 12.5 percent of total premiums.
[o] Rate is reduced to .50 percent if 50 percent of assets are invested in State.
[p] A franchise tax is levied on capital and surplus.
[q] Rate is reduced if specified percentage of assets are invested in State.
[r] Subject to income tax.
[s] Tax on capital stock.
[t] Rate is reduced if specified percentage of reserves are invested in State.
[u] Tax is on renewal premiums only. Rate is reduced if a specified percentage of reserves are invested in State. If gross premium receipts from all sources are less than $450,000 the rate is 55/80 of 1 percent.
[v] Domestic companies pay license fee of 3.5 percent of gross income from all sources excepting interest required to maintain reserves, rents from real estate on which company has paid taxes assessed, and insurance premium and annuity considerations. Tax is limited to an amount which, when added to valuation fee does not exceed percentage of foreign company premium tax on like amount of business. No company with insurance in force of $450 million or more shall pay less than the specified premium of foreign company premium tax.

Note: Insurance companies paying a premium tax are specifically exempted from the corporate income tax in 30 of the 34 states which have the latter tax.

Source: Commerce Clearing House, *State Tax Guide, 1957.*

A principal argument against exemption with or without the investment tie-in (which itself is subject to question as a basis for exemption) is that insurance companies operating in Colorado are not subject to any tax other than that levied on general property. As such they are favored over other profit making enterprises which are subject to the income tax. Such discrimination appears to have little, if any, rational basis either in terms of relative services received from government or in ability to pay taxes. If it is argued that domestic companies should be subsidized for investing a relatively large proportion of their assets in Colorado the answer is, of course, that Colorado needs no subsidy to attract capital.[17] If this were the case Colorado's growth would have long since stopped. Moreover, foreign companies without exemption are investing large amounts in the State. Although for individual companies the amounts invested are less in proportion to their assets than holds for the domestic companies the absolute amounts may in cases far exceed those of the domestic companies.

[17] In accordance with sound economic principles, taxes should have a minimum influence in determining the allocation of economic resources in a relatively free market. Such allocation in a private enterprise system will best be determined according to the pattern of consumer preferences and relative costs. This being so, the existing tax subsidy for investing money in Colorado would be considered both economically and socially undesirable.

Table 11.9

Selected Data for Domestic Insurance Companies[a] in Colorado, 1957

(Dollar totals in thousands)

Life insurance companies	Date of incorporation	Assets	Liabilities	Capital	Surplus	Net gain before dividends[b] (life co's) or net income before fed. tax (all other co's.)	Total insurance in force	Premiums collected on Colorado business

[a] Exclusive of fraternal and benevolent associations and mutual fire insurance companies which are expressly exempt from gross premiums tax.

[b] Before dividends to policyholders and stockholders.

[c] Figures not presented in published annual report and are therefore omitted in this tabulation.

[d] Exclusive of State compensation insurance fund.

Source: State of Colorado, Commissioner of Insurance, *76th Annual Report, 1958.*

The subsidy argument can be pushed in another direction by pointing to the fact that the domestic companies are for the most part newly started and therefore small in capital and business volume. (See Table 11.9.) This being so, tax exemption is needed to promote their development. Recognizing that it is desirable to encourage the development of new and small business it must also be recognized that "infant industry" is universal and equity demands that all new business concerns be similarly treated should tax concessions be made on this account. Moreover, a tax concession is a weak reed for supporting an industry which in private competitive economy must and should be expected to stand on its own feet.

How Should Domestic Companies Be Taxed?

Assuming that the domestic companies in Colorado should take their place beside foreign insurance companies as well as other business enterprise and contribute their fair share of taxes to the State the problem then arises as to what type of tax would accomplish this end. Under the universally adopted gross premiums tax, insurance companies generally have claimed that they were more heavily taxed than other businesses. Although measurement of relative tax burdens is difficult at best there is no concrete evidence to substantiate this claim. Nor have insurance companies come forth with any alternatives which could be effectively implemented in lieu of the much maligned premiums tax. What then are possible alternatives?

Corporate Net Income Tax. The use of the corporate income tax appears on the surface at least to be the best method of taxing insurance companies. Since it reaches income and therefore ability to pay it would bring insurance taxation into conformity with other businesses paying a similar tax. Unfortunately, and as earlier noted, the net income of insurance companies is not readily ascertained. The problem of arriving at net income particularly for mutual companies but, in large degree for stock companies also can be resolved only by a more or less general adoption by the states and the companies of arbitrary standards of reasonable expenses and costs. Such an effort has not yet been attempted by either taxing agencies or insurance associations. Until this is done, if it can be done in any mutually satisfactory way, the income tax cannot be used effectively as an insurance tax.

Capital Stock Tax. Another alternative is the capital stock tax. Several states as indicated in Table 11.8 are using this tax in limited degree but largely as a supplement to the premium tax. The principal disadvantages of this form of tax are: (1) it is difficult to apply in the case of mutual companies, (2) prices of stock are not necessarily true indices of value, (3) prices may be lacking where stock is closely held, (4) valuation is difficult where there is a parent and subsidiary company relationship and (5) the determination of book value when market value is not available is difficult to ascertain because of the peculiarities of insurance accounting wherein true costs and income are not identified in the usual sense.

Application of the Gross Premiums Tax. The two aforementioned alternatives not being feasible, as evidenced by their limited adoption, directs attention again to the gross premiums tax as the more likely tax to use in reaching domestic companies in Colorado. Admittedly the tax at best is a crude device for reaching taxpaying capacity. To the extent that the tax is shifted it becomes a regressive franchise tax on the policyholder. The contention that the premium tax places a heavier burden on insurance companies than does an income tax on other businesses is valid only if the tax is not shifted, a situation which is not likely to occur, at least to the full amount of the tax levied. Similarly it has been held that since the premium tax is a proportional tax it places a heavier burden on new and small companies. Again this assumes that tax shifting does not take place.

The principal advantages of the gross premium tax is clearly the ease with which the tax base can be ascertained. Then too the larger companies pay more of the tax and it does provide a substantial amount of revenue. Finally, to the extent that the tax is not shifted it serves, in some degree, as a substitute for the income tax. In the absence of a more effective alternative state legislators have generally accepted the gross premiums tax as the most appropriate levy for reaching the insurance business.

Potential Revenues From Modification of Existing Colorado Law

If Colorado were then to eliminate its existing investment provision of the law, which has the effect of exempting all of its domestic insurance companies, this would add $15,294,000 to the tax base as measured by gross premiums in 1957.[18] At the present nominal rate of 2 percent this would add $306,000 to tax revenues. If, however, the tax rate were applied to "new" premiums—that is only to premiums on policies written from the date when tax exemptions

[18]This includes domestic life insurance companies, multiple line companies, fire insurance companies (stock companies only) casualty companies and reciprocals. (For basis of computation see Table 11.3.)

were removed—the estimated additional tax revenue would amount to $46,000.[19]

If domestic companies, otherwise exempt, were taxed (e.g. fraternal societies, mutual fire insurance companies, mutual benefit associations and county mutual protective associations) the tax base, measured by gross premiums collected in 1957, would be increased by $1,643,000 with a tax potential of $33,000.[20]

Changing the Rates on Foreign Companies. Table 11.10 shows the fiscal effect of increasing Colorado's 2 percent tax rate on foreign companies comparable with those used in a number of the Western States.[21] It will be observed that if Colorado's rate in 1957 had been 2.25 percent, which is the rate used in Utah, its revenues for that year would have been $534,000 over what they were. Similarly at the rate of 2.50 percent, which is the rate used in Wyoming, revenues would have been enlarged by $1,068,000 and by $2,136,000 if the rate had been 3 percent as in Idaho.

[19] This figure is based on the reports of a representative list of domestic companies which estimate that approximately 15 percent of their 1957 premiums income in Colorado was from new business or policies written in that year.

[20] This figure includes total premiums. For basis of computation, see Table 11.3.

[21] Because of retaliatory legislation in most states an increase of the rate on foreign companies would also increase the rate on domestic company business done in other states if the latter did not have a rate above 2 percent.

Table 11.10

Estimated Insurance Tax Revenues With Varying Rates Applied to 1957 Calendar Year Gross Premiums Base of Foreign Companies Operating in Colorado

Rate (Percent)	Estimated revenues	Estimated increase over 1957 revenues
2.00	$4,271,164[a]	$ —
2.25	4,805,059	533,895
2.50	5,338,955	1,067,791
3.00	6,406,746	2,135,582

[a] Actual premium revenue from a gross premium base of $222,974,812. The succeeding estimated figures have been increased in the proportion that the assumed rate increases bear to each other. It should be recognized that estimated revenue totals are conservative for purposes of estimating future revenues since premium volumes will be constantly increasing.

CHAPTER XII

PERSONAL INCOME TAXATION

The personal income tax is the most important single tax in the United States. It alone in our battery of taxes is based directly on the ability-to-pay principle and provides the major element of progressivity in the nation's over-all tax structure. As a dominant and permanent feature of the American fiscal system, it is essentially a twentieth century phenomenon which has been aptly described as "the outstanding contribution of popular and liberal philosophy to modern fiscal practice."[1]

Taxation cannot be divorced from expenditure policy and the growth of federal income taxation in the United States may be attributed primarily to the continuous increase in the cost of financing war and national security.[2] Similarly, on the state level, the expansion of government expenditures, particularly for education, highway construction, and social welfare services, has been basically induced by the increase in population, urbanization, the development of modern technology, and the industrialization of the economy. Thus the growth in the importance of both federal and state personal income taxation reflects the unprecedented rise in governmental services and expenditures during the past half century and the public's insistent demands that the increased tax burdens be distributed more directly, widely and equitably. Today, in addition to the federal government, more than three-fifths of the states, plus numerous local taxing jurisdictions, mainly in Pennsylvania, Ohio and Kentucky, have incorporated some variant of the personal income tax into their revenue structures.

Although the net income tax is a relatively modern innovation, the origins of the tax can be traced back to its sporadic use as a graduated poll tax in England during the Middle Ages,[3] and to the "faculty" taxes levied upon professional people and artisans in the early American colonies.[4] Some forms of state income taxes, ineffectively administered by local assessors, persisted in a few states throughout the nineteenth century. The first American federal levy on personal incomes was passed by Congress as an emergency measure during the Civil War and the first peace-time version was enacted in 1894 only to be declared unconstitutional by the Supreme Court the following year.[5] It is generally agreed that the real beginnings of personal income taxation in the United States were marked by Wisconsin's enactment of a centrally administered state income tax in 1911 and by the passage of the 16th Amendment and the federal income tax act of 1913. The success of these measures soon became apparent and during the next two decades a dozen states introduced centrally administered income taxes. Another wave of the adoptions occurred in the nineteen-thirties[6] when sixteen more states, including Colorado, enacted income tax laws in order to cope with the fiscal problems caused by the Great Depression and to relieve the badly strained general property tax. Although there have been no additional state adoptions of the personal income tax since the nineteen-thirties,[7] an unparalleled increase in the amount of individual income tax collections has taken place on both the federal and state levels as shown by Table 12.1.

[6] State adoptions of personal income taxation in addition to Wisconsin were as follows:

1912—Mississippi
1917—Montana, Massachusetts, Missouri, New York
1919—North Dakota
1921—Delaware, North Carolina
1926—South Carolina, Virginia, Arkansas, Oregon
1931—Georgia, Idaho, Utah, Vermont
1933—Alabama, Arizona, Kansas, Minnesota, New Mexico
1934—Iowa, Louisiana
1935—California, Oklahoma
1936—Kentucky
1937—Colorado, Maryland

U. S. Bureau of the Census lists 31 personal income tax states, but New Hampshire (1923) and Tennessee (1931) limit the tax only to incomes derived from interest and dividends and are excluded from the above compilation.

[7] A corporate income tax was enacted in Rhode Island in 1947, and in Delaware and New Jersey in 1957.

Table 12.1

Personal Income Tax Collections in the United States, Fiscal Years, 1942-1957

	Collections (millions)		Percent of total tax collections	
	1942	1957	1942	1957
Nation as a whole	$3,527	$37,387	16.8	37.8
Federal Government only	3,251	35,620	26.5	51.0
The 29 income tax states	249	1,557	9.2	18.5
Colorado	3	23	8.0	15.7
Colorado General Fund	2[a]	22[a]	33.3[a]	48.4[a]

[a] Revenue only.

Source: U. S. Department of Commerce, Bureau of the Census, *Statistical Abstract of the United States: 1949*, p. 398; *Governmental Finances in the United States: 1952* and *1957*, Table 2; *Compendium of State Government Finances in 1957*, Table 5; State of Colorado, Department of Revenue, *Sixteenth Annual Report*, 1958, Table 17; and *State of Colorado Budget Reports*, 1943 and 1958.

It will be noted that in a decade and a half the increase in federal income tax receipts was ten-fold, and for state receipts six-fold. Equally significant is the fact that during this same period the relative importance of the tax (expressed as a percentage of total tax collections) actually doubled for Colorado and the other income tax states, as well as for the federal government. During fiscal year 1957 the combined value of tax collections from this source for federal, state and local units of government exceeded $37 billion, or comprised almost two-fifths of the nation's total tax revenues. On the state level alone they amounted to more than $1.5 billion, or 18.5 percent of the total taxes collected by the twenty-nine states which levy personal income taxes. There were, of course, wide variations in the relative importance of the tax between individual states, ranging from 4 percent for Mississippi to 48 percent for Oregon. In Colorado, personal income taxes provided $20 and $23 million during fiscal 1956 and 1957, respectively, or approximately 14 and 16 percent of the total tax collections for these years. Although the percentage share obtained from this source by Colorado is below the average of the other income tax states, the aggregate data do not fully disclose the quantitative significance of the tax in the State's fiscal structure. Colorado currently is earmarking more than 70 percent of its tax revenues for specific expenditure purposes.[8] Of the "big three" revenue raisers for the State—sales, highway user and income taxes—only the proceeds of the latter are available for legislative appropriations. As such the income tax constitutes the principal source of revenue for the State's General Fund. In 1957 personal income tax collections alone provided almost one-half, and when combined with the corporate income tax they accounted for 58 percent of the total tax receipts making up the General Fund.[9] This does not imply that the income tax is relatively too heavy or that the level of services currently financed by earmarked funds would be appreciably altered if such taxes were freed from earmarking and transferred to the General Fund. But it does indicate that in light of the constitutional earmarking of excise, sales and highway user taxes, and the continued declining importance of the property tax on the state level, it is not unlikely that the major reliance for providing new revenues and achieving fiscal flexibility will continue to fall mainly upon the income tax. On this score alone the income tax may be the key to the problem of state finance.

[8] State of Colorado, *Budget Report*, January, 1958, Statement III.

The Rationale of Income Taxation

The personal income tax probably conforms in principle more closely than any other single tax to the ideal of the good tax. Ever since the publication of Adam Smith's celebrated canons of taxation in 1776[10] public finance scholars have agreed that one of the most basic requisites of sound taxation is that it be fair—that it result in an equitable allocation of the tax burden. And today the generally acknowledged standard of fiscal fairness is that taxes be levied in accordance with the taxpayer's economic well-being or "ability-to-pay" as reflected by his net income adjusted for variation in family obligations. It is recognized that exact differences between individuals' taxpaying capacities cannot be measured precisely by any single criterion. Personal net income, for example, only indirectly takes into account differences in accumulated wealth or rates of saving and spending, factors which also could be considered as affecting tax equity. Nevertheless, no other single factor is as general or significant a measure of relative economic well-being and taxpaying capacity as personal income received. This is especially so for an industrialized economy such as ours in which approximately three-fourths of the nation's total personal income is received in the form of wages, salaries and non-property income, and only one-fourth takes the form of interest, rents and profits arising from the ownership of wealth.[11]

Legally, taxes are based on a variety of specific things and transactions, such as the

[9] *Ibid.*

[10] A. Smith, *Wealth of Nations*, Bk. V, Chap. 2. Smith's first canon of taxation was that "the subjects of every state ought to contribute toward the support of the government, as nearly as possible, in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state." This implies that both the "ability-to-pay" principle and the "benefit" principle of taxation are essentially to be based on income received (or "revenue" in Smith's terms).

[11] U. S. Department of Commerce, *Survey of Current Business*, April, 1958.

assessed value of real estate, the sale of liquor, cigarette consumption, the purchase of gasoline; but whether direct or hidden the impact of taxes is always on people. Regardless of the type of tax levied—income, property, general sales, or specific excise—its effect is to leave the person upon whom the incidence of the tax falls with less real income (i.e., with less money income, higher prices on goods and services purchased, or both) than would have been the case in the absence of the tax. In this sense practically all taxes are "income taxes" in that they ultimately must be paid from the economy's real income stream.[12] *In other words, the various types of taxation used by the state actually do not represent alternative sources of revenue, but rather different allocations of the tax burden since the distribution patterns of the sundry tax bases and rates by income groups do not parallel each other.*

The great bulk of state taxes based on general sales, alcohol, tobacco, gasoline, motor vehicles and residential real estate fall directly on family consumption expenditures and, thus, work out to be regressive in character. For example, on the basis of the comprehensive LIFE *Study of Consumer Expenditures* for the year 1956, it appears that the Colorado sales tax burden on families with annual incomes of $2,000 or less was 1.7 percent, or more than twice as much as that on families with incomes of $10,000 or more for whom the sales tax burden worked out to be approximately .8 of 1 percent.[13] Similarly, on a broader scale it has been estimated by a national tax authority that combined state and local property, excise and sales tax levies in 1954 averaged 9.4 percent of the pre-tax incomes for all spending units in the nation with annual incomes of $2,000 or less, and was only 5.3 percent for spending units with incomes of $10,000 or more.[14] This regressivity of state sales taxation is further confirmed by a post-war comparative study of income and sales taxation for the State of Washington which also showed that "families with incomes of $1,000 pay twice as large a percentage of their incomes in sales taxes as do families with incomes of $10,000 or more."[15]

In brief, only the personal income tax is directly based on the ability-to-pay principle as measured by net income. The tax liability is legally related to the amount of income received and some allowance is provided for the cost of acquiring gross income. As a direct tax it generally cannot be shifted by the initial taxpayer to others through the pricing system and result in a distortion of the apparent distribution of the costs of supporting state government. And an income tax system that incorporates withholding and "pay-as-you-go" features matches to a large degree the administrative convenience and collection advantage of sales and excise taxes[16] which allegedly are relatively painless in that they only extract a few pennies at a time from the taxpayers' pockets. And since the income tax is not likely to be hidden by the shifting process the people know or can easily ascertain what taxes they are actually paying. This is of considerable importance in a democratic society which always must be concerned with developing a responsible and tax-conscious citizenry.

The tax also provides the fiscal structure with a large degree of inherent flexibility—individual tax liabilities, as well as state revenue, automatically adjust to changing economic conditions. During periods of national economic growth characterized by increased governmental services and expenditures the rise in personal income automatically provides an expanded income tax base and tax yield which in part helps meet the state's need for greater revenues. Also, from the individual taxpayer's point of view, because the tax is assessed only during those periods in which net income is earned it proves to be significantly less burdensome than relatively fixed taxes such as those based on real property values or the purchase of commodities which are highly income inelastic. This is particularly evident in the case of farmers and small businessmen whose incomes are subject to considerable cyclical fluctuations and for individuals whose incomes fall drastically because of some personal misfortune. Of course, it would appear by definition that the counterpart of flexibility for the taxpayer is instability of revenue for the state. These concepts are said to be merely the two sides of the same coin. But it does not follow that the advantages of one are necessarily offset by the

[12] An apparent exception is the taxpayer with insufficient current income who lives off his capital by drawing upon past accumulated savings or inherited wealth in order to meet his tax liabilities. In this case the current tax actually is being paid from past income; contrariwise, if paid with borrowed funds it could be considered a charge against future income.

[15] P. W. Cartwright, "Public Attitudes Towards Sources of State Revenue," *National Tax Journal*, Dec., 1949, p. 370.

[16] The cost of administering the personal and corporate income taxes in Colorado since the introduction of payroll withholding in 1954 has averaged 3 percent of the total collections, whereas the cost of collecting state cigarette taxes has been estimated to be 6 to 7 percent of the gross tax. See Chapter XVIII, below.

disadvantages of the other. Tax flexibility is highly desirable for the individual taxpayer in terms of convenience and fairness, and for the economy as a whole in that it helps mitigate the swings of the business cycle. On the other hand, it is obvious that instability of revenue yields makes the planning of public expenditures and fiscal budgeting extremely difficult, particularly for state and local authorities. However, so-called "stable taxes" such as those based on property, also have proven to be highly unstable sources of revenue during periods of severe economic crisis as in the nineteen-thirties when state and local governments were confronted with an "avalanche of property-tax delinquencies and forced sales."[17]

Moreover, it should be noted that the personal income tax ordinarily is not levied upon incomes below some socially acceptable minimum standard of living. By use of exemptions and deductions the legal definition of taxable income takes into consideration the size of family, physical infirmities of old age and blindness, and extraordinary drains on income due to medical expenses or casualty losses. On the other hand, the application of graduated rates to incomes above the socially determined minimum standards of living provides the major element of progressivity to the state's revenue structure.[18] All of these factors make the personal income tax eminently fair and convenient. To summarize, since income received is the most satisfactory measure of economic well-being, the apportionment of the cost of state government will conform to the ideal of tax equity based on the ability-to-pay principle to the extent that a graduated personal income tax is used as a principal source of state revenue.

In addition to being the most desirable form of taxation in terms of equity considerations, it appears that the personal income tax has less adverse effects than other leading types of taxation on the operation of the economy in terms of economic efficiency. It substantially meets the test of tax neutrality which has been defined as "taxation that does not alter the allocation of resources."[19] All taxes, of course, have some influence on the structure of relative prices, production and employment which prevail in the private sector of the economy. There are no neutral taxes in the sense that a tax can be completely independent of the economic activity which individuals undertake. It is generally understood, that sales, excises and ad valorem levies relatively have the greatest *direct* effect on the market prices of individual goods and services taxed and, therefore, directly disturb economic relationships which otherwise would emerge from the operation free-market forces. In other words, such taxes distort the allocation of resources unless it can be shown that the tax offsets competitive imperfections in the system or helps achieve other socially desired goals of the private enterprise economy. On the other hand, a uniform lump-sum levy which is not passed on to others, such as a poll tax, might be considered ideal by the neutrality criterion although it obviously would prove to be inequitable by accepted standards of fiscal fairness. But even the poll tax leaves the taxpayer with less purchasing power, and the reduction in income influences his spending and saving decisions. Similarly, the personal income tax is levied in part upon economic surpluses and to the extent that the tax cannot be directly shifted through the market it too has only an "income effect" on price neutrality. Moreover, it is not likely that any significant shifting of the tax occurs indirectly through changes in the supply of the factors of production.[20] Although economic analysis indicates that theoretically all taxes should have some finite impact on factor supply there is no conclusive evidence that the personal income tax actually deters work incentives or discourages aggregate investment. To the contrary, such evidence as is available supports the proposition that the imposition of income taxes has had a tendency to stimulate effort and risk-taking on the part of many individuals who attempt to compensate for the loss in "take-home" income due to taxation.[21] In brief, the personal income tax is highly neutral in that it does not tend to distort the structure of relative prices or materially alter the patterns of consumption and production, and thus it has minimal adverse effects on the efficiency of the

[17] A. H. Hansen and H. S. Perloff, *State and Local Finances in the National Economy* (New York: W. W. Norton, 1944), p. 39. For example, in Colorado state assessed valuations declined by about 31 percent, and state property tax collections fell by more than 35 percent during the four year period from 1929 to 1933. And "at the end of the calendar year (1933) the tax delinquency was 26.6 percent by counties, ranging from 66.3 percent in Costilla County . . . to 3.6 percent in Jackson." Colorado State Tax Commission, *22nd Annual Report*, 1933, p. 6.

Butters, "Taxation, Incentives, and Financial Capacity," *American Economic Review*, Supplement, May, 1954, p. 505.

economy as judged by the market standards of a free-enterprise system.[22]

Another related advantage of the income tax is that it automatically provides a counter-cyclical effect to the fluctuations which occur in over-all business activity. The achievement of domestic economic stability is widely recognized today to be an important goal of governmental fiscal policy. For example, post-war federal legislation has explicitly stated that it "is the continuing policy and responsibility of the federal government. . . to promote maximum employment, production and purchasing power."[23] At the state and local levels, however, tax policy understandingly must be more concerned with developing adequate and stable sources of revenue than with compensating for the ups and downs in general business activity. Nevertheless, state taxes that automatically have a stabilizing effect are to be preferred over those which aggravate the business cycle. On this score the graduated personal income tax is unique in that it adds a degree of "built-in flexibility" to the private sector of the economy. Without legislative (or deliberate) alteration of the structure of tax rates or change in definition of tax base the total revenues from this source will vary directly and progressively with changes in levels of aggregate employment and income. In periods of prosperity the sharp rise in income tax collection tends to dampen private spending and check inflationary forces which lead to "boom and bust." Contrariwise, in periods of depression the automatic reduction in the public's tax liability helps to induce consumption and investment expenditures which tend to mitigate the severity of the business contraction, unemployment and price deflation. In passing, it may be noted that one of the obstacles to economic stability before World War II was the "fiscal perversity" of state and local government units whose collective taxing and spending activities intensified rather that moderated the forces behind both inflation and depression.[24] During the post-war era the continuous growth of total state and local expenditures, from less than $10 billion in 1946 to over $35 billion in 1957, has been one of the primary factors accounting for the general economic prosperity and stability which has characterized this period. And with state and local taxes constituting more than one-quarter of the nation's total tax bill during the past decade[25] it would appear that all units of government will continue to have some responsibility for pursuing tax policies which do not unnecessarily induce economic instability.

Apart from the administrative considerations treated in the latter part of this chapter, the rationale for utilizing the personal income tax as a major source of state revenue is that it, more than any other single type of state taxation, meets the four basic criteria of a "good tax" for a modern industrialized economy: (1) *adequacy*—it directly reflects the state's taxable capacity inasmuch as all taxes ultimately are paid from the state's income stream; (2) *fairness*—it conforms with the ability-to-pay principle which is socially accepted as the standard of equity for the apportionment of the tax burden; (3) *neutrality*—it has minimal adverse effects on economic efficiency as determined by market standards; and (4) *flexibility*—as a compensatory fiscal device ("built-in stabilizer") it contributes to the state's economic welfare by lessening the degree of instability in the private sphere of the system.

History of Personal Income Tax Legislation in Colorado

Prior to World War II the history of income taxation in Colorado, as in many other states was closely related to perennial attempts to reform the administration of state property taxation. As already noted, the first successful development in this direction was Wisconsin's enactment of a centrally administered state income tax in 1911. The following year, the newly created Colorado State Tax Commission, in its first annual report, advocated the use of an income tax as a supplementary source of state revenue. The Commission's strongest recommendation for the tax was made in its *7th Annual Report* in which it explicitly stated that:

> years of experience by every state in our nation has conclusively demonstrated that a success cannot be made of trying to tax intangibles. Experience has likewise demonstrated that the income tax for all purposes is the only rational solution of the problem. Of all systems, the income tax is by far the fairest.[26]

This remained the Commission's position throughout the next decade notwithstanding the unsuccessful attempts made to pass an income tax amendment to the State Constitution by farmers who formed a Colorado State Tax Revision Committee in 1922 and by Governor Sweet's

[22] It may be noted that one cannot logically argue that he favors a private enterprise system in which market forces are determinate and at the same time advocate in place of the income tax the extensive use of sales and excise levies which misallocate resources as well as work out to be regressive in character.

administration in 1923 and 1924. No additional income tax referenda were initated during the twenties but the public continued to be concerned with the inherent administrative weaknesses of the property tax. In 1930 the Denver Chamber of Commerce commissioned Professor J. P. Jensen, a national tax authority, to make a comprehensive study of the State's fiscal structure. In his final report, Jensen noted that the "first and greatest requirement of a state tax system is that the aggregate tax each taxpayer pays must bear some reasonable relation to his net income" and that it would not be possible to reduce taxes on property so long as no other taxes, such as income taxes, were permitted.[27] With the advent of the Great Depression the Tax Commission changed its former position and advocated a state sales tax as the "panacea" for resolving the State's aggravated financial difficulties.[28] A large body of public opinion, however, continued to favor the personal income tax. Two bills, one with graduated and the other with flat rates, were defeated in the legislature ostensibly because there were some doubts "as to their legality without constitutional amendment," and three more unsuccessful attempts to amend the constitution were made in the early nineteen-thirties.[29] In 1935 an income tax bill, still based on the belief that an amendment was not necessary, was passed by the legislature, but Governor Johnson vetoed the act on grounds that in his opinion it was unconstitutional. Finally, in 1936, with strong support throughout the State from organized labor, farm, and public education groups, the income tax amendment was passed by popular referendum.[30] The following year, after a quarter of a century of fiscal controversy on this score, Colorado's first income tax was enacted, effective July 1, 1937.

The basic provisions of the original act and the major statutory revisions made during the next two decades are summarized below:

(1) *Coverage.* The tax was and continues to be applicable to all residents within the State and all non-residents who receive all or part of their personal income from sources within the State.

(2) *Deductions.* Determination of taxable income in general follows the federal practice of permitting some deductions for charitable contributions, interest paid, casualty losses, medical expenses, and taxes paid other governmental units. The importance of the latter is that since its inception in 1937 the State has permitted full deductibility of federal income tax in the determination of taxable income for State purposes.

(3) *Exemptions.* The original 1937 normal tax exemptions were $1,000 for a single person, $2,500 for married persons or head of household, and $400 for each additional exemption other than husband or wife. Since 1937 the normal tax base has twice been widened considerably[31] by statutory lowering of normal tax exemptions: in 1947 they were reduced to a uniform $600 individual exemption. Finally, they were restored to the current $750 individual exemption which became effective January 1, 1957.

(4) *Tax rates.* The original 1937 normal marginal tax rates ranging from 1 percent on the first $1,000 of taxable income to 6 percent on that over $10,000 also prevailed for a decade. The first major rate revision occurred in 1947 when the statutory rates were made slightly more progressive and raised to the current levels ranging from 1 percent on the first $1,000 of net taxable income to 10 percent on that over $11,000. However, in 1950 the State Legislature enacted a temporary 20 percent credit against the normal tax liability of all taxpayers which in effect reduced the statutory marginal rates by an equal percentage for all income brackets. This "temporary" 20 percent reduction was subsequently put into effect each successive year until 1957 when it was lowered to 15 percent.

(5) *Surtax.* In addition to the normal tax, the original 1937 act levied a surtax of 2 percent, without exemptions, upon all interest and dividend income received in lieu of a property tax on intangibles. The 2 percent surtax rate has been continued since the inception of the tax and is currently effective. However, the surtax exemption provision has twice been revised upwards resulting in a relative narrowing of the surtax base: in 1943 a $200 surtax exemption per individual was permitted; and in 1951 it was further increased to the current exemption of $600.

(6) *Collections.* The original 1937 act, conforming to the then existent federal practice, provided for payment of the tax on a quarterly basis during the year following the taxable period in which the income was received. This resulted in a one year lag between the periods in which the tax was incurred and collected. In 1954 a partial withholding plan was introduced, limited to payrolls only, with collection from employers on all wage and salary income. Al-

[29] Twice in 1932 and once in 1933.

[30] The Income Tax Amendment (Section 17, Article X) states: The General Assembly may levy income taxes, either graduated or proportional or both graduated and proportional for the support of the State, or any political subdivision thereof, or for public schools, and may, in the administration of an income tax law, provide for special classification or limited taxation or the exemption of tangible and intangible personal property.

[31] See Table 12.2.

though other income tax levying states also had initiated withholding during the post-war years,[32] Colorado's scheme was unique in its administrative simplicity—it merely required that employers withhold from payrolls an amount equal to 4 percent of the amount withheld for federal income tax purposes. Taxpayers not subject to the above payroll withholding were placed on a comparable "pay-as-you-go" basis by an income tax amendment passed in 1958, effective with the taxable year 1959,[33] which requires such taxpayers to make a declaration and pay an estimated tax on income received during current taxable years.

(7) *Allocation.* Finally, the original 1937 act provided that all income tax collections were to be used for support of public schools as replacement for local property taxes. Two years later the legislature diverted 65 percent of income tax revenues to the State's General Fund and in 1947 the earmarking of the remaining 35 percent for school purposes was completely abandoned. Since then all income tax collections flow to the State's General Fund.

Extension of Personal Income Taxation in Colorado

The historical growth of the personal income tax in Colorado as measured by the number of individuals required to file and by the number subject to the tax is shown in Tables 12.2 and 12.3

It will be noted that the personal income tax, originally levied on a relative handful of the State's wealthier taxpayers, has been broadened during the post-war years to the point where it today affects practically all families and unrelated individuals in the State except those in the very lowest income groups. The total number of returns filed rose continuously from about 52,000 in 1938 to more than half a million in 1958, a phenomenal tenfold expansion since the inception of the tax. And the growth in the number of taxable returns during the same period rose from slightly more than 38,000 to about 400,000, which also represented an increase of more than 1,000 percent. The expansion in the number of taxpayers from 1938 through 1947 mainly reflected the World War II and immediate post-war prosperity and concomitant rise in personal incomes in Colorado. However, the continued upward trend after that year cannot be primarily attributed to the growth in per capita money income or population for these factors increased during the entire 20-year period by only 50 and 300 percent, respectively, as shown in Table 12.3 and Chart 12.1. In other words, the remarkable expansion in both the number of total and taxable returns filed during this period essentially reflects the broadening of the tax base by statutory revision. For example, the greatest annual increase occurred in 1948 when the number of taxpayers almost doubled in one year as a result of the lowering of the original exemption of $1,000 to $750 per individual. Similarly, the further reduction of the exemption to $600 in 1951 increased the total number of taxpayers by an additional 29 percent and raised the ratio of taxable to nontaxable returns from approximately 7:3 to 8:2 (i.e., eight out of every ten returns filed showed some positive amount of tax liability). The introduction of payroll withholding in 1954 also enlarged the tax base—but not by as much as achieved through the lowering of the exemptions. The number of taxable returns increased by 17 percent, but the ratio of taxable to nontaxable returns remained practically unchanged. On the other hand, the greater impact of changing exemption values on the number of taxpayers and the amount of

Table 12.2

Number of Taxable and Nontaxable Individual Returns Filed in Colorado During Calendar Years 1938-1958

Year	Number of individual returns filed[a]			Number of taxable returns as percent of	
	Total	Taxable	Nontaxable	Total returns	Colorado's population
1938	51,807	38,436	13,371	74.2	3.5
1939	58,026	44,152	13,874	76.1	3.9

Alabama (1956)	Idaho (1955)	Montana (1955)
Arizona (1954)	Kentucky (1954)	Oregon (1948)
Delaware (1953)	Maryland (1955)	Vermont (1951)

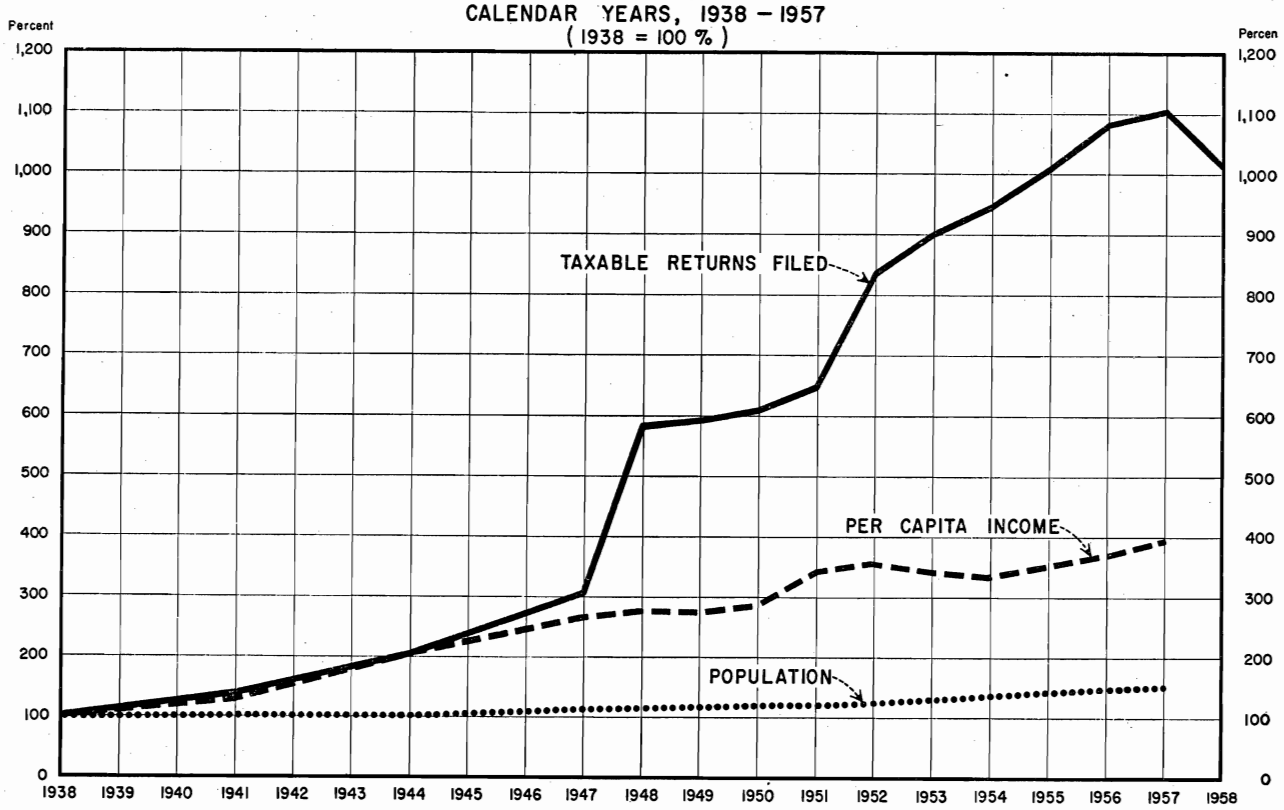
[33] *Session Laws of Colorado*, 1958, Ch. 57. This applies to taxpayers whose tax liability during the preceding taxable year exceeded the amount withheld, if any, by $20 or more.

tax revenues collected is further evidenced by the 1957 experience. Notwithstanding the reduction in the "temporary" tax credit from 20 to 15 percent and the continued rise in the State's population and per capita income, the restoration of the $750 individual exemption in 1957 resulted in a significant contraction of the tax base. The total number of returns filed during the first six months of 1958 showed a 3 percent increase, but the number of taxable returns[34] was actually 7.6 below the previous year's total and represented only 75 percent of all returns filed. If the 1956 statutory exemption and tax credit provisions had been in effect in 1957 it is estimated that at least some 50,000 additional persons who paid no tax on their 1957 incomes would have incurred some tax liability and the total individual income tax colections from all taxpayers would have been on net balance $1.5 million greater.

Expressed in relative terms, the extended coverage of the personal income tax in its present form is indicated by the fact that the total number of taxpayers expanded from less than 5 percent of the State's total population before World War II to 25 percent in each year since 1955. For example, the more than one-half million resident tax returns for 1957 filed in 1958 accounted for about 1,350,000 taxpayers and dependents, based on an average of 2.6 exemptions per return, exclusive of extra exemptions granted for old age and blindness. This means that either as taxpayers or dependents of taxpayers 81 percent of the State's 1957 population can be traced directly to the 1957 resident tax returns filed in the first six months of 1958. Moreover, the latest available federal data show that the number of federal individual income tax returns filed in Colorado during the

[34]Since the inception of payroll tax withholding in 1954 the Colorado Department of Revenue has classified all refund returns, including those with neither normal nor surtax liability, as taxable returns. The latter constitute about 9 percent of the Department's reported "taxable returns" and the totals for these categories in Tables 12.2 and 12.3 have been adjusted and decreased accordingly for the years 1955-57.

RELATIVE GROWTHS OF TAXABLE INCOME TAX RETURNS FILED, PER CAPITA INCOME AND POPULATION IN COLORADO
CALENDAR YEARS, 1938 – 1957
(1938 = 100 %)



SOURCE: State of Colorado, Department of Revenue, Annual Reports; U. S. Department of Commerce, Personal Income By States Since 1929 and Survey of Current Business, August 1958

CHART 12.1

calendar year 1956 was slightly less than 553,000, or approximately 10 percent above the number of Colorado individual income tax returns filed the same year. [35] The fact that the total number of federal returns exceeded the number of Colorado returns filed in 1956 when both federal and Colorado filing requirements were essentially the same may be partly explained by the federal distribution of returns between the states which is "primarily based on the district in which the return is filed" (rather than classified on the basis of the taxpayer's residence or territorial source of income), and partly by better taxpayer compliance induced by the higher federal tax rates and liability.

Table 12.3

Absolute and Relative Growth of Taxable Returns Filed, Population, and Per Capita Incomes for Colorado, For Selected Years 1938 - 1957

				—Relatives (1938 = 100)—		
Year	Number of taxable returns	Population (thousands)	Per capita income	Number of taxable returns	Population	Per capita income
1938	38,436	1,112	$ 507	100.0	100.0	100.0

The extension of personal income taxation in Colorado during the past two decades also is indicated by the absolute and relative changes which have occurred in the annual dollar amounts of collections from this source.

Table 12.4 shows that personal income tax receipts rose from less than $1.8 million on the 1938 returns filed and paid in 1939 (the first full year for the tax) to more than $21.8 million, net of refunds, in 1957. This represents a twelve-fold increase in collections at current prices and a six-fold increase when measured in dollars of constant purchasing power.[36] Although this expansion in income tax collections in part reflects population growth, rising money incomes, and the high levels of employment and prosperity of the war and post-war decades, the largest annual increases occurred in the years immediately following basic statutory revisions in the tax, such as the lowering of exemptions, the raising of rates, and the introduction of payroll withholding. Thus, in 1955 when wage earners were placed on a "pay-as-you-go" basis without forgiveness of the previous year's tax liability, collections increased by $7 million, or more than 50 percent, and since then have continued above the $20 million level.

Table 12.4

Colorado Income Tax Collections Calendar Years, 1938-1957

	Amount of collections (thousands)			Personal income tax as percent of		
Year	Personal income taxes [a]	Corporation income taxes	Total income taxes	Total income tax revenue	Total State taxes [b]	Total personal income
1939	$ 1,775	$1,054	$ 2,829	62.7	5.9	0.31
1940	2,136	1,225	3,361	63.6	6.4	0.35
1941	2,437	1,106	3,543	68.8	6.9	0.33
1942	3,155	1,441	4,596	63.6	8.4	0.31

[c] Adjusted to exclude withholding refunds.

Source: State of Colorado, Department of Revenue, *Annual Reports*, 1942-1957; U. S. Department of Commerce, *Personal Income by States Since 1929;* and *Survey of Current Business*, August, 1958.

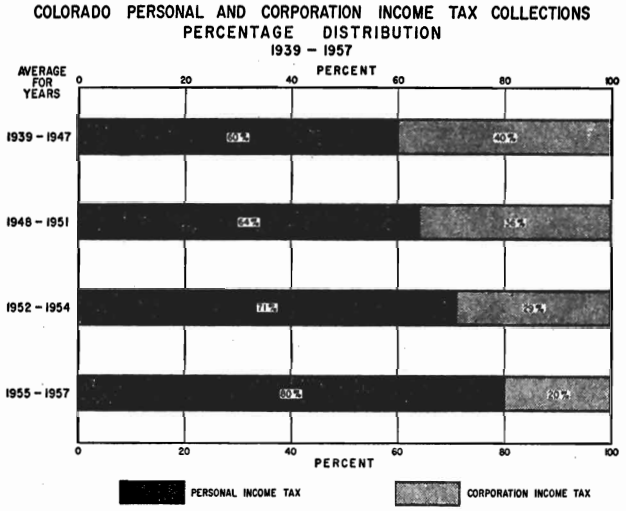
The change in the relative significance of the tax is measured by personal income tax revenues expressed as percentages of total income tax revenues, total state tax collections, and the total personal income received annually. All three are good indicators of the growth of personal income taxation in Colorado since 1938. Moreover, on the basis of the above data, it appears that with the expansion of personal income taxation, the corporation net income tax has become relatively less important, as shown in Chart 12.2. During the first ten years of state income taxation, payments made by individuals and fiduciaries averaged about 60 percent of the State's total income tax receipts,[37] with the cor-

[35] U. S. Treasury Department, *Statistics of Income for 1955* (Washington, 1958), p. 51.

[36] The U. S. Department of Labor's Consumer Price Index actually doubled during the past 20 years, rising from 60.3 in 1938 to 120.2 in 1957. See the *Economic Report of the President* (Washington, 1958), p. 160.

[37] Collections from fiduciaries and trusts have averaged about one percent of total income tax collections since the enactment of the tax in 1937.

poration tax providing the remaining 40 percent. Since then the ratio has steadily risen and in recent years the personal tax has accounted for as much as 80 percent of the total while the corporate has averaged about 20 percent. [38] The growing importance of the personal income tax is further revealed by the fact that over the years it has provided an increasingly larger share of Colorado's total tax revenues—from less than 6 percent in 1939 to approximately 15 percent in 1957. And although the tax has never accounted in any one year for as much as one percent of the State's total personal income received before tax, nevertheless when measured as a percentage of such income it actually doubled during the period under consideration.



Source: Table 12.4

CHART 12.2

In summary, it is evident that the statutory revisions of the Colorado personal income tax law—particularly the lowering of exemptions and introduction of payroll withholding — coupled with the growth in population and money income during the past two decades have resulted in the tax being transformed from a minor source of school revenues, originally levied as a substitute for the property tax on intangibles, into a major source of general revenue collected on an extensive basis from the vast majority of Colorado's householders and employed single individuals.

[38]The relative instability and decline of the corporate income tax in the face of generally increased economic activity in Colorado during the past 10 years are fully analyzed in the next chapter.

Basic Features of Personal Income Taxation in Colorado

As in most other states, the Colorado income tax statute[39] levies a tax on the net income of individuals, fiduciaries and corporations. In general, the taxation of fiduciaries (estates and trusts) is substantially similar to that of individuals and is considered part of the personal income tax structure in this study. The corporate income tax, however, differs significantly in both rate and base from the personal income tax and for analytical purposes is discussed separately in the next chapter. The basic features of personal income taxation in Colorado compared with that of other states are briefly described below.

Coverage. Every resident of Colorado who has an annual gross income of $750 or more, or receives $600 or more from interest and dividends, must file a state income tax return. Unmarried individuals file separate returns. Taxpayers who are married on the last day of the taxable year, may file joint or separate returns, but the Colorado statute does not permit income-splitting as is the case under the federal code and in a few community-property states.[40] In addition, individuals receiving less than $750 in annual income may elect to file a return in order to obtain a refund for taxes withheld from earnings. Part-time residents of the State must file a return if their gross income exceeds their pro-rated exemptions. Also, every non-resident of the State must file a return if he derived income from Colorado sources, apportioning his deductions and exemptions in accordance with the ratio of his Colorado income to total income for the taxable year.

The total number of taxable and nontaxable 1957 returns filed in 1958, classified by residency and marital status, is shown in Table 12.5.[41]

It will be noted that of the more than one-half million personal income tax returns filed in Colorado in 1958 almost 94 percent were from full-time residents and 5 percent from part-time residents of the State. The six thousand non-resident returns represented only slightly more than 1 percent of the total and as such appear to

[39]*Colorado Revised Statutes*, 1953, Ch. 138, Article I, Sec. 1-60, as amended.

[40]See Table 12.6.

[41]Detailed Colorado individual income tax data for 1957 included in this report were compiled from a sample of all individual income tax returns filed during the first six months of 1958. On the basis of previous years' experience it appears that approximately 99 percent of the year's total individual returns are filed during the first half of the calendar year. The sample survey excluded fiduciary, prior-year delinquent and tentative returns. A detailed explanation of the sources of the 1957 data, methods of estimation, description of the sample and limitations of the data are presented in the Appendix to this chapter.

be relatively unimportant. This very low nonresident filing may be accounted for mainly by the fact that Colorado's major urban centers are located considerable distances from surrounding border states and hence do not provide wage earners, businessmen and professional people who earn their incomes in Colorado with the opportunity of living in "bedroom communities" situated across the state line. Thus, to a large extent Colorado is spared one of the more difficult administrative problems of state personal income taxation—the collection of tax from out-of-state residents.

Table 12.5

Taxable and Nontaxable Individual Income Tax Returns Filed in Colorado 1958 Classified by Residency and Marital Status of Taxpayer

Status of Taxpayer	All returns		Taxable returns		Nontaxable returns	
	Number	Percent of total	Number	Percent of total	Number	Percent of total
Residency						
Full-time res.	491,364	93.6	365,193	93.4	126,171	94.4
Part-time res.	27,049	5.2	21,145	5.4	5,904	4.4
Total res.	518,413	98.8	386,338	98.8	132,075	98.8
Total non-res.	6,408	1.2	4,755	1.2	1,653	1.2
Total filed	524,821	100.0	391,093	100.0	133,728	100.0
Marital						
Married-Joint	279,891	53.3	197,507	50.5	82,384	61.6
Married-Separate	100,227	19.1	87,003	22.2	13,224	9.9
Single-Separate	144,703	27.6	106,583	27.3	38,120	28.5
Total filed	524,821	100.0	391,093	100.0	133,728	100.0

When classified by the marital status of the taxpayers, approximately three-fourths of the Colorado state income tax returns were filed by married individuals and one-fourth by single persons. Joint returns of husbands and wives represented more than 50 percent of all returns filed. However, this percentage is lower than that for the joint returns filed under the federal income tax code. The latest available Treasury data indicate that 61 percent of total number of federal individual returns filed in 1956 were joint returns of married couples.[42] It is reasonable to expect a higher proportion in the federal levy since Colorado does not permit income-splitting, while federal tax schedules incorporate a "split-income" provision for married couples which in general eliminates any advantage to be derived from separate filing under the federal code. For the same reason, the relative number of separate returns filed by married individuals under the state tax, about one-fifth of the total returns, is considerably higher than under the federal tax.

Tax Base. The income tax from a conceptual point of view is somewhat more complex than other taxes, particularly with regard to the determination of the tax base on which the rates are to be applied. With most other forms of taxation the tax rate is based upon some readily measurable physical or economic commodity or transaction. Under personal net income taxation, however, the tax base—*net taxable income*—must be derived from a series of accounting computations[43] (whether worked out by the individual taxpayer or incorporated in an optional tax table) which require clearcut and fairly rigorous statutory definitions of economic concepts such as gross income, business expenses, adjusted gross incomes, personal deductions, exemptions and credits. Although the federal government and most income tax levying states follow the same general pattern in the determination of "net taxable income" they differ significantly in their statutory definitions of these concepts and in their treatment of specific inclusions and exclusions from taxable income. Thus, large variations in the income tax base occur between taxpayers of the several states who have essentially the same pre-tax incomes. Obviously, interstate comparisons of income tax rate structures are of little value unless these differences in the tax base are also taken into consideration.

The major types of income inclusions and exclusions and expense deductions and exemptions which make up the income tax base under the Colorado statute are briefly described and in some instances compared with the statutory provisions of other states in the discussion below.

Gross Income. This term is broadly defined to include all forms of compensation for services rendered, interest earned, dividends, rents, royalties, gains (and losses), business profits and the like. It is an all-inclusive concept comprising, according to the statute, "income derived from any source whatever" unless specifically excluded by law.

Exclusions from Gross Income. The following are the most important items specifically excluded from gross income, and thus from taxation, under the Colorado statute:

[42] U. S. Treasury Department, *Statistics of Income for 1955* (Washington, 1958), p. 4.

[43] The derivation of the tax base for the Colorado personal income tax is shown by the following outline:
1. Personal income received from all sources
2. Less: Statutory exclusions from gross income
3. Equals: Gross income to be reported
4. Less: Business and travel expense
5. Equals: Adjusted gross income
6. Less: Statutory personal deductions plus federal income tax
7. Equals: Net income before personal exemption
8. Less: Statutory personal exemptions
9. Equals: Net taxable income—the tax base for normal rates

1. Interest on federal securities and other obligations of U. S. instrumentalities because of the federal constitution.

2. Certain types of dividends receipts, such as corporate stock dividends, stock rights, and mutual insurance company dividends.

3. Capital gains from the sale of assets to the extent of 50 percent of the gain if the asset has been held by the taxpayer for 6 months or more. The same percentage applies to losses except the maximum capital loss deductible against other gross income is limited to $2,000. Special treatment of long-term capital gains is recognized to be an important tax-saving provision for individuals in the upper-income groups whose incomes are mainly derived from sources other than wages, salaries and business profits. However, as shown in Table 12.6, the majority of income tax states do not distinguish between capital gains and other types of taxable income. Fifteen of the 29 states which levy personal income taxes include 100 percent of all capital gains in the tax base regardless of the length of time the assets were held by the taxpayers. Only eight states in addition to Colorado exclude 50 percent of long-term capital gains defined as realized earnings on assets held at least six months. California, the District of Columbia, and Oklahoma use longer holding periods with sliding scales of percentage exclusions. Maryland and Vermont are the only two states which exclude all capital gains from the tax base.

4. Gifts, bequests and inheritances. Although these receipts are excluded from gross income any income produced by such property is taxable.

5. Leasehold improvements if the lessor does not realize income when such improvements vest in the owner by reason of forfeiture or termination of lease.

6. Retirement allowances and pensions under certain union agreements, the federal OASI program, and the federal civil service act. In addition, income from other types of pensions and annuities in excess of 3 percent of the cost is also excluded from taxable gross income until the aggregate receipts equal the total cost of the contract.

7. Life insurance benefits by reason of the death of the insured, damages received in payment for personal injuries, and benefits from accident, health and workmen's compensation insurance.

8. Compensation, mustering-out pay, and payments to dependents of active and reserve members of the armed forces, with an annual maximum exclusion of $2000 if the United States is at war, and a maximum of $1000 if not at war.

9. Patronage dividends, refunds and rebates from cooperative organizations on expenditures made for personal, living or family expenses.

10. Rental value of a vicarage or parsonage.

11. Alimony. In contrast with the federal code, the receipt of alimony is excluded from gross income but the payment is not allowed as a personal deduction.

Table 12.6

Comparative State Summary of Selected Personal Income Tax Base Factors, 1958

State	Provision for splitting of income	Include all capital gains in: Tax base	Include all capital gains in: Percent included[a]	Permit full deductibility of federal income taxes
Alabama	No	Yes	100	Yes
Arizona	Yes	No	50	Yes
Arkansas	No	Yes	100	No
California	Yes	No	[b]	No
Colorado	No	No	50	Yes
Delaware	No	Yes	100	No[c]
District of Columbia	No	No	[d]	No
Georgia	No	No	50	No
Idaho	Yes	Yes	100	Yes
Iowa	No	No	50	Yes
Kansas	Yes	No	50	Yes
Kentucky	No	No	50	Yes
Louisiana	Yes	Yes	100	Yes
Maryland	No	No	—	No
Massachusetts	No	Yes	100	No[e]
Minnesota	No	Yes	100	Yes
Mississippi	No	Yes	100	No
Missouri	No	No	50	Yes
Montana	No	No	50	Yes
New Mexico	Yes	Yes	100	Yes
New York	No	No	[f]	No
North Carolina	No	Yes	100	No
North Dakota	No	No	50	Yes
Oklahoma	Yes	No	[g]	Yes
Oregon	Yes	Yes	100	Yes
South Carolina	No	Yes	100	No[h]
Utah	No	Yes	100	Yes
Vermont	No	No	—	No
Virginia	No	Yes	100	No
Wisconsin	No	Yes	100	No[i]

[a] If less than 100 percent, the reduced percentage applies only to long-term capital gains on assets held 6 months or longer unless otherwise noted.

[b] California includes capital gains at:
100 percent on assets held 1 year or less,
80 percent on assets held 1 to 2 years,
60 percent on assets held 2 to 5 years,
40 percent on assets held 5 to 10 years,
30 percent on assets held 10 years or longer.

[c] Limited to $300 per taxpayer.

[d] District of Columbia includes capital gains at: 100 percent on assets held less than 2 years, and completely excludes capital gains on assets held 2 years or longer.

[e] Limited to earned and business income only. Not permitted against dividends, interest, annuities and capital gains.

[f] New York taxes capital gains separately at one-half the normal income tax rate.

[g] Oklahoma includes capital gains at: 100 percent on assets held 18 months or less, 66⅔ percent on assets held 18 to 24 months, 50 percent on assets held 24 months or longer.

[h] Limited to $500 per taxpayer.

[i] Limited to 3 percent of net income before deduction of federal income tax.

Source: Income tax statutes, regulations and tax forms of the several states.

In addition to the above, it should be noted that although not explicitly covered by statute the imputed income from non-exchange productive activities and assets, such as the rental value of owner-occupied residences, "do-it-yourself" building projects, housewife services, and home-grown produce consumed by farm families, also are generally excluded from reported

gross income and taxation under both federal and state income tax statutes.[44]

Adjusted Gross Income. This term may be broadly defined as the gross income described above less the deduction of various types of expenses paid or incurred in the earning of taxable income, or in connection with the maintenance of property held for the production of taxable income. Such expenses, generally referred to as business deductions, under the Colorado act uniquely include all travel expenses connected with employment. The statute specifically provides that "adjusted gross income" means gross income minus:

1. Trade and business expenses of taxpayers other than employees of such trades and businesses.
2. Travel, lodging and other reimbursible expenses incurred in connection with employment.
3. Travel (commutation) expenses incurred in traveling to and from any place of employment. In lieu of itemizing the actual cost of travel the taxpayer may take a flat annual deduction of $75 against gross income.
4. Expenses attributable to property held for the production of rents and royalties.
5. Losses from the sale or exchange of property, including gambling losses to the extent of gambling gains.

Several specific items included in the above listed deductible business expenses are accorded special treatment under the Colorado act in the determination of adjusted gross income and in some instances may materially affect the size of the income tax base. For example, depletion is allowed for the exploitation of natural resources "in the case of mines, oil and gas wells, other natural deposits and timber." It may be calculated on the basis of the cost or adjusted basis of the property or it may be calculated by the application of statutory percentages (ranging from 10 percent to 50 percent dependent on type of resource) to the gross income of the property being exploited. The latter method, as under the federal provisions, makes it possible for a taxpayer over a period of years to deduct an aggregate amount of depletion which is actually in excess of the total cost (value) of the property involved. Similarly, the present tax base is reduced by accelerated depreciation of capital investments—"fast write-offs" taken over a five year period by taxpayers who have received certificates of necessity from the federal government. And although the costs incurred for the permanent improvement of existing property are not deductible, the cost of repairs, maintenance and current upkeep of such property is considered to be a deductible business expense. The line between these concepts necessarily is somewhat tenuous and rather difficult to assess.

Intangible assets which have a limited life expectancy, such as patents, copyrights, leaseholds, franchises, licenses, and even good will under certain conditions, may be amortized for tax purposes and the determined allowance is permitted as a deductible business expense against taxable gross income. Finally, taxes incurred in a trade or business also are deductible as business expenses with the exception of the following: Colorado state income taxes, taxes paid to another state for which a tax credit is permitted under the Colorado income tax law, federal income taxes paid on income not subject to the Colorado income tax, death duties and gift taxes, and local assessment levies which affect the value of property.

Personal Deductions from Adjusted Gross Income. As in most other states, Colorado does not allow deductions from adjusted gross income for "personal, living or family expenses" except those explicitly provided for by statute. However, it is in the treatment of these specific personal deductions from adjusted gross income, particularly federal income taxes and optional standard deduction, that some of the most important differences occur between the income tax bases of the various states as shown in Tables 12.7, 12.8 and 12.9. The principal deductions permitted under the Colorado statute are:

1. Interest paid during the taxable year on outstanding indebtedness but not deducted as business expense.

2. Federal income taxes paid during the taxable year, and all other taxes paid except the following: self-employment taxes, social security taxes, state income taxes, death duties and gift taxes, federal liquor, tobacco and excise taxes, and special assessments levied for the improvement of property. Table 12.6 shows that about half the states, including Colorado, permit full deductibility of federal income taxes; that eight others and the District of Columbia permit none; and that the remaining four allow limited deductibility ranging from 3 percent of net income to a flat $500.

3. Charitable contributions or gifts not to exceed 15 percent of the net income of the taxpayer before the deductions of such donations. This provision conforms with the general practice of the other income tax states, about half of them limit contributions to 15 percent of adjusted gross or net income and the others mainly use a 20 percent limit.

4. Medical and dental expenses in excess of 5 percent of adjusted gross income. On an individual return the deduction is limited to $1,250 per exemption and maximized at $2,500. On a joint return it is limited to $5,000. The wide vari-

[44]For an analysis of the effects of the exclusion of imputed income, particularly the net rental value of owner-occupied homes, on the tax base and progressivity see W. Vickrey, *Agenda for Progressive Taxation* (New York: The Ronald Press Company, 1947), Chapter II.

ation between the states in the handling of this deduction is shown in Table 12.7. About one-third of the income tax states permit medical deductions to the extent that they exceed 5 percent of the adjusted gross income. Arizona and Minnesota allow the entire medical expense as deductions from taxable income, and other states either follow the federal code or allow only those expenses over some stated dollar amount, ranging from $50 in Kansas to $200 for a married couple in Oklahoma.

5. Casualty and theft losses not compensated for by insurance or otherwise.

6. Bad debt losses, including worthless stocks and bonds if deducted in the year of the actual loss.

Table 12.7

Medical Expense Deductions Permitted by Personal Income Tax States, 1958

State	Expenses permitted in excess of:	Maximum permitted: Single individuals	Maximum permitted: Married couples
Alabama	5% gross income	$1,250	$ 2,500
Arizona	Permit total expense	2,500	5,000
Arkansas	3% adj. gross income	5,000	10,000
California	5% adj. gross income	1,250	2,500
Colorado	5% adj. gross income	2,500	5,000
Delaware	5% adj. gross income	[a]	[a]
District of Columbia	5% adj. gross income	1,250	2,500
Georgia	5% adj. gross income	1,250	1,250
Idaho	$100	[a]	[a]
Iowa[b]	3% adj. gross income	2,500	5,000
Kansas	$ 50	[a]	[a]
Kentucky[b]	3% adj. gross income	2,500	5,000
Louisiana	None	—	—
Maryland	3% adj. gross income	1,250	2,500
Massachusetts	None	—	—
Minnesota	Permit total expanse	[a]	[a]
Mississippi	None	—	—
Missouri	5% adj. gross income	1,250	2,500
Montana[b]	3% adj. gross income	2,500	5,000
New Mexico	None	—	—
New York	3% net income[c]	1,250	2,500
North Carolina	5% net income	5,000	5,000
North Dakota	3% adj. gross income	2,500	5,000
Oklahoma	$100 single, $200 joint	750	1,500
Oregon	5% adj. gross income	1,250	5,000
South Carolina	5% adj. gross income	[a]	[a]
Utah	5% gross income	750	1,500
Vermont[b]	3% adj. gross income	2,500	5,000
Virginia[d]	5% adj. gross income	1,250	2,500
Wisconsin	$ 75	1,500	1,500

[a] No maximum limit.

[b] Same as federal provision—$2,500 per exemption with limit of 2 exemptions on separate returns and 4 exemptions on joint returns.

[c] New York—in excess of 3% of net income under $6,000, 5% over $6,000.

[d] Virginia—$1,250 per exemption with limit of 2 exemptions on separate returns and 4 exemptions on joint returns.

Source: Income tax statutes, regulations and tax forms of the several states.

In lieu of itemizing the personal deductions, Colorado resident taxpayers on a full calendar year basis with adjusted gross income of $5,000 or less may compute their taxes on the basis of a table prescribed by the Department of Revenue which incorporates a standard deduction of approximately 10 percent of the adjusted gross income plus an amount equal to the federal income taxes paid. Taxpayers with adjusted gross income of $5,000 or more may also use a standard deduction of 10 percent of adjusted gross income of $1,000, whichever is lesser, plus an amount equal to the federal income tax paid. For married taxpayers filing separate returns the maximum standard deduction for each spouse is $500 plus the federal income tax paid. Although some form of standard or optional deduction in lieu of itemizing personal expenses is permitted by practically all the income tax states (the only exceptions are Delaware, Massachusetts, New Mexico and North Dakota) there is little uniformity in the treatment of this item as shown in Table 12.8. The deductions vary from 5 percent of net income to 10 percent of adjusted gross income with maximum permissible deductions ranging from $250 to $1,000. The most common practice, used by twelve states and the District of Columbia, is to permit a married couple filing a joint return a deduction of 10 percent of adjusted gross income, or $1,000, whichever is lesser. However, of these states only Colorado and three others permit the taxpayer to take the federal income tax deduction in addition to the standard deduction. More than half the states do not allow the deductibility of federal income taxes when taxpayers take standard deductions.

Virginia	5	500	250	500
Wisconsin[d]	—	450	450	450

[a] Generally based on adjusted gross income but a few states use net income. Detailed provisions vary.

[b] Deduction of federal income tax allowed *in addition* to standard deduction.

[c] Do not permit standard deductions for personal expense.

[d] Taxpayers may use optional tax table if adjusted gross income is under $5,000; a standard deduction of $450 if income is over $5,000.

Source: Income tax statutes, regulations and tax forms of the several states.

Personal Exemptions. Under the Colorado statute, as amended in 1957, a resident taxpayer is entitled to a personal exemption of $750 for himself, his spouse, and for any qualified dependent whose gross income was less than $750. In addition, Colorado grants the taxpayer additional exemptions if he or his spouse are blind and/or 65 years of age or older. Table 12.9 is a comparative summary of the exemption practices for the twenty-nine income tax states and the District of Columbia. Although practically all the states permit some form of personal exemptions, the large variations in the treatment of this factor also have given rise to significant differences between the tax bases of the several states. For example, only five states follow the federal code of allowing a standard $600 exemption per individual. The combinations of the other states range from $500 for a single individual and $1,000 for a married couple in Vermont, to $4,000 and $6,000 exemptions for similar categories in Mississippi. Moreover, six states have introduced, in lieu of exemptions that reduce the tax base, flat dollar credits as deductions from normal tax. The rationale for the use of the tax credits in place of exemptions is that the value of the credit varies only with the size of the taxpayer's family regardless of the level of income, whereas the value of the personal exemption varies directly with both the size of family and level of income. For example, Wisconsin grants all taxpayers, regardless of income class and marginal tax rates, a uniform $7 tax credit for each taxpayer, spouse and dependent covered by the return. In contrast, the exemptions in Colorado have varying values dependent upon the taxpayer's income class—a single exemption in Colorado is worth $75 to taxpayers with incomes subject to the 10 percent marginal tax rate and only $7.50 to those in the lower income classes subject to the 1 percent rate. In any case, after deducting personal exemptions from net income the remainder is the net taxable income which represents the base for applying the normal tax rates.

Table 12.9

Exemptions and Credits for Dependents Permitted by Personal Income Tax States 1958

State	Personal exemption: Single individual	Personal exemption: Married or head of family	Credits for dependents
Alabama	$1,500.00	$3,000.00	$300.00
Arizona	1,000.00	2,000.00	600.00
Arkansas[a]	17.50	35.00	6.00
California	2,000.00	3,500.00	400.00
Colorado	750.00	1,500.00	750.00
Delaware	600.00	1,200.00	600.00
District of Columbia	1,000.00	2,000.00	500.00
Georgia	1,500.00	3,000.00	600.00
Idaho	700.00	1,500.00	200.00
Iowa[a]	15.00	30.00	7.50
Kansas	600.00	1,200.00	600.00
Kentucky[a]	13.00	26.00	13.00
Louisiana[b]	2,500.00	5,000.00	400.00
Maryland	800.00	1,600.00	800.00
Massachusetts[c]	2,000.00	2,500.00	400.00
Minnesota[a]	10.00	30.00	10.00
Mississippi	4,000.00	6,000.00	—
Missouri	1,200.00	2,400.00	400.00
Montana	600.00	1,200.00	600.00
New Mexico	1,500.00	2,500.00	200.00
New York	1,000.00	2,500.00	400.00
North Carolina[d]	1,000.00	2,000.00	300.00
North Dakota	600.00	1,500.00	600.00
Oklahoma	1,000.00	2,000.00	500.00
Oregon	600.00	1,200.00	600.00
South Carolina	1,000.00	2,000.00	400.00
Utah	600.00	1,200.00	600.00
Vermont	500.00	1,000.00	500.00
Virginia	1,000.00	2,000.00	200.00
Wisconsin[a]	7.00	14.00	7.00

[a] Instead of personal exemption these states use the indicated dollar tax credit against normal tax.

[b] The exemptions are deductible from lowest income tax bracket only, and are equivalent to tax credits of $50, $100 and $8, respectively.

[c] In case of a joint return the smaller of $4,000 or $2,000 plus the income of the spouse with smaller income. In addition, $500 for dependent spouse with income of less than $2,000.

[d] Additional exemption of $1,000 allowed a married woman with separate income.

Source: Income tax statutes, regulations and tax forms of the several states.

Normal and Surtax Rates. As already noted, the current statutory marginal rates in Colorado have prevailed since 1947, but in effect have been reduced each year since 1950 by the annual legislative enactment of a tax credit against normal tax liability. The tax credit of 15 percent for taxable year 1957 lowered the statutory marginal rates by an equal percentage for all income brackets. Table 12.10 shows the 1957 statutory and net marginal rates.

Table 12.10

Colorado Normal Tax Rates, 1957

Net taxable income	Statutory marginal rate	Net marginal rate
$ 0 to $1,000	1.0	0.85
1,001 to 2,000	1.5	1.275
2,001 to 3,000	2.0	1.70
3,001 to 4,000	2.5	2.125
4,001 to 5,000	3.0	2.55
5,001 to 6,000	4.0	3.40
6,001 to 7,000	5.0	4.25
7,001 to 8,000	6.0	5.10
8,001 to 9,000	7.0	5.95
9,001 to 10,000	8.0	6.80
10,001 to 11,000	9.0	7.65
11,001 and over	10.0	8.50

These rates are, of course, applied to "net taxable income" which will be significantly smaller than the "adjusted gross income" and "personal income received" for many taxpayers as indicated in the above description of the tax base. Moreover, it is important in any discussion of income tax rates to distinguish the *marginal* or bracket rate from the *average* or effective rate. The former is the tax rate applied, in the case of Colorado, to each $1,000 *increment* of net taxable income; whereas the latter represents the *total* dollar amount of normal tax liability expressed as a percentage of the *total* net taxable income. The incremental and total dollar amount of tax liability for varying levels of income based on the marginal or bracket rates, adjusted for the "temporary" 1957 tax credit of 15 percent, and the computed average or effective rates (the total normal tax liability

expressed as a percentage of the total net taxable income, are shown in the following tabulation:

Table 12.11

Colorado Normal Tax Liability and Average Tax Rates, 1957

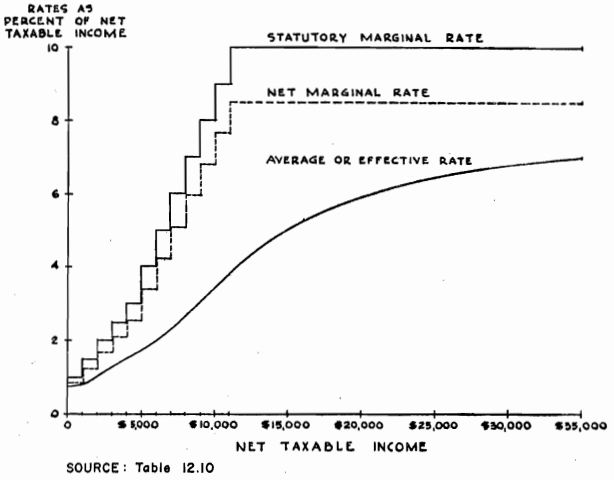
Net taxable income			Net marginal	Dollar amount of tax liabilty		Average or effective
Total	Brackets		rate	Increment	Total	rate
$ 1,000	First	$1,000	0.85	$ 8.50	$ 8.50	0.85
2,000	Second	1,000	1.275	12.75	21.25	1.06
3,000	Third	1,000	1.70	17.00	38.25	1.28
4,000	Fourth	1,000	2.125	21.25	59.50	1.49
5,000	Fifth	1,000	2.55	25.50	85.00	1.70
6,000	Sixth	1,000	3.40	34.00	119.00	1.98
7,000	Seventh	1,000	4.25	42.50	161.50	2.31
8,000	Eighth	1,000	5.10	51.00	212.50	2.66
9,000	Ninth	1,000	5.95	59.50	272.00	3.02
10,000	Tenth	1,000	6.80	68.00	340.00	3.40
11,000	Eleventh	1,000	7.65	76.50	416.50	3.79
12,000	Twelfth	1,000	8.50	85.00	501.50	4.18

It is evident from Table 12.11 that except for the first bracket the average normal income tax rates are always smaller than the net marginal rates at all levels of net taxable income, and considerably smaller than the nominal statutory rates shown in Table 12.10. For example, the Colorado income taxpayer who had taxable income of $5,000 in 1957 was subjected to a net marginal rate of 2.55 percent, but an average rate which was only two-thirds as large—1.7 percent. Similarly, the taxpayer with a net taxable income of $12,000 had to pay a top marginal rate of 8.5 percent but an average rate of only 4.2 percent—actually less than one-half the marginal rate. Of course, as net taxable income rises above the level to which the maximum rate first applies, the marginal rate remains constant as the average continues to increase. However, the latter will never reach the marginal and, therefore, is always the lesser of the two rates. The relationship of these Colorado rates to each other at varying levels of income are shown in Chart 12.3.

In addition to the normal tax, Colorado levies a flat 2 percent surtax on income derived from interest and dividends in excess of $600 for a single individual, and $1,200 for a married couple filing jointly if each spouse independently has surtaxable income in excess of $600. Any distributive income from estates, trusts, partnerships or other unincorporated business which represents interest or dividends is also subject to the surtax on the taxpayer's individual return. Under the present statute, surtaxable income is also subject to normal tax, but in a few instances taxpayers liable for surtax may not have to pay any normal tax because of their relatively large personal deductions and exemptions against the latter.

Table 12.12 is a comparative summary of statutory tax rates for the 29 personal income states and the District of Columbia. In addition

RELATIONSHIP OF COLORADO MARGINAL (BRACKET) AND AVERAGE TAX RATES 1957



SOURCE: Table 12.10

CHART 12.3

to showing the minimum and maximum marginal rates, including surtaxes, surcharges and tax credits, the table indicates whether the net rates have been increased or decreased during the past few years.

As with the tax base, there is considerable variation between the rate structures of the states and no two have identical tax schedules. The most common unadjusted minimum rate, used by almost half the states, is 1 percent. However, it is applied to varying amounts of taxable income, ranging from the first $1,000 of income in nine states, including Colorado, to the first $10,000 of income in New Mexico. The highest beginning rates are in Maryland, North Carolina and Oregon where the tax structures start at 3 percent. There is even less uniformity with regard to maximum marginal rates. They range from a low of 3.75 percent on taxable income in excess of $4,000 in Iowa to a high of 11 percent on taxable income in excess of $15,000 in North Dakota. The next highest unadjusted maximum rates are to be found in Colorado and Minnesota where a rate of 10 percent is applied to taxable incomes above $11,000 and $20,000, respectively. But when modifications in rate structures due to temporary surcharges and tax credits are taken into consideration Colorado's maximum *net* marginal rate of 8.5 percent is then exceeded by those of five other states—Idaho, Minnesota, North Dakota, Oregon and Wisconsin. Moreover, the 6.25 percent increase in Colorado's bracket rates in 1957,[45] the first

[45]The reduction in the temporary credit against normal tax from 20 percent in 1956 to 15 percent in 1957 represented a 6.25 percent increase in net marginal rates for all tax brackets. But, the simultaneous reduction in the tax base effected by raising the personal exemptions from $600 to $750 per individual *more than offset the rate increase.* On net balance, approximately 80 percent of the taxpayers actually had their income tax liability reduced, 17 percent were unaffected, and only 3 percent had an increased tax bill due to the statutory changes in rates and exemptions.

change made in the net tax schedule since 1950, is relatively small when compared with increases ranging from 20 to 50 percent put into effect since 1954 by some ten other states and the District of Columbia. The only state to increase rates less than Colorado was Mississippi which raised its taxes by approximately 3 percent. On the other hand, fifteen states have not changed their rate structure and two states have actually decreased their statutory rates during this same period. Thus, on the basis of the above rate comparisons it would appear that Colorado ranks among the half-dozen states with the highest state personal income tax rates in the nation.

Table 12.12

Comparative State Summary of Statutory Personal Income Tax Rates, 1957

State	Minimum marginal rate		Maximum marginal rate		Rates changed since 1954
	Percent	Applied to first	Percent	Applied to income over	
Alabama	1.5	$ 1,000	5.0	$ 5,000	No
Arizona	1.0	1,000	4.5	7,000	No
Arkansas	1.0	3,000	5.0	25,000	No
California	1.0	5,000	6.0	25,000	No
Colorado[a]	1.0	1,000	10.0	11,000	Increase
Delaware[b]	1.5	3,500	8.0	8,000	Increase
District of Columbia	2.5	5,000	5.0	25,000	Increase
Georgia	1.0	1,000	6.0	10,000	Decrease
Idaho[c]	2.0	1,000	8.0	5,000	Increase
Iowa	0.75	1,000	3.75	4,000	No
Kansas[b]	1.5	2,000	5.5	7,000	Increase
Kentucky[d]	2.0	3,000	6.0	8,000	Increase
Louisiana	2.0	10,000	6.0	50,000	No
Maryland[b]	3.0	[e]	5.0	[e]	Increase
Massachusetts	2.5	[f]	6.0	[f]	Increase
Minnesota[g]	1.0	1,000	10.0	20,000	No
Mississippi[h]	2.0	5,000	6.0	25,000	Increase
Missouri[i]	1.0	1,000	4.0	9,000	No
Montana[j]	1.0	1,000	5.0	7,000	Increase
New Mexico	1.0	10,000	4.0	100,000	No
New York[k]	2.0	1,000	7.0	9,000	Decrease
North Carolina	3.0	2,000	7.0	10,000	No
North Dakota	1.0	3,000	11.0	15,000	No
Oklahoma	1.0	1,500	6.0	7,500	No
Oregon	3.0	500	9.5	8,000	Increase
South Carolina	2.0	2,000	5.0	6,000	No
Utah	1.0	1,000	5.0	4,000	No
Vermont	2.0	1,000	7.5	5,000	Increase
Virginia	2.0	3,000	5.0	5,000	No
Wisconsin[l]	1.0	1,000	8.5	14,000	Increase

[a] Less normal tax credit of 15 percent for 1957, plus 2 percent surtax on income over $600 from intangibles.

[b] Rates effective for taxable year, 1958.

[c] Plus surtax of 10 percent on income over $2,000, less $5 tax reduction per dependent.

[d] Plus surtax of 10 percent of first $25 of normal tax, 20 percent of next $75, and 30 percent of all over $100.

[e] All income subject to 3 percent rate, except investment income over $500 subject to 5 percent rate.

[f] Rate of 2.5 percent applies to earned and business income; 6 percent rate to interest, dividends, and capital gains; and 15 percent to annuities. In addition, all income subject to 23 percent surtax

[g] Plus 5 percent surtax on rates before personal credit, and additional 5 percent surtax after credit.

[h] Plus surtax of 14 percent.

[i] Rates are average and not marginal, i. e., apply to entire income and not brackets.

[j] Minimum tax of $10.

[k] Less 15 percent of first $100 of tax liability and less 10 percent of next $200 of tax liability for 1957.

[l] Plus surtax of 20 percent after tax credits for years 1955-58.

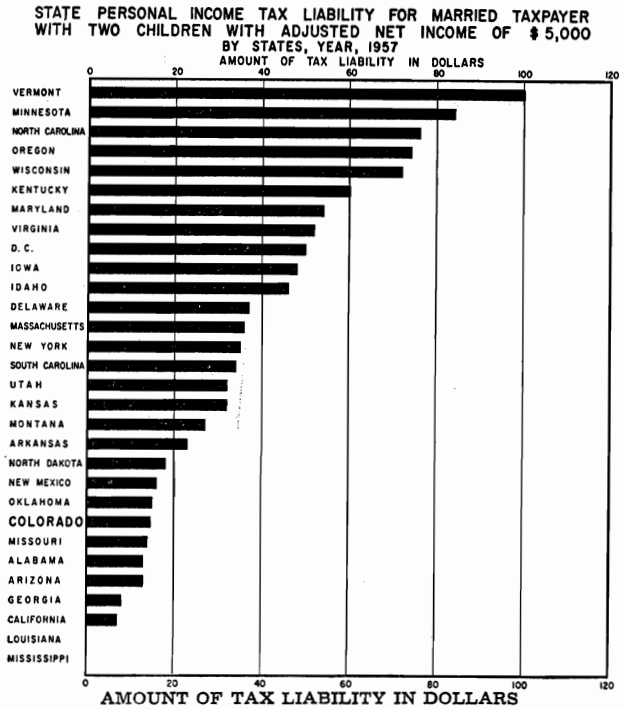
Interstate Comparisons of Personal Income Tax Liability

As has already been indicated, interstate comparisons of tax rate structures, particularly when used as the basis for analyzing relative tax burdens, may be grossly misleading, if not meaningless, unless the large variations between the tax bases of the several states due to differences in the treatment of such factors as income-splitting, federal tax deductibility, and personal exemptions are also taken into consideration. This is done in Tables 12.13 and 12.14 and Charts 12.4 through 12.6, which show what the computed personal income tax liabilities would be at eight different levels of adjusted net income in each of the twenty-nine income tax states and the District of Columbia for a married couple with two dependent children. In order to maintain comparability between the states and keep the analysis relatively simple, it is further assumed that the wife has no independent income and that the family receives no income from intangible assets or capital gains. The income levels represent "adjusted net income" which as used here refers to the taxpayer's income *after* deduction of whatever personal or non-business expenses the various states and federal government allow in the determination of taxable income, but *before* either either federal or state income taxes, and *before* any personal exemptions or tax credits. Of course, the "adjusted net income" will always be smaller, and in some instances by a considerable amount, than the family's adjusted gross income or personal income received during the taxing period.

The computed tax liabilities which prevailed in the various states in 1957 for such families with adjusted net incomes of $10,000 or less are shown on a comparative basis in Table 12.13.

It will be noted that at the first four levels of income Colorado uniformly falls in the lowest quartile of the nation's income tax states when they are ranked by the dollar amount of income tax liability. At the $3,000 level of income the married taxpayer with two children would have no tax obligation in Colorado (nor in fifteen other personal income tax states and the District of Columbia).

At the $5,000 level no tax would be due in Louisiana or Mississippi, but the Colorado tax of $14.62, representing an average or effective rate of less than 3/10 of 1 percent of the adjusted net income, exceeds the tax that would be paid by a comparable family in only five of the other twenty-seven taxing jurisdictions as shown in Chart 12.4. Of the eleven Western States that are the basis for intra-regional comparisons made in this study only three—Nevada,



Source: Income Tax Statutes, Regulations, and Tax Forms of the States

CHART 12.4

Washington and Wyoming—do not levy personal income taxes. The eight states which use income taxation as part of their fiscal structures are: Arizona, California, Colorado, Idaho, Montana, New Mexico, Oregon and Utah. When Colorado is compared with the seven other Western States which also levy personal income taxes, only Arizona and California impose a smaller tax at this level of income.

Similarly, at the $8,000 and $10,000 levels of income Colorado ranks correspondingly low among the income tax levying states—23rd and 24th—and the tax liability would be $56.27 and $98.72, or 7/10 of 1 percent and slightly less than 1 percent, respectively, of the adjusted net income. And at these levels of income half of the Western States—Oregon, Idaho, Utah and Montana—require the payment of income taxes considerably above those of Colorado. For example, the Oregon income tax works out to be almost four times as large as the Colorado tax at the $8,000 level of income, and more than three times as large at the $10,000 level, as shown in Chart 12.5.

In brief, under the assumed conditions, the computed dollar amount of income tax liability for Colorado taxpayers with adjusted net in-

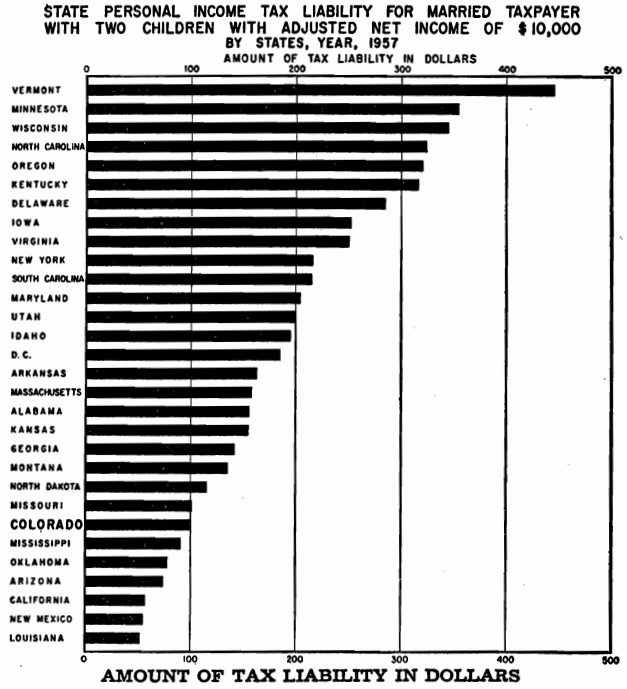
Colorado as percent of net adjusted income		—			0.3			0.7			1.0

[a] The computed tax liabilities for each state at the four assumed levels of adjusted net income are based on the following assumptions: (1) the taxpayer is married and has two dependent children; (2) wife has no income, and family receives no income from dividends, interest or capital gains; and (3) the adjusted net income is *after deductions* of whatever "personal" and/or "non-business" expenses the various states and federal government allow; but *before* any personal exemptions, or credits, and *before* either federal or state income taxes.

Source: Computed from the individual income tax regulations, instructions, and forms of the several states.

comes of $10,000 or less works out to be lower than that of similar taxpayers in three-fourths of the other income tax levying states. Or stated differently, it appears that a married taxpayer with two dependent children whose adjusted net income is $10,000 or less would incur in Colorado an income tax liability which was approximately only one-half that of the national average, and about one-fifth that of a taxpayer with comparable income in the state with the highest tax.

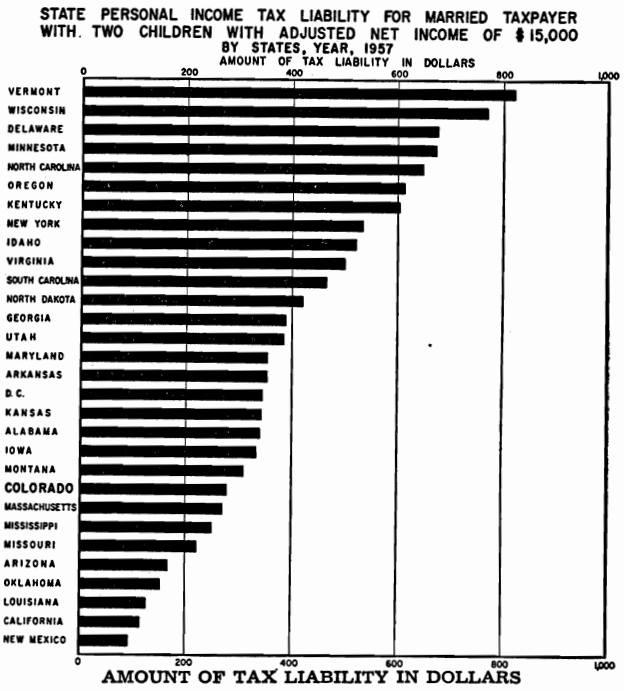


Source: Income Tax Statutes, Regulations, and Tax Forms of the States

CHART 12.5

The comparative tax liabilities for taxpayers with adjusted net incomes of $15,000 and more are presented in Table 12.14. At these upper income levels Colorado's rank among the states is relatively higher than was the case for the lower and medium adjusted net incomes used in Table 12.13, but the dollar amount of computed tax liability for the Colorado taxpayer remains below the average for the twenty-nine income tax states and the District of Columbia at all levels of income.

At the $15,000 level the Colorado tax is $278.80, or less than 2 percent of the adjusted net income, and only eight states in the nation impose a smaller tax as shown in Chart 12.6. As income increases the relative position of Colorado among the states rises and at $25,000 the Colorado tax is above the median for all the states but continues to be below the national average and about two-thirds that of Oregon, the top-ranking Western State. At the $50,000 and $100,000 levels of income the Colorado tax liabilities of $1,871.36 and $3,313.98, representing approximately 4 and 3 percent of adjusted net income, continue to be below the national averages. At these higher levels of adjusted net income Colorado's rank among the states successively drops below the median to the 17th and 18th positions, primarily because the federal income tax deductibility provision has a relatively greater impact on the state tax. For example, not one of the five states imposing the heaviest taxes permits full deductibility of the federal tax in the computation of the state income tax liability. Among the fifteen states ranked above the median only five allow full deductibility at the $50,000 level, and only three allow it at the $100,000 level.



Source: Income Tax Statutes, Regulations, and Tax Forms of the States

CHART 12.6

When compared with the other seven Western States levying income taxes, Colorado ranks about in the middle at these income levels of $15,000 and more. Oregon and Idaho consistently impose heavier income taxes than Colorado. And California, with both a lower tax rate structure and an income-splitting provision, levies a tax almost one-fourth greater than Colorado at the $100,000 level because it does not permit any federal income tax deductibility in the determination of the state tax. In summary, although Colorado's top marginal income tax rate is one of the half-dozen highest in the nation, the com-

[a] The computed tax liabilities for each state at the four assumed levels of adjusted net income are based on the following assumptions: (1) the taxpayer is married and has two dependent children; (2) wife has no income, and family receives no income from dividends, interest or capital gains; and (3) the adjusted net income is *after deductions* of whatever "personal" and/or "non-business" expenses the various states and federal government allow; but *before* any personal exemptions, or credits, and *before* either federal or state income taxes.

Source: Computed from the individual income tax regulations, instructions and forms of the several states.

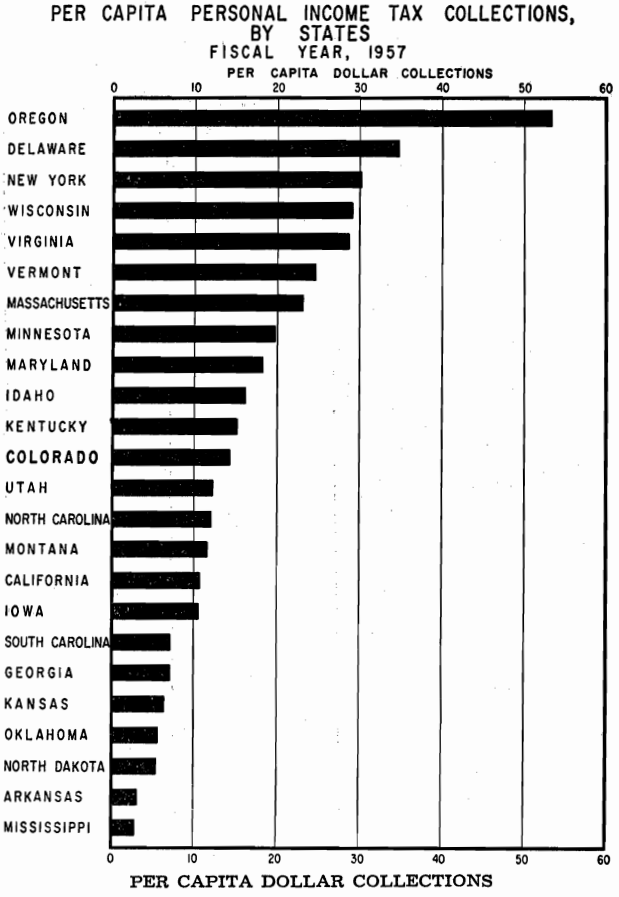
puted tax liability of Colorado taxpayers actually works out to be significantly below the national averages at all levels of income, with the deviation being considerably larger for those taxpayers who have adjusted net incomes of $10,000 or less. And it is important to note that the vast majority of income taxpayers in Colorado, as elsewhere throughout the nation, are to be found in these medium and lower income categories.

Interstate Comparisons of Personal Income Tax Collections

Interstate comparisons of tax collections represent another basis commonly used for analyzing a specific tax in a state's fiscal program. Table 12.15 shows the personal income tax collections expressed in both absolute and relative terms for the twenty-four states for which data were available for the fiscal year, 1957.

The wide variation shown in the total dollar amount of state collections, ranging from almost a half billion to less than $4 million, when considered alone is not very meaningful. For example, New York's revenue from this source was more than a hundred times larger than North Dakota's, but after the data are reduced to per capita figures the ratio becomes less than six to one. Of course, interstate tax comparisons based on averages and "averages of averages" actually may conceal as much as they reveal, particularly in the case of personal income taxation. Reducing total tax collections to a per capita basis adjusts for the population variable but obviously does not take into account other major factors, such as differences between the states' over-all tax structures, levels of income and economic activity, and patterns of income distribution. For example, per capita personal income tax collections in Colorado were almost 20 percent larger than those in North Carolina, although total collections actually accounted for a significantly smaller percentage of personal income received before tax in Colorado than in North Carolina and, therefore, represented a smaller relative tax burden. Similarly, states such as Kentucky and North Dakota which have comparatively low per capita tax collections generally ranked high in terms of the computed tax liability for a representative family of four

at varying levels of taxable income as shown in Tables 12.13 and 12.14. And since the very essence of progressive income taxation is that it not be levied as a capitation tax, perhaps a more important limitation of the per capita analysis is the fact that it conceals both the extensiveness of the tax, i.e., the relative number of individuals actually affected, and the apportionment of the tax burden among the various income groups within the taxing jurisdiction. But within these limitations, the per capita data do reveal the general levels of income taxation which prevail in the several states. For the fiscal year 1957 per capita state collections ranged from a high of $53 in Oregon to a low of less than $3 in Mississippi as shown on Chart 12.7.



SOURCE: U. S. Bureau of the Census, Compendium of State Government Finance, 1957

CHART 12.7

On this basis Colorado ranked twelfth among the twenty-four states but its average collection of $14.24 was almost 15 percent below the unweighted national average of $16.70. Moreover, its tax was only about one-fourth as large as the per capita tax in Oregon, the state which is most comparable to Colorado in other basic economic characteristics such as size of population, income produced, total wages, and federal tax collections.[46]

Table 12.15

Comparative State Personal Income Tax Collections, Fiscal Year 1957[a]

State	Total amount of personal income tax collections (thousands)	Amount of per capita collections	Personal income tax as percent of: State's total tax revenues	Personal income tax as percent of: State's total personal income[b]
Arkansas	$ 5,431	$ 3.07	4.3	0.27
California	143,339	10.64	8.8	0.41
Colorado	23,188	14.24	15.7	0.69

Iowa	28,673	10.41	11.6	0.57
Kansas	13,266	6.31	8.4	0.35
Kentucky	45,346	15.13	22.5	1.09
Maryland	51,355	18.18	20.5	0.82
Massachusetts	111,222	23.11	26.9	0.98
Minnesota	64,445	19.77	22.0	1.05
Mississippi	5,982	2.78	3.7	0.29
Montana	7,750	11.56	14.3	0.60
New York	476,312	30.10	33.1	1.16
North Carolina	52,873	12.00	14.3	0.89
North Dakota	3,444	5.36	6.7	0.37
Oklahoma	12,563	5.60	5.3	0.34
Oregon	92,245	53.23	47.6	2.73
South Carolina	16,387	7.04	8.9	0.59
Utah	10,081	12.22	13.1	0.70
Vermont	9,132	24.61	26.2	1.51
Virginia	106,048	28.63	33.6	1.68
Wisconsin	110,256	29.11	31.0	1.49
All States	1,439,658	16.70	19.6	0.89

[a] Alabama, Arizona, Louisiana, Missouri and New Mexico are excluded from the above compilations because the Bureau of Census data show only combined corporate and personal income tax collections for these states.
[b] Personal income received data are on a calendar year basis.

Source: U. S. Department of Commerce, Bureau of the Census, *Compendium of State Government Finance in 1957;* and *Survey of Current Business*, August, 1958.

When compared with respect to the relative extent that personal income taxation was used in the over-all tax structure, as shown in Chart 12.8, Colorado again ranked twelfth and Oregon first among the income tax levying states for which data were available. As already indicated,

[46]The remarkable similarity of the economic bases of the two states is shown by the following comparative data for 1957:

Economic bases	Colorado	Oregon	Range for all states: Maximum	Range for all states: Minimum
Total population (thousands)	1,673	1,769	15,888	267
Area (thousand square miles)	104	97	267	1
Per capita personal income	$1,996	$1,914	$ 2,821	$958
Personal income produced (millions)	$3,339	$3,385	$40,954	$626
Wages and salaries	$2,120	$2,215	$28,457	$400
Proprietors farm income	$ 150	$ 148	$ 994	$ 5
Proprietors non-farm income	$ 390	$ 436	$ 3,534	$ 59
Property income	$ 450	$ 411	$ 6,247	$ 73
Transfer payments	$ 225	$ 246	$ 2,402	$ 29
Total number federal individual tax returns filed in 1956 (thousands)	553	593	6,394	96
Total amount federal individual tax collections in 1956 (millions)	261	285	3,947	41

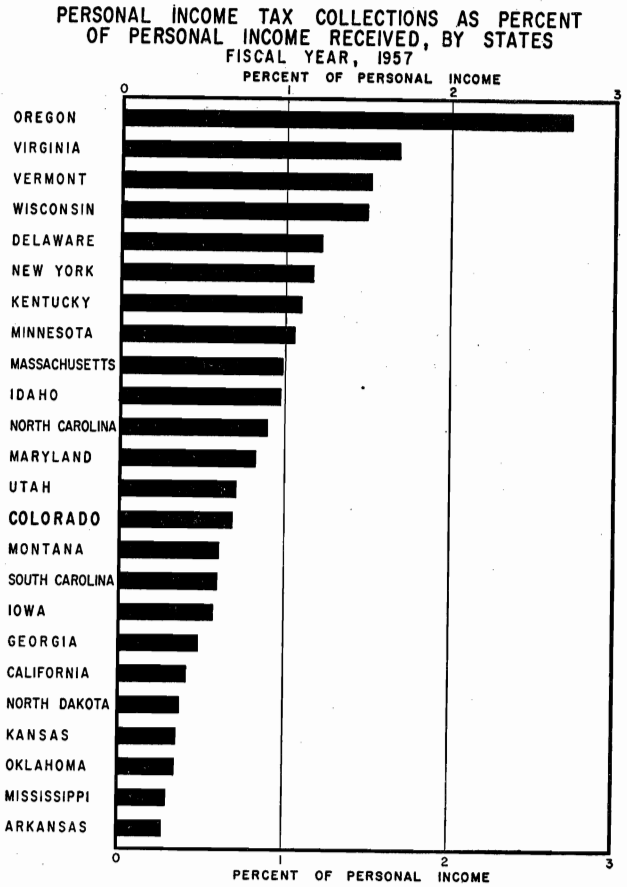
CHART 12.8

Oregon's collections accounted for almost one-half of its total taxes. Other states which also utilized the tax extensively, obtaining about one-third of their revenue from this source, were Delaware, New York, Virginia and Wisconsin. In contrast, Colorado's personal income tax revenues of $23 million for fiscal year 1957 represented less than one-sixth of its total taxes and as such the Colorado ratio was below the national average and only about one-third as large as that of Oregon. Similarly, when the tax is expressed as a percentage of income Colorado ranked fourteenth among the twenty-four states as shown in Chart 12.9 Its personal income tax collections amounted to less than 7/10 of 1 percent of the total personal income received before tax. This was approximately four-fifths and two-thirds of the national and Western State averages, respectively; whereas the Oregon tax-income ratio of 2.7 percent was the highest of any state and four times as large as the Colorado percentage.

In summary, it is evident that on the basis of interstate comparisons Colorado is a relatively low personal income tax state whether measured by the amount of tax liability imposed on representative families at varying levels of income or in terms of the total amount of income tax revenues collected from families and individuals subject to the State's taxing jurisdiction. Notwithstanding the limitations of the comparative data, it is also evident that the tax takes a significantly smaller percentage of personal income received in Colorado than in most other states and that Colorado's utilization of personal income taxation in its over-all fiscal structure is below the national average and considerably below that of Oregon, the one state which in other basic economic characteristics is most comparable to Colorado.



Source: U. S. Bureau of the Census, Compendium of State Government Finance, 1957.

CHART 12.9

Erosion of the Income Tax Base

Colorado's relatively low personal income tax liabilities and collections, as already noted, may be attributed primarily to the nature of the State's income tax base rather than the structure of rates. Analysis of the 1957 returns filed in

1958 indicates that a large part of the tax base is simply "eroded away" before any rates are applied. Thus, the major portion of the personal income received by Colorado residents in 1957 was never subjected to income tax since it never found its way into the tax base.

Personal income for Colorado, as estimated by the U. S. Department of Commerce, amounted to $3,339 million for the calendar year 1957.[47] In contrast, the data reported on the 1957 Colorado individual income tax returns show that the *net taxable income* used as the basis for the computations of normal tax amounted to about $800 million, or less than 25 percent of the total personal income received in Colorado during that year. The large gap of more than $2.5 billion between the actual flow of income and that finally subjected to the State's personal income tax can be attributed mainly to the following four factors: (1) basic differences in the conception and statutory definition of income; (2) legal and illegal underreporting of income by taxpayers; (3) extensive use of statutory personal expense deductions, particulary the federal income tax; and (4) statutory personal exemptions.

The derivation of Colorado's adjusted gross income for tax purposes from personal income received in 1957 is summarized in Table 12.16 which is based, in part, on post war studies of the relationship of federal taxable and personal income.[48] Although these figures are estimates, in broad terms they represent the relevant magnitudes of the components that determine taxable income and, as such, are indicative of the factors which account for erosion of this part of the Colorado income tax base.

It will be noted that on the basis of personal income of $3,339 million (Table 12.16, column 1), the corresponding adjusted gross income that should have been reported for tax purposes amounted to $2,880 million (column 3). The gap between the two measures represents Colorado's specific statutory exclusions from gross income[49] and other conceptual differences in the definition of income. For example, the Department of Commerce concept includes such nontaxable components as imputed rent of owner-occupied residences, imputed and accrued interest, government and business transfer payments, and income in kind. On the other hand, it excludes

[47]The aggregate annual flow of income to individuals, both on a national and statewide basis, is estimated by the National Income Division, Office of Business Economics, U. S. Department of Commerce. Personal income for national income accounting purposes is broadly defined as the sum of: wages, salaries and other labor income; interest, dividends and rents received by persons; net income of non-corporate enterprise (business, farm, professional, and other self-employed individuals); and government and business transfer payments (such as veterans' benefits and unemployment compensation). The 1957 estimate of personal income for Colorado is reported in "Regional Income Distribution in 1957," U. S. Department of Commerce, *Survey of Current Business*, August, 1958, Table 55, p. 20.

[f] Primarily income in kind and imputed income.
[g] Imputed rent on owner-occupied dwellings, imputed and accrued interest, income of non-profit organizations, etc.

certain forms of income considered taxable under the Colorado code, such as net capital gains, employee contributions to social security, and annuity payments in excess of cost. In order to derive the adjusted gross income which corresponds with the Department of Commerce estimate of personal income received by Colorado residents in 1957, it is necessary to adjust for the above differences in conception. The largest single adjustment required is the deduction from personal income of the $225 million for transfer payments not subject to taxation. In contrast, the $64 million of personal contributions to social insurance, omitted from the personal income measure, must be added back into the tax base.

Another important adjustment is the inclusion of net capital gains in the adjusted gross income total. As already noted, Colorado is among the minority of income tax states which statutorily excludes 50 percent of long-term capital gains from the tax base. It is estimated that the $37 million of net capital gains reported on the 1957 returns actually represented about $83 million of net long-term gains and $4 million of net short-term losses. Or stated differently, this special provision in the Colorado code resulted in the exclusion of more than $40 million, or approximately 5 percent of the 1957 personal income tax base. In addition to its erosion effect, the special treatment accorded capital gains has been widely criticized by tax authorities in terms of its inequity and regressivity.[50] A taxpayer whose income primarily consists of long-term capital gains obviously enjoys a special tax benefit not available to taxpayers with equal pre-tax incomes derived from other sources, such as business or farm profits, which are 100 percent includable as taxable income by statutory definition. And the exclusion of 50 percent of long- term capital gains introduces an element of regressivity since the receipt of this type of income generally is concentrated in the upper income groups. For example, on the basis of the survey data it appears that less than 10 percent of all taxpayers reported capital gains income, and among those that did, the 2 percent of taxpayers with adjusted gross incomes of $10,000 or more accounted for over 50 percent of the total amount of net long-term capital gains reported on all tax returns.[51]

Table 12.16 (column 2) shows the adjustments which were also made to wage, entrepreneurial and property incomes in order to take account of conceptual differences between personal and taxable income.[52] The wage difference amounted to less than $100 million, or approximately 4 percent of the total wage income estimated by the Department of Commerce. It mainly reflects employers' contributions to social insurance and nontaxable military pay and allowances. The incomes of businessmen, farmers and other self-employed persons were decreased by $66 million, or about 12 percent, as a measure of the receipt of income in kind and imputed income. The largest adjustment was made to the property income component which was reduced by $175 million, or almost 40 percent, primarily because neither the State nor federal income tax code makes any reference to imputed interest and rent.[53] The latter may be defined as the amount of income which could have been obtained as a net return on home investment if owner-occupied residences were rented to others. Several tax authorities have contended that the omission of such rental income from the tax base confers "an immense tax benefit to the person who occupies his own home" and results in tax discrimination between renters

---

[50]Published criticism of capital gains taxation is practically limited to the federal tax because of the relatively high marginal rates involved under the federal code and the general recognition that the federal tax is significantly more crucial than state taxes in investment decision-making. In consideration of the comparatively low state rates and federal tax deductibility, the rationale for preferential treatment of capital gains becomes less tenable on the state level.

The following are cited merely as representative of the voluminous literature on the subject: L. H. Seltzer, *The Nature and Tax Treatment of Capital Gains* (New York: National Bureau of Economic Research, 1951); H. Simon, *Personal Income Taxation* (Chicago: University of Chicago Press, 1938), Chap. VII, pp. 148-169; W. Vickrey, *Agenda for Progressive Taxation* (New York: The Ronald Press Company, 1947), Chap. V, pp. 135-150; H. Groves, *Financing Government* (New York: Henry Holt and Company, 1954), pp. 168-173; W. W. Heller, "Investors' Decisions, Equity, and the Capital Gains Tax," *Federal Tax Policy for Economic Growth and Stability*, pp. 381-394, and "Practical Limitations on the Federal Net Income Tax," *Journal of Finance*, September, 1952, pp. 185-199; W. Cary, "Pressure Groups and the Revenue Code," *Harvard Law Review*, Vol. 68 (1955), pp. 745-780; R. E. Paul, "Erosion of the Tax Base and Rate Structure," *Federal Tax Policy for Economic Growth and Stability*, pp. 297-311; and H. M. Somers, "An Economic Analysis of the Capital Gains Tax," *National Tax Journal*, September, 1948, pp. 226-232.

[51]The following tabulation shows the net long-term capital gains reported on the 1957 Colorado returns classified by adjusted gross income groups:

Adjusted gross income class	Total number of taxpayers	Number of taxpayers reporting	Long-term capital gains included at 50 percent: Percent of total taxpayers	Net amount of capital gain (thousands)	Average net gain
$ 0 - 4,999	357,600	27,000	7.6	$12,630	$ 467
5,000 - 7,999	120,700	11,000	9.1	5,244	476
8,000 - 9,999	23,000	3,900	17.0	2,193	562
10,000 - 14,999	14,320	4,310	30.1	4,363	1,012
15,000 - 49,999	8,532	4,364	51.1	8,495	1,946
50,000 and over	669	507	75.8	8,693	17,145
Total[a]	524,821	51,081	9.7	$41,617	—

[a] Sum of items may not equal total because of rounding.

[52]These adjustments, based on ratios developed by Holland from federal data, were made on the assumption that the national ratios were applicable to the State since Colorado's per capita personal income in recent years has closely approximated the median for the Nation. See Holland, *op. cit.*, Table 1, p. 315.

[53]In contrast, under the income tax laws of England and several other countries imputed rent derived from the ownership of real property explicitly is considered to be income and is taxed accordingly. See Simon, *op. cit.*, pp. 113-119.

and homeowners.[54] Moreover, this type of tax exemption has a regressive effect on the tax structure since the extent of homeownership among taxpayers tends to vary directly with income. For example, a recent Federal Reserve study indicates that in 1957 about 80 percent of non-farm households with incomes of $10,000 or more owned their own homes, whereas homeownership was only 40 percent among those with net incomes of $4,000 or less.[55] However, since estimates of imputed income are included in the Department of Commerce measures of interest and rent it is necessary to make appropriate adjustment for these factors in the derivation of taxable income.

After all of the above adjustments are taken into consideration it appears on net balance that $459 million, or approximately 14 percent of the personal income received in Colorado, did not find its way into the state income tax base because of statutory exclusions and conceptual differences. Comparable studies made on the national level indicate that more than 11 percent of personal income is excluded from the federal tax base for the same reasons.[56] The Colorado and federal percentage estimates of this type of leakage from the tax base should roughly approximate each other since the broad definitions of adjusted gross income for tax purposes are generally similar under both codes.

Although we can definitionally account for about $459 million of income excluded from the adjusted gross income concept, the gap between the personal income total (column 1) and the adjusted gross *actually* reported on the returns filed (column 5) amounted to almost $960 million. Thus, the other missing $500 million, approximating 15 percent of the personal income flow, must be considered unreported income which never found its way into Colorado's normal income tax base.[57] In part, it can be explained by the fact that returns were not legally required from an undisclosed number of individuals whose incomes were below the required filing minimum of $750 per annum.[58] The remainder of this leakage represents the underreporting of income due to deliberate tax evasion and/or oversight on the part of taxpayers. It is difficult to come up with any exact figures as to the magnitude of these factors, but rough estimates of the degree of underreporting of particular types of income can be obtained by comparing the wages and salaries, entrepreneurial incomes, and property incomes actually reported on the 1957 tax returns (column 5) with the estimated amounts that taxpayers should have reported on the basis of the data which correspond with the Department of Commerce income figures for Colorado (column 3).

The distribution of the major sources of adjusted gross income is shown in Table 12.17 and the percentage variations in reporting particular types of income on the Colorado tax returns appear in Chart 12.10. It is estimated that 87 percent of the total wages and salaries received showed up on the 1957 returns and 13 percent went unreported. However, the studies of both Goldsmith and Holland indicate that only about 5 percent of wages and salaries was underreported on federal income tax returns during 1946 and 1952.[59] Because taxpayers generally report the same amount of wage income on both their federal and state tax returns, particularly since the Colorado payroll withholding is tied to the federal withholding reported by employers, it is reasonable to assume that the 5 percent national ratio of wage leakage is applicable to the 1957 Colorado state income tax returns. Thus, it appears that approximately $150 million, or more than half of the 13 percent of labor income unreported on the Colorado returns, represented wages which were legally excluded from adjusted gross income primarily because incomes were below the minimum required for filing. In contrast, the percentages of underreporting of the other major sources of income are significantly higher than that calculated for wages and salaries and, in part, must be attributed to the fact that comparable "withholding-at-source" methods of collection are not applied to non-wage incomes. It is estimated that about 27 percent of the income derived from

Marsh, "The Taxation of Imputed Income," *The Political Science Quarterly*, December, 1943, pp. 317-336; H. Simon, *op. cit.*, pp. 112-119; and W. Vickrey, *op. cit.*, pp. 18-24.

[55] Federal Reserve System—Survey Research Center of the University of Michigan, "1957 Survey of Consumers Finances: Housing and Durable Goods," *Federal Reserve Bulletin*, June, 1957, p. 639.

[56] Holland estimated the conceptual difference between personal and adjusted gross income for the federal income tax to be 11.6 percent for 1952. Similarly, the estimates reported by Pechman for this conceptual difference averaged 11.3 percent for the nine years, 1948-1956 inclusive. See Holland *op. cit.*, Tables 2 and 3, pp. 315-317; and Pechman, *op. cit.*, Table 1, p. 4.

[57] Some part of this unreported income may represent statistical errors since neither the Department of Commerce nor the Colorado income tax survey data are absolutely precise figures. See Appendix to this chapter for methods of estimation, description of sample, and statistical limitations of the Colorado income tax data.

[58] As noted, on the basis of the 1957 resident returns filed in 1958 approximately 20 percent of Colorado's total population were neither income taxpayers (in the reporting sense) nor the dependents of taxpayers. However, it is not possible to ascertain the number in this group that were legally exempted from filing because of inadequate income. Moreover, many individuals who were legally exempted filed returns in order to obtain payroll withholding refunds. About 15,000 nontaxable refund returns, or 12 percent of the total number of nontaxables were in the adjusted gross income category of $750 or less in 1957.

[59] Goldsmith, *op. cit.*, p. 302; and Holland, *op. cit.*, p. 320, Table 4.

the ownership of property, 30 percent of the income of business and self-employed professional persons, and 43 percent of farm income were *not reported* on the 1957 Colorado tax returns. On the other hand, the estimates on the underreporting of farm and property incomes (dividends, interest and rents) for the Colorado returns worked out to be considerably lower than those calculated for federal returns by Goldsmith and Holland.[60] But it should be noted that the latter, except for the category of nonfarm business income, generally confirm the pattern of the Colorado estimates.

Table 12.17

Distribution of the Major Sources of Adjusted Gross Income Reported on Colorado Personal Income Tax Returns, 1957[a]

	Amount (thousands)	Percentage distribution
Wages and salaries	$1,824,233	76.5
Proprietors' (entrepreneurial) income	316,374	13.3
Business income	180,912	7.6
Farm income	66,760	2.8
Self-employed professional	61,390	2.6
Miscellaneous[b]	7,312	0.3
Property income	200,822	8.4
Dividends	71,072	3.0
Interest	63,897	2.7
Rents and royalties	65,853	2.8
Net capital gains	37,463	1.6
Net long-term capital gains[c]	41,617	1.8
Net short-term capital losses	—4,154	0.2
Annuities	4,793	0.2
Adjusted gross income[d]	$2,383,685	100.0

[a] Based on survey of Colorado 1957 tax returns filed in 1958.
[b] Proprietor income of taxpayers whose primary sources of income were wages, or interest, dividends, rents, etc.
[c] Total net long-term capital gains were $83.3 million, of which 50 percent were taxable by statute.
[d] Before travel allowance deduction.

In the aggregate it appears that the adjusted gross income leakage on the 1957 Colorado tax returns was in the neighborhood of $500 million, and that the amount underreported by taxpayers, deliberately or through oversight, ranged between $300 and $350 million, or approximately 10 to 12 percent of the total adjusted gross income that should have been reported for tax purposes. Again, the reader is forewarned that these data are imprecise, although generally indicative of the importance of the problem.[61] Of course, in terms of taxpayer compliance the voluntary reporting of 88 to 90 percent of the adjusted gross income represents a very substantial proportion of taxable income and, as such, makes clear that the erosion of the Colorado personal income tax base cannot be mainly attributed to widespread underreporting of income. Nevertheless, the marked variations in the degree of reporting different types of income creates serious "horizontal" inequities in the tax system. As observed by Holland:[62]

> . . . some taxpayers because of the particular sources from which their income derives, are in a better position to play the game of tax avoidance than others. A game not open equally to all is unfair . . . . This is a matter of concern because it leads to continual taxpayer irritation and ultimate disrespect for the income tax whose success depends on a high standard of reporting.

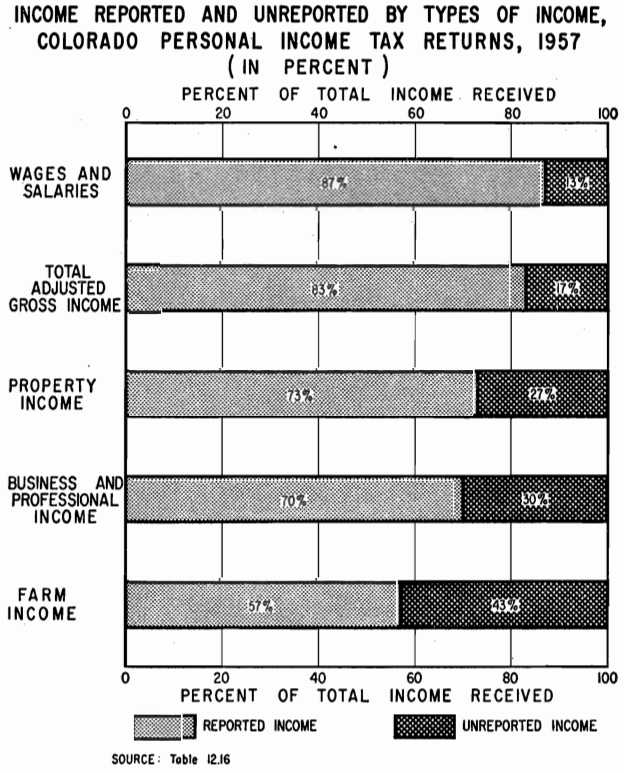

CHART 12.10

[60] The Goldsmith and Holland estimates for the underreporting of particular types of income on federal tax returns for 1946 and 1952 are as follows:

Type of income	Percentage estimates of underreported income: 1946[a]	1952[b]
Wages and salaries	5	5
Proprietors' income	29	30
Farm Income	64	61
Business and professional	13	12
Property income	42[c]	39[d]
Dividends	24	13
Interest	63	61
Rent	55	—

[a] Goldsmith, *op. cit.*, p. 302.
[b] Holland, *op. cit.*, p. 320, Table 4.
[c] Computed average of the reported rates on dividends, interest and rents, weighted by Holland's 1952 national data.
[d] Based on the Goldsmith rate for rents since Holland has no rent estimate.

[61] It may be appropriate, however, to remind the reader at this point of the maxim that "it is better to be loosely correct, than precisely incorrect."

[e] This and all subsequent items based on data derived from survey of Colorado 1957 personal income tax returns.
[f] Except for federal income tax.

In brief, almost $1 billion, or about 29 percent of the total personal income received in Colorado in 1957, never found its way into the adjusted gross income reported on all returns because of explicit statutory exclusions, conceptual differences in the definitions of income, and legal and illegal underreporting of income. Stated positively, only $2.4 billion, or 71 percent of the total flow of personal income received by Colorado residents in 1957, as measured by the Department of Commerce, was reported on the individual tax returns filed for that year. This is considerably less than the comparable 81 percent ratio of adjusted gross to personal income maintained on federal income tax returns in recent years.[63] In part, it reflects the fact that administrative enforcement and taxpayer compliance on the national level continue to be significantly superior to that achieved on the state level.

Table 12.18 summarizes the derivation of net taxable income from personal income received and Chart 12.11 shows the major factors responsible for the shrinkage of the 1957 Colorado individual income tax base. The preceding analysis of excluded and underreported income accounted for less than $1 billion of the total leakage in the circuit flow of income from receipt to tax base. Various deductions permitted under the Colorado code—particularly statutory personal expenses and personal exemptions—accounted for the remaining gap of $1.6 billion which was two-thirds of the $2.4 billion of adjusted gross income (before travel allowance) reported on all returns.

Generally, adjusted gross income represents the taxpayer's income net of expenses incurred in earning such income. In the case of the Colorado tax, however, it is useful to distinguish adjusted gross income *before* and *after* travel allowance since Colorado is unique among the income tax states in permitting a standard minimum travel expense deduction of $75 to all

---

[63] The ratios of reported adjusted gross income on federal tax returns to national personal income for the five most recent years for which data were available are calculated below:

Year	Adjusted gross income on federal returns[a] (billions)	National personal income[b] (billions)	Adjusted gross income as percent of personal income
1956	$265[c]	$327	81
1955	249	306	81
1954	230	287	80
1953	230	286	80
1952	217	272	80

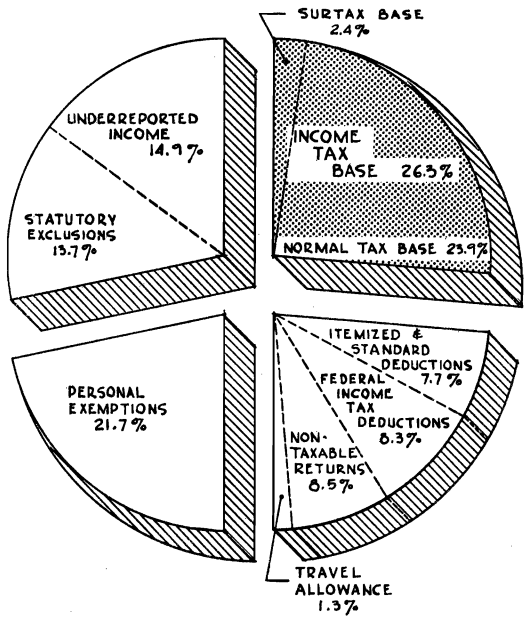
[a] U. S. Treasury Department, *Statistics of Income for 1955* (Washington, 1958), p. 62, for years 1952-1955, inclusive.
[b] *Economic Report of the President* (Washington, 1958), p. 129.
[c] Pechman, *op. cit.*, p. 4.

taxpayers with earned income. This provision alone removed more than $44 million from the tax base, or slightly less than 2 percent of the adjusted gross income. The latter, after travel allowance, was $2,339 million, or almost exactly 70 percent of the personal income received by Colorado residents in 1957. If from this figure we further subtract the $282 million of income reported on nontaxable returns,[64] we obtain an adjusted gross income of approximately $2,000 million for those individuals subject to normal tax.

In turn, the statutory personal expense deductions taken by taxable individuals totaled $534 million which represented more than one-fourth of their adjusted gross income. Moreover, the relative importance of the Colorado provision permitting full deductibility of federal income taxes in addition to other personal expenses is indicated by the fact that the $276 million of federal tax deduction accounted for more than the total amount of all other itemized and standard personal expenses reported on taxable returns. But the largest single factor responsible for the shrinkage of the tax base, as shown in Chart 12.11, was the personal exemption deduction which in 1957 was raised by the legislature from $600 to $750 per taxpayer and dependent. The exemption increase on taxable returns alone eliminated some $145 million of income from the tax base, and the dollar value of the total exemptions claimed by taxable individuals was $725 million—a deduction in excess of one-third of the reported adjusted gross income of this group.

After these exemptions are deducted, the remaining $800 million constituted the *net taxable income* used as the basis for the computation of the normal tax liabilities on the 1957 returns. In brief, it appears that after statutory personal expense and exemptions are taken the normal tax base represented only about one-fourth of the personal income received and one-third of the income reported on all taxable and nontaxable returns. To the net taxable income we must add the *net surtaxable income,* i.e., gross income from intangibles less surtax exemptions,[65] which amounted to another $80 million, or more than 10 percent of the net income subject to normal tax.

MAJOR FACTORS RESPONSIBLE FOR THE EROSION OF 1957 COLORADO PERSONAL INCOME TAX BASE



SOURCE : TABLE 12.10

CHART 12.11

Thus, at the end of the income circuit, the net individual income tax base for Colorado was $880 million, or just slightly more than one-third of the adjusted gross income actually reported on all tax returns. Viewed in terms of erosion, it is estimated that only 26 percent of the total personal income received by Colorado residents in 1957 found its way into the State's individual income tax base and, hence, three-fourths was never subjected to state income taxation. In contrast, federal returns reveal that more than 40 percent of the personal income received by the nation as a whole was included in the federal income tax base during the most recent years for which data are available.[66] The fact that the State ratio is more than one-third lower than the federal must be attributed in large part to the higher personal exemptions on the state level and the reciprocal income tax deductibility provisions which result in a con-

[64]Nontaxable returns were eliminated at this point in the analysis because the sum of personal expenses and exemptions exceeded the adjusted gross income for these returns, as shown by the following tabulation:

Nontaxable Returns	Amount (thousands)
Personal expenses:	
(a) Itemized deductions	$ 25,482
(b) Standard deductions	19,233
(c) Federal income tax deductions	8,937
Total	53,652
Personal exemptions	347,017
Sum of personal expenses and exemptions	400,669
Reported adjusted gross income	282,140
Excess of deductions and exemptions over adjusted gross income	118,529

[65]Net surtaxable income as reported on the 1957 taxable returns was equal to the $123.3 million of gross surtaxable income less $43.3 million of surtax exemptions.

[66]Total personal income for the United States amounted to $285 billion in 1954 and $307 billion in 1955; total taxable income reported on federal returns was $115 and $128 billion, respectively for these two years. See U. S. Department of Commerce, *Survey of Current Business,* August, 1958, Table 1, p. 13; U. S. Treasury Department, *Statistics of Income for 1954* (Washington, 1957), Table 1, p. 33; and *Statistics of Income for 1955* (Washington, 1958), Table 1, p. 18.

siderably large bite being taken from the State tax base because of the relatively high federal rate structure. Finally, to carry the analysis one step further, it should be noted that the normal and surtax rates applied to the "eroded" tax base produced a total tax liability of $18.3 million for Colorado taxpayers in 1957.[67] Expressed as average rates, it means that this tax liability worked out to be only 2.1 percent of net taxable income, .8 of 1 percent of all reported adjusted gross income (taxable and nontaxable after travel allowance), and .5 of 1 percent of the total personal income received in Colorado that year, as estimated by the U. S. Department of Commerce.

Personal Deductions and Exemptions

The comparative magnitudes and distribution of the statutory personal expense deductions and exemptions reported by Colorado taxpayers on their 1957 returns are reviewed in this section. Under the Colorado code the deduction of allowable personal expenses is provided for by the following three methods:

Itemized deductions—All taxpayers have the option of itemizing personal expenses which are explicitly covered by statute, such as medical expenses, contributions, interest and taxes.

Optional standard deductions — In lieu of itemizing, taxpayers with adjusted gross incomes of $5,000 or more may elect to take a standard deduction of 10 percent of their adjusted gross income or $1,000, whichever is lesser, plus an amount equal to the federal income tax paid during the taxable year. In the case of married taxpayers filing separately the maximum deduction is limited to $500 for each spouse.

Table deductions—Taxpayers with adjusted gross incomes of less than $5,000 may use a tax table prescribed by the Department of Revenue which incorporates a standard deduction equal to 10 percent of adjusted gross income, plus an amount equal to the average federal income tax paid by such taxpayers.[68]

Table 12.19 shows the number of returns filed and the total value of the personal expense deductions for 1957 classified by the above categories.

Table 12.19

Major Types of Personal Expense Deductions Reported on Colorado Individual Income Tax Returns, 1957

Type of deduction	Tax returns[a] Total number filed	Tax returns[a] Percent of all returns	Total deductions Amount (thousands)	Total deductions Percent distribution	Average deduction per return
Table					
Standard deduction	260,100	49.6	$ 66,618	11.3	$ 256
Federal income tax	105,600	20.2	55,600	9.5	527
Total	260,100	49.6	122,218	20.8	470
Optional standard					
Standard deduction	80,228	15.3	47,375	8.1	597
Federal income tax	77,858	14.8	68,211	11.6	876
Total	80,228	15.3	115,586	19.7	1,441
Itemized					
Medical expense	62,684	12.0	19,982	3.4	318
Miscellaneous	99,937	19.0	25,415	4.3	254
Contributions	153,608	29.3	31,207	5.3	203
Interest expense	127,774	24.4	54,901	9.4	429
Other taxes	174,311	33.2	57,009	9.7	327
Federal income tax	165,772	31.6	161,073	27.4	971
Total	184,493	35.1	349,587	59.5	1,895
Total, all returns	524,821	100.0	587,391	100.0	1,119

[a] Not additive.

The itemized deductions were quantitatively the most important, exceeding the dollar value of the table and optional standard deductions combined. Although one-half of all taxpayers used the tax table, their deductions amounted to only $122 million, or one-fifth of the total. And of this group, approximately 60 percent did not have any deductible federal income tax expense.[69] The optional standard deductions in the aggregate were the least important. They numbered less than one-sixth of the returns filed and amounted to only $115 million, or less than one-fifth of the total. It appears that taxpayers in this category had relatively few deductible expenses to itemize other than federal income taxes since the latter were reported on 97 percent of the returns and exceeded the standard deduction by more than $20 million. In contrast, itemized expenses were reported on more than one-third of the tax returns and totaled almost $350 million, or approximately three-fifths of the deductions claimed by all taxpayers. Moreover, when the data are expressed as averages, the itemized deductions were four times as large as those based on the tax table and one-third larger than the optional standard deduction.

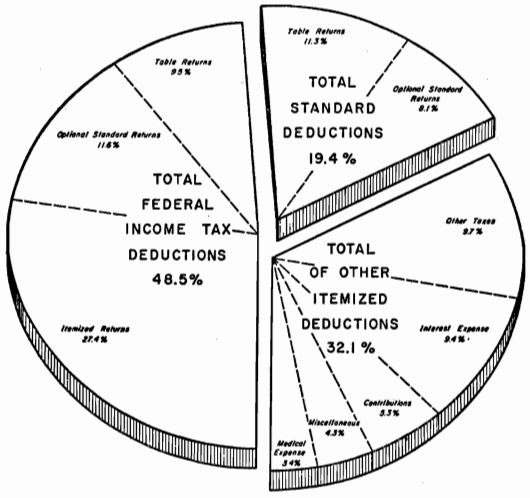
[67]The above $18.3 million of tax liability is only for the regular 1957 returns filed in 1958, and is exclusive of fiduciary, deficiency, tentative and prior-year delinquent returns. In contrast, the $21.8 million of tax collections for 1957 shown in Table 12.4 includes revenues from all types of returns and actually represents the tax liability reported on 1956 returns filed in 1957.

[68]Taxpayers using the prescribed tax table may file returns either on Form 104, the regular tax return, or on Form 104A, a tabulating machine card which is limited in use to full-time resident taxpayers with adjusted gross incomes of less than $5,000 derived solely from "salaries, wages, commissions, dividends and interest." Standard deductions based on the above two forms of returns will be designated as "table deductions" in order to distinguish them from the "optional standard" deductions taken by taxpayers who do not use the table.

[69]Of course, the relatively small percentage of taxpayers subject to federal tax in this category is mainly due to the fact that it includes the bulk of individuals with the lowest adjusted gross incomes. For example, the distribution of nontaxable returns by type of deductions was as follows: 78 percent table deductions; 19 percent itemized deductions, and only 3 percent optional standard deductions.

As is strikingly evident, the most important single deduction was the federal income tax expense. It was taken by 90 percent of the taxpayers filing itemized returns and amounted to more than $161 million, or 46 percent of the total of itemized expenses. When aggregated for all returns filed—table, optional standard and itemized—it amounted to $285 million, or practically one-half of the total deductions claimed by all taxpayers, as shown on Chart 12.12. The "other taxes" category of $57 million was the second largest itemized expense but only accounted for 10 percent of the total deductions. In turn, the deductible interest expense was slightly smaller —about $55 million, or 9 percent of the total. Charitable contributions were reported by 29 percent of the taxpayers but amounted to only 5 percent of the total deductions, and miscellaneous expenses were reported by 19 percent of the taxpayers and accounted for 4 percent of the total (Chart 12.13).

PERCENTAGE DISTRIBUTION OF TOTAL DOLLAR AMOUNT OF PERSONAL EXPENSE DEDUCTIONS REPORTED ON COLORADO INDIVIDUAL INCOME TAX RETURNS, 1957

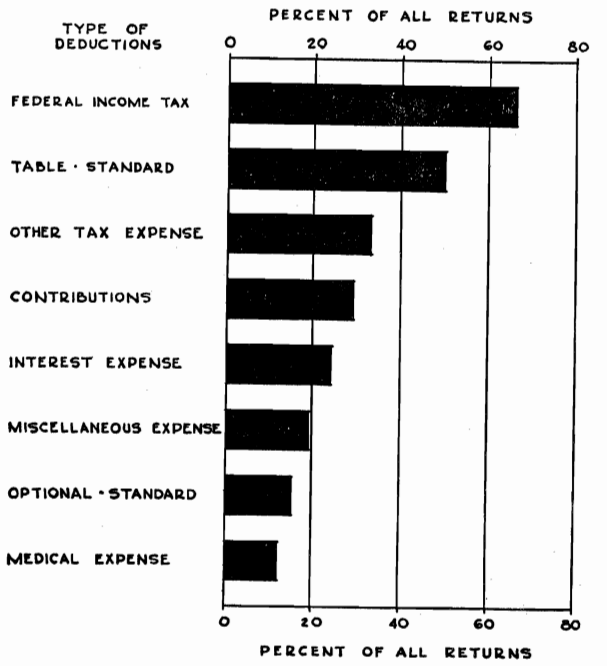


SOURCE: Table 12.19

CHART 12.12

Quantitatively, the least important itemized deduction was represented by allowable medical expenses which were claimed by only 12 percent of the taxpayers and amounted to less than $20 million, or approximately 3 percent of the total deductions reported on all returns. The relatively small amount of deductible medical expense is partly explained by the fact that the Colorado statute permits the deduction of only such expenses in excess of 5 percent of adjusted gross income while the federal code and eight other income tax states allow medical

PERCENTAGE OF ALL TAXPAYERS REPORTING MAJOR TYPES OF DEDUCTIONS ON COLORADO INDIVIDUAL INCOME TAX RETURNS 1957



SOURCE : TABLE 12.19

CHART 12.13

expenses in excess of 3 percent.[70] It is estimated that if Colorado had used 3 percent as the break-off point the allowable medical expenses would have been approximately $7 million larger for those taxpayers who reported medical deductions on their 1957 returns.[71] In general terms, however, the broad variations in the number and amount of these major forms of deductions—standard and itemized—may be attributed essentially to the distribution of income before tax since deductible expenses for tax purposes tend to vary in a significant manner with levels of taxpayer income.

Table 12.20 and Chart 12.14 show the total, itemized and standard deductions reported on the 1957 Colorado tax returns classified by adjusted gross income categories.

Taxpayers with incomes of less than $5,000, representing 68 percent of all individuals filing returns, had personal deductions of $205 million or 35 percent of the total reported; those with incomes from $5,000 to $10,000, representing 27

[70] *Supra.*, Table 12.7.

[71] The total adjusted gross income for taxpayers who claimed allowable medical expenses on their 1957 returns was approximately $350 million.

[c] Table and optional standard deductions, exclusive of federal income tax.

percent of the taxpayers, accounted for another $242 million, or 40 percent; while the remaining three categories with incomes above $10,000, representing less than 5 percent of all taxpayers, deducted personal expenses in excess of $140 million, or 24 percent of the total. Similarly, when the deductions were measured as percentages of adjusted gross income there were important variations between income levels. Taxpayers with incomes above $50,000 reduced their taxable incomes by 48 percent as a result of legally deductible expenses; whereas, those with incomes of less than $5,000 were able to claim deductions which averaged only 21 percent. When federal income tax expense was considered by itself the degree of direct variation between income levels became even more pronounced, ranging from 42 percent for the highest income category to 9 percent for the lowest.

On the other hand, the standard deductions actually varied inversely with income—from slightly more than 7 percent for taxpayers with incomes below $5,000 to less than one-tenth of 1 percent for those above $50,000. Of course, this primarily reflects the fact that the ratio of itemized to standard returns was considerably greater at the higher levels of income. In the lowest income class three-fourths of all taxpayers used the tax table or took the optional standard deduction, but at income levels above $10,000 the situation was reversed with approximately one-fourth of the taxpayers taking standard deductions and three-fourths itemizing their expenses.

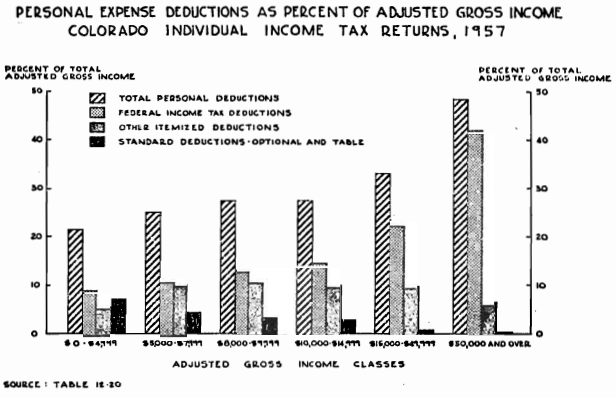

CHART 12.14

The total dollar amount of itemized deductions, exclusive of the federal tax expense, when measured as a percentage of adjusted gross income indicated a relatively high degree of stability between income levels—approximately 10 percent for each of the four income categories between $5,000 and $50,000, and about 6 percent at both ends of the income scale. But here, also, there were some marked differences between specific itemized expenses when classified by adjusted gross income, as shown in Table 12.21. For example, individuals with incomes between $5,000 and $10,000, representing 27 percent of the taxpayers and 41 percent of the income reported on all returns, accounted for 59 percent of the total interest expense and 52 percent of the "other tax" deductions. In consideration of the fact that interest costs and property taxes on owner-occupied residences are deductible expenses and the recent estimate that "consumers with incomes of $5,000 or more owned more than one-half of all nonfarm houses early this year (1957),"[72] the above percentages partly reflect the tax advantage of homeownership for Colorado taxpayers in the middle income categories.[73]

---

[72] Federal Reserve Board of Governors—Survey Research Center of the University of Michigan, "1957 Survey of Consumer Finances: Housing and Durable Goods," *Federal Reserve Bulletin*, June, 1958, p. 630. The Federal Reserve estimate is for the nation and its income categories of spending units are not strictly comparable with those developed above for individual taxpayers. However, the conceptual difference will not materially alter the picture and since Colorado is a fairly typical state, it may be assumed that a somewhat comparable distribution of home ownership prevails in Colorado.

[73] As noted, both the federal and state tax codes provide taxpayers who own their homes with a double tax advantage for in addition to the above deductible expenses the imputed rental values of owner-occupied residences are excluded from the tax base.

Table 12.21

Distribution of Itemized Personal Expense Deductions by Adjusted Gross Income Classes, Colorado Individual Income Tax Returns, 1957

[a] Exclusive of federal income tax for table and optional standard returns.
[b] Sum of individual income classes may not equal totals because of rounding.

The allowable medical expense was the only itemized deduction permitted under the Colorado code which on a percentage basis was concentrated in the lowest income category. Of the total number of taxpayers reporting medical expenses, more than 50 percent had incomes of less than $5,000, and only 5 percent were in the income class of $10,000 or more. Similarly, in terms of the actual dollar amount of medical deductions allowed, more than 44 percent was claimed by taxpayers in the lowest income category and less than 10 percent by those in the top income classes above $10,000. And although the average was considerably larger for taxpayers with higher incomes, the medical expense was the only itemized deduction which as a percentage of adjusted gross income varied inversely with the levels of income and worked out to be relatively most important for the lower income groups.

The following tabulation shows the average value of some specific expenses reported on the 1957 itemized returns, classified by adjusted gross income.

Table 12.22

Average Value of Selected Itemized Deductions Colorado Individual Income Tax Returns 1957

Adjusted gross income classes	Average deduction per taxpayer reporting: Medical expense	Contributions	Federal tax expense
$ 0 - $4,999	$ 286	$ 125	$ 363
5,000 - 7,999	306	178	655
8,000 - 9,999	411	237	1,137
10,000 - 14,999	522	336	1,741
15,000 - 49,999	881	707	5,631
50,000 and over	1,619	2,544	37,820
Total	318	203	971

In brief, it is evident from the over-all data that not withstanding the above differences Colorado taxpayers in the higher income classes generally were able to charge a significantly larger absolute and relative amount of deductible expenses against their reported adjusted gross income than was possible for other taxpayers, and primarily because of the statutory provision permitting the deductibility of federal income taxes.

The personal exemption deduction of $750 per taxpayer and dependent provided by the Colorado income tax code,[74] is the largest single factor accounting for the erosion of the Colorado individual income tax base. The total dollar value of exemptions exceeded $1,000 million, or 46 percent of the adjusted gross income reported by all taxpayers. By itself, the $150 statutory increase in the 1957 exemption resulted in a reduction of more than $200 million in the tax base. The total of personal exemptions claimed on the 1957 tax returns, classified by the number per return, is shown in the following tabulation.

Table 12.23

Personal Exemptions, Classified by Number per Return, Colorado Individual Income Tax Returns, 1957

Exemptions per return	Returns filed: Number	Percent	Exemptions claimed: Number	Percent
1	163,949	31.2	163,949	11.5
2	115,265	22.0	230,530	16.1
3	76,791	14.6	230,373	16.1
4	93,222	17.8	372,888	26.1
5	43,415	8.3	217,075	15.2
6	19,576	3.7	117,456	8.2
7 and over	12,603	2.4	96,509	6.8
Total	524,821	100.0	1,428,780	100.0

[74] See Table 12.9.

On the basis of the survey data, the exemptions represented an average of 2.7 per return and an average deduction in taxable income of more than $2,000 per taxpayer. Approximately 30 percent of the taxpayers had only one exemption, almost 50 percent claimed at least three, and less than 15 percent were able to take five or more exemptions. The above percentage distribution essentially reflects the age and family structure of the Colorado population in 1957, but the table understates the actual number of exemptions per family to the extent that married individuals filed separate returns.[75] Moreover, the data also include the extra exemptions granted under the Colorado code to taxpayers who are blind or aged 65 or more, as shown below.

Table 12.24

Extra Exemptions for Taxpayers Aged 65 or More and/or Blind, Colorado Individual Tax Returns, 1957

Type	Returns filed		Exemptions claimed	
	Number	Percent	Number	Percent
Age 65 or more 1 exemption	36,606	69.9	36,606	55.0
Age 65 or more 2 exemptions	14,052	26.9	28,104	42.2
Total	50,658	96.8	64,710	97.2
Blind 1 to 3 exemptions[a]	1,703	3.2	1,840	2.8
Total	52,361	100.0	66,550	100.0

[a] Includes taxpayers who were blind *and* aged 65 or more.

Extra exemptions were reported by one out of every ten taxpayers filing Colorado tax returns and practically 97 percent of such exemptions were claimed by taxpayers aged 65 or more and only 3 percent by the blind. On the whole, the extra exemptions appear to have had a relatively small impact on the income tax base for they represented less than 5 percent of the total exemptions taken by all taxpayers, and dollarwise amounted to less than $50 million, or approximately 2 percent of the adjusted gross income reported on all returns.

Table 12.25 shows the distribution of the extra and regular exemptions reported on the 1957 tax returns classified by adjusted gross income.

There was a greater concentration of extra exemptions than of regular exemptions in the lowest income category—almost 80 percent of the former in contrast with about 60 percent of the latter. Also, the average number of regular exemptions per return rose from 2.3 to 3.4 with the increases in taxpayer incomes to the $10,000 level, and then varied inversely, dropping successively to an average of 2.7 per return for the top income class of $50,000 and more. However, as noted above,[76] it is important to bear in mind that the *actual tax saving* obtained from any single $750 personal exemption varied directly and significantly with taxable income, ranging from $75 for taxpayers subject to the 10 percent marginal rate to $7.50 for those in the lowest income bracket subject to the 1 percent rate. And, of course, this direct variation between tax savings and income levels also held for all the other personal expense deductions described above.

Table 12.25

Distribution of Personal Exemptions by Adjusted Gross Income Classes, Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Extra exemptions		Regular exemptions		
	Number	Percent	Number	Percent	Average
$ 0 - $4,999	52,800	79.3	809,400	59.4	2.26

8,000 - 9,999	1,640	2.5	77,480	5.7	3.36
10,000 - 14,999	1,760	2.6	47,800	3.5	3.35
15,000 - 49,999	1,496	2.3	26,968	2.0	3.16
50,000 and over	204	0.3	1,782	0.1	2.66
Total	66,550	100.0	1,362,230	100.0	2.59

In addition to the normal exemptions the Colorado code permits taxpayers to take a special exemption against surtaxable income derived from interest and dividends. Currently it is $600 for a single individual and is limited to $1,200 on a joint return if both husband and wife each have surtaxable incomes of $600 or more. Table 12.26 shows the gross and net surtaxable income reported on the 1957 Colorado tax returns, classified by the adjusted gross income categories used above.

Table 12.26

Gross and Net Surtaxable Income Reported on All Individual Income Tax Returns Colorado, 1957

Adjusted gross income classes	Gross surtaxable income	Net surtaxable income	Net as percent of gross
A. Number of returns filed			
$ 0 - $4,999	45,900	11,550	25.2
5,000 - 7,999	30,200	5,450	18.1
8,000 - 9,999	9,420	2,220	23.6
10,000 - 14,999	8,220	3,330	40.5
15,000 - 49,999	6,532	3,840	58.8
50,000 and over	608	537	88.3
Total	100,880	26,927	26.7
B. Dollar amounts (in thousands)			
$ 0 - $4,999	$ 43,337	$13,725	31.7
5,000 - 7,999	16,051	8,865	55.2
8,000 - 9,999	8,524	5,503	64.6
10,000 - 14,999	13,291	10,045	75.6
15,000 - 49,999	29,262	24,417	83.4
50,000 and over	17,530	17,403	99.3
Total	127,995	79,958	62.5

On the basis of the above survey data, more than a hundred thousand of Colorado's half million taxpayers reported *gross* surtaxable income which amounted to $128 million. However, after surtax exemptions were deducted, less

CHART 12.17

income, and tax reported on the 1957 tax returns. In brief, it is evident on the basis of the survey data that the personal income tax in Colorado works out to be essentially an urban tax due to the marked concentration of income, wealth and economic activity in the geographic band of metropolitan counties situated along the east-central slope of the State.

Table 12.29 and Chart 12.18 present the same basic data, classified by adjusted gross income categories.

Again in answer to the basic question of "Who pays the tax?" it is patently evident that in terms of income classes the overwhelming majority of taxpayers with adjusted gross incomes of less than $10,000 accounted for significantly less than half of the total tax reported on the 1957 returns.[78] These data primarily reflect the existent inequality and concentration of income before tax, the extensive erosion of the tax base, and the low marginal rates for the lowest taxable income brackets.

---

[78]The above data are based on individual tax returns and should not be interpreted as family units, particularly in light of the substantial number of separate returns filed by married individuals—approximately 20 percent of the total of all 1957 tax returns.

It will be noted that individuals with incomes of less than $3,000, representing more than 37 percent of all taxpayers, had 13 percent of the adjusted gross income but were liable for only 4 percent of the total personal income tax. Of course, this group of taxpayers is composed of families and individuals with the lowest incomes—the reported adjusted gross income for the group averaged less than $1,600 per taxpayer—and such taxpayers with two or more exemptions would not be subject to any income taxation. For example, the survey data reveal that almost 100,000 nontaxable returns, or more than 70 percent of the total nontaxables, were filed by taxpayers with incomes of less than $3,000.

In the next category, taxpayers with incomes from $3,000 to $5,000, representing 31 percent of the returns, reported 28 percent of the total income and 12 percent of the tax. When the data are cumulated for all returns with incomes below $5,000, it appears that 68 percent of the taxpayers, with 41 percent of the adjusted gross income, accounted for only 16 percent of the total tax liability. Similarly, the percentages of the total tax accounted for by the next two categories in the income scale were less than their respective shares of the adjusted gross income, but by successively smaller amounts, as may be reasonably expected under a system of progressive taxation. Thus, taxpayers with incomes ranging from $5,000 to $10,000 represented another 27 percent of the returns and 40 percent of the income, but accounted for only 27 percent of the tax.

In contrast, taxpayers with reported incomes of $10,000 or more represented less than 5 percent of all taxpayers and 18 percent of the adjusted gross income, but as a group were liable for 57 percent of the total normal and surtax reported on the 1957 tax returns. However, it is important to note that the combined income tax liability for this small minority of taxpayers with incomes of $10,000 or more averaged less than *2.5 percent* of their reported adjusted gross incomes, and on the same basis it averaged only *.3 of 1 percent* for the vast majority of taxpayers with incomes below $5,000.

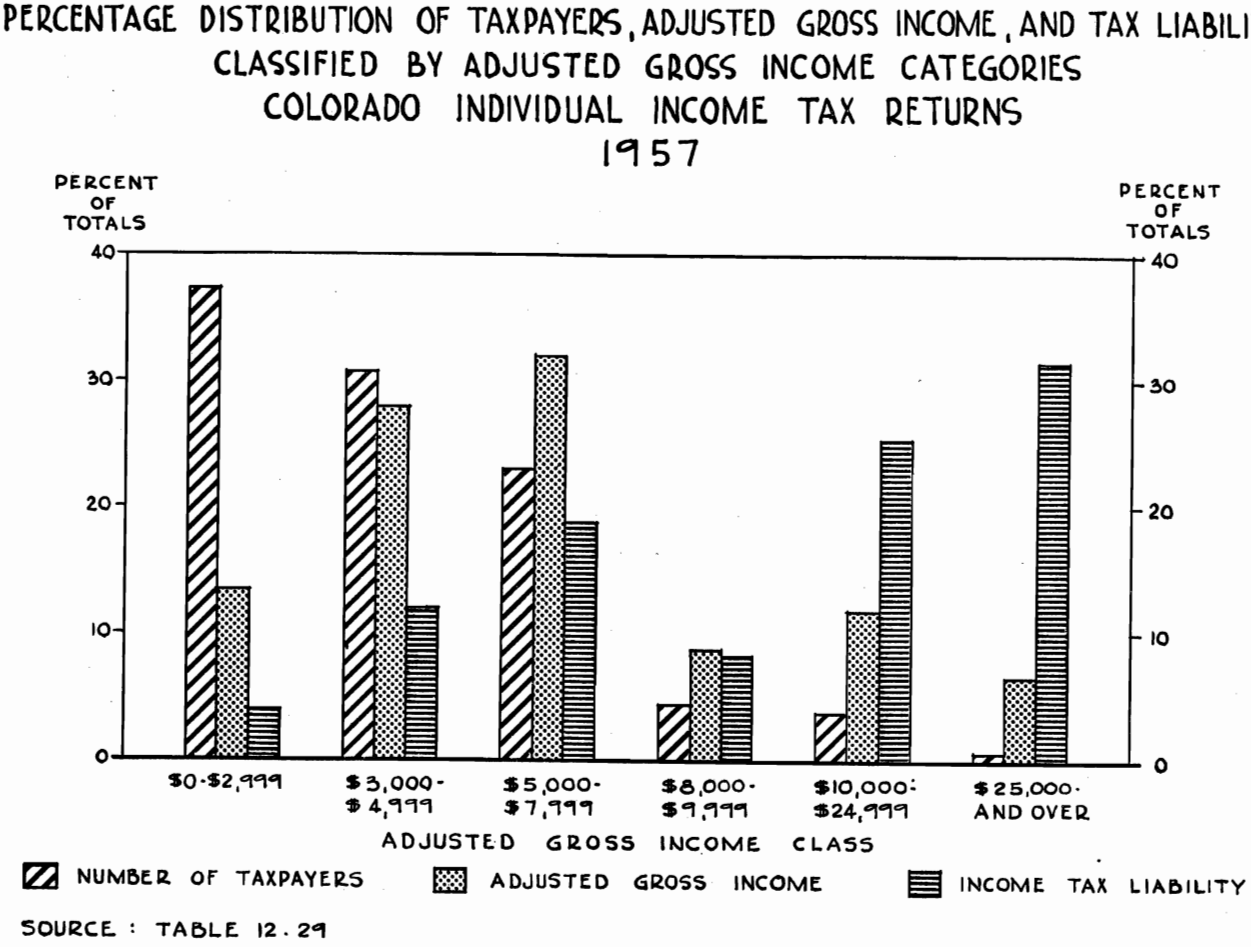

CHART 12.18

The relative progressivity of the Colorado income tax structure compared with that for the federal income tax is shown by the three diagrams on Chart 12.19. The federal distributions are based on the most recent available data — 1955 tax returns filed in 1956.[79] Diagram "A" relates the percentages of taxpayers, cumulated from the lowest income class to the highest, with the corresponding percentages of adjusted gross income reported on the State and federal returns. The 45° curve is the line of equal income distribution for it represents what the relationship would have been if the total dollar amount of adjusted gross income were distributed equally among all taxpayers, i.e., 20 percent of the taxpayers would account for 20 percent of the income, 40 percent of the taxpayers would account for 40 percent of the income, etc. The two curves below the 45° line are the cumulative percentage distributions of adjusted gross income actually reported on the State and federal returns, respectively. Thus the vertical distance by which the actual curve diverges from the 45° line may be considered a measure of the inequality in the distribution of adjusted gross income. It will be noted that the State and federal curves parallel each other rather closely, with the inequality being somewhat less for the State. For example, the 40 percent of State taxpayers with the lowest incomes accounted for approximately 16 percent of the total amount of adjusted gross income shown on the State returns, where as the same percentage of federal taxpayers accounted for 13 percent of the federal income. Similarly, 80 percent of State and federal taxpayers accounted for 58 and 54 percent of the respective State and federal total incomes. As already noted, the smaller degree of inequality on the State level is partly due to the fact that a considerably higher pro-

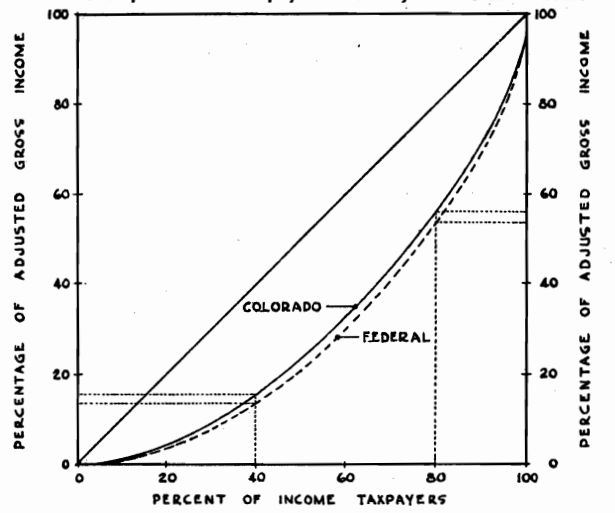
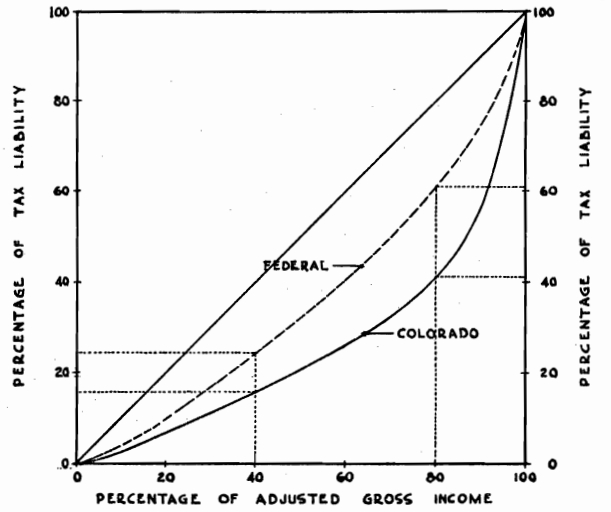
RELATIONSHIPS BETWEEN ADJUSTED GROSS INCOME, NUMBER OF INDIVIDUAL INCOME TAXPAYERS AND TAX LIABILITY COLORADO, 1957, AND FEDERAL, 1955

A. Relationship Between Taxpayers and Adjusted Gross Income



B. Relationship Between Adjusted Gross Income and Tax Liability



C. Relationship Between Taxpayers and Tax Liability

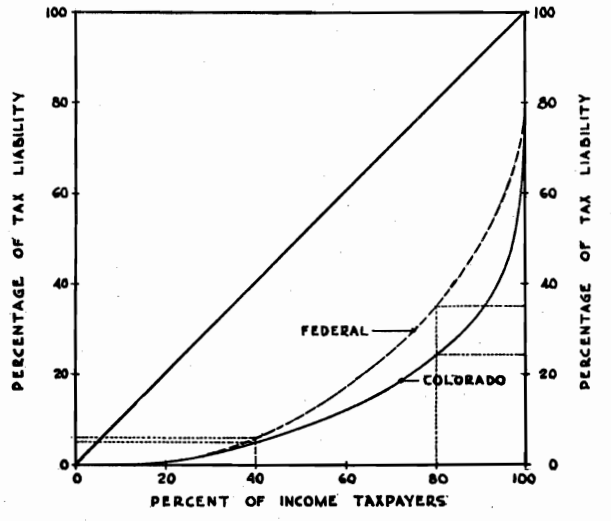


CHART 12.19

portion of separate returns were filed under the Colorado tax since it does not incorporate a split-income provision such as provided by the federal code which practically eliminates the advantage of separate filing for married individuals with independent incomes. In short, on the basis of Diagram "A" it appears that the degree of income inequality in both cases was essentially the same and, therefore, major differences between the relative distributions of State and federal income taxes must be attributed primarily to differences in personal expense deductions, exemptions and the progressivity of the respective tax structures.

Diagram "B" provides a comparative measure of income tax progressivity by relating the cumulative percentages of adjusted gross income with the corresponding percentages of tax liability. The 45° curve in this diagram represents what the relationship between income and taxes would be if a proportional, instead of progressive, rate structure were used, i.e., a uniform percentage rate for all levels of income so that 20 percent of the income would invariably produce 20 percent of the total tax, 40 percent of the income would produce 40 percent of the total tax, etc. Again the two curves below the 45° line represent the actual percentages of total taxes produced by the corresponding cumulated adjusted gross income reported on the State and federal returns. In this case, the vertical distances between the actual curves and the 45° line of proportional taxation measure the relative progressivity of the State tax structure in 1957 and the federal tax structure in 1955. For example, Diagram "B" shows that the 40 percent of total adjusted gross income reported by State taxpayers in the lowest income classes produced only 16 percent of the total state income tax, whereas the same percentage of income on the federal level produced 23 percent of the total tax. Similarly, the 80 percent of income accounted for by State taxpayers cumulated from the bottom produced 41 percent of the tax; whereas on the federal level the same percentage of income produced more than 60 percent. Reversing the analysis and cumulating from the top down, the diagram shows that taxpayers in the highest income categories who accounted for 20 percent of the total income actually were liable for 59 percent of the total tax on the State level and less than 40 percent on the federal level. Thus, with the State curve falling below the Federal curve it is evident that the former was markedly more progressive than the latter.

Diagram "C" indicates the comparative progressivity of the two tax structures by relating the cumulative percentage of taxpayers with corresponding percentages of tax liability. In this diagram the 45° curve represents what the distribution of the tax would be if all taxpayers were liable for exactly the same dollar amount

of income tax so that 20 percent of the taxpayers would pay 20 percent of the tax, 40 percent would pay 40 percent of the tax, etc. The vertical distance by which the actual curves diverge from the 45° line of equal dollar taxation also may be considered a measure of the progressivity of the state and federal tax structures. Although the State and Federal curves practically parallel each other for the 40 percent of taxpayers with the lowest incomes, primarily because of the concentration of nontaxable returns in these income categories, it will be noted that the 80 percent of State taxpayers with the lowest incomes paid only 24 percent of the total State tax, while the same percentage of federal taxpayers were liable for more than 34 percent of the total federal tax. Since the State curve falls below the Federal, again it is apparent that the Colorado income tax structure is comparatively more progressive than the federal tax structure. However, it is important to bear in mind that the relative progressivity of a tax structure does not indicate either the actual magnitude or burden of the tax. Obviously, a highly progressive but insignificant tax does not offset the effects of a quantitatively important but regressive tax—either in terms of revenue or equity. As already noted in the preceding sections, on the basis of interstate comparisons, the 1957 Colorado income tax actually worked out to be significantly below the national averages for all the income tax levying states whether measured in terms of per capita tax, total tax collections, personal income received, or computed tax liability for varying levels of income. Without considering at this point the extent to which reciprocal federal-state income tax deductibility further reduced the real tax burden, it is patently evident that the Colorado income tax has not proven to be heavy or burdensome for any broad income category of taxpayers, notwithstanding its comparatively high degree of progressivity.

Table 12.30 and Chart 12.20 present a distribution by size of the actual dollar amounts of income tax liability incurred by Colorado taxpayers on their 1957 tax returns.

Table 12.30

Number of Taxpayers Classified by Size of Tax Liability Colorado Individual Income Tax Returns, 1957

Dollar amount of tax liability[a]	Taxpayers filing returns: Number		Cumulated number	
	Total	Percent	Total	Percent
None	133,728	25.5	133,728	25.5
$ 1 - $ 5	78,139	14.9	211,867	40.4
6 - 10	66,292	12.6	278,159	53.0

Total	524,821	100.0	—	—

[a] Combined normal tax and surtax liability.

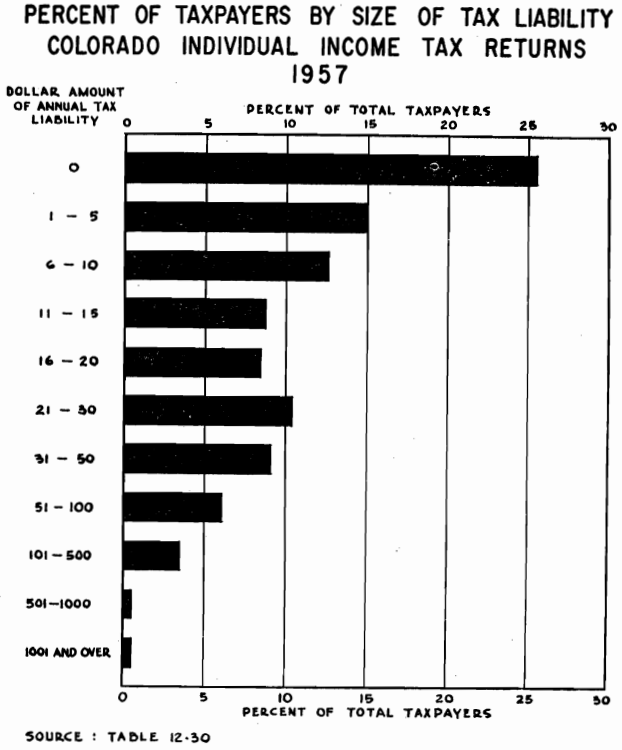

CHART 12.20

Perhaps more strikingly than any other single set of data the above table reveals the extent to which Colorado taxpayers are nominally bearing the cost of state government through personal income taxation. First, it should be noted that more than a fourth of all individuals filing returns, approximately 134,000, paid neither normal tax nor surtax on their 1957 reported income. Another 78,000 incurred a total income tax which ranged from $1 to $5. Thus, for some 200,000 taxpayers, representing 40 percent of all individuals filing returns, the personal income tax was less than $5 for the year. In other words, for 40 percent of the State's taxpayers the net reduction in "take-home" pay or income due to the imposition of the Colorado income tax actually amounted to less than 10 cents a week. Similarly, on a cumulated basis more than half the taxpayers paid a tax of $10 or less, and three-fourths paid a tax of $25 or less for the year. Since it cost the State on the average more than $2 to process a single income tax return,[80] it would appear that a large part of the Department of Revenue's personal income tax collec-

[80] State of Colorado, Department of Revenue, *Sixteenth Annual Report*, 1957, Tables 12 and 16. This report only shows combined administration and collection costs for all income taxes (personal, corporate and oil and gas) on a fiscal-year basis. It amounted to $1,085,735 for fiscal year 1957, and the average number of returns, exclusive of partnership information returns, for calendar years 1956-57 was 501,150. Thus, on the basis of these data, the over-all average cost of processing a return was $2.15 for fiscal year 1957.

tion and administration activity takes on the character of "pouring water in a bushel basket."

With regard to tax liabilities at the upper end of the income scale, less than 5 percent of all taxpayers had a combined normal and surtax in excess of $100 a year, and less than 1 percent paid state income taxes in excess of $500. Moreover, the above amounts of tax liability did not constitute the real or effective state income tax burden since practically all taxpayers in these categories were able to use their state income taxes as legal expenses against their federal tax liability. Without considering at this point the effect of reciprocal income tax deductibility on tax burdens, it is evident on the basis of the survey data that for the overwhelming majority of Colorado taxpayers the nominal amount of personal income tax liability incurred in 1957 was significantly less than the other taxes they paid, particularly sales and excises, for the financing of state government.[81]

Finally, a measure of the relative magnitude of the personal income tax for the major income categories of Colorado taxpayers is obtained by expressing the combined normal tax and surtax liability as percentages of the total amounts of taxable income reported on the 1957 returns, as shown by the following table.

Table 12.31

Normal Tax, Surtax, and Total Income Tax Liability, Classified by Adjusted Gross Income Categories, Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Normal tax liability (thousands)	Surtax liability (thousands)	Total income tax liability (thousands)	Total net income before tax[a] (thousands)	Total tax as a percent of net income
$ 0 - $4,999	$ 2,652	$ 275	$ 2,927	$263,768	1.11
5,000 - 7,999	3,269	177	3,446	253,156	1.36
8,000 - 9,999	1,402	110	1,512	89,602	1.69
10,000 - 14,999	1,897	201	2,098	91,369	2.30
15,000 - 49,999	5,462	488	5,950	135,703	4.38
50,000 and over	2,047	348	2,395	45,219	5.30
Total	16,279	1,599	18,328	878,817	2.09

[a] Combined net taxable income and net surtaxable income.

The data reveal that of the combined income tax liability, the normal tax represented over 91 percent and the surtax slightly less than 9 percent of the total. The latter, however, was more highly concentrated than the normal tax among taxpayers in the upper income categories. Less than one-third of the individuals reporting surtax had incomes above $10,000, but as a group they accounted for approximately two-thirds of the total surtax liability. Because the tax is levied at a proportional rate of 2 percent the relative liability was, of course, uniform for taxpayers in all income categories.

[81] For example, it is estimated that the Colorado state sales tax averaged $57 a year for families with before-tax income of $4,000 to $5,000. See Chapter VIII, below of this study.

As may be reasonably expected, the total income tax liability expressed as a percentage of the net tax base varied directly with the levels of income, ranging from 1.1 percent for the vast majority of taxpayers with incomes of less than $5,000 to 5.3 percent for the very small minority in the top income category of $50,000 and over. Notwithstanding the propressive rate structure, the combined tax liability on an over-all basis averaged only 2.1 percent of the total normal and surtaxable income base, and less than .8 of 1 percent of the adjusted gross income reported on all 1957 tax returns.

Tax Burdens and Reciprocal Tax Deductibility

The preceding analysis of the distribution of the State income tax liability does not necessarily reflect the magnitude nor progressivity of the true tax burden. As indicated above, it is important to distinguish marginal or incremental tax costs from average costs, particularly since the former are invariably larger under a statutory tax rate structure which is progressive. Similarly, it would be misleading if the nominal tax burden, whether expressed in marginal or average terms, were not distinguished from the real or effective tax burden. In the case of state income taxation, the nominal burden is represented by the tax liability, i.e., the amount of tax the individual pays and the state collects; whereas, the real burden is measured by the net increase in tax cost which may be attributed to the imposition of the state tax i.e., the net amount by which a taxpayer's state and federal income tax liability *combined* exceeds the federal tax he would have paid in the absence of any state income tax. If federal and state income taxes were not used as partial offsets against each other, the nominal and effective tax burdens would be identical. The federal code, however, permits the deduction of all state income taxes in the computation of taxable income for the federal tax purposes and, in turn, about half of the states which levy income taxes, including Colorado, permit the full deductibility of the federal tax.[82] Thus, each tax reduces the liability on the other, and it is this reciprocal deductibility which gives rise to the difference between the net increase in cost to the taxpayer and the amount of income tax collected by the state.

Table 12.32 compares the nominal and real marginal costs of the Colorado income tax on

[82] *Supra*, Table 12.6. However, it is important to note that the State permits federal income tax deductibility on all types of returns—itemized, standard and optional—but the federal code permits the deduction of state income taxes only on itemized returns. Thus, an increase in state income tax cannot be used as an offset against the federal tax by taxpayers who, when filing federal returns, use the table or take the standard deduction. The majority of taxpayers with incomes of $10,000 or more filed federal returns on an itemized basis in 1956. See U. S. Treasury, *Statistics of Income for 1955*, Tables 1 and 5.

$100 of additional income received by taxpayers at varying levels of *net income* after all legal expenses and exemptions, exclusive of income taxes paid, have been deducted. In order to simplify the analysis it is assumed the taxpayer is a single individual, the additional income is not derived either from capital gains or intangible assets subject to surtax, and that the taxpayer itemizes personal expense deductions on his federal return. Since the dollar amounts of tax liability shown in the table are based on $100 increments of income, they actually represent the percentage rates of taxation on net income before any income tax paid.

Table 12.32

Nominal and Effective Marginal Tax Costs on $100 Increments of Net Income for Single Taxpayer Under the Colorado Individual Income Tax, 1957

Taxpayer net income before any income tax[a]	(1) State income tax liability and revenue	(2) Combined federal and state tax liability	(3) Federal tax liability if no state income tax	(4) Net (real) cost of state income tax to taxpayer
$ 3,000	$1.57	$23.23	$22.00	$1.23
7,000	2.83	31.98	30.00	1.98
11,000	4.46	40.77	38.00	2.77
17,000	5.26	52.63	50.00	2.63
19,000	4.96	55.33	53.00	2.33
21,000	4.66	58.05	56.00	2.05
29,000	4.05	63.59	62.00	1.59
55,000	2.70	75.67	75.00	.67
175,000	1.10	90.11	90.00	.11

[a] Levels of income are the midpoints of selected income brackets for federal tax and are net of all deductions and exemptions, except for federal and state income taxes paid.

The real cost of the state income tax (column 4) at all levels of income is significantly less than the amount paid to the State (column 1). For example, under conditions of mutual deductibility, a taxpayer at the $3,000 level of income who received an additional $100 of taxable income would pay on the increment of income a *combined* federal-state tax of $23.23, of which $1.57 would represent the amount paid to the State.[83] In the absence of any state tax, however, the full $100 would have been subject to the federal statutory rate of 22 percent, or $22.00 of tax liability. Therefore, the net cost of the state income tax to the taxpayer is the $1.23 difference between the $23.23 of combined tax liability (column 2) and the $22.00 of federal tax taken alone (column 3), or 1.23 percent of the net marginal income before any tax. In other words, the taxpayer's real tax burden would amount to 78 percent of each tax dollar paid to the State, and the remaining 22 percent would be absorbed by the federal government since it represents the federal tax loss due to the deductibility of the state tax.

This difference between the nominal and effective cost of the State income tax becomes significantly greater for taxpayers in the higher income categories. A taxpayer with net income of $17,000 in the 50 percent federal tax bracket pays his state income tax with 50¢ after-federal-tax dollars, and his nominal tax liability of $5.26 is cut in half. Although the statutory rate under Colorado code at this income level is 10 percent, the nominal rate with mutual deductibility is 5.26 percent and the real state income tax burden works out to be only 2.63 percent. Similarly, taxpayers with incomes in the 90 percent federal tax bracket[84] are able to pay their state income taxes with extremely cheap 10¢ after-federal-tax dollars, or $9 out of every $10 of state income tax receipts in this case is indirectly financed by the federal government. For such taxpayers the real tax burden on a $100 increment of income turns out to be only 11¢ or 1/10 of 1 percent of the net income before tax. Thus, when reciprocal tax deductibility is taken into consideration the effective marginal rates of the personal income tax actually become regressive above the $11,000 income level, notwithstanding the progressivity of the statutory rate structure.

It should be noted that although the net amounts of federal and state income taxes are both reduced by mutual deductibility, the percentage absorption of state tax by the federal government is essentially a function of the taxpayer's federal tax because of its significantly higher rate structure. Thus, the ratio of the nominal burden to effective burden for the state income tax results from taking the state tax as a deduction against the federal tax, and not the reverse. This means that the elimination of the federal tax, in whole or in part, as an allowable expense deduction on the state returns could only reduce the percentage of state tax currently absorbed by the federal government to the extent that some taxpayers would be shifted to a lower federal tax bracket. Moreover, the differential tax burdens between states is reduced by taking the state tax as a partial offset against the federal, and not the reverse. For example, a Colorado taxpayer with an income of $55,000 before state or federal income tax, subject to the state marginal rate of 10 percent, would be able to reduce his marginal tax bill by only .67 percent if he moved to a state which levied no personal income tax but had a similar tax structure in all other respects.[85]

[83] Computation of state and federal income tax liabilities under conditions of reciprocal deductibility was based on the following equations: $X = r_x(\$100 - Y)$ and $Y = r_y(\$100 - X)$, when X=federal tax, Y=state tax, r_x=federal statutory (bracket) rate, and r_y=state statutory (bracket) rate.

[84] On federal returns the 90 percent bracket for single individuals is $150,000 to $200,000, but for married individuals filing jointly, it is $300,000 to $400,000 because the federal code incorporates a split-income provision in its rate structure.

[85] If all states had identical personal income distributions and state income tax structures, no single state could benefit from the federal provision permitting deductibility of state income taxes, particularly since the total amount of revenue required by the federal government is essentially determined by the level of federal expenditures. However, to the extent that all states do not have either the same distributions of income or personal income tax structures, those states which rely more heavily on income taxation, in effect, are financing part of their state expenditures at the expense of taxpayers in the other states. Of course, it also holds for other forms of state taxation which are likely to be reported and fully utilized as deductions on itemized federal tax returns.

In short, it is evident that as a result of the existent pretax income structure, the extensive erosion of the tax base, the relatively low marginal rates for the bottom tax brackets, and the indirect absorption of a substantial part of the state tax by the federal government, the Colorado personal income tax has not proven to be a substantial source of state revenue nor has it imposed an unduly heavy tax burden on the Colorado taxpayer.

Estimates of the Effects of Selected Income Tax Revisions

On the basis of the preceding detailed survey it is possible to estimate the effects on State revenues and taxpayer costs of revisions in the following seven features of the present code:

1. Personal exemption provision
2. Federal income tax deductibility
3. Special treatment of capital gains income
4. Special $75 minimum for travel allowance
5. Surtax on income from intangible assets
6. Medical expense allowance
7. Basic statutory rate structure, particularly the lower tax brackets.

The impact of such revisions on different classes of taxpayers may be gauged by applying the percentage changes in revenues to the average income tax liability reported on all 1957 Colorado individual income tax returns shown in the table below.

Table 12.33

Average Combined Normal and Surtax Liability, Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Total number of returns filed	Total income tax liability (thousands)	Average combined tax liability
$ 0 - $ 4,999	357,600	$ 2,927	$ 8.19
5,000 - 7,999	120,700	3,445	28.54
8,000 - 9,999	23,000	1,512	65.74
10,000 - 14,999	14,320	2,098	146.51
15,000 - 49,999	8,532	5,950	697.37
50,000 and over	669	2,396	3,581.46
Total	524,821	18,328	34.92

It must be borne in mind that the figures presented in the following tables are based on 1957 returns, filed in 1958, and therefore, do not take into account subsequent changes in the level of income and pattern of income distribution. Also the real or effective costs to the taxpayers are considerably less than the stated increase in revenues since taxpayers who itemize their deductions on federal returns, generally those in the upper income categories, will use the increase in state taxation as an offset against their federal income tax liability. For example, the federal government indirectly will finance one-half of any state income tax increase for taxpayers in the 50 percent federal bracket class. Therefore, the data provide conservative estimates of the magnitude, distribution and costs to the taxpayer of possible legislative changes in the Colorado income tax which would raise additional General Fund revenues and at the same time result in a more equitable and balanced tax structure. As such the tables and analyses presented below should prove to be useful guides for tax policy.

1. Personal Exemptions. The largest single factor accounting for the shrinkage of the tax base in 1957 was the personal exemption deduction which exceeded $1 billion. The estimated impact on State revenue and taxpayer cost of an additional $100 increase or decrease in the value of the exemptions, in terms of the 1957 rate structure, is shown below.

Table 12.34

Estimated Effect on Revenue and Taxpayer Cost of a $100 Revision in the Personal Exemption Deduction, Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Amount of change in state revenue (thousands)	Percentage change relative to 1957 tax
$ 0 - $ 4,999	$ 684	23.4
5,000 - 7,999	533	15.5
8,000 - 9,999	130	8.6
10,000 - 14,999	114	5.4
15,000 - 49,999	137	2.3
50,000 and over	15	0.6
Total	1,613	8.8

On the basis of the data, it appears that every $100 of personal exemption reduces State revenues by more than $1.6 million. It is evident that the impact of any revision in the value of the exemption is mainly concentrated in the lower income categories for more than four-fifths of all personal exemptions are claimed by taxpayers with incomes of less than $8,000. Since the percentage change in tax liability resulting from the alteration of the exemption varies inversely with income levels, raising the value of the exemptions makes the tax structure more progressive. For example, the 1957 legislative action, which concurrently increased the exemptions by $150 and reduced the tax credit from 20 to 15 percent, resulted in a net tax reduction of approximately $1.5 million for more than 80 percent of all Colorado personal income taxpayers. The cost of the exemption increase to the State was about $2.4 million, and the change in net rates yielded approximately $.9 million. Also, an estimated 50,000 individuals paid no tax on their 1957 incomes who otherwise would

have incurred some tax liability as a result of the exemption increase. Because of the lack of adequate statistical data at the time these income tax revisions were made, neither the Administration nor the Legislature could accurately estimate what the net effect of such changes would be on state revenue or taxpayer costs.

2. Federal Income Tax Deductibility. As noted, the quantitatively most important single personal expense deduction taken on the 1957 returns was the federal income tax which amounted to practically one-half of the total deductions claimed by all taxpayers on their 1957 returns. Table 12.35 shows the increased State revenues and taxpayer cost which would result from partially or wholly eliminating the federal income tax deductibility provision from the present Colorado personal income tax code.

Table 12.35

Increased State Revenue and Taxpayer Cost of Selected Changes in Deductibility of Federal Income Tax Provision, Colorado Individual Income Tax, 1957

Adjusted gross income classes	"A" Deductibility of $300 of federal income tax permitted	"B" Deductibility of 10 percent of federal tax permitted	"C" No deductibility of federal income tax permitted
A. Amount of increase in State revenues (thousands)			
$ 0 - $ 4,999	$ 641	$ 919	$ 1,024
5,000 - 7,999	849	1,278	1,458
8,000 - 9,999	543	658	739
10,000 - 14,999	887	950	1,092
15,000 - 49,999	3,392	3,277	3,658
50,000 and over	2,029	1,891	2,098
Total	8,341	8,973	10,069
B. Percentage increase over 1957 tax liability			
$ 0 - $ 4,999	21.9	31.4	35.0
5,000 - 7,999	24.6	37.1	42.3
8,000 - 9,999	35.9	43.5	48.9
10,000 - 14,999	42.3	45.3	52.0
15,000 - 49,999	57.0	55.1	61.5
50,000 and over	84.7	78.9	87.6
Total	45.5	49.0	54.9

Alternative "A" would permit taxpayers to take up to $300 of their federal tax as a personal expense deduction in the computation of their state net taxable income. Such a change would conservatively yield more than $8 million of additional revenue to the State, and cost the taxpayer considerably less because of the large amount which would be absorbed, in effect, by the federal government as a result of deductibility. It is estimated that approximately one-half of all taxpayers would be affected, but only one-third of those with incomes of less than $5,000. In other words, the percentage increase in tax cost would be progressive by income categories.

The distribution of the effective tax burden would be less progressive if a fixed percentage of the federal tax rather than a lump sum was used as the deductibility limit. For example, as illustrated by alternative "B", if the Colorado taxpayer were permitted to deduct only 10 percent of his federal tax on the state returns, the additional state revenue would approximate $9 million. Under this example, more than three-fifths of the taxpayers would be affected, and almost one-half of those in the lowest income category. Of course, changing the percentage limit would result in coresponding changes in state revenue and taxpayer cost, but it would not materially affect the progressivity or relative distribution of the real tax burden.

As already indicated, one-third of the states which levy personal income taxes *do not permit any deduction* of federal income tax in the computation of the state tax liability.[86] If Colorado should adopt such a provision, as shown by alternative "C", it is estimated on a conservative basis that the State would obtain more than $10 million in additional revenue. In this case the number of taxpayers affected and the relative distribution of this tax burden by income categories would be similar to that of alternative"B" and again significantly less progressive than alternative "A". Moreover, it is important to note that if the latter were adopted it would eliminate with one clean sweep what is probably the most awkward, intricate and troublesome feature of the present state tax from the standpoint of compliance for most taxpayers other than those who use the tax table—namely, the completion of Schedule I of Form 104 which requires the computation of the federal tax deduction on a net cash basis.

3. Special Treatment of Capital Gains Income. Revision of the present code to close the so-called "capital gains loophole" would require the inclusion in the normal tax base of 100 percent of all net capital gains, regardless of the length of time the assets were held by taxpayers. Table 12.36 indicates what the increased State revenues and taxpayer costs would be if the Colorado code were modified to eliminate the special treatment of this form of income.

Table 12.36

Estimated Increase in State Revenue and Taxpayer Cost If 100 Percent of Net Capital Gains Included in Normal Tax Base, Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Amount of increase in State revenue (thousands)	Percentage increase over 1957 tax liability
$ 0 - $ 4,999	$ 134	4.6
5,000 - 7,999	70	2.0
8,000 - 9,999	37	2.4
10,000 - 14,999	102	4.9
15,000 - 49,999	417	7.0
50,000 and over	641	26.8
Total	1,401	7.6

[86] *Supra*, Table 12.6.

The revision of his provision would yield $1.4 million of additional State revenue. In this case, the federal government in effect would indirectly absorb a large percentage of the increased cost since the capital gains are highly concentrated in the upper income groups which are subject to the highest federal tax rates. For example, on the basis of the data less than 10 percent of the Colorado taxpayers reported long-term capital gains on their 1957 returns, and among those that did the 2 percent with incomes of $10,000 or more accounted for more than 50 percent of the total net long-term capital gains reported on all returns. Moreover, the very small minority of taxpayers reporting capital gains who had incomes in excess of $50,000 actually represented less than 1/10 of 1 percent of all taxpayers but as a group they accounted for more than 20 percent of the total amount of capital gains. The average long-term capital gain in this category was slightly more than $34,000 per taxpayer, of which only 50 percent was subject to state tax. And if such gains were included in the State's normal tax base at 100 percent, approximately two-thirds of the increased tax cost would be absorbed by the federal government and the taxpayer's incremental real cost would be less than one-third of the additional revenue received by the State.

4. Special $75 Minimum Travel Allowance. As noted, the Colorado income tax code is somewhat distinctive in its treatment of travel expense. It permits the taxpayer to deduct all expenses incurred in commuting to and from any place of employment, with a flat minimum of $75 which may be taken in lieu of itemizing the actual expense. Table 12.37 below shows the estimated revenue and cost effects which would result from the elimination of this provision.

Table 12.37

Estimated Increase in State Revenue and Taxpayer Cost If $75 Minimum Travel Allowance Not Permitted as Deduction on Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Amount of increase in State revenue (thousands)	Percentage increase over 1957 tax liability
$ 0 - $ 4,999	$138	4.7
5,000 - 7,999	94	2.7
8,000 - 9,999	20	1.3
10,000 - 14,999	15	0.7
15,000 - 49,999	13	0.2
50,000 and over	1	*
Total	281	1.5

* Less than 1/100 of 1 percent.

On the basis of the survey data almost 300,000 taxpayers claimed a travel expense deduction which averaged $150 per return. If the provision were revised to allow only itemized travel expenses in excess of $75, it is estimated the State would obtain less than $300,000 of additional revenue, with the major cost borne by taxpayers with incomes of less than $5,000. However, even for these taxpayers the increased cost would be minimal, less than 40¢ per taxpayer per year, since the average income tax for this group amounted to only $8.19 during 1957. In short, revision of the travel expense allowance would not have any appreciable effect upon state revenues or taxpayers cost, but should be considered in terms of simplifying taxpayer compliance by bringing this feature of the Colorado statute in closer accord with the federal code.

5. Surtax on Income from Intangible Assets. Another unique provision of the Colorado income tax has been the levying of the 2 percent surtax on income derived from intangible assets —primarily interest and dividends. As in the case of the special treatment of long-term capital gains, designating a particular source of income for either lighter or heavier taxation under the personal income tax inevitably results in "horizontal" inequities between taxpayers who in other respects are in similar economic circumstances. The effect of the elimination of the surtax on State revenue and taxpayer real savings is shown below.

Table 12.38

Estimated Decrease in State Revenue and Taxpayer Cost If Surtax on Income from Intangibles is Eliminated from Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Amount of decrease in State revenue (thousands)	Percentage decrease in 1957 tax liability
$ 0 - $ 4,999	$ 257	9.4
5,000 - 7,999	177	5.1
8,000 - 9,999	110	7.3
10,000 - 14,999	201	9.6
15,000 - 49,999	488	8.2
50,000 and over	348	14.5
Total	1,599	8.7

It is estimated that the loss in State revenue from such a revision in the tax would amount to $1.6 million. On the basis of the survey data almost two-thirds of the 27,000 taxpayers who would benefit had incomes of less than $8,000 in 1957. (See Table 12.26.) Although the largest nominal saving would accrue to taxpayers with incomes in excess of $50,000, the largest percentage of taxpayer real saving would be enjoyed by taxpayers with incomes of less than $5,000.

6. Medical Expense Allowance. The personal income tax is widely accepted as the fairest of taxes because it takes into consideration, in addition to income, variations in the taxpayers' size of family, physical infirmities of old age and blindness, and extraordinary drains on family income due to serious illness and accidents. With regard to the latter, however, the Colorado code is less generous than the federal govern-

ment in that it permits the deduction of only those expenses in excess of 5 percent of adjusted gross income. On the basis of the survey data the medical expense allowance reported on all 1957 tax returns was dollarwise the least important of the itemized deductions, and it was claimed by less than one-eighth of the taxpayers, mainly concentrated in the lowest income category. Serious consideration should be given to liberalizing this provision. Table 12.39 below shows what the estimated effect on State revenue and taxpayer cost would be if Colorado should revise the medical expense deduction: (a) to conform with the federal provision which allows such expenses in excess of 3 percent of the adjusted gross income, as is the present practice in eight other income tax states; or (b) to allow as legal deductions the entire medical expense incurred by a family as is currently done in Arizona and Minnesota.

Table 12.39

Estimated Decrease in State Revenue and Taxpayer Cost of Selected Changes in Medical Expense Deduction on Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Amount of decrease in State revenue (thousands)	Percentage decrease in 1957 tax liability
A. Allowance in excess of 3 percent of adjusted gross income		
$ 0 - $ 4,999	$ 21	0.7
5,000 - 7,999	42	1.2
8,000 - 9,999	13	0.9
10,000 - 14,999	12	0.6
15,000 - 49,999	16	0.3
50,000 and over	4	0.2
Total	108	0.6
B. Allowance of full medical expense[a]		
$ 0 - $ 4,999	$ 53	1.8
5,000 - 7,999	102	3.0
8,000 - 9,999	32	2.1
10,000 - 14,999	29	1.4
15,000 - 49,999	40	0.7
50,000 and over	9	0.4
Total	265	1.4

[a] Based only on returns which reported medical deductions.

It will be noted that if alternative "A" were followed the loss in State revenue would be only about $100,000. This appears to be a very small cost for achieving greater equity and taxpayer convenience which should result from conforming more closely with the federal provision. In the case of alternative "B" it is estimated that the loss to the State would be less than $300,000, but this is somewhat understated for it does not take into account the additional taxpayers who would also take medical deductions if there were no adjusted gross income limitation. In the aggregate the taxpayer savings under either alternative do not appear to be very large—on the average about 1 percent of the total tax liability. However, it could prove to be quite significant for the individual family struck with a catastrophic illness or accident during the taxable year and, perhaps more importantly, such liberalizing revisions of the code would help to improve taxpayer morale with regard to the equity and fairness of the tax burden.

7. Statutory Bracket Rates. Notwithstanding the possible revision of the tax base, in light of the entire preceding analysis consideration must be given to raising the relatively low statutory rates for the bottom tax brackets if the Colorado income tax is to be broadened to the point where it actually serves as the major fiscal instrument for meeting the State's continuing need for increased General Fund revenues.

Table 12.40 shows three hypothetical tax structures which would raise the normal rates in the lower brackets while retaining or reducing the present rates for the upper brackets. It should be noted, however, that all taxpayers with any taxable income would be affected by an upward revision of the first bracket rate.

Table 12.40

Possible Alternative Normal Tax Rate Structures for the Colorado Individual Income Tax

Net Taxable income brackets	1958 marginal rates	Alternative hypothetical rate structures "A"	"B"	"C"
$ 0 - $ 1,000	1.0	2.0	3.0	3.0
1,001 - 2,000	1.5	2.5	3.25	3.5
2,001 - 3,000	2.0	3.0	3.5	4.0
3,001 - 4,000	2.5	3.5	3.75	4.5
4,001 - 5,000	3.0	4.0	4.0	5.0
5,001 - 6,000	4.0	4.5	4.5	5.5
6,001 - 7,000	5.0	5.0	5.0	6.0
7,001 - 8,000	6.0	6.0	6.0	6.5
8,001 - 9,000	7.0	7.0	7.0	7.0
9,001 - 10,000	8.0	8.0	8.0	7.5
10,001 - 11,000	9.0	9.0	9.0	8.0
11,001 and over	10.0	10.0	10.0	8.0

Schedule "A" starts at 2 percent, the beginning rate used in eight other income tax states, and then matches the present Colorado statutory rate structure at 5 percent and above. Schedule "B" starts at 3 percent, the beginning rate currently in effect in Oregon and North Carolina,[87] and then parallels schedule "A" for taxable income in excess of $4,000. Finally, schedule "C," the least progressive structure of the three, also starts at 3 percent, but increases throughout at ½ percent breaks for every $1,000 and reaches a maximum of 8 percent on all net taxable incomes in excess of $10,000. The latter is below the 9.5 percent maximum rate used by Oregon, but above the North Carolina maximum of 7 percent. However, Oregon allows full deductibility of the federal income tax in the computation of taxable income, whereas North Carolina doesn't permit any.

Table 12.41 compares the effect of the above three rate structures on state revenue and taxpayer cost.

[87] *Supra*, Table 12.12.

Table 12.41

Estimated Increase in State Revenue and Taxpayer Cost of Alternative Normal Tax Rate Structures Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	"A" Rate structure ranging from 2 to 10 percent	"B" Rate structure ranging from 3 to 10 percent	"C" Rate structure ranging from 3 to 8 percent
A. Amount of increase in State revenues (thousands)			
$ 0 - $ 4,999	$2,147	$ 4,117	$ 4,331
5,000 - 7,999	2,206	3,882	4,411
8,000 - 9,999	735	1,180	1,486
10,000 - 14,999	608	930	1,300
15,000 - 49,999	406	757	369
50,000 and over	71	102	—259
Total	6,173	10,968	11,638
B. Percentage increase over 1957 tax liability			
$ 0 - $ 4,999	73.4	140.7	148.0
5,000 - 7,999	64.0	112.7	128.0
8,000 - 9,999	48.6	78.0	98.3
10,000 - 14,999	30.0	44.3	62.0
15,000 - 49,999	6.8	12.7	6.2
50,000 and over	3.0	4.3	—10.8
Total	33.7	59.8	63.5

On the basis of the 1957 returns and assuming no change in the normal and surtax base provisions, it is estimated that schedule "A" would yield more than $6 million of additional normal tax revenue; schedule "B" would increase State revenues by $11 million; and finally, schedule "C" would yield almost $12 million. Under all three, the distribution of both the nominal and real burden of the increased tax would vary inversely with levels of income, resulting in a significantly more productive but less progressive tax structure. And in the case of schedule "C", although the total amount of increase would be the greatest, the very small minority of taxpayers with incomes in excess of $50,000 would actually enjoy a nominal tax saving of almost 11 percent.

Table 12.42 presents estimates of the additional revenue and taxpayer cost which would result from combining each of the above hypothetical tax rate structures (Table 12.41) with the following suggested modification of the tax base: inclusion of 100 percent of net capital gains in the normal tax base (Table 12.36); elimination of the 2 percent surtax on intangibles (Table 12.38); and allowance of full medical expense deduction (Table 12.39). Of course, a large number of alternative combinations are possible and the three selected illustrate the quantitative importance of some of the revisions considered in the preceding analysis. Moreover, in each case the increase in the State revenue is understated since the amount of additional tax liability attributed to rate change was computed on the 1957 taxable income, while that due to the revision of the tax base itself was computed in terms of the 1957 rate structure. Notwithstanding the limitations of the combined data, they indicate the approximate magnitude and distribution of the increased tax liability which would result from these alterations in the rate and base of the Colorado personal income tax.

Table 12.42

Summary of Combined Estimates of Changes in Tax Base and Normal Tax Rate Structure Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Revision "A" with rates of 2 to 10 percent and revision of tax base	Revision "B" with rates of 3 to 10 percent and revision of tax base	Revision "C" with rates of 3 to 8 percent and revision of tax base
A. Amount of increase in State revenues (thousands)			
$ 0 - $ 4,999	$1,953	$ 3,923	$ 4,137
5,000 - 7,999	1,997	3,673	4,202
8,000 - 9,999	630	1,075	1,381
10,000 - 14,999	480	802	1,172
15,000 - 49,999	295	646	258
50,000 and over	355	386	25
Total	5,710	10,505	11,175
B. Percentage increase over 1957 tax liability			
$ 0 - $ 4,999	66.7	134.0	141.3
5,000 - 7,999	58.0	106.6	122.0
8,000 - 9,999	41.7	71.1	91.3
10,000 - 14,999	22.9	38.2	55.9
15,000 - 49,999	5.0	10.9	4.3
50,000 and over	14.8	16.1	1.0
Total	32.2	57.3	61.0

As conservative estimates, such revisions would yield between $6 and $11 million of additional revenue for the General Fund. Revision "C" would produce the largest increase and "A" the smallest, but in each case the relative change in the tax burden for taxpayers, grouped by adjusted gross income categories, would vary inversely with the income levels. Thus, the increased revenue productivity would be obtained by making the tax structure successively less progressive.

A rough measure of the degree of change in the allocation of the aggregate income tax burden which would result from the suggested changes in base (capital gains, surtax and medical expense) and rate can be obtained by comparing the distribution of the total tax liability which would be incurred under revisions "A", "B", and "C" with that of the 1957 Colorado tax and the 1955 federal tax, as shown below.

Table 12.43

Percentage Distributions of Total Personal Income Tax Liability, Classified by Major Adjusted Gross Income Categories for Selected Federal and Colorado Tax Structures

Adjusted gross income classes	1955 Federal personal income tax[a]	1957 Colorado personal income tax[b]	Selected hypothetical Colorado tax structures[c] Revision "A"	Revision "B"	Revision "C"
$ 0 - $4,999	25.2	16.0	20.3	23.8	23.9
5,000 - 7,999	26.8	18.8	22.6	24.7	25.9
8,000 - 9,999	9.2	8.3	8.9	9.0	9.8
10,000 - 14,999	9.1	11.4	10.7	10.0	11.1
15,000 - 49,999	16.7	32.4	26.0	22.9	21.1
50,000 and over	13.1	13.1	11.5	9.6	8.2
Total[d]	100.0	100.0	100.0	100.0	100.0

[b] Based on Table 12.31.
[c] Based on Table 12.31 and Table 12.42.
[d] Total may not equal sum of parts because of rounding.

It is evident on the basis of the above data that although the net effect of each of the specified revisions would be to increase the relative tax liability of taxpayers in the three lowest income categories—those with incomes of less than $10,000, representing more than 95 percent of all returns filed in 1958—the over-all Colorado income tax structure would continue to remain significantly more progressive than the federal tax was in 1955, the most recent year for which data are available. And as already noted, the marked variance between the state and federal progressions cannot be attributed primarily to differences in income distribution for on this score Colorado appears to be practically a median state and its adjusted gross income pattern closely parallels that of the nation as a whole.[88]

The comparative progressivity of the three alternative revisions is shown even more clearly by Chart 12.21 which relates the cumulated percentage of adjusted gross income with the corresponding percentage of tax liability. The vertical distances between the 45° line of proportional taxation and the curves representing the revisions "A", "B", and "C", as well as the actual State and Federal distributions, roughly measure the relative degree of progressivity of these alternative tax structures. Although revision "A" lies below "B", and "B" below "C", it is evident that all three fall between the actual 1955 Federal and 1957 State curves. In other words, any one of the three revisions would result in the State tax remaining significantly *more* progressive than the federal tax structure, notwithstanding the relatively heavier tax burden levied on the overwhelming majority of taxpayers with incomes of less than $5,000. In summary, modification of the tax base—inclusion of capital gains at 100 percent, elimination of the surtax, and allowance of full medical expenses as a deduction—plus the upward revision of the tax rates for the lowest brackets would not only raise a substantial amount of additional state revenue for the General Fund, but would also result in a more equitable and still highly progressive income tax system—one more progressive than the federal.

[88]The remarkably close similarity between the Colorado and national percentage distributions of both the number of income tax returns filed and the adjusted gross income, based on the 1957 State survey data and the 1955 federal data, is revealed by the following tabulation:

Adjusted gross income classes	Number of returns filed		Adjusted gross income	
	Colorado[a]	Federal[b]	Colorado[a]	Federal[b]
$ 0 - $ 4,999	68.1	70.6	41.2	41.7
5,000 - 7,999	23.0	21.0	31.8	30.1
8,000 - 9,999	4.4	4.0	8.7	8.2
10,000 - 14,999	2.7	2.6	7.2	7.2
15,000 - 49,999	1.6	1.6	8.6	9.0
50,000 and over	0.1	0.2	2.6	3.8
Total[c]	100.0	100.0	100.0	100.0

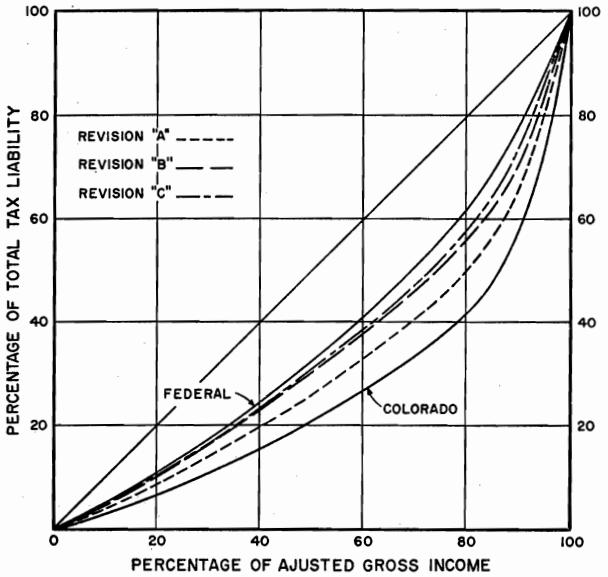
PROGRESSIVITY OF THREE ALTERNATIVE REVISIONS OF THE COLORADO INDIVIDUAL INCOME TAX STRUCTURE COMPARED WITH THE PROGRESSIVITY OF THE FEDERAL INCOME TAX STRUCTURE



SOURCE: Table 12.43 and U. S. Treasury, Statistics of Income for 1955, Table 1.

CHART 12.21

Personal Income Tax Administration

The administration of income taxes in Colorado, like that under the federal and other state statutes, is governed by the fact that the tax is self-assessed. There are fundamentally three basic steps in income tax administration: taxpayers must be identified and those who do not report must be located, returns must be verified, and the tax must be collected. Although it can be assumed that the majority of taxpayers prepare and file honest returns, such practice is likely to continue only so long as administration of the tax is honest, equitable, and effective. Administration must be consistently good or extensive evasion results, the state loses revenue, and the apportionment of the tax burden becomes less equitable.

Administration Procedures. Under the Colorado statute, responsibility for the administration of the income tax rests with the Director of Revenue.[89] He has authority, within the limits of the statute, to adopt rules and regulations which become valid and binding upon all taxpayers. Broadly, the Revenue Department identifies and locates taxpayers by the use of information returns and payroll withholding returns filed by employers. These returns provide the Department with the names, addresses,

[89]*Colorado Revised Statutes, 1953*, Ch. 138-1-42.

amounts of income, tax payments, and other relevant information. In addition, the Department has the power to examine books, records and any other pertinent papers of taxpayers in order to verify the validity of any income tax return. In its efforts to implement this verification, it also has the power to subpoena both taxpayers and witnesses through the State District Courts.

In general, the procedure to be used in the assessment of any deficiencies is prescribed by the statute and accompanying regulations.[90] It is significant to note that virtually all additional assessments, made as a result of audits by the Revenue Department, are settled at either the conferee level or by the Deputy Revenue Director. During the two decades of income taxation in Colorado only 127 cases have resulted in litigation.

The auditing procedure involved in verifying returns consists of both office audits and field audits. In recent years approximately 27,000 returns annually have been subject to office audit, or approximately 5 percent of the total number of individual and corporate income tax returns filed. In 1958, total assessment deficiencies were approximately $1,000,000, refunds were about $350,000,[91] and the State obtained additional revenue of $650,000 as a result of office auditing. The staff was composed of forty agents with an average annual salary of about $5,500, but the average net assessment per agent was roughly $16,000. In other words, on the average each agent produced three times his salary in the form of assessments. Moreover, this figure grossly understates the average revenue productivity of agents since the staff devotes practically six months of the year to tasks unrelated to the auditing of income tax returns.[92] Thus, the forty man staff is really equivalent to that of twenty agents devoting their full time to the examination of income tax returns exclusively. In light of the above, it is evident that immediate consideration should be given to increasing the size of the office auditing staff. It has been estimated that ten more agents could be effectively utilized, and if such action were taken it appears that the State could obtain additional revenue of approximately $100,000 above the additional salary costs.

In contrast to the office auditors, field agents examine sales, use, motor fuel, and gross ton-mile tax reports as well as income tax returns. Moreover, they also spend about six months of the year in performing sundry non-auditing tasks. Although it is difficult to determine the actual time devoted to the examination of income tax returns, it has been estimated by the Department of Revenue that the income tax auditing done by its 25 field agents in 1957 was at most equivalent to approximately four men working full time. In the same year, total income tax assessments made in the field amounted to approximately $100,000 and agents' salaries averaged $6,300 annually. Thus, the assessments were about four times what would have been the combined salaries of four agents working exclusively on income tax returns. Since it is impractical for any one agent in the field to work exclusively on the income tax, it may be more meaningful to compare the total annual assessments of approximately $1 million from field audits of all taxes with the total number of auditors. On this basis each auditor annually assessed $40,000 gross or, deducting the average salary of $6,300, about $33,700 net. It has been estimated that the field auditing staff could effectively be increased by five agents.[93] And finally, it should be noted that tax inequities as well as revenue losses inevitably result from a policy which attempts to "save taxpayer money" by maintaining an insufficient staff of auditors and an ineffective system of tax return verification.

Colorado is one of several states participating in a program for the exchange of tax audit information with the U. S. Bureau of Internal Revenue. This program has been in operation in Colorado since the early 1950's. The Revenue Department takes abstracts from those federal audit reports which produced changes in the federal tax liability of individual taxpayers, and similarly Colorado permits the Bureau of Internal Revenue to abstract information from state returns.[94] In fiscal 1958, approximately 9,000 federal returns were abstracted which resulted in gross assessments of approximately $515,000, or about one-half of the total assessments made by the State office audit staff. Although this program is well conceived and reasonably effective, it is limited solely to comparing state returns with those federal returns which have been revised as a result of federal audits. To expand the program, the Revenue

[91] These refunds are the result of errors discovered by office auditing and should not be confused with withholding refunds.

[92] Examples are assisting taxpayers with return preparation, opening mail during the filing period, assisting the Clearing Section and performing sundry other special tasks.

[93] For a complete discussion of the problems involved in determining the proper size of a field auditing staff, see R. B. Welch, "Measuring the Optimum Size of a Field Audit Staff," *National Tax Journal*, 1954, pp. 210-221.

[94] To facilitate this exchange program, three agents from the office auditing staff are permanently assigned to the New Customs House, preparing abstracts from adjustments made on federal returns. For a complete discussion of cooperative audit programs related to state income taxes, see C. Penniman, "Selected Problems in State Income Tax Administration," *Proceedings of the National Tax Association* (Detroit, 1955), pp. 488-90.

Department could microfilm all federal returns filed in Colorado, or abstract a random sample[95] of federal returns which were not affected by federal auditing. This would provide a means of test-checking Colorado returns of taxpayers who may have filed correctly on the federal level, but incorrectly on the state level.

The third major aspect of income tax administration is the collection of the tax. Certain collection procedures are specified by the statute, but only in relation to penalties which may be assessed and the legal action which may be taken by the Revenue Department.[96] While a detailed examination of cash flows, accounting procedures, and internal checks involved in the collection of the tax would be desirable, such an analysis was not within the scope of this study.

Cost of Administration. Total costs incurred by the Revenue Department in administering the personal and corporate income taxes are shown in the following table.

Table 12.44

Total Income Tax Collections and Cost of Administration, Colorado Income Tax Returns, Fiscal Years, 1947-1957

Year	Total corporate and personal income tax collections	Cost of income tax administration	Administrative costs as percent of total collections
1947	$ 8,634,796	$243,637	2.82
1948	11,682,199	373,033	3.19
1949	17,064,672	427.820	2.51
1950	17,495,008	436,478	2.49
1951	19,022,355	461,942	2.43
1952	20,255,644	538,945	2.66
1953	19,173,261	632,869	3.30
1954	18,301,139[a]	667,932[b]	3.65
1955	24,093,315[a,c]	777,598[b]	3.23
1956	27,529,869[a,c]	882,584[b,d]	3.20
1957	29,383,579[a,c]	955,697[b,d]	3.25

[a] Excludes collections from Oil and Gas Production Tax.
[b] Adjusted for pro-rata administrative costs allocated to Oil and Gas Tax collections.
[c] Includes collections from withholding tax, which became effective July 1, 1954.
[d] Includes allocated I. B. M. expense.

Source: State of Colorado, Department of Revenue, *Annual Reports*, 1947-1957.

Total administrative costs during fiscal year 1957 amounted to $955,697, which represented 3.25 percent of the total income tax collections. This is within the 2 to 5 percent range which generally is considered to be an important characteristic of a "good tax" from the collection aspect. It compares favorably with the 1957 cost-collection ratio for the ton-mile tax of 3.31 percent, and although above the Colorado ratio for the sales and use tax of 1.56 percent, it is considerably below the estimated 6 to 7 percent collection cost of a state cigarette excise tax.[97]

Another measure of the cost of income tax administration is to relate the total number of returns filed to total costs, deriving an average cost per return, as shown by Table 12.45.

Table 12.45

Administrative Cost per Return for the Colorado Income Tax, Fiscal Years 1949-1957

Year	Personal and corporate income tax returns filed[a]	Cost of income tax administration	Cost per return
1949	238,550	$ 427,820	$1.79
1950	309,387	436,478	1.41
1951	328,220	461,942	1.41
1952	347,022	538,945	1.55
1953	375,940	632,860	1.68
1954	416,142	772,757	1.86
1955	443,723	894,079	2.01
1956	470,133	987,617[b]	2.10
1957	501,147	1,085,735[b]	2.17

[a] Excludes partnership information and oil and gas returns.
[b] Includes allocated I. B. M. expense.

Source: State of Colorado, Department of Revenue, *Annual Reports*, 1949-1957.

The data show that while the number of total corporate and personal returns has increased by 62 percent since 1950, administrative costs have increased by 149 percent, and the corresponding cost per return rose from $1.41 to $2.17. This 54 percent increase may be explained largely in terms of the rising price level. The upward trend in average cost may be expected to continue as long as the economy is characterized by inflationary pressures, although more efficient utilization of equipment and staff by the Department would help offset this tendency.

Administrative Problem Areas. The problems involved in administration of the Colorado income tax are not dissimilar to those in most of the other states which tax income. In addition to minimizing his tax bill, the taxpayer is interested in convenience, ease of preparation, and simplicity of the tax return. The state's interest is in collecting the proper amount of revenue in an economical, effective, and equitable manner. Hence, administrative problems, and suggested alternative procedures, must be evaluated from both the state's as well as the taxpayer's viewpoint.

The Income Tax Return. The center of any self-assessed income tax system is obviously the tax return—its preparation, characteristics, and

[95] For a discussion of this and other exchange procedures see the article prepared by the Bureau of Internal Revenue, "Exchange of Information for Purposes of Federal, State, and Local Tax Administration," *National Tax Journal*, 1949, pp. 151-56.

[96] *Colorado Revised Statutes, 1953*, Ch. 138-1-37.

[97] State of Colorado, Department of Revenue, *Annual Report, 1957*, p. 16, and Chapter XVIII of this study.

ability to yield the proper amount of revenue. Ease of payment, convenience and certainty are well-established principles of taxation. Moreover, the equitable distribution of the tax burden and the yield of the tax itself depends to a large degree on the effectiveness and simplicity of the return. The nature of the return should continuously be evaluated in terms of changing economic conditions, and proposed alternatives should be discussed in an effort to render the return a more effective "tax collector."

An apparently complicating factor in the preparation of the Colorado income tax return is the multiplicity of forms and schedules which must be used under various circumstances by the taxpayer. The use of a large number of forms, however, is not necessarily undesirable and should be viewed in light of several considerations. First, taxpayers are a highly heterogeneous group, and since the major virtue of the income tax is its ability to allocate the tax burden on the basis of ability-to-pay, the return must be consistent with this goal. A simple tax on income, such as a gross receipts tax, might result in a less complicated return but its imposition violates the essential rationale of income taxation. Another consideration is the fact that a multiplicity of forms and schedules usually simplifies return preparation rather than complicates it. The multitude of forms could, of course, be combined into one voluminous return, but in addition to creating taxpayer confusion, such action would render processing and auditing by the Revenue Department extremely difficult. Nevertheless, the number of forms and schedules required should be examined periodically in light of taxpayer convenience as well as administrative ease.

Another problem area, involving return preparation, results from the fact that the taxpayer must make virtually two independent computations because of differences between the federal and the state income tax codes. At the present time some of the more significant differences are the following:[98]

1. Head of household and income-splitting provisions.
2. Treatment of items such as capital gains and losses, annuities, alimony, and insurance proceeds; and adjusted gross income differences, such as employee travel expense to and from work.
3. Exclusions from gross income, involving such items as the treatment of death benefits, armed service compensation, dividend exclusions and credits, and retirement income.
4. Deductions, including such items as carrying charges, taxes, losses, bad debts, contributions, net operating loss deductions, medical expenses, child care, and depreciation and depletion.
5. Exemptions.

In consideration of the above, it has frequently been proposed that state income taxation should be related either directly or indirectly, to the federal income tax.[99]

Harmonizing state income tax provisions with those of the federal government could be achieved in a number of ways. The most thoroughgoing integration involves a direct tie-in with the taxpayer's federal income tax liability—a state tax levy which is equal to a percentage of the federal tax. Alaska, an outstanding example, collects an amount equal to 10 percent of the federal tax. Computation simply involves moving the decimal point one place to the left. A variation of this type of direct tie-in is to provide a separate state tax system and give the taxpayer the option of paying a percentage of the federal tax or filing under the state's system. In recent years, Utah and New Mexico have experimented with this type of procedure, but after a short period of time abandoned it for reasons which are subsequently discussed.

Another method of integrating state and federal income taxes is for states to adopt certain features of the federal tax, particularly the federal definition of net taxable income. Having accepted this base, states may then utilize any rate structure they wish. Vermont is the outstanding example of a state which uses this method, not only with respect to the personal income tax base but also the corporate income tax base.[100] Massachusetts, Connecticut, Rhode Island, New York, and Pennsylvania also rely to some degree on the federal definition of taxable income, for either their personal or corporate income tax.[101] Of course, many states undoubtedly use specific features of the federal code as a guide for their state tax code, but not as a fixed and continuing policy.[102]

[98]For a complete discussion of these and approximately 86 other differences see Legislative Council, "Colorado Income Tax Selected Problems, Part I," *Legislative Council Report to the Colorado General Assembly*, Research Publication 9-2, 1955.

[99]A more extreme proposal, which is also founded on other reasons, is for the states to abandon income taxation and leave the field exclusively to the federal government. As compensation for this abandonment, the federal government would either share its income tax receipts with the states or increase grants-in-aid. However meritorious this proposal may be, the likelihood of its fruition in the immediate future seems quite negligible. For further discussion of this proposal, see H. C. Simons, *Personal Income Taxation* (Chicago: University of Chicago Press, 1938), pp. 214-15.

[100]This form of integration has even been given the name "the Vermont type." For a brief history of Vermont's adoption of this system, see J. K. Lasser, "State Income Taxation in Vermont," *National Tax Journal*, 1948, pp. 60-66.

[101]R. M. Kamins, "Federal-Based State Income Taxes," *National Tax Journal*, March, 1956, p. 47.

[102]Still another minor way in which states may utilize the federal income tax is to base state withholding on a percentage of the federal tax withheld. Colorado, for example, withholds 4 percent of the federal tax withheld.

Certain advantages may be claimed for tying-in to the federal code either directly or indirectly. The taxpayer is able to compute his tax with more ease, especially when the state tax is simply a fraction of the federal tax. Some administrative problems involving verification may be performed with greater ease through cooperation with the federal authorities.[103] It is even possible to transfer all auditing duties to federal agents, for which the state would pay a fee. Another advantage claimed for tying-in is the potential increase in revenue which could be realized by some states. This point has little merit, however, since revenues, of course, could be increased in any number of other ways within the present framework.

In contrast to these possible advantages, numerous criticisms have been made with regard to integrating state and federal income taxes. While some emphasis may be placed on the desirability of maintaining state autonomy, a more important point is that an income tax on the state level is significantly different than an income tax on the federal level. While state income taxes commonly yield less than 20 percent of total state revenue, the federal income tax accounts for approximately 70 percent of total federal taxes.[104] Moreover, many provisions relating to federal income taxation are not equally applicable to state income taxation. For example, the traditional rationale, whatever its merit, for the liberal treatment of capital gains is founded on the fear that the high *marginal* tax rates on the federal level might impair capital formation. Hence, in reference to state taxation, where a much lower rate is in effect, the manner in which capital gains should be treated is quite different.[105]

A major assumption involved in the belief that a federal tie-in would be desirable is that federal regulations "are as likely to be as equitable as those developed by a state tax commission and much more likely to be consistent and available."[106] This, however, is not necessarily tenable as evidenced by certain federal provisions which are considered by some tax authorities to be loopholes, such as the "usual quota of 'private relief' provisions" in the Internal Revenue Code of 1954.[107] Additional criticism of the federal code is not difficult to find. One writer comments on the problems of administration and compliance in the IRC of 1954 as follows: "Whereas the objective was simplification, the net result . . . has been to make administration and compliance much more difficult than in the past."[108] It also appears that the federal income tax base has been defined primarily in light of the federal rate structure and, therefore, state use of the same base is of questionable tenability. The serious problem of the continuous erosion of the federal rate structure as well as well as the base has been noted by numerous public finance authorities.[109] While criticism of the federal income tax does not insure that the states can propose a more effective tax, it does indicate that the federal tax is not the sole criterion for good state taxation.

Another criticism of the federal tie-in relates to the loss of control over state revenue. Time-lags necessarily occur between changes in the federal code and possible changes in the state's system. A direct tie-in assumes that changes in federal and state revenue requirements occur simultaneously, which may or may not be the case. Moreover, states lack the financial capacity to cope with the revenue flexibility inherent in an income tax system which accounts for a significant portion of total revenue.[110] Thus, while the federal government may incur significant deficits in times of recession, states must curtail expenditures or seek other revenues to replace the losses of a federally-based income tax.

Numerous technical criticisms may be levied against a federal tie-in. Some of the more significant are as follows:

1. Computation of federal net income includes income from certain federal bonds whereas the states do not have the power to tax such income.

---

[103]Substantial cooperation with federal authorities is also possible under state income taxes which are unrelated to the federal code. See Bureau of Internal Revenue, "Exchange of Information for Purposes of Federal, State, and Local Tax Administration," *op. cit.*, pp. 151-56.

[104]*Federal Reserve Bulletin*, January, 1959, p. 47.

[105]For this reason over half the income taxing states treat capital gains differently than the federal government.

[106]R. M. Kamins, *op. cit.*, p. 51.

[107]A. W. DeWind, "A Technical Appraisal of the Internal Revenue Code of 1954," *National Tax Journal*, 1955, p. 66. For a less critical view of the Code, see K. W. Gemmill, "An Appraisal of the Internal Revenue Code of 1954," *National Tax Journal*, 1955, pp. 36-39.

[108]J. A. Pechman, "Individual Income Tax Provisions of the 1954 Code," *National Tax Journal*, 1955, p. 135. For still another critical appraisal of the 1954 Code, see C. S. Shoup, "The Dividend Exclusion and Credit in the Revenue Code of 1954," *National Tax Journal*, 1955, pp. 136-147.

[109]For a critical discussion of these and other issues see the following: W. Cary, "Pressure Groups and the Revenue Code," *Harvard Law Review*, Vol. 68, 1955; W. W. Heller, "Practical Limitations of the Federal Income Tax," *Journal of Finance*, 1952; R. E. Paul, "Erosion of the Tax Base and Rate Structure," *Federal Tax Policy for Economic Growth and Stability* (Washington, D.C.: U. S. Government Printing Office, 1955); L. H. Seltzer, "Capital Gains and the Income Tax," *American Economic Review*, Vol. 40, 1950; P. Strayer, "Individual Income Tax and Income Distribution," *American Economic Review*, Vol. 45, 1955.

[110]H. M. Groves, *Financing Government* (fourth edition; New York: Henry Holt & Co., 1954), p. 205.

2. Many states tax income from bonds of other states and their municipalities, but the taxation of this income by the federal government is considered to be unconstitutional.
3. Many states do not permit the deduction of state income taxes, whereas the federal government does.
4. Certain problems are created by the different basic compliance dates of state and federal taxes.

Moreover, a major technical problem associated with state income taxation, especially corporate, is the allocation of interstate incomes. This could not be solved by a federal tie-in, i.e., determining what portion of total income is earned within a given state.[111]

A final problem involved with a federal tie-in is the questionable constitutionality of such a measure. It has been suggested that adoption of the federal income tax statutes by reference would be constitutional in most cases,[112] but a 1955 opinion by the Attorney General of Colorado indicated that a tie-in by Colorado with the federal code would be constitutional only "if the statute were carefully drawn" and were on an optional basis.[113] The latter opinion was further qualified by pointing to the difficulty of rendering a decision without the presence of actual legislation.

Although a federal tie-in would simplify computation by the taxpayer, numerous alternatives could achieve this objective within the present state system. For example, a major source of confusion in the present return is computing the deduction allowed for federal income taxes paid. Schedule I of the Colorado personal income tax form, which requires computation of the federal tax on a cash basis, probably causes more difficulty for the taxpayer than any other feature of the return. While a direct tie-in to the federal code would eliminate this source of confusion, it could also be removed simply by disallowing federal deductibility on the state level. Although a decision to eliminate federal deductibility must be evaluated essentially in terms of its impact on the distribution of the tax burden, it should be kept in mind that a major virtue of such a policy would be simplification of the taxpayer's computation of his tax liability. Another source of some confusion is the deduction allowed for traveling expenses going to and from work. Without any direct tie-in to the federal code, this type of compliance difficulty could be eliminated simply by disallowing the travel deduction provided under the State code. Such a decision, however, should be based on considerations of taxpayer equity as well as taxpayer convenience.

In conclusion, the numerous criticisms of a federally-tied state income tax appear to outweigh the one major advantage—simplification of tax liability computation. State sovereignty and taxpayer equity should not be sacrificed solely for the purpose of achieving convenience in the preparation of returns. Moreover, a certain amount of simplification is possible without delegating state responsibility to Congress and federal tax administrators. Of course, the federal code should be continuously used as a guide for possible improvement of the state tax, but any revision should be exaluated on its own merits, and not adopted simply because it has been deemed desirable by the federal government.

Withholding Provisions. Withholding of state income taxes by employers is relatively new. Oregon led the way in 1948, and since then nine other states, including Colorado, have adopted a form of withholding.

The primary advantage of withholding is that the state is able to collect a greater amount of revenue in a manner which is less burdensome to the taxpayer. Despite this advantage, withholding creates a refund problem, the magnitude of which is determined by the relationship between the amount withheld and the taxpayer's liability. Although it is generally contended that it is better to withhold too much than too little, the number of refunds processed should not reach such proportions that possible gains from the system are cancelled out. However, even when numerous refunds are made, the state has the use of interest-free money from the time of withholding to the time of the refund.

The magnitude of the refund problem in Colorado may be demonstrated by comparing refunds with the returns which are subject to withholding as shown in Table 12.46.

It will be noted that approximately two-thirds of the returns subject to withholding required refunds and nearly one-fourth of the total dollar amount withheld was returned to taxpayers in the form of refunds. In addition, the problem is concentrated in the lower income group, as shown by the fact that over 75 percent of the total number and total dollar amount of refunds were made to taxpayers with incomes of less than $5,000.

8,000 - 9,999	816	62	7.6
10,000 - 14,999	530	10	1.9
15,000 - 49,999	516	13	2.5
50,000 and over	122	3	2.5
Total	8,414	1,983[a]	23.6

[a] Totals do not equal sum of items due to rounding.

Source: Survey data of 1957 returns filed in 1958.

In an effort to solve the problem of excessive refunds seven of the ten states which employ withholding utilize tables similar to those of the federal government. Of the three remaining states, Arizona withholds ½ percent of total wages, while Utah and Colorado withhold a percent of the federal tax withheld.[114] It appears that a withholding table which takes into account levels of income, exemptions, and a standard deduction, would provide a withholding pattern which most closely corresponds with actual tax liability. While the use of such a table would decrease the number of refunds in the lower income levels, it would not be as effective in the upper income groups where itemized deductions are much more common.

Another approach to this problem would be to base state withholding on federal withholding, but as a percentage which is *graduated* according to the amount withheld for the federal tax. This would involve the least amount of change in the present witholding system if the revision were limited to the use of only two "flat-percentage" rates. For example, a 3 percent rate could be applied in the case of taxpayers with federal tax withholding of $50 or less a month, and a 5 percent rate could be used for those with federal withholding in excess of $50. This would roughly approximate a break at the $5,000 level of adjusted gross income for the average taxpayer and, therefore, would more adequately relate state tax withholding to tax liability. Of course, if the present state personal income tax structure were revised upward, particularly for the lower income groups, then the present 4 percent rate could be retained for taxpayers with federal withholding of $50 or less a month, and a 6 percent rate could be applied to those with federal withholding above $50.

Broader Application of Tax Tables. The Colorado statute provides a taxpayer with the option of using a prepared tax table for the determination of his income tax liability provided his adjusted gross income is under $5,000. Such factors as personal expense deductions and the federal income tax are computed into the tax due. There is little doubt that this procedure greatly simplifies the preparation of tax returns and reduces the amount of verification and auditing which otherwise must be undertaken by the Revenue Department.

Attention should be directed to the possibility of expanding the present table to include taxpayer with the adjusted gross incomes up to $10,000. Such a revision would materially simplify the preparation of returns for taxpayers, would reduce auditing and other administrative costs, and at the same time should not result in any significant revenue change for the state. The number of taxpayers using different computation methods in the preparation of the 1957 returns is shown in the table below.

Table 12.47

Number of Taxpayers Classified by Computation Method Used, Colorado Individual Income Tax Returns, 1957

Adjusted gross income classes	Total number of returns filed	Number of taxpayers using: Itemized deductions	Standard deduction	Tax table
$ 0 - $4,999	357,600	87,000	10,500	260,100
5,000 - 7,999	120,700	66,100	54,600	—
8,000 - 9,999	23,000	14,460	8,540	—
10,000 - 14,999	14,320	9,530	4,790	—
15,000 - 49,999	8,532	6,780	1,752	—
50,000 and over	669	623	46	—
Total	524,821	184,493	80,228	260,100

Source: Survey data of 1957 returns filed in 1958.

On the basis of these data, it appears that the extension of the present table to $10,000 of adjusted gross income could affect as many as 63,000 taxpayers with incomes between $5,000 and $10,000 who chose the optional standard deduction in 1957. It may be assumed that taxpayers are primarily concerned with minimizing their tax liability and that in most cases considerations of convenience are secondary. Therefore, it is unlikely that those who find it beneficial to itemize would use the table. On the other hand, taxpayers presently taking the optional standard deductions probably would use the extended tax table as long as the "built-in" federal tax deduction was equal to or greater than their actual federal tax liability. The major convenience to taxpayers with incomes between $5,000 and $10,000 would be that they no longer would be required to complete Schedule I—the taxpayer's computation of his federal income tax deduction on a cash basis.

[114] W. W. Heller and C. Penniman, "A Survey and Evaluation of State Income Tax Withholding," *National Tax Journal*, December, 1957.

In summary, if Colorado income tax administration is to be improved consideration should be given to expansion of the present auditing staff, simplification of return preparation without resorting to any direct tie-in with the federal code, use of a withholding technique which more nearly reflects taxpayers' liability, and the extension of the present $5,000 tax table to $10,000.

APPENDIX NOTE ON DESCRIPTION OF SAMPLE

The data presented in this chapter for the Colorado individual income tax returns for 1957 are based on a stratified, cluster, systematic sample consisting of 100 percent of returns showing adjusted gross income of $50,000 and more, and of various lesser percentages of returns showing adjusted gross income of under $50,000. The number of individual income tax returns selected for the sample was 10,182, which represented slightly less than 2 percent of the 520,196 returns actually filed by Colorado income taxpayers between January 1, 1958, and June 20, 1958, exclusive of irregular returns. The latter represented fiduciary, tentative, prior-year delinquent, and partnership information returns not included in either the sample or the population from which the sample was drawn. On the basis of the three previous years' experience it was found that approximately 99 percent of the year's total number of individual income tax returns are filed during the first six months of the calendar year. Data as extensive as that required for the preceding anaylsis of the Colorado personal income tax could be obtained only on a sampling basis if the data were to be current and the study completed within the prescribed time limit. On the basis of accepted statistical principles the sample was designed to achieve a fixed degree of sampling reliability at minimum cost.

Description of the Sample. The Department of Revenue sorted all 1957 individual income tax returns received in 1958 according to whether the taxpayer's reported adjusted gross income was less than $10,000 or not, and the returns were then batched in envelopes, with approximately 100 returns per batch. Within each of these two strata of batches a sample of batches (clusters) was systematically selected. The returns in each sample batch, in turn, were then systematically selected according to a plan which prescribed different sampling fractions for each of seven adjusted gross income groups. The prescribed sampling ratios used for the selection of the batches and the returns within each sample batch, classified by adjusted gross income, are shown in Table 12A.1.

On the basis of the sampling fractions, income tax returns for the sample were selected from each adjusted gross income stratum. As noted in Table 12A.1, the sampling ratio achieved for the seven income categories combined was approximately one out of every 51 Colorado income tax returns filed during the period covered. In order to extend the sample values to that of the returns represented they were multiplied by "weighting factors" which are the reciprocals of the over-all sampling fractions, e.g., the estimated number of returns showing incomes of less than $5,000 was obtained by multiplying the 2,384 returns in this stratum of the sample by the factor of 150. It is important to note that when the number of sample returns in each of the seven income categories is inflated to population size, the estimated total number of returns (524,821) based on the sample works out to be 100.9 percent of the total number of the regular returns processed by the Department of Revenue during the period to which the sample was limited. In other words, the estimate derived from the sample comes within 1 percent of the number actually filed by income taxpayers.

Table 12A.1

Sampling Fractions Between Batches and Within Batches

Adjusted gross income classes	Prescribed sampling ratios: For all batches	Within each batch	On an overall basis	Total returns in sample
$ 0 - $ 4,999	1/20	2/15	1/150	2,384
5,000 - 7,999	1/20	2/5	1/50	2,414
8,000 - 9,999	1/20	1/1	1/20	1,150
10,000 - 14,999	1/1	1/10	1/10	1,432
15,000 - 24,999	1/1	1/4	1/4	1,433
25,000 - 49,999	1/1	1/4	1/4	700
50,000 and over	1/1	1/1	1/1	669
Total	—	—	1/51[a]	10,182

[a] Achieved ratio.

Reliability of Estimates from the Sample. The data from returns showing adjusted gross income of $50,000 or more are not subject to sample variability since all such returns were included in the sample. However, the estimates which include data from returns with adjusted gross income of less than $50,000 are subject to sampling variability. Since a sample is only a part of the population from which it comes, differences are likely to occur between sample estimates and the corresponding values obtained from examination of the entire population made under identical circumstances, i.e., from a census of the universe. A measure of how well sample values approximate those that would have been obtained from a census is called a measure of sampling reliability. Such a measure generally depends upon the number of samples on which

an estimate is based as well as the variation between the individual sample values. A measure of sampling reliability for each item in the study could be estimated from the sample itself, but due to the complexity of the computations and the large number of items involved, it is impractical to derive individual estimates for all sample values. However, the following estimates of sampling reliability at the 95 percent level of confidence were computed for three highly significant items in the study—4.4 percent for adjusted gross income, 4.0 percent for the number of exemptions, and 2.7 percent for the combined normal and surtax liability reported on all returns. This means that the chances are 95 out of 100 that: (1) the sample value for total adjusted gross income, which was $2,384 million, will not differ from that obtained from a census of all returns by more than 4.4 percent; (2) that the estimated total number of personal exemptions, which was 1.4 million, will not differ from an actual count of all exemptions by more than 4 percent; and (3) that the estimated total tax liability of $18.3 million will not differ from the actual by more than 2.7 percent. Moreover, it is reasonable to assume that the estimates for adjusted gross income, personal exemptions, and tax liability do not possess a lesser degree of reliability than other associated sample values. For example, since estimates of other money amounts derived from the sample are closely related to or depend on adjusted gross income it may be confidently assumed that they also possess a comparable degree of reliability.

Another indication of the reliability of the sample estimates is revealed by comparing the estimate of the aggregate amount of combined normal and surtax liability derived from the sample with that computed by the Department of Revenue on the basis of actual tax liability reported on all returns from which the sample was drawn. The Department of Revenue figure for the total tax liability on the returns filed during the period was $18,567,216, whereas the aggregated sample estimate amounted to $18,327,614, or 98.7 percent of the actual. In other words, the sample estimate was only 1.3 percent less than the actual figure obtained from a complete census of this item. Equally significant is the fact that this 1.3 percent margin of error for total tax liability is actually less than one-half as large as the 2.7 percent estimate of sampling reliability obtained for this item at the 95 percent level of confidence, as noted above.

Other Limitations of the Data. In addition to sampling variability the data used as the basis for the analysis of the 1957 personal income tax returns are subject to a number of other limitations which are inherent in any survey. Since the returns were used in pre-audit form, they do not reflect the changes which will be made on some of the returns as a result of the Department of Revenue's auditing program. Moreover, controls maintained over the selection, processing and editing of the sample data do not completely eliminate the possibilities of errors having been made in recording, coding, editing and tabulating. The exact extent to which such errors affect the accuracy of the estimates is unknown, but it is believed that the quality of the survey data would not have been as high had a complete census of the returns been undertaken.

CHAPTER XIII

THE CORPORATION INCOME TAX

The corporation income tax has become widely accepted as an indispensable component of the modern American tax structure. It has proved to be a highly productive source of revenue, an essential instrument of fiscal policy, and an important supplement to the personal income tax. On the state level it has grown more rapidly during the past two decades than any other major source of state tax revenue. Not only is the tax second in quatitative importance, but it has been described as the nation's "second-best tax."[1]

The present federal corporate income tax was adopted in 1909,[2] four years before the enactment of the federal personal income tax. During World War I federal corporate income tax revenues were more than twice as large as personal income tax revenues,[3] and throughout the inter-war period of 1925-1940, they exceeded the personal income tax collections in every year but two.[4] It has been only since World War II that the latter have remained consistently greater than corporate income tax receipts.

On the state level the patterns of development of corporate and personal income taxation generally have been similar. Beginning with Wisconsin's income tax act of 1911, the two forms of state income tax usually have been enacted in the same statute, as in the case of Colorado. At present all states which levy a regular personal income tax also use a corporation income tax of some type, and income taxes are limited solely to corporations in four states—Connecticut, Rhode Island, New Jersey and Pennsylvania. At present thirty-four states and the District of Columbia levy taxes on corporate net income. Twelve states introduced corporate income taxes prior to 1929; nineteen others, including Colorado, adopted them during the decade of the Great Depression; and three more states have enacted the tax since World War II.[5]

The growth and relative importance of federal and state corporate income tax collections are shown in Table 13.1.

Table 13.1

Corporate Income Tax Collections in the United States for Selected Fiscal Years 1939, 1950 and 1957

Jurisdiction	1939	1950	1957
A. Amount of collections (millions)			
Nation as a whole	$1,276	$11,488	$22,628
Federal government only	1,156	10,854	21,531
27 income tax states[a]	108	624	1,046
Colorado	1	6	4
B. Percent of total tax collections			
Nation as a whole	14.5	24.0	23.9
Federal government only	22.4	27.9	26.9
27 income tax states[a]	5.0	11.5	11.8
Colorado	2.0	6.5	2.9

[a] Excludes five states which do not segregate corporate and personal income tax receipts.

Sources: U. S. Department of Commerce, Bureau of the Census, *Compendium of State Government Finances, 1950-1957;* and *Financial Statistics of States, 1939 and 1949; Statistical Abstract of the United States, 1948-1958;* and *Annual Report of the Secretary of the Treasury for Fiscal Year 1957.*

On the basis of the above data it appears that corporate tax collections increased almost twenty-fold on the federal level and approximately ten-fold on the state level in less than two decades. Moreover, the 27 corporate income tax states, for which separate data were available, showed a greater increase in the relative importance of the corporate tax than did the federal government during this period. Corporate tax collections for the states, expressed as a percentage of their total tax receipts, more than doubled from 1939 to 1957, increasing from

[4] *Annual Report of the Secretary of the Treasury, 1946,* p. 405. Receipts from the corporation and personal income taxes were not reported separately for the fiscal years 1918-1925.

[5] State adoptions of corporate income taxation were as follows:

1911—Wisconsin
1912—Mississippi
1915—Connecticut
1917—Missouri, Montana, New York
1919—North Dakota, Massachusetts
1921—North Carolina
1922—South Carolina
1923—Tennessee
1926—Virginia
1929—Arkansas, California, Georgia, Oregon
1931—Idaho, Oklahoma, Utah, Vermont
1933—New Mexico, Alabama, Arizona, Kansas, Minnesota
1934—Iowa, Louisiana
1935—Pennsylvania
1936—Kentucky
1937—Colorado, Maryland
1939—District of Columbia
1947—Rhode Island
1957—Delaware, New Jersey

5 to almost 12 percent; whereas, the federal receipts only rose from 22 to 27 percent. In sharp contrast, the development of the Colorado corporate income tax during the same period did not parallel either the experience of the other income tax states or the federal government. Although as a percentage of total tax collections the Colorado corporate income tax always has been below the average of the other states, revenue yields from this source in Colorado roughly increased at the same rate as in the other states from 1939 to 1950. Since then, however, Colorado corporate income tax collections actually have declined by approximately 25 percent—from slightly less than $6 million in 1950 to $4.4 million in 1957—while corporate tax collections for all states combined rose by almost 75 percent. On a relative basis, corporate income tax receipts increased from 2 percent of Colorado's total tax revenues in 1939 to 6.5 percent in 1950, only to fall back to 2.9 percent by 1957, despite the fact that the State experienced considerable economic expansion during the period. This relative decline in the tax may largely be attributed to the American Can case of 1947 which severely limited the legal definition of Colorado taxable income for foreign interstate corporations doing business within the State, and consequently resulted in a shrinkage in the State's corporate tax base. In short, the corporation income tax, traditionally underutilized as a source of State revenue, has become even less important in Colorado's over-all tax structure in recent years.

The Rationale of Corporate Income Taxation

A fundamental justification for corporate income taxation is the special benefit or privilege theory, as developed by a series of court decisions. As early as 1911, the U. S. Supreme Court upheld the corporate income tax as "an excise upon the particular privilege of doing business in the corporate capacity," and termed it "a tax upon the doing of business with the advantages which inhere in the peculiarities of corporate or joint-stock organization."[6]

Originally, the privilege theory of corporate taxation was associated with the origin of the corporate form itself. The earliest corporations were granted by the state particular monopoly privileges or exclusive franchises to carry on business in specified regions or communities. As the nature of the corporation changed and corporate charters became more generalized and more easily obtainable by all types of business concerns, the actual development of modern big business became dependent upon the corporation form of organization. Apart from the legal right of existence, the specific privileges or benefits conferred by a corporate charter are: limited liability of stockholders, perpetual life, easy transfer of ownership, diffused sources of financing, and possibilities for intercorporate affiliation. As noted by Goode:[7]

> These characteristics make it easy for corporations to grow in size and power and to tap new sources of finance and wide markets. Undoubtedly they make possible modern big business as we know it and help to account for a large part of corporate profits.

If the benefit principle is accepted as a valid justification of a special tax on corporations, then the amount of corporate net income or profits reflects the benefits of incorporation better than any other single measure of business activity. "The fact that business is done in the corporate form, despite special corporation taxes, is a clear indication that the charter is worth something."[8]

A second major justification of the corporate income tax has been termed the government "partnership in enterprise" principle.[9] According to this view, the remarkable success of modern business in the corporate form justifies special direct taxation of corporate enterprise. The tax provides a way of tapping directly the community's income stream at one of its principal sources, and in so doing it serves as an important supplement to the personal income tax. If government is justified in taxing income after its distribution to the individual agents of production, it is no less justified in taxing part of the yield from production directly at its source. The "partnership principle" also provides a rationale for the carry-back and carry-over of losses for tax purposes, in that government under such provisions shares the losses as well as the gains of enterprise. In other words, the tax "does not substantially modify the chances and risks involved in a business venture, since the government participates in both gains and losses."[10] In short, an important part of the responsibility of both state and federal government is to help maintain the kind of conditions under which free enterprises can flourish and the concomitant obligation of successful corporate enterprises is to bear a share of the costs of government. Corporations are taxed separately from their individual legal owners because they are established and function as separate and independent economic entities.

[10] *Ibid.*, p. 496.

The economic effects of the corporate income tax have made it a principal instrument of fiscal policy. The flexibility of its yield exceeds that of any other tax and it contributes significantly to the over-all stability of the economy. On the state level, the degree of flexibility of the corporate income tax, and consequently its stabilizing effect, is considerably less than for the federal tax. Nevertheless, for all states combined the stabilizing effect of corporate income taxation is quantitatively important. Moreover, during periods of economic growth characterized by increased demands for state services the rise in corporate income automatically provides an expanded corporate income tax base and tax yield which in part helps meet the state's need for greater revenues.

In order to assess the distribution of the burden of a tax, it is necessary to distinguish its impact, i.e., the economic units upon which the tax is levied, from its incidence, i.e., the persons upon whom the burden of the tax ultimately comes to rest. While it is difficult generally to determine accurately the incidence of any tax, the numerous shifting possibilities open to the corporate income tax render a precise determination of the distribution of its burden impossible. Perhaps the most accurate description is provided by the theory of "tax diffusion" which holds that the burden of the corporate income tax is shifted to consumers, wage-earners, and stockholders; and in part is reflected by reduced undistributed corporate profits. Over a long period the tax becomes so imbedded in the commodity price structure and in equity values that its burden is diffused broadly throughout the economy.

Finally, it should be noted that there are two major considerations which specifically favor the use of the corporate income tax by state government. Due to the limited taxing jurisdiction of state governments, the personal income tax cannot reach the entire income produced within the state and corporate profits channeled to out-of-state stockholders will escape a state's taxable income base entirely unless a corporate income tax is also levied. In other words, the corporate tax provides an effective and practical means for states to tax corporate profits originating within their boundaries, and thus, supplements a personal income tax which does not apply to the interest and dividends received by non-residents of the state. Secondly, the over-all state and local tax structure is essentially regressive and to the extent that the corporate income tax burden is borne by the stockholders, it provides an element of progressivity. For all of the above reasons, the corporate income tax works out to be a necessary, productive and equitable feature of a state tax structure in a modern big-business economy.

History of the Corporation Income Tax in Colorado

The Colorado corporation income tax became effective on July 1, 1937, at an initial rate of 4 percent of corporate taxable net income. The enactment followed years of agitation for an income tax, beginning as early as 1912 and finally culminating successfully in the income tax amendment of 1936.

One important argument used throughout the period to support a corporation income tax was based on the inadequate assessment of intangible and real property owned by individuals. It was argued in Colorado, as in other states, that a corporation income tax would be a more effective means of taxing these two categories of property.

A related problem was the difficulty the State Tax Commission encountered in attempting to determine the assessed value of corporations for general property taxation. By 1915 the Tax Commission was setting the assessed value for some 300 corporations, which entailed no less than 105 hearings and 42 rehearings.[11] Moreover, the authority granted the Commission for this task was ambiguous and ill-defined. An independent report in 1916 noted that "just how far the law permits the Commission to go in assessing corporations is not definitely known."[12]

The difficulties inherent in the assessment of corporate property were compounded by an amendment in 1914 empowering the State Board of Equalization to alter valuations of corporate property as determined by the Tax Commission. Until this power was curbed by a court decision in 1929, the Board of Equalization was petitioned by numerous corporations, and generally granted their requests for lower assessments. For example, the Tax Commission stated that:[13]

> . . . in 14 years, the Board has lowered this Commission's valuations on public utilities, railroads, and other like corporations, approximately $30,667,810 . . . In all that time not a single increase in valuations has been made or ordered, and, with one exception, all its reductions have been given to corporate property. In other words, its equalization has been 100 percent downward and confined to corporations.

Also, during this period the courts interfered with the assesment of corporate property. It was contended that Colorado was practically the only state where valuations fixed by the State Tax Commission could be attacked in court based solely on the proposition that the valu-

[13]State of Colorado, State Tax Commission, *Fifteenth Annual Report*, 1926, p. 8.

ations were too high. This practice was stopped by a Colorado Supreme Court decision in 1934, in which it was declared that the "lower Court obviously misapprehended its proper function."

Thus, the taxation of corporations under the general property tax in the period before 1937 was extremely difficult and inadequate, and despite the fact that some of the deficiencies were remedied, they all served to help strengthen the growing pressure for a corporation income tax.

The 1937 corporation income tax provisions and regulations were patterned closely after those of the federal code in effect at that time. The principal statutory amendments and court interpretations affecting the Colorado corporate income tax base since 1937 are as follows:

1947—The American Can case, in which the court restricted the legal definition of "Colorado sales" made by interstate firms, thereby reducing the Colorado taxable income base.[14]

1951—An amendment to broaden the Colorado tax base of interstate firms by defining Colorado taxable income as corporate "income from any activities carried on in this state, regardless of whether carried on in intrastate, interstate or foreign commerce."

1952—An amendment changing the status of savings and loan associations, credit unions, and cooperatives under the Act. Savings and loan associations were to be treated essentially as ordinary corporations, and credit unions and cooperatives were required to apply individually for tax exempt status.

1953—An amendment which provided that net capital losses could be carried over as a deduction from gross income for four succeeding tax years, limited to an annual deduction of $2,000 in excess of any net capital gains. Net operating losses were allowed a four-year carryover and were to be treated as short-term capital losses. The statutory depletion allowance for coal-mining firms was increased from 5 to 10 percent of the yearly gross income. The Oil and Gas Gross Receipts Tax was enacted as an amendment to the Income Tax Act and thus could not be used as a deduction against corporate taxable income.

1954—The Colorado Revised Statutes (1953) became effective, including a substantive alteration in the Income Tax Act which made the Oil and Gas Gross Receipts Tax deductible under the regular income tax.

1955—Contributions claimed as deductions by interstate firms were limited to 5 percent of their Colorado taxable net income.

1958—An amendment which redefined the "Colorado sales" factor of the allocation formula used by interstate firms.[15]

In addition to the above changes in tax base, variations in the statutory rate of the corporation tax have been made as follows: in 1947 the rate was raised from 4 to 5 percent of corporate net income for a temporary period. In 1949 the rate reverted automatically to 4 percent, but in March of that year the 5 percent rate was again adopted. In 1950 a "temporary" 20 percent rate reduction was granted, which was annually re-enacted for six more years. In 1957 the tax credit was set at 15 percent, and finally in 1958 the "temporary" reduction was allowed to lapse, restoring the 5 percent statutory rate. During this period the rate on banks remained at 6 percent of net income, except for the single year 1950 when the 20 percent reduction was also extended to banks.

The expansion in the scope of the Colorado corporation income tax is indicated by Table 13.2.

Table 13.2

Number of Colorado Corporate Income Tax Returns Filed, Calendar Years, 1938-1958

Year	Number of returns filed			Taxable returns as percent of total
	Total	Taxable	Non-taxable	
1938	6,180	1,992	4,188	32
1939	5,830	1,963	3,867	34
1940	5,625	2,183	3,442	39
1941	4,863	1,969	2,894	40
1942	5,449	2,763	2,686	51

1956	9,814	6,128	3,686	63
1957	11,733	8,174	3,559	70
1958	12,009	7,885	4,124	66

Source: State of Colorado, Department of Revenue, *Annual Reports*, 1942-1957.

While the total number of corporations filing returns increased by about 100 percent from 1939 to 1958, the number of taxable returns increased by over 300 percent. The latter rose from less than 2,000 in 1939 (the first full year of the tax) to almost 8,000 in 1959. Expressed as a fraction of the total, they increased from about one-third to two-thirds by the mid-forties, and have remained approximately at this level since the war.

[14] *State v. American Can Co.*, 117 Colorado 312; 186 P. (2d) 779.

[15] In addition to the above revisions an amendment was passed in 1958 which placed the payment of the tax on a current year basis. All corporations with expected tax liabilities in excess of $1,000 were required to pay their taxes in the same year in which the liabilities were incurred.

Fiscal year collections from the Colorado corporate income tax are shown in the following table.

Table 13.3

Net Collections from the Colorado Corporate Income Tax
Fiscal Years, 1939-1958

Year	Net collections after refunds: Amount (thousands)	Index (1939 =100)	As percent of total collections
1939	$ 706	100	2.0
1942	1,218	173	3.2
1944	2,319	329	5.6
1945	2,546	361	6.0
1946	3,301	468	6.5
1947	3,076	436	4.6
1948	4,620	654	5.6
1949	5,783	819	6.4
1950	5,987	848	6.5
1951	6,535	926	6.5
1952	6,121	867	5.8
1953	5,515	781	4.9
1954	6,153	872	5.4
1955	5,677	804	4.3
1956	6,071	860	4.2
1957	4,399	623	2.9

Source: U. S. Department of Commerce, Bureau of the Census, *State Government Finances, 1946;* and *Compendium of State Government Finances, 1947-1957.*

On the basis of the above data it is evident that the corporate income tax has been a relatively minor source of state revenue. Throughout the period net receipts from this tax ranged from 2 to 6.5 percent of the total tax collections. Corporate tax revenues rose steadily from $.7 million in 1939 to $6.5 million in 1951. The following six years, while the State economy in general continued to expand[16] corporate tax collection remained under the 1951 level and reached a low of $4.4 million in 1957. In large part, this decline was due to the effects of the American Can case which diminished legally taxable income of foreign interstate firms operating in Colorado and the corporate tax refunds made pursuant to this decision. A single refund of almost $.4 million was made as late as fiscal 1957. However, it appears that the effects of the American Can decision had been fully absorbed into the corporate tax structure by 1958, for in that year net collections showed a strong element of normal growth for the first time since 1951. Moreover, the tax base will be enlarged if the 1958 amendment redefining the "sales" component of the allocation formula works out to be successful, and corporate tax collections should continue to increase with expanding economic activity.

Tables 13.4 and 13.5 compare Colorado's corporate income tax collection with that of the other 26 income tax levying states for which data were available for fiscal year 1957.

[16]During this period Colorado personal income increased by 74 percent and taxable retail sales of foreign corporations rose by 94 percent.

[a] Alabama, Arizona, Louisiana, Missouri, and New Mexico are not included because personal and corporate income tax collections were not reported on a segregated basis.

Source: U. S. Bureau of the Census, *Compendium of State Government Finances in 1957*, p. 11.

On the basis of Tables 13.4 and 13.5 it will be noted that the corporation income tax is highly unutilized as a source of state revenue in Colorado when compared with that of other income tax states. Colorado's collections, which amounted to less than 3 percent of its total tax revenues, was significantly below the national average of 11 percent, and ranked 25th among the 27 corporate income tax states for which corporate tax data were available. It is interesting to note that the six states which on a relative basis utilize the tax most fully as a part of their tax structures—New York, Pennsylvania, Wisconsin, Connecticut, Rhode Island and North Carolina—do not allow corporations to deduct their federal income tax payments from state taxable income; whereas, the half-dozen lowest ranking states—Montana, Oklahoma, Kansas, Colorado, North Dakota, and Iowa—all permit such federal income tax deductibility. Or viewed differently, corporate income tax collections for 1957 for the nine states which permitted federal income tax deductibility averaged 5 percent of their total tax revenues, whereas for the 18 states which do not permit deductibility the corporate tax collections averaged more than 10 percent. Table 13.5 presents three other relevant measures used as the basis for making interstate

comparisons. Colorado's corporate income tax collections, when expressed as percentages of total state income tax collections, federal corporate tax collections, and state personal income receipts, ranked 26th, 27th and 24th, respectively, among the 27 corporate income tax states for which data were available for fiscal 1957. Thus, the Colorado corporate income tax clearly plays a much less important role in state government finance than is the practice of the vast majority of other income tax states.

Basic Provisions of the Colorado Corporate Income Tax

Under the Colorado Income Tax Act, the scope of the corporation tax is somewhat broader than the legal definition of a "corporation." The tax applies equally to "associations and joint-stock companies and organizations by whatever name known, which act or do business in an organized capacity."[17] The only types of business organizations specifically excluded from the provisions of the Colorado corporation income tax are estates, trusts and partnerships. A number of types of non-profit organizations are tax-exempt under the law. In order to qualify for tax-exemption, an organization must submit proof of its non-profit status to the Director of Revenue, and must belong to one of the tax-exempt categories listed in the law.[18] The coverage of the Colorado corporation income tax regarding the types of organizations exempted under the statute, as well as the definition of organizations taxable as corporations, is essentially similar to that of the federal tax and the majority of state corporate income taxes. However, the Colorado statute includes special provisions for the taxation of banks, including national banking associations, state banks, industrial banks, trust companies, finance and loan associations, and Morris Plan companies. The income tax on a bank is "for the privilege of exercising its corporate franchise within the State . . . (as) measured by its net income," and is in lieu of all state and local property taxation of intangible bank assets.

The Colorado corporate income tax, except in the case of banks, is a direct tax *levied* on corporate net income, in contrast to a corporate excise, privilege or annual franchise tax which is *measured* by net income. As noted above, the Colorado Income Tax Act, as amended in 1951, imposes the tax upon a corporation's net income

[17] This definition includes savings and loan associations, credit unions and cooperatives, but does not include municipal or public corporations. *Colorado Revised Statutes, 1953*, Ch. 138-1-1.

[18] *Colorado Revised Statutes, 1953*, Ch. 138-1-8.

that is "derived from sources within Colorado, including intrastate, interstate and foreign commerce carried on within the State of Colorado."

Tax Base Provisions. The definition of corporate "gross income" under the Colorado statute is that income received from all sources unless specifically excluded by law. The exclusions from gross income under the corporate tax are the same as those under the personal tax, except for an additional exclusion of 85 percent of all intercorporate dividend receipts. In this respect, the Colorado statute differs from that of the majority of the other corporate income tax states as shown by Table 13.6. Only six other states are as generous as Colorado, sixteen states exempt only those dividends paid out of corporate income already taxed by the taxing state, and eight states do not allow any exclusion of dividend receipts.

[a] "No" indicates that state either includes all dividend receipts in taxable income, or excludes only specific limited categories of dividend receipts.
[b] Same as federal code.
[c] Excludes 50 percent of long-term losses only.
[d] Deductibility of federal tax limited to 10 percent of state taxable income.

Source: Commerce Clearing House, *State Tax Guide, 1958*, and corporation income tax forms and instructions of the several states.

The state is prohibited from taxing dividends from corporations owned or sponsored by the federal government, or interest derived from obligations of the United States and its agencies (interest from bonds of the T.V.A. is an exception).[19] However, interest from state and municipal bonds in Colorado is not excluded from the tax base, and in this respect Colorado conforms to the practice of the majority of income tax states.

Net capital gains to corporations are fully taxable under the present income tax statute and on this score Colorado also is in line with most other income tax states. Twenty-two of the 34 states require full inclusion of net capital gains, and nineteen states allow full exclusion of net capital losses. Fourteen states, including Colorado, impose restrictions of various sorts on the deductibility of net capital losses.[20]

The corporate income tax bases of the various states also differ in the particular deductions from gross income allowed in computing taxable net income. The specific deductions allowed under the Colorado statute are as follows:

1. Ordinary and necessary business expenses, salaries, traveling expenses and rentals.
2. Interest paid on indebtedness, except that incurred to purchase or to carry tax-exempt securities; and for savings and loan associations, amounts paid or credited on share capital, share accounts and savings accounts.
3. All taxes, except: (a) those levied under the Colorado income tax, other than the oil and gas gross income tax; (b) income taxes paid to another state, the District of Columbia, and territories or possessions of the United States (but interstate corporations allocating income to Colorado may deduct the above taxes); and (c) death and gift taxes, and special local assessments which tend to increase the value of the property assessed.
4. Uninsured or otherwise uncompensated losses.
5. Net capital losses, to a maximum amount of $2,000 in a given year. Capital losses may be carried forward for four succeeding years, for a maximum amount of $2,000 above capital gains in each of the years.
6. Net operating losses from previous years, to a maximum amount of $2,000 above net capital gains in the given taxable years, may be carried forward for four successive years.
7. Bad debts charged off during the year.
8. Reasonable allowance for depreciation and obsolescence of property used in the trade or business.

[19] A state may not levy a direct tax upon federal obligations or the income therefrom, but in the case of corporate franchise or privilege taxes, income from federal securities may be included in the measure of the tax base. See Miller et al. v. Milwaukee, 1927, 1 STC P265, 272 U. S. 713, 47 S.Ct. 280; Pacific Co., Ltd., v. Johnson, 1932, 1 STC P275, 285 U. S. 480, 52, S.Ct. 424.

[20] Eleven states, including Colorado, allow operating loss carryover, but only four states allow the carryover for a smaller number of years than Colorado does. Colorado also is unique in limiting the amount of loss carryover in any one year to $2,000 in excess of the net capital gains of that year.

9. Depletion allowances, as follows: (a) *for oil and gas producers*—adjusted cost basis or 27 percent of gross income (excluding any rents or royalties paid); (b) *for coal mines*—adjusted cost basis, or 10 percent of gross income; (c) *for mineral and other mines*—adjusted cost basis, or 40 percent of gross income (excluding any rents or royalties paid); and (d) *for timber growers*—adjusted cost basis. If the taxpayer is using the percentage-of-income type of depletion allowance, it may not exceed 50 percent of current *net* income, but in no case is the allowance less than it would be if computed on the adjusted cost basis.
10. Chairtable gifts, limited to 5 percent of net income, (i.e., 5 percent of net income allocated to Colorado in the case of interstate firms).
11. In the case of R.E.A. and other cooperatives, all patronage-dividends, refunds, rebates, or capital credits paid, credited, or allocated to members.
12. In the case of savings and loan associations, additions to a reserve established for the sole purpose of meeting or absorbing losses, up to 5 percent of net income.

The deductions allowed under the Colorado statute generally parallel those of the other corporate income tax states. However, with regard to the most important single deduction, federal income taxes paid, Colorado is in the distinct minority among the corporate income tax states of the nation. Out of thirty-four states presently using corporate income taxes, nineteen do not permit any deductibility of federal income taxes, and Wisconsin permits limited deductibility only. It may be noted that the states which permit federal tax deductibility are primarily agricultural states and their corporate income tax revenues are relatively small. In contrast, the states which do not permit federal deductibility are generally the important industrial and manufacturing states, and the corporate income tax accounts for a significantly higher proportion of their total tax collections.

Tax Rate Provisions. The nominal statutory rate of the Colorado corporate income tax was 4.25 percent of taxable net income in 1957, and 5 percent in 1958. For banks, the nominal rate was 6 percent in both years. Table 13.7 presents an interstate comparison of nominal corporate income tax rates in use throughout the nation in 1958. It will be noted that twenty-eight states used a single rate and only six had progressive rate structures. The most commonly used rate was 5 percent, levied by seven states including Colorado, and it represented the median for all the corporate income tax states. In terms of "effective rates," however, the Colorado tax was considerably below the national median at all levels of corporate net income, as shown by Table 13.8. The "effective rate" measures the actual tax cost attributable to the imposition of the state tax expressed as a percent of the firm's

Table 13.7

total net income before either federal or state income taxes. In other words, the effective or actual cost of the tax to the corporation is the net amount by which the firm's total state and federal income tax liability *combined* exceeds the federal tax the firm would have incurred in the absence of a state income tax. The data show that at the $25,000 level of net income the Colorado effective rate was 2.5 percent and the State ranked 21st, at the $1 million level the rate was only 1.2 percent, and at levels of net income above $50,000 Colorado ranked 24th, or among the lowest one-third of the states levying corporate income taxes. This comparatively low position primarily results from the fact that Colorado is among the minority of states which permit the deductibility of the federal income tax in the computation of the state tax liability. Thus, nineteen of the twenty states which do not permit full federal tax deductibility have higher effective corporate income tax rates than Colorado at all levels of income above $50,000, although half of these states have statutory rates which are actually equal to or smaller than the Colorado nominal rate. Moreover, it is im-

[a] On net income before any income tax.
[b] Do not permit full deductibility of federal income tax.

Source: Commerce Clearing House, *State Tax Guide, 1958.*

portant to note that income tax deductibility transforms slightly progressive and proportional nominal corporate rates into regressive effective rates, with the regressivity being considerably greater for the minority of states which allow the full deductibility of the federal tax. For example, this is shown for Colorado in the table below which compares the 1958 effective rates in Colorado for firms at different levels of net income with the effective rate which would prevail if federal tax deductibility on the state level were not permitted.

Table 13.9

Effective Rates of the Colorado Corporate Income Tax at Selected Levels of Net Income, 1958

Net income before all income taxes	Effective rates with federal tax deductibility	Effective rates without federal tax deductibility
$ 25,000	2.49	3.50
50,000	1.78	2.95
100,000	1.46	2.68
500,000	1.24	2.46
1,000,000	1.21	2.43

It will be noted that under Colorado's present statutory rate of 5 percent, the effective rate for the firm with $25,000 of net income before tax is more than twice as large as that for the firm with $1 million of income; whereas, if the deduction of the federal tax were not permitted by the State the effective rate for the smaller firm would be about 50 percent greater than that for the larger firm. In short, reciprocal tax deductibility makes the effective state corporate income tax structure more regressive as long as the federal nominal rate structure is slightly progressive (30 percent on the first $25,000 of corporate taxable income, and 52 percent on income in excess of $25,000).

Allocation of Interstate Income. One of the most difficult problems of corporate income taxation on the state level is the apportionment or allocation of net income for tax purposes by interstate firms, i.e., by firms carrying on business both within and without the State of Colorado. Among the corporate income tax states, three types of methods are in general use for apportioning interstate corporate income: (1) separate accounting, (2) allocation of particular classes of income to the state in which they may be said to have a taxable situs, and (3) apportionment by an allocation formula. Most states allow the separate accounting method whenever the taxpayer's accounts are kept in a manner which reflects the business attributable to the taxing state, and some states prescribe this method. Every state, however, provides a stat-

utory allocation formula of some sort, since many types of interstate incomes cannot be directly attributed to any given state.

In Colorado, both general methods of apportionment—separate accounting and formula allocation—were provided for in the original statute, and both were used widely until 1958,[21] when the separate accounting method was eliminated by statutory amendment[22] as a general method of apportionment. The amended act provides for the allocation of interstate income as follows: (1) interest, dividends, and royalties or similar receipts are to be allocated to the state in which the principal place of business of the corporation is located;[23] (2) rents and capital gains and losses are to be allocated to the state in which the property or capital asset is located, and (3) the remainder of net income is to be allocated by the statutory two-factor formula based on property and sales. The property factor (the ratio of a firm's Colorado tangible property to its total property) is applied to one-half of a firm's total net income which cannot be directly allocated to Colorado, and the sales factor (the ratio of a firm's Colorado gross receipts to total receipts) is applied to the other half. In effect, an interstate firm's net income not directly allocable to Colorado is multiplied by the average value of the property and sales ratios, each weighted equally, in order to determine the amount of income subject to the state tax.

Colorado's two-factor allocation formula, however, is unique among the thirty-four corporate income tax levying states. As shown in Table 13.10 twenty-eight states use a three-factor formula, generally composed of property, gross receipts and payroll components. The property factor usually consists of all tangible property used in connection with the business and six states specifically include rental property. The payroll factor usually consists of all wages, salaries, bonuses, commissions, or other payments made to employees, but compensation of officers is not always included. In a few states the sales factor also includes various types of non-operating income, such as rents and royalties. The half dozen states which substitute costs for payrolls in their formulas variously define such cost components as manufacturing or selling costs only, as operating costs, or as all business expenses.

The statutory definition of a sale made by an interstate firm within the given state constitutes one of the major differences between the allocation formulas of the several states. Thirty-three of the 34 states include sales as a basic factor in their formulas. The principal criteria used in the various definitions of in-state sales for tax purposes are shown in Table 13.11.

As is evident, the most widely used method is to attribute the sale to the given state if it is "principally secured, negotiated or effected by

[21] The distribution of interstate firms by the allocation methods used on their 1957 Colorado returns filed in 1958 was:

	Number of firms
Direct allocation based on separate accounts	446
Regular statutory allocation formula	951
Special allocation formulas approved by Director of Revenue	43
Total number of interstate firms	1,440

[22] See 1958 amendments to *Colorado Revised Statutes*, Ch. 138-1-28.

[23] The allocation of such receipts as interest, dividends, and royalties was made more clear-cut by this amendment. Under the original statute they were allocated to Colorado only if "received in connection with business transacted and property located within the state." (*Colorado Revised Statutes*, 1953, Ch. 138-1-28, par. 2.) This provided a loophole for some domestic firms who, by holding a sizable part of their intangible assets in out-of-state banks, had been able to claim that the income from such investments was not taxable to Colorado.

Table 13.11

Statutory Criteria of Sales by Foreign Interstate Firms State Corporate Income Taxation, 1957

employees, agents, offices or branches of the corporation located in this state,"[24] or if it is any sale except those "negotiated or effected by agents or agencies chiefly situated at, connected with, or sent out from premises . . . outside the state."[25] Only a few states in addition to Colorado now use the destination of goods sold as the chief criterion for an in-state sale, although in many ways this is the simplest and least ambiguous criterion. It is interesting to note, however, that under the Colorado statute the legal definition of a "Colorado sale" by a foreign firm has actually been the most crucial determinant in the operation of the allocation formula. From 1937, when the original statute was enacted, until 1954 the Department of Revenue attempted to uphold the interpretation of a "Colorado sale" as one in which the merchandise involved was transported to some destination within the State. In the American Can decisions, however, it was ruled that the location of a sale for tax purposes was to be determined by the place where the sale contract was approved and/or title to the merchandise was passed. Finally, the 1958 amendment which redefined a sale in terms of the destination of the goods, explicitly provided that the place where the contract is approved or title is passed shall not be used as the criterion for determining the Colorado sales of interstate firms. The effect of this last attempt to close the "loophole" caused by the American Can cases of a decade ago will not become apparent until the 1959 corporate tax levy is collected in 1960. But in any case, Colorado continues to be one of the two states in the nation (the other is Virginia) operating under a two-factor formula in which the sales component is a basic determinant of the amount of an interstate firm's net income subject to state corporate income taxation. In order to attain uniformity in the allocation procedures of all the states, and thereby achieve more equitable taxation of corporate net income derived from interstate business, the National Tax Association, the National Association of Tax Administrators, and the American Bar Association have recommended that all states adopt a standardized version of the three-factor formula currently used by twenty-two states.[26]

Distribution of the Colorado Corporate Income Tax Base

A detailed analysis of the types of firms subject to the Colorado corporate income tax during taxable year 1957, classified by geographic scope of operations, principal place of business, and asset size of firms, was made on the basis of a census of all 1957 regular returns filed by interstate firms, and a systematic sample of those filed by firms whose operations were confined solely to Colorado.[27] Table 13.12 shows the number of active firms filing 1957 corporate returns, classified on the basis of the first two factors.

Table 13.12

Distribution of Firms and Corporate Taxable Income by Scope of Operations and Principal Place of Business,[a] Colorado Corporate Income Tax Returns, 1957

Type of firm	Total number of firms	Taxable Corporations: Number of firms	Taxable Corporations: Percent dist.	Taxable income: Amount (thousands)	Taxable income: Percent dist.
Colorado firms					
Domestic	7,420	3,769	79.6	$ 63,123	43.9
Foreign	324	110	2.3	4,053	2.8
Total	7,744	3,879	81.9	67,176	46.7
Interstate firms					
Domestic	184	122	2.6	35,820	24.7
Foreign	1,256	733	15.5	40,958	28.6
Total	1,440	855	18.1	76,778	53.3
All firms					
Domestic	7,604	3,891	82.2	98,943	68.6
Foreign	1,580	843	17.8	45,011	31.4
Total	9,184	4,734	100.0	143,954	100.0

[a] Classification of firms is based on following definitions:
Colorado firms—net income derived solely from Colorado operations, i. e., intrastate firms.
Interstate firms—net income derived from operations in Colorado and other states.
Domestic firms—main offices located in Colorado, i. e., domestic commercial domicile.
Foreign firms—main offices located outside Colorado, i. e., foreign commercial domicile.

On the basis of the survey data it appears that less than five thousand corporations, or only about one-half of the nine thousand active firms

[26] The effects on Colorado tax revenues and corporate tax costs which would have resulted if firms filing Colorado returns in 1958 had been required to use a three-factor formula (i.e., the addition of a payroll factor) in the computation of their 1957 corporate tax liability are presented in the final section of this chapter.

[27] For the purposes of this survey the taxable year 1957 included the returns of firms filing on a calendar year basis as well as those with fiscal years ending between April 1, 1957 and March 31, 1958. Delinquent returns, informational returns of tax exempt corporations, and returns filed by firms inactive in Colorado during 1957 were excluded from this part of the analysis. As a group they accounted for the difference between the total number of returns used in the survey and the number reported by the Department of Revenue for 1957.

filing Colorado state income tax returns in 1958, reported Colorado taxable income for 1957. Of this group, the 100 percent Colorado firms (intrastate firms), representing more than four-fifths of the total number, accounted for less than one-half of the tax base. In contrast, interstate firms operating in Colorado represented less than one-fifth of the returns but accounted for more than one-half of the taxable income. Moreover, the intrastate firms were primarily domestic corporations with main offices located in Colorado; in contrast, six out of every seven interstate firms were foreign corporations with main offices and operations domiciled outside the State. In short, the intrastate domestic firms are relatively large in number but small in size as measured by taxable income, whereas the interstate firms, both domestic and foreign, are relatively few in number but large in size and taxable income. This distribution pattern is further evidenced by Table 13.13 which shows the distribution of the number of firms and Colorado taxable income classified by the asset size of the nine thousand active corporations which filed returns in 1958.

Table 13.13

Distribution of Firms and Corporate Taxable Income, Classified by Asset Size of Corporations,[a] Colorado Corporation Income Tax Returns, 1957

Asset size (thousands)	Total number of firms	Taxable Corporations: Number of firms	Taxable Corporations: Pct. dist.	Taxable Income: Amount (thousands)	Taxable Income: Pct. dist.
Colorado firms[a]					
Less than $ 100	4,320	1,729	44.6	$ 6,887	10.3

Total	9,184	4,734	100.0	143,954	100.0

[a] See footnote, Table 13.12.

It will be noted that 87 percent of the taxable Colorado firms had assets of less than $1 million but accounted for only 48 percent of the total taxable income reported by intrastate firms on the 1957 corporate returns. In the case of the taxable interstate firms almost 80 percent had assets in excess of $1 million, and the 15 percent of the firms in the $100 million and over category accounted for more than 50 percent of the total interstate tax base. On an over-all basis, the smallest firms, those with assets of less than $1 million, represented three-fourths of the total number of taxable firms but accounted for only one-fourth of the taxable income; whereas the largest firms, those with assets of $10 million or more, represented less than one-tenth of the total number of taxable returns but accounted for more than one-half of the total reported taxable income.

Erosion of the Tax Base

The derivation of the 1957 Colorado corporate income tax base for both intrastate and interstate firms is presented in Table 13.14.

The data show that only about 50 percent of the corporate net income earned in Colorado in 1957 was taxable because of the specific statutory allowances permitted under the Colorado corporate income tax. The taxable firms operating in the State that year reported Colorado net income of $286 million, but only $144 million was subject to state tax. Moreover, except for the dividend credit, the interstate firms benefited significantly more from the statutory deductions than did the intrastate Colorado firms. The combined depletion allowance and oil and gas income tax credit for Colorado firms amounted to 3 percent of their total net income, whereas the same items for the interstate firms amounted to 8.4 percent. Also, when the data were classified by the situs of the commercial domicile of the reporting firms, it appears that the tax benefits derived from these two statutory allowances mainly benefited foreign corporations. For example, foreign firms accounted for 59 percent of the total depletion allowance and 88 percent of the oil and gas credit claimed by all Colorado intrastate firms. And among the interstate corporations the concentration of benefits was even greater—foreign firms accounted for 98 and 99 percent, respectively, of the total depletion allowance and oil and gas income tax credit claimed by all firms in this category. However, as indicated in Table 13.14, these first three types of statutory allowances permitted in the computation of the corporate income tax base amounted to only 7.5 percent of the total Colorado corporate net income reported on the 1958 tax returns.

Federal Tax Deductibility. The quantitatively most important single factor accounting for the erosion of the corporate income tax base was the deduction of the federal corporate income tax. This provision alone reduced the tax base by $120 million, or 42 percent of the total net income derived from the Colorado operations of the reporting corporations. In the case of the 100 percent Colorado firms the federal tax deduction amounted to more than $38 mil-

Table 13.14

Derivation of the Colorado Corporate Income Tax Base[a] Taxable Firms Operating in Colorado, 1957

	Colorado firms		Interstate firms		All firms	
	Amount (thousands)	Percent	Amount (thousands)	Percent	Amount (thousands)	Percent
Total Colorado net income before selected allowances and income taxes	$111,090	100.0	$174,705	100.0	$285,795	100.0
Less:						
85% dividend credit	2,239	2.0	1,119	0.7	3,358	1.2
Depletion allowance	3,121	2.8	11,695	6.7	14,816	5.2
Oil & Gas Income Tax	172	0.2	3,042	1.7	3,214	1.1
Statutory allowances	5,532	5.0	15,856	9.1	21,388	7.5
Equals:						
Reported net income before any income taxes	105,558	95.0	158,849	90.9	264,407	92.5
Less:						
Federal income tax payments claimed in Colorado returns	38,382	34.5	82,071	47.0	120,453	42.1
Equals:						
Colorado taxable income	67,176	60.5	76,778	43.9	143,954	50.4

[a] See footnote Table 13.12.

lion, or almost 35 percent of their total net income for the taxable year. And for the interstate firms it was significantly larger, amounting to more than $82 million, or 47 percent of their total Colorado net income.

The greater effect of federal tax deductibility upon the tax base of interstate firms partly reflects the larger average Colorado income, and correspondingly the larger average federal tax liabilities of these firms. Moreover, since the federal corporate tax rate structure is progressive, the relatively more profitable interstate firms pay a larger proportion of their Colorado net income in federal taxes and, therefore, have proportionally larger deductions against their state tax than do the less profitable Colorado firms operating solely within the State. But it also should be noted that, in part, the relatively greater federal tax deductions taken by the interstate firms result from the fact that Colorado permits them to allocate their federal income tax liability by the same method used in the allocation of their interstate income. Thus, an interstate firm with a given amount of Colorado net income generally will be able to claim a larger federal tax deduction on its Colorado business than a 100 percent Colorado firm, even though both report the same amount of net income from their Colorado operations. This is illustrated by Table 13.15 which is based on two corporations, one intrastate and the other interstate, that have equivalent amounts of Colorado net income before tax, but for whom the tax liability works out to be significantly different.

It is evident that because of the allocation and deductibility of the progressive federal tax, the relatively larger interstate firm pays a Colorado corporate tax that is almost one-third smaller than that incurred by the 100 percent Colorado firm, although both earned the same amount of net income on their Colorado operations. (Table 13.15). In short, the allowance of federal tax deductibility in the computation of the state tax favors interstate firms more than it does those firms which are wholly intrastate. Moreover, since 86 percent of the taxable interstate corporations which filed returns in 1958 were foreign firms, and 97 percent of the taxable intrastate corporations were domestic, it appears that the federal tax deductibility provision of the state statute also works out to be more favorable for foreign corporations.

Table 13.15

Differential Effect of Federal Income Tax Deductibility upon Comparable Intrastate and Interstate Colorado Corporations

	Colorado intrastate firm	Any interstate firm
1. Allocated Colorado net income from operations within Colorado[a]	$25,000	$25,000
2. Total net income from over-all operations, within and without Colorado	25,000	1,000,000
3. Ratio of Colorado operations to total operations (1 ÷ 2)	100%	2.5%
4. Total federal corporate income tax liability[b]	$ 7,233	$514,184
5. Federal tax liability allocated to Colorado operations (3 x 4)	7,233	12,855
6. Net taxable income for Colorado corporate income tax (1 — 5)	17,767	12,145
7. Colorado statutory tax rate	5%	5%
8. Colorado corporate income tax liability (6 x 7)	$ 888	$ 607

[a] After all expenses, but before federal and state income tax.
[b] Based on present federal and state income tax rates.

Deductibility of the Oil and Gas Gross Income Tax. The oil and gas gross income tax, enacted in 1953 as an amendment to the Colorado Income Tax Act, was originally not an allowable

deduction in the computation of personal or corporate taxable income. It was enacted as subsection (f) of Section 2 of the original Colorado Income Tax Act, as amended. Section 1 of the amendment stated:[28]

> Section 2, Chapter 175, Session Laws of Colorado 1937, as amended, is hereby further amended by adding a new subsection (f), reading as follows . . .

Section 2 of the original income tax act already included the personal income tax, the corporate income tax, the income taxation of fiduciaries, the income tax provisions relating to partnerships, and the income taxation of banks. And significantly, these Section 2 taxes, in turn, were explicitly excluded from the allowable deductions permitted in the computation of net income by Section 5 of the original act which stated:[29]

> Section 5: Deductions Allowed . . . Subsection (c). Taxes paid during the taxable year, except taxes levied under the provisions of section 2 of this Act . . .

In brief, by being enacted as an amendment to Section 2 of the original act, the oil and gas gross income tax could not be used as a deduction in the computation of the normal personal or corporate income tax base. The non-deductibility feature of the oil and gas tax was further clarified shortly after the enactment of the amendment by the issuance of a Department of Revenue memorandum which stated:[30]

> Section 5 (c) of the Income Tax Act prohibits any taxes imposed by this Act, from being a deduction in the computation of any tax due thereunder. Therefore, the tax upon the gross income produced within the State of Colorado, as provided in the 1953 Amendment to the Income Tax Act, is not an allowable deduction in computing the normal tax under the Income Tax Act.

Nevertheless, under the Colorado Revised Statutes of 1953 the oil and gas gross income tax was excluded by the Committee for Statute Revisions from the taxes not allowed as deductions in the computation of ordinary net taxable income. Section 2 of the original act, as amended, was revised as six separate sections, numbered 138-1-2 (Individual Income Tax) through 138-1-7 (Oil and Gas Gross Income Tax). But Section 5 of the original act which listed the specific deductions allowed in computing net income, renumbered as Section 138-1-12, was effectively changed in the Revised Statutes. The subsection referring to taxes allowed as deductions against regular income had been altered to read:[31]

> Section 138-1-12, Deductions Allowed . . . Subsection (3) Taxes. Taxes paid during the taxable year, except taxes levied under the provision of sections 138-1-2 to 138-1-6 . . .

In other words, part of the amended Section 2 of the original act, renumbered as Section 138-1-7 had been omitted from the non-deductible taxes included in the new Section 138-1-12, and thus the oil and gas gross income tax was no longer included among the taxes specifically not allowed as deductions in computing the regular income tax.

It is apparent that by this renumbering and omission the Committee for Statute Revision actually had effected the substantive change in the Income Tax Act, notwithstanding the fact that the 1951 act which had established the Committee for Statute Revision had provided that:[32]

> All of the foregoing (i.e., the adoption of a uniform arrangement and numbering system) shall be done in such form and manner as to preserve the intent, effect and meaning of any and every . . . statutory provision.

And it should be noted that the 1953 act providing for the general revision of the Colorado statutes had explicitly stated:[33]

> The classification and arrangement by chapter, article and number system of sections of Colorado Revised Statutes 1953 . . . form no part of the legislative text enacted hereby; such inclusion is only for the purpose of convenience, orderly arrangement and information, and, therefore, no implication or presumption of a legislative construction is to be drawn therefrom.

But it was precisely through a shift in the section number and classification of the oil and gas gross income tax that the status of the tax was, in effect, changed from a non-deductible to a deductible expense under the regular income tax.

Since the Colorado Revised Statutes 1953 did not become effective until December 1, 1954, the diminution of the regular income tax base as a result of the deductibility of the oil and gas tax on a full taxable year basis did not occur until 1955. It is estimated from the survey data that the total loss in tax revenue due to this provision from 1955 through 1958 under the corporate income tax alone has been approximately $600,000. Thus, if the immediate past trend of corporate oil and gas tax collections continue, the

revenue loss resulting from their deduction from net income in the computation of the corporate income tax base will average approximately $200,000 annually over the next several years.

The American Can Case. The Colorado corporate income tax base was further eroded during the past decade by the court decisions in the American Can case.[34] In this suit the interpretation of *Colorado sales* by foreign corporations, as developed by the Revenue Department in apportioning the incomes of such firms for tax purposes, was effectively challenged. The point at issue in the case was not whether the type of Colorado sale disputed by the American Can Company could itself properly be included in the Colorado taxable income of a foreign corporation, but whether or not it should be included in the sales ratio of the "allocation formula" used by the interstate firms.[35]

The Denver District Court ruled, and its decision was upheld by the Colorado Supreme Court, that the sale of goods ordered from Colorado and destined for Colorado did not necessarily constitute a Colorado sale for a foreign firm, since such orders were not binding on the company "unless and until accepted by it at one of its foreign offices." In other words, the courts' criterion of a Colorado sale was not the destination of goods sold, but rather the location at which the contract was approved or the title to the goods passed. For a foreign corporation to avoid acquiring Colorado sales for tax purposes, it needed only to insist when making sales to Colorado customers that the sale contract be aproved at one of its foreign offices, and/or that the goods be shipped into Colorado f.o.b. point of delivery. Such sales would then be excluded from the numerator, or Colorado sales factor, of the allocation formula, and the amount of taxable income attributable to the Colorado operations of the firm would be reduced correspondingly. In brief, the net effect of the American Can case was to wipe out a considerable part of the Colorado corporate income tax base.

The total quantitative significance of this alteration in the definition of "sales" for allocation purposes is suggested by the amount of actual tax assessments and subsequent refunds directly related to the disputed definition, and by the shrinkage of the over-all corporate tax base since 1951, a period characterized by economic growth for Colorado when measured by other indices.

Even before the American Can case some foreign corporations had ignored the broader definition of Colorado sales which the Revenue Department was trying to enforce. In 1943 the Department instituted a program of out-of-state field audits against such firms and when the program was finally discontinued a decade later it had accounted for more than $1 million of additional corporate income tax assessments.[36] Moreover, this amount represented only a part of the corporate tax revenue attributable to the Revenue Department's position on this matter, for during the earlier period many foreign interstate companies voluntarily had abided by the broader definition of a Colorado sale. After the American Can case, however, the State had to refund approximately $1 million to foreign companies in settlement of corporate tax claims based on the court decisions.[37] Again, this amount represented only a part of the total tax loss resulting from the American Can case, for the courts' narrower definition of Colorado sales was subsequently adopted by a growing number of firms which were not subjected to the extra tax assessments and, therefore, claimed no refunds.

The quantitative significance of this altered conception of the sales factor in the allocation formula is also indicated by the extent corporate income tax collections declined during the greater part of the decade following the American Can decisions. It should be noted, however, that the over-all revenue effects of the case were forestalled for several years. The Revenue Department first took the position that the court decisions of 1947 applied only to the American Can Company and that any other interstate firm which wanted to use the narrower definition of a Colorado sale in its allocation formula would also have to initiate and win a court case to that effect. Only after the Department's unsuccessful attempt in 1951 to bring a second "American Can case" before the court was the narrower definition of a Colorado sale widely utilized in the allocation formulas of foreign interstate firms.[38] But, as already noted above

---

[34] *State of Colorado v. American Can Company*, (1947), 117 Colorado 312; 186 Pac. (2d) 779.

[35] In at least two U. S. Supreme Court rulings it has been held that unless a corporation owns no property within a state and carries on no business within the state, a portion of its income from interstate commerce may be attributed to and taxed by that state. *Interstate Oil Pipe Line Company v. Stone* (1949), 337 U. S. 662, 69 S. Ct. 1264; *Underwood Typewriter Company v. Chamberlin* (1920), 254 U. S. 113, 41 S. Ct. 45.

Moreover, it has also been ruled that "apportionment of income in accordance with a formula of this type (such as the Colorado allocation formula) is prima facie valid and can be refuted only upon a positive showing by the taxpayer that it reaches an arbitrary and unreasonable result wholly out of accord with the facts and by a showing of what the true net income within the state should be." *Butler Brothers v. McColgan*, (1942), 315 U. S. 501, 62 S. Ct. 701.

[36] State of Colorado, Department of Revenue, *Annual Reports*, 1946, 1953, and 1957.

[37] These refunds were begun in 1954 and only completed as recently as 1957.

[38] The Revenue Department attempted to obtain a reversal of the earlier ruling on the basis of the 1951 income tax amendment which redefined Colorado taxable income for interstate corporations. The Denver District Court refused to hear the case on the grounds that the legal issues involved had been resolved by the American Can decisions of 1947.

(Table 13.3), it was during the period from 1951 to 1957 that corporate income tax collections in Colorado revealed the extraordinary decline from $6.5 million to $4.4 million, a contraction in excess of 30 percent in six years. Thus, the timetable of the gradually unfolding effects of the American Can case and the period of unprecedented shrinkage in the corporate income tax base practically coincided. Furthermore, during this same period other important measures of economic activity in Colorado revealed consistent growth. For example, from 1950 to 1957, total personal income received in Colorado as reported by the United States Department of Commerce increased by 73 percent[39] and taxable retail sales in Colorado made by foreign corporations, increased by 93 percent.[40]

It appears that by 1958 the effects of the American Can case generally had been absorbed by the corporate tax structure. Collections in that year rose to $6.5 million, achieving the level of 1951 for the first time since that year. Also the tax refunds paid by the State in settlement of claims pursuant to the case were completed in 1957 and, finally, the State Legislature in 1958 tried to close this sales "loophole" by amending the allocation formula of the Income Tax Act. The most significant part of the amendment which redefined a Colorado sale for foreign interstate corporations stated that includable sales would henceforward be:[41]

> Sales where the goods, merchandise and property is received in this state by the purchaser . . . the place at which the goods are ultimately received after all transportation had been completed shall be considered as the place at which the goods are received by the purchaser . . . The place where the order is taken or approved or the place where title to property passes shall be disregarded for the purposes of determining sales which are assignable to this State under this section.

The 1958 amendment thus was aimed explicitly at eliminating the type of erosion of the corporate income tax base caused by the American Can decisions. If successful,[42] the tax base should expand significantly and it is estimated that annual collections from this source should increase between $2 and $3 million as a result of the redefinition of the sales factor used in the allocation formula of interstate firms operating in Colorado.

The Distribution and Burden of the Tax

On the basis of the 1957 survey data prepared for this study, the distribution of the corporate income tax by type of firm, amount of tax liability, and real tax burden is presented for the first time since the inception of income taxation in Colorado in 1937.

As already noted, it is important to distinguish the nominal tax liability from the real or effective tax burden. In the case of the state corporation tax, the nominal tax liability is represented by the amount of tax the firm actually pays and the state collects; while the effective tax liability or real tax burden is measured by the net increase in tax cost which may be attributed solely to the imposition of the state tax, i.e., the net amount by which the firm's state and federal income tax *combined* exceeds the amount of federal corporation tax the firm would have paid in the absence of any state income tax. Since the federal code permits the deduction of all state taxes in the computation of the federal corporate income tax, and Colorado permits the full deductibility of the federal income tax in the computation of the state income tax, each tax reduces the effective liability of the other. It is this reciprocal deductibility which gives rise to the difference between the effective cost of the state income tax to the firm and the amount of income tax actually collected by the state. In short, the imposition of the state corporation tax reduces the firm's federal tax and, thus, the effective liability of the Colorado income tax is the nominal amount of tax paid to the State less the consequent saving in the federal tax.

Moreover, in evaluating the burden of the Colorado income tax on corporations, it is important to recognize: (1) that in some instances the tax, in whole or in part, is shifted by the firm to its customers or factor sources, in which case the incidence or real burden of the tax does not fall entirely upon the firm and its stockholders; and (2) that the more meaningful measures of tax burden are those expressed in relative terms—the firm's net income tax cost computed as a percentage of operating revenues, total costs, and total taxes.

In Table 13.16 below, the 1957 nominal and effective tax liabilities for the major categories of corporations subject to the Colorado tax are compared.

---

[39] U. S. Department of Commerce, *Survey of Current Business*, 1951-1958.

[40] State of Colorado, Department of Revenue, *Annual Reports*, 1951-1957.

[41] *Session Laws of Colorado, 1958*, Ch. 56, Section 3 (a), p. 271.

[42] It should be noted that the 1958 amendment may not achieve its purpose due to the somewhat ambiguous wording of the final sentence in the subsection which reads:

> The word 'sales,' as used in this subsection shall not be construed to include sales made to purchasers in this state if the taxpayer does not thereby derive income from sources within this State.

Whether or not this one sentence will have the effect of undermining the clear intent of the remainder of the amendment will not be known, of course, until the 1958 returns, filed in 1959, are audited, tax assessments made on the basis of the new definition, and possibly court interpretations of the amendment are obtained.

[b] Amount of tax to be paid to State.

[c] Nominal tax liability less reduction in federal income tax attributable to deduction of Colorado income tax.

[d] Ratio of effective tax liability to nominal tax liability.

The total nominal tax liability of $6.3 million reported on the 1957 Colorado corporate income tax returns was distributed almost equally between the 100 percent Colorado intrastate firms and the interstate firms. The former accounted for slightly more than 48 percent of the total tax liability while the latter was liable for the balance. The average nominal tax per firm[43] was less than $800 for the 100 percent Colorado corporations and almost $4,000 for the interstate firms. Domestic interstate corporations had an average in excess of $12,000 per firm, the highest for any category, in comparison to an average of slightly less than $2,500 for foreign interstate companies. But approximately one-third of the interstate firms allocated less than 1 percent of their total net income to their Colorado operations.[44] Although the foreign firms incurred the major share of the tax liability of all interstate firms, the latter as a group accounted for less than one-third of the total tax liability since the Colorado intrastate firms are almost all domestic corporations. Moreover, it should be noted that the distribution pattern of the effective tax liability (real cost) practically parallels that of the nominal tax. This may reasonably be expected under the present federal corporate tax rate structure, and the data show that on the average the firms in each of the categories are able to pay their state corporate income tax with approximately "50 cents-after-federal tax" dollars. Thus, the real cost of each dollar of state income tax liability was $.54 for the Colorado intrastate firms, only $.50 for the interstate firms, and $.52 for all firms combined. In aggregate terms, the real cost of the $6.3 million of 1957 Colorado corporate income tax to the firms was only $3.3 million. The other $3 million represents the amount of state tax indirectly absorbed by the federal government as a result of reciprocal deductibility.

Table 13.17 shows the nominal and real state tax costs of all taxable firms, classified by size of the tax liability reported on the 1957 returns.

Practically two-thirds of all taxable firms in 1957 incurred a total nominal state income tax of less than $500, which on the average was paid with "73 cents-after-federal tax" dollars. And six out of every seven firms in this lowest tax category were intrastate corporations with operations confined solely to Colorado. In contrast, at the other extreme, only 2 percent of the firms had a state tax liability of $10,000 or more, and on the average these companies were able to pay their Colorado income tax with "46 cents-after-federal tax" dollars. And among this latter group, more than three-fifths of the total number were represented by interstate corporations. On the basis of the above data, it is evident that the real cost of each dollar of nominal tax liability varied inversely with the absolute level of profits for both intrastate and interstate corporations.[45] In other words, the effective relative cost of the Colorado corporate income tax is considerably higher for the large number of small and less profitable firms than for the handful of large corporations (predominantly interstate) which reported greater absolute profits. This is another reflection of the "effective regressivity" of the Colorado corporate income tax—the 5 percent statutory rate which actually works out to be an *effective tax rate* that is more than twice as high for the small firm as it is for the largest corporations.[46]

Tables 13.18 through 13.20 show three important measures of the relative burden of the Colorado income tax upon corporations. The first of these tables develops the net cost of the

[43] Derived by dividing the nominal tax liabilities for each category in Table 13.16 by the number of taxable firms reported in Table 13.12.

[44] In 1957, corporations using the formula method of allocation, in contrast to the separate accounting method, constituted 69 percent of all interstate firms and accounted for 73 percent of the total tax liability of interstate firms. Among companies using the formula, about 44 percent allocated less than 1 percent of their total net income to Colorado.

[45] The fact that within each tax category the Colorado intrastate firms had a lower real cost per tax dollar than the interstate firms, while between the groups as a whole the interstate firms had the lowest average real costs, is accounted for by the heavy concentration of tax liabilities of the interstate firms in the highest tax brackets where the real cost per tax dollar is the lowest.

[46] See Table 13.9.

tax as a percentage of corporate operating revenues, and as such provides some evidence of the magnitude of its impact on the price structure if the entire tax were shifted forward to the customers of the taxed corporations. Various empirical studies in recent years have indicated that even the high federal taxes of the post-war period have been largely shifted through corporate price increases.[47] As already noted, the ability of a firm to shift the income tax depends upon the elasticities of demand and supply of its products, the nature of the market structure in which it operates, and other technical characteristics of its industry. One of the primary determinants in any situation, however, is simply the size of the relative price increase necessary to recover the amount of tax through additional sales revenues—and the smaller the required price increase, the more likely the tax will be shifted.[48]

Table 13.18, shows the net cost of the Colorado corporate income tax for 1957 expressed as a percentage of corporate operating revenues for the major categories of taxable firms.

Table 13.18

Net Cost of the Colorado Corporation Income Tax as Percentage of Gross Operating Revenues of Taxable Corporations, 1957[a]

[a] See footnote a, Table 13.12.
[b] See Table 13.16.

For all taxable corporations in Colorado the $6.3 million of nominal state income tax liability amounted to less than 2/10 of 1 percent of the $3,489 million of Colorado gross operating revenues these firms reported on their 1957 returns. More significantly, the $3.3 million net cost of the tax to these firms (the effective tax liability) actually averaged 9/100 of 1 percent of the total operating revenues of all taxable firms, with no

[47] See, for example, E. M. Lerner and E. S. Hendriksen, "Federal Taxes on Corporate Income and the Rate of Return on Investment in Manufacturing, 1927 to 1952," *National Tax Journal*, September, 1956. For a comprehensive survey of the recent literature on corporate tax shifting see B. U. Ratchford and F. B. Han, "The Burden of the Corporate Income Tax," *National Tax Journal*, December, 1957.

[48] M. Beck, "Ability to Shift the Corporate Income Tax: Seven Industrial Groups," *National Tax Journal*, September, 1950.

variance appearing between the relative real costs incurred by intrastate and interstate firms. The data reveal, however, some marked differences when the firms are classified in terms of situs of business domicile—the real cost of the tax was 11/100 of 1 percent of the operating revenues of the domestic corporations, and only 7/100 of 1 percent for foreign firms.

In any case, on an over-all basis, if a corporate tax of this magnitude were largely shifted forward to the customers of the taxed firms, it would result in practically imperceptible unit price increases for most goods and services produced by the taxed firms. And in long-run periods of general economic expansion and buoyant sellers markets, such as has characterized the Colorado economy during the post World War II era, it would not be unlikely for such taxes to be shifted forward and built into the existing corporate price structure.[49]

Table 13.19 below shows the net cost of the 1957 Colorado corporate income tax as a percentage of the total business expenses allocated to Colorado by taxable firms filing returns with detailed cost information.

Table 13.19

Net Cost of the Colorado Corporation Income Tax as Percentage of Total Business Expenses for Corporations Reporting Cost Items, 1957[a]

Type of Firm	Total business expenses[b] (thousands)	Net cost of corporate income tax (thousands)	Net cost of taxes as percent of total expenses
Colorado firms			
Domestic	$1,578,912	$1,535	0.10
Foreign	82,522	90	0.10
Total	1,661,434	1,625	0.10
Interstate firms[c]			
Domestic	105,660	253	0.24
Foreign:	168,421	143	0.08
Total	274,081	396	0.15
All firms[d]			
Domestic	1,684,572	1,787	0.11
Foreign	250,943	234	0.09
Total	1,935,515	2,021	0.10

[a] See footnote a, Table 13.12.
[b] Includes all direct and indirect business expense, and all statutory allowances except federal income tax.
[c] Includes only interstate firms using separate accounting methods of allocation of income and expense (198 taxable firms in 1957). The interstate firms using the allocation formula method do not report Colorado cost items.
[d] Combined Colorado and interstate firms listed above.

On the basis of the survey data, the net cost of the Colorado corporate income tax amounted to 10/100 of 1 percent of the total business expenses for the Colorado intrastate firms, and 15/100 of 1 percent for the interstate firms which used separate accounting methods for allocating their Colorado income and expenses. When the firms were classified on the basis of commercial domicile the difference between categories was even smaller, the tax amounted to 11/100 of 1 percent of the total expenses of the domestic firms and only 9/100 of 1 percent for the foreign corporations. For all firms included in the table, the real cost of the tax averaged 1/10 of 1 percent of the total business expenses reported. Thus, even if it is assumed that no part of the tax was shifted in the pricing process, which is unlikely, it appears that the real burden of the Colorado corporate income tax is relatively insignificant when compared with the total business expenses of the taxed corporations.

Table 13.20 shows the net cost of the Colorado income tax as a percentage of the total federal, state and local tax liability incurred by corporations on their Colorado operations.

Table 13.20

Net Cost of the Colorado Corporation Income Tax[a] as Percentage of the Total Tax Liability Incurred on Corporate Business in Colorado, 1957

Type of firm	Business taxes on Colorado Operations (thousands): Federal income tax[b]	State income tax	All other taxes[c]	Total tax liab.	Net cost of state income tax	Net cost as percent of total tax liability
Colorado firms						
Domestic	$35,336	$2,864	$20,999	$59,199	$1,535	2.59
Foreign	3,046	170	1,118	4,334	90	2.10
Total	38,382	3,034	22,117	63,533	1,625	2.56

Total	82,071	3,261	7,241	92,573	1,634	1.77
All firms						
Domestic	70,447	4,375	26,384	101,206	2,270	2.24
Foreign	50,006	1,920	2,974	54,900	989	1.62
Total	120,453	6,295	29,358	156,106	3,259	2.08

[a] See footnote a, Table 13.12.
[b] Federal income tax apportioned to Colorado only.
[c] Omits "other Colorado taxes," except Oil and Gas Gross Income Tax, of interstate firms using the formula allocation method of apportioning income. Therefore, total tax liability of interstate firms is understated and the net cost of the state income tax as percent of total tax bill for these firms as a group is overstated.

The $3.3 million net cost of the state income tax represented only slightly more than 2 percent of the $156 million of total Colorado business tax liability reported by taxable corporations on their 1957 state tax returns.[50] This is simply another indication of the negligible significance of the total state income tax when compared with the over-all amount of business tax incurred by all firms on their Colorado operations. Moreover, it will be noted that for the

[49] Ratchford and Han, *op. cit.*, p. 323. It may be noted that in the shifting of a tax, commodity price increases are required only in the period following the initial imposition of the tax or increase in its effective rate. Once the normal amount of tax has been built into the corporate price structure, no further price increases are necessary to bring about the shifting of each successive year's tax liability.

[50] The reason the $3.3 million of *effective* state tax is used as the numerator in the ratio of state income tax to total tax liability, and not the $6.3 million of nominal state tax included in the total tax liability, is that the former represents the net increase in the total tax attributable to the imposition of the state tax. In other words, the federal tax would have been approximately $3.0 million larger in the absence of any state income tax and, thus, this $3.0 million figure plus the $3.3 million net cost of the state income tax equals the $6.3 million which is included in the denominator of the ratio.

Colorado intrastate firms the state tax amounted to about 2.6 percent of their total tax bill, while for the interstate firms it averaged slightly less than 1.8 percent. This difference, of course, is primarily attributable to the fact that the interstate firms generally derive the greater benefit from the federal tax deductibility provision of the Colorado statute. As already noted, the total amount of federal taxes deducted by the interstate firms in the computation of their state tax was more than twice as large as that reported by firms operating solely in Colorado. Thus, the larger federal taxes claimed by the interstate firms more than offset the effect of "all other taxes" paid, of which three-fourths was accounted for by Colorado intrastate firms. Similarly, when the firms were classified on the basis of business domicile, this measure of the net cost of the state tax was about 50 percent larger for domestic firms than for foreign corporations.

In summary, the above analysis of the relative burden of the Colorado income tax upon corporations revealed that the net cost of the 1957 tax for all taxable firms averaged:

(a) 9/100 of 1 percent of corporate gross operating revenues obtained from Colorado business;

(b) 1/10 of 1 percent of total business expense apportioned to Colorado operations; and

(c) 2.1 percent of the total federal, state and local tax liability incurred on their Colorado business.

All three measures indicated that the relative net cost of the state income tax for foreign corporations as a group was significantly lower than that for the domestic firms. On the other hand, the only marked contrast between the intrastate and interstate corporations, as such, was in the measure of net cost as a percentage of the total business tax bill in Colorado. Notwithstanding these differences among the various groups, it is evident that by almost any standard the real cost imposed upon all categories of corporations by Colorado income taxation cannot be considered unduly burdensome, even if these taxes were never shifted in the pricing process. When it is further noted that the tax has in part been absorbed into the general corporate price structure, the impact of the Colorado corporation income tax upon the decision-making of the firm, particularly with regard to location, appears to be practically negligible.

Estimates of the Effects of Selected Tax Revisions

On the basis of the survey data obtained from the 1957 tax returns, it is possible to estimate the increase in State revenues and taxpayer costs which would have resulted if selected statutory changes in the corporate income tax base and rates had been in effect that year. Four of the tax base revisions considered are the elimination of the oil and gas gross income tax credit, the 85 percent dividend exemption, the depletion allowance, and the deductibility of federal income tax allocable to Colorado operations. These are summarized below:

Table 13.21

Estimated Increases in State Revenues and Taxpayer Costs Resulting from Selected Changes in the Tax Base, Colorado Corporate Income Tax, 1957

Elimination of:	All taxable corporations[a] dollar amount of increase in: State revenues (thousands)	Taxpayer real costs (thousands)
(a) Oil and gas gross income tax credit	$ 137	$ 71
(b) Exemption of 85% of dividend receipts	143	74
(c) Statutory resource depletion allowance	550	285
(d) Federal corporate income tax deductibility	5,223	2,655
Totals	6,053	3,085

[a] Some non-taxable firms in 1957 would have been taxable that year had these statutory changes been in effect, and since the above estimates apply only to taxable firms they understate the aggregate amount of increases that would have resulted from these revisions.

It is evident that the first three listed deductions—the oil and gas tax credit, the 85% dividend exemption and the depletion allowances—are not quantitatively significant, amounting to less than $.9 million, or less than one-seventh of the total increase in State revenues that would have resulted from all of the above statutory changes. In contrast, the elimination of the federal tax deductibility provision alone would have accounted for more than six-sevenths of the total, and would have yielded $5.2 million of additional corporate income tax revenues in 1957. The real cost of the latter to the firms would have been less than $2.7 million, and the federal government indirectly would have financed the balance of $2.5 million since this would represent the amount of federal income tax saving obtained by the firms subjected to the increased state tax. In short, they would have paid the increased tax with "51-cents-after-federal-tax" dollars and the net cost of the revised total tax liability for all taxable firms would have been less than 2/10 of 1 percent of their gross operating revenues. It is further estimated that the removal of the federal tax deductibility provision would produce in fiscal year 1960 additional revenues ranging from $7 to $7.5 million. Therefore, the $5.2 million increase should be considered a conservative estimate since it does not take into account normal economic growth or the revision in the definition of an interstate sale provided by the 1958 amendment to the Income Tax Act.[51]

[51] The 1958 statutory change in the allocation procedure should increase the Colorado tax liability, but also the claimed federal tax deduction of many foreign interstate firms. The net effect of the new sales definition will be diminished by the extent of the additional federal tax deduction; but by the same token the elimination of federal tax deductibility will be magnified by the prior change in the allocation procedure.

Table 13.22 shows the distribution of the estimated increase in tax liability which would have resulted from the elimination of federal tax deductibility in the computation of the 1957 State corporate income tax.

Table 13.22

Distribution of Estimated Increase in State Tax Liability If Federal Income Tax Deductibility Eliminated from Colorado Corporate Income Tax Returns, 1957

Type of firm	Taxable corporations[a] Number of firms	Percent of total	Increased tax liab. Amount (thousands)	Percent of total

Total	4,734	100.0	5,223	100.0

[a] Based on Table 13.12, see footnote a.

It will be noted that 67 percent of the increase in Colorado tax revenues which would have resulted from not allowing federal tax deductibility would be borne by interstate corporations, notwithstanding the fact that such firms represented only 18 percent of the total number of taxable firms and accounted for 52 percent of the actual 1957 tax liability. Since the vast majority of interstate corporations are foreign, while virtually all of the 100 percent Colorado firms are domestic, the tax increase would have fallen relatively more heavily upon the foreign firms. For example, they would have paid over 40 percent of the total tax increase, although as a group they represented less than 18 percent of all taxable firms and accounted for less than 31 percent of the 1957 tax liability. Similarly, when the firms are classified by asset size it appears that one-fourth of the firms (the largest with assets in excess of $1 million) would have borne over three-fourths of the total nominal tax increase.[52]

Table 13.23 shows the percentage increases in State revenues and taxpayer real costs resulting from the elimination of federal tax deductibility.

The $5.2 million of additional State revenue and nominal tax liability would have represented an 83 percent increase in the Colorado income tax bill for all firms. As already noted, it would have been paid with "51-cents-after-federal-tax" dollars. The increase would have amounted to 57 percent for the Colorado intrastate firms and 107 percent for the interstate corporations. This marked variance between the two categories, of course, is due to the fact that the federal tax deductions claimed in 1957 reduced the taxable income of the Colorado intrastate firms by only 36 percent, and that of the interstate firms by almost 52 percent.[53] Similarly, in both groups, the percentage increases in nominal and real tax liability are significantly higher for the foreign firms than for the domestic corporations. In brief, it appears that the elimination of federal tax deductibility in the computation of the State corporate income tax would increase the nominal and real State tax liability for the minority of large, interstate, foreign corporations significantly more than for the vast majority of small, intrastate, domestic firms whose operations are wholly confined to Colorado. Finally, it should be noted that the net cost of the 1957 increased tax for all firms, when expressed in relative terms, would have amounted to only 2.1 percent of their combined total federal and state income tax liability, 1.6 percent of their total local-state-federal tax bill allocable to Colorado operations, and .07 percent of their total business expenses.

Table 13.23

Distribution of Estimated Increases in State Revenue and Taxpayer Costs If Federal Income Tax Deductibility Eliminated from Colorado Corporate Income Tax Returns, 1957[a]

Type of firm	Additional revenue to State Amount (thousands)	Percent over 1957[b]	Additional net cost to corporations Amount (thousands)	Percent over 1957[b]	Real cost to corporations of additional tax dollars
Colorado firms					
Domestic	$1,604	56.1	$ 924	60.2	$.58
Foreign	128	80.5	64	71.1	.50
Total	1,732	57.4	988	60.8	.57
Interstate firms					
Domestic	1,504	99.5	722	98.2	.48
Foreign	1,987	113.5	945	105.1	.47
Total	3,491	107.0	1,667	102.0	.48
All taxable firms					
Domestic	3,108	71.1	1,646	72.5	.53
Foreign	2,115	110.8	1,009	102.0	.48
Total	5,223	83.2	2,655	81.5	.51

[a] See footnote a, Table 13.12.

[b] Computed on basis of Table 13.16. For any given firm, the percentage increases in tax liability and net cost are identical. For groups of firms, the percentage increases for the aggregates will differ because of weighting.

The total revenue increase of $5.2 million that would have resulted from not allowing federal tax deductibility on the 1957 returns, also could have been achieved by raising the statutory rate of the corporate income tax 3.75 percentage points (from 4.25 to 8 percent). There are, how-

[52] See Table 13.13 for size distributions of intrastate and interstate firms.

[53] See Table 13.14.

ever, three important respects in which broadening the tax base by eliminating reciprocal deductibility is preferable to a rate increase for raising the same amount of additional revenue. First, a change in tax base would place the intrastate and interstate firms on a more equitable basis since the latter benefit both absolutely and relatively more from federal tax deductibility than do the corporations with operations limited solely to Colorado.[54] Second, the change in tax base would lessen the "effective regressivity" of the Colorado corporate income tax,[55] an effect that otherwise could be achieved only by adopting a progressively graduated structure of nominal tax rates.[56] Third, by broadening the corporate tax base and retaining the present 5 percent nominal rate Colorado would be conforming to the practice of the overwhelming majority of the 34 income tax states with regard to the treatment of federal tax and at the same time would be retaining a statutory rate which was equal to the national median.[57] However, in terms of the relative utilization of the corporate income tax as a source of State revenue, if the federal tax deductibility had not been permitted on the 1957 returns, Colorado's rank would have been 20th from the top (instead of 25th) among the 27 corporate income tax states for which data were available.[58]

The Statutory Allocation Formula. As noted above, the particular form of Colorado's allocation formula is now unique among the states.[59] As recently as 1954 five other states used the two-factor formula based on property and sales ratios, now Colorado stands alone in its use. In view of the importance of the statutory allocation formula, both with regard to tax equity and revenue, an analysis was undertaken to measure the quantitative effects which would have resulted if the standard three-factor formula, currently required by 22 other income tax states, had been used in 1957 by interstate firms reporting Colorado income.[60]

The table below presents the over-all effect of adding a payroll factor to the present Colorado statutory two-factor allocation formula.

Table 13.24

Effect of Adopting a Standard Three-Factor Allocation Formula on Interstate Firms Classified by Principal Place of Business, Colorado Corporate Income Tax Returns, 1957

A. Number of firms affected[a]

Type of firm:	Increase	Decrease	Total
Domestic	58	27	85
Foreign	257	466	723
Total	315	493	808

B. Dollar change in tax liability (thousands)[b]

Type of firm:	Increase	Decrease	Net Amount
Domestic	$164	$ 75	+$ 89
Foreign	517	210	+ 307
Total	681	285	+ 396

C. Percentage change in tax liability

Type of firm:	Increase	Decrease	Net Amount
Domestic	27.8	22.1	+ 9.6
Foreign	97.6	26.0	+23.0
Total	60.9	24.8	+17.5

[a] Based on 867 firms for which data were available, representing 87 percent of the total number of firms using an allocation formula. Of these, 59 non-taxable firms were unaffected by the change in formula.

[b] Tax liability computed at rate of 5 percent.

The data show that the use of a three-factor formula in the allocation of the 1957 interstate income would have altered the tax liabilities of 808 firms, or 93 percent of the total number of allocation formula-using firms for whom data were available. But of these, only 315 firms, or 39 percent of the number affected, would have had a tax increase—the remainder would have benefited from lowered tax liabilities. Similarly, about one third of the foreign firms

---

[54] See Tables 13.15 and 13.23.

[55] See Table 13.9.

[56] Elimination of federal tax deductibility would lessen the effective regressivity of the Colorado corporate income tax but would not overcome it entirely. The only states having effective corporate tax rates that are not regressive throughout their entire range are those that have adopted progressively graduated structures of statutory rates. The tabulation below shows the average nominal rates required at various income levels before all income taxes in order to maintain a constant (proportional) effective tax rate when federal tax deductibility is *not* permitted.

AVERAGE NOMINAL RATES REQUIRED AT SELECTED INCOME LEVELS TO ACHIEVE CONSTANT EFFECTIVE RATES UNDER A STATE CORPORATION INCOME TAX

	Nominal rates required to achieve constant (proportional) effective rates of:			
Net income level	4%	3½%	3%	2½%
$ 25,000	5.71	5.00	4.29	3.57
50,000	6.78	5.93	5.08	4.34
100,000	7.48	6.54	5.61	4.67
500,000	8.15	7.13	6.11	5.09
1,000,000	8.24	7.21	6.18	5.15

Of course, if reciprocal tax deductibility is allowed the required nominal rate structure for achieving each of the constant effective rates would be considerably higher and more progressive at all income levels.

[57] See Tables 13.6 and 13.7.

[58] See Table 13.4.

[59] See Table 13.10.

[60] The computations were made by the Division of Program Analysis, Bureau of Old Age and Survivors Insurance, U. S. Department of Health, Education and Welfare. A payroll ratio for each corporation, computed on the basis of 1957 Colorado payroll data provided by the Colorado Department of Employment and 1957 OASI national payroll data, was combined with the actual sales and property ratios reported on the 1957 returns. Thus, a three-factor allocation ratio was obtained for each firm. This ratio, in turn, was used to derive Colorado taxable income which was then compared with the reported 1957 taxable income based on the two-factor formula. The firms were then classified, and the data aggregated on the basis of whether the change to a three-factor formula resulted in an increase or decrease in taxable income. The over-all change in the tax liability of each category of firms was then calculated as the final step. The analysis was carried out for 867 firms for which detailed data were available, and these companies represented 87 percent of the 995 interstate firms which used the formula method of allocating income on their 1957 Colorado tax returns.

would be affected adversely, while more than two-thirds of the domestic firms would have reported greater taxable income. However, in terms of the dollar amount of tax involved, the addition of the payroll factor would on net balance have increased the taxable income of all interstate firms by approximately $8 million. At a tax rate of 5 percent, this net increase would have produced additional revenues of almost $.4 million, or a tax increase of approximately 18 percent for all firms affected.[61] More than three-fourths of the net increase would have fallen upon foreign interstate firms which in 1957 under the two-factor formula accounted for slightly more than one-half of the total tax liability of all interstate firms.[62] This relatively heavier impact, dollarwise, on foreign firms is also indicated by the fact that the net percentage increase would amount to less than 10 percent for the domestic firms, and more than 20 percent for the foreign corporations. With regard to the specific group of interstate firms adversely affected, the increase would be about 28 percent for domestic corporations, but almost 98 percent for the foreign firms. In brief, although a larger absolute and relative number of out-of-state firms than domestic companies would have benefited from tax decreases, the foreign firms also would have accounted for the largest absolute and relative dollar amount of tax increases if a payroll factor had been used in the allocation formula applied to the net income reported on the 1957 Colorado corporate tax returns.

Table 13.25 shows the effect of a three-factor formula applied to the 1957 income tax returns filed by interstate firms, classfied by asset size.

It is evident that less than one-half of the firms in each size category would be subjected to a tax increase as a result of the addition of the payroll factor. However, when the effect is measured dollarwise, only those firms with assets ranging from $1 to $10 million would generally benefit from the change—on net balance, a reduction of 11 percent. More significantly, the largest part of the increase in taxable income allocable to Colorado, two-thirds of the total, would be borne by the very largest interstate corporations, those with assets of $100 million or more. For this category, the increase in tax liability would amount to almost 113 percent, in contrast to an average increase of 61 percent for all interstate firms subjected to the tax increase. In other words, it appears that the tax reductions would be relatively small and widespread among all size categories of firms, while the tax increases would be relatively large and concentrated among the biggest interstate firms.

Table 13.25

Effect of Adopting a Standard Three-Factor Allocation Formula on Interstate Firms Classified by Asset Size, Colorado Corporate Income Tax Returns, 1957

A. Number of firms affected[a]

Asset size (millions)	Increase	Decrease	Total
Under $ 1	68	82	150
$ 1 to 10	89	167	256
10 to 100	99	164	263
100 and over	53	72	125
Not classified	6	8	14
Total	315	493	808

B. Dollar change in tax liability (thousands)[b]

Asset size (millions)	Increase	Decrease	Net Amount
Under $ 1	$ 26	$ 6	+$ 19
$ 1 to 10	21	61	— 40
10 to 100	197	69	+ 128
100 and over	435	143	+ 292
Not classified	3	5	— 2
Total[c]	681	285	+ 396

C. Percentage change in tax liability

Asset size (millions)	Increase	Decrease	Net Amount
Under $ 1	102.4	28.1	+40.3
$ 1 to 10	14.7	28.4	—11.2
10 to 100	35.2	20.0	+14.1
100 and over	112.9	26.3	+31.4
Not classified	51.4	28.5	— 7.9
Total	60.9	24.8	+17.5

[a] Based on 867 firms for which data were available, representing 87 percent of the total number of firms using an allocation formula. Of these, 59 non-taxable firms were unaffected by the change in formula.

[b] Tax liability computed at rate of 5 percent.

[c] Items may not add to totals due to rounding.

Table 13.26 probably is one of the most useful for assessing the impact of the adoption of a three-factor formula, for the firms are classified by the percentage of their nationwide net income allocated to Colorado.

It is evident on the basis of data presented in Table 13.26 that the majority of firms in the first two categories, those with less than 25 percent of their total net income allocated to Colorado, would have experienced a tax decrease as a result of the addition of a payroll factor. On the other hand, for the majority of firms with a larger ratio of Colorado net income such a revision would have resulted in an increased tax liability for 1957. When the impact of the adoption of a three-factor formula is assessed by the dollar amount of change in tax liability, it appears that approximately two-thirds of the total net increase in tax revenues ($257,000 of the $396,000) would come from those interstate corporations that in 1957 allocated less than 1 per-

[61] As noted, only 87 percent of the interstate firms are included in the analysis and, therefore, the net increase of $396,000 represents about a 12 percent tax increase for all interstate firms, and approximately a 6 percent increase in the total corporate tax liability of all firms—interstate and intrastate—combined.

[62] See Table 13.16.

cent of their total net income to Colorado. Moreover, all categories of firms with a ratio of Colorado income of less than 50 percent would on net balance have experienced a tax increase, while those with 50 percent or more of their net incomes originating in Colorado would, as a group, have benefited taxwise by the use of a three-factor allocation formula. In terms of the percentage change in tax liability, those firms with a Colorado income ratio of less than 1 percent would have been subjected to a 180 percent increase in taxable income, whereas for the two categories with income ratios of 50 percent or more the increased tax would have been only 7 and 4 percent respectively. For the firms benefiting from the addition of a payroll factor, the percentage tax decrease would be fairly uniform for the different categories of firms, and in no case would it amount to 30 percent of the total tax liability.

Table 13.26

Effect of Adopting a Standard Three-Factor Allocation Formula on Interstate Firms Classified by Ratio of Colorado Taxable Income to Total Net Income, Colorado Corporate Income Tax Returns, 1957

A. Number of firms affected[a]

Colorado taxable income ratio[d]	Increase	Decrease	Total
Less than 1%	165	263	428
1% to 25%	93	182	275
25% to 50%	23	22	45
50% to 75%	16	11	27
75% to 100%	18	15	33
Total	315	493	808

B. Dollar change in tax liability (thousands)[b]

Colorado taxable income ratio[d]	Increase	Decrease	Net Amount
Less than 1%	$347	$ 89	+$257
1% to 25%	206	111	+ 96
25% to 50%	116	38	+ 78
50% to 75%	9	11	— 2
75% to 100%	2	35	— 32
Total	681	285	+ 396

C. Percentage change in tax liability

Colorado taxable income ratio[d]	Increase	Decrease	Net Amount
Less than 1%	179.8	28.6	+50.9
1% to 25%	42.4	24.3	+10.1
25% to 50%	45.9	28.6	+20.1
50% to 75%	7.3	9.2	— 0.8
75% to 100%	4.0	28.8	—17.9
Total	60.9	24.8	+17.5

[a] Based on 867 firms for which data were available, representing 87 percent of the total number of firms using an allocation formula. Of these, 59 non-taxable firms were unaffected by the change in formula.

[b] Tax liability computed at rate of 5 percent.

[c] Items may not add to totals due to rounding.

[d] Colorado net taxable income based on the statutory two-factor formula expressed as percentage of total nationwide net income reported by each firm on their 1957 return.

In summarizing the effects which would have occurred through the addition of a payroll ratio to the allocation formula under the Colorado corporate income tax in 1957, several facts stand out in importance:

(1) The majority of all interstate firms, approximately 60 percent of the total number, would have benefited by a reduction in tax liability;

(2) But on net balance it would have produced an increase in the income tax base of about $8 million, and an over-all increase in tax revenue of approximately $.4 million;

(3) More than three-fourths of the net tax increase would have fallen upon foreign interstate firms for whom the increase would have been 23 percent, in contrast to an increase of 10 percent for domestic firms;

(4) Almost three-fourths of the net tax increase would have fallen upon the largest interstate firms, those with assets of $100 million or more, and the increase for this category would have been 31 percent, in contrast to an average of 18 percent for all firms;

(5) Almost two-thirds of the net tax increase would have fallen upon national corporations that allocate less than 1 percent of their total net income to Colorado, and the increase for this category would have been 51 percent; in contrast, firms which allocate 50 percent or more of their income to Colorado would on net balance actually have experienced a reduction in tax.

In short, it appears that the major burden of a tax increase resulting from a revision of the allocation formula would fall upon the large, foreign, interstate corporations which allocated less than 1 percent of their total net income to their Colorado operations.

Inasmuch as the above findings were based on the 1957 survey data, they are useful for estimating the effects of proposed revisions in the present two-factor formula only to the extent that essentially the original relationships between the sales, property and payroll factors continue to hold. Moreover, it is important to note that the addition of a payroll factor would increase an interstate firm's Colorado taxable income only if the value of the payroll ratio was greater than the average value of the property and sales ratios already included in the present allocation formula. Since the geographic distributions of property and payrolls for most national corporations are closely correlated, it is reasonable to assume that the ratios based on these data tend to have similar values. If the introduction of a payroll factor causes increased taxation for such firms, it simply means that the value of their reported sales ratios were significantly smaller than their payroll ratios.

The preceding analysis of the 1957 Colorado corporate tax returns has shown that the introduction of a three-factor allocation formula would have caused the bulk of the tax increase to fall upon the large, foreign, interstate firms which allocate only a very small fraction of their total net income to the State. Thus, it is evident that the 1957 Colorado sales ratios reported by these firms must have been relatively low—and primarily because of the restrictive legal interpretation given to a "Colorado sale" by the courts in the American Can cases. How-

ever, if the 1958 income tax amendment, which attempted to close the sales "loophole" by redefining a Colorado sale, effectively raises the value of the sales ratios of interstate firms, then the net effect of the addition of a payroll factor to the present two-factor formula probably would be to reduce the state tax liability of large foreign interstate firms, while at the same time increase the relative tax burden of domestic firms which have proportionally greater employment and payrolls in Colorado. On net balance, the adoption of a three-factor formula by Colorado would result in an increase in state tax revenues only if the average value of the sales ratios of the interstate firms (domestic and foreign) continued to be smaller than the average value of their payroll ratios. On the other hand, if the broader definition of a Colorado sale, as provided by the 1958 income tax amendment, should prove to be effective and raise the average value of the sales ratios of interstate firms above that of their payroll ratios, then the use of a three-factor formula would result in a decrease in State corporation income tax revenues. But whether or not the 1958 amendment will have a significant impact on the sales ratios reported by interstate firms will not be known, of course, until after the 1959 tax returns, filed in 1960, are processed and audited by the Revenue Department, tax assessments made on the basis of the new definition, and possibly court interpretations of the amendment are obtained.

In consideration of all of the above, and particularly the fact that even under the restricted American Can case definition of a Colorado sale the addition of a payroll factor would have increased the 1957 State corporate income tax revenue by only 6 percent, it would appear that Colorado's present two-factor allocation formula should not be substantially revised until a more adequate and clear-cut case can be made for revision on the grounds of both equity and revenue. Moreover, as already noted, the elimination of the federal income tax deductibility provision would offset some of the inadequacies of the present allocation formula, as well as reduce the regressivity of the effective rate structure.

CHAPTER XIV

SEVERANCE TAX

The severance tax upon certain types of natural resource production is largely a development of the present century. It is a special tax both in terms of its scope and the objectives it is intended to serve. The tax is now employed by some 28 states, but it is a minor source of revenue in most of these jurisdictions.

Nature of Tax

The serverance tax is commonly defined as a levy on the extraction or removal of certain natural resources from the soil or water. It is applied to virtually all kinds of sub-soil resources, including oil, gas and other minerals, and timber. These resources, as contrasted to agricultural products, are either not reproducible or, in the case of timber, require a long period of growth. The distinctive character of the resources gives rise to special taxing problems, and the severance tax is designed to provide a partial solution to these problems.

While the term severance clearly implies that the tax is imposed upon the act of severing or removing a resource from its natural location, this is often not the case. Physical units of the product are only one of several bases upon which the tax is imposed including sales, gross receipts and gross income. The terminology used by state legislatures in describing the tax is also highly variable. In addition to the basic term, the tax may be called an occupation, privilege, production or special excise levy.

Considering the variations in the tax base and legal descriptions of the tax, it is often difficult to distinguish the character of a particular tax as well as the legislative intent. Certain jurisdictions, for example, impose very heavy rates on natural resource production (higher than manufacturing or retail sales) under their general sales tax. Though there is no indication in the law that the additional tax represents a severance tax, this is the apparent purpose. Thus, the existence of a special or additional tax on the resources in question logically may be said to constitute severance taxation.

Severance taxes were originally conceived as a substitute for the property tax. If the tax is in lieu of property taxes, therefore, there is a reasonable pesumption that it is intended to be a severance levy. Actual state practice, it should be noted, usually does not conform to the alternative tax concept.

The above characteristics generally serve to distinguish servance taxes. However, the features noted are subject to question in particular instances, and it is not surprising that laymen as well as tax authorities often disagree in their interpretations of this form of taxation.

Development and Principal Features. Michigan pioneered the development of severance taxation by adopting a tax on specified mineral resources in 1846, and Pennsylvania and Minnesota followed in 1874 and 1881, respectively. All of these jurisdictions had extensive coal, iron ore and other mineral resources, and have depended upon the tax as a substantial source of state tax receipts. In the early 1900's several of the major oil-producing states adopted the tax. Texas and West Virginia led the way in 1907, and Oklahoma and Louisiana followed in 1908 and 1910. Most of the present state severance taxes were adopted in the period preceding and following World War I. Twenty-eight states now impose severance taxes on various types of mineral products. In addition to these taxes, six states (Arizona, Indiana, Mississippi, New Mexico, Washington, West Virginia) include certain extractive industries under their general sales levies.[1] The latter practice may or may not reflect an intent to put a special or additional tax burden on these resources. It should also be noted that there are twenty jurisdictions (most of which impose severance taxes) that have modified their property tax treatment of forest lands.[2]

The general scope, base and rates, as well as the in lieu features of the severance taxes in the twenty-eight states are shown in Table 14.1. Oil and gas resources are taxed in the largest number of states or in twenty-three; coal and/or iron ore in nine; other specified minerals in eleven; and timber in six. Ten jurisdictions restrict their severance taxes to oil and gas, and an equal number have relatively comprehensive levies applying to three or more types of mineral or other resources.

---

[1] Ohio Department of Taxation, *Severance Taxation* (Division of Research, Columbus, Ohio, 1956), Table 2, p. 18.

[2] *Ibid.*, Table 3, pp. 19-21.

produced (with the exception of timber), it is also highly important that the enterprises engaged in this type of production pay a proportionate share of the total tax burden.

The property tax, as previously indicated, may have the effect of stimulating rapid and wasteful production or cropping methods, whereas the severance tax does not involve this influence. In fact, the latter tax which only applies to resources which are currently productive may tend to deter or prevent present use in the case of marginal or high cost properties. Thus, the severance tax may have a positive influence in promoting conservation objectives as opposed to the potential negative impact of the property tax.

Absentee Ownership and Special Tax Advantages. In many states, including Colorado, a large proportion of mineral and timber resources are owned by non-resident corporations or individuals. Absentee ownership, rightly or wrongly, is often subject to public disfavor, and proponents of severance taxes sometimes suggest that the people are entitled to an additional tax dividend from such production (over and above regular taxes). While the idea of a discriminatory tax is indefensible, absentee owners may largely escape general tax burdens. The severance tax, therefore, may be used to offset this advantage, and is an effective instrument for achieving proportionality of tax burdens.

The owners of mineral and timber resources also are said to enjoy substantial tax advantages under certain general tax forms, and the severance tax is supported as a means of offsetting these favors. In particular, it is alleged that the ratio of assessment under the property tax is extremely low and that the oil and certain other mineral industries are extended special privileges under federal and many state income tax laws. While a special basis of assessing producing oil properties is employed in a number of states, including Colorado, there is little doubt that non-producing oil lands and other mineral properties are usually grossly under-assessed as compared to other types of real estate. The inherent difficulties in determining the extent and value of mineral deposits, the tendency to permit self-assessment by mining companies and the alternative practice of assessing the property almost entirely on the basis of surface developments and improvements have all contributed to this result.[4] The implications of Colorado's special bases of assessment and actual assessment practices are considered in the final section of this chapter.

It is generally recognized that the special "percentage depletion" allowances granted to oil and other mineral producers under the federal and certain state income tax laws (Colorado is a notable example) are very liberal. However, unless they are determined to be excessive they do not in any way justify offsetting or additional tax burdens.[5]

Finally, it should be emphasized that natural resource industries have a tax responsibility equal to that of other forms of production. It is evident that this responsibility is not being met under existing assessment practices and provisions of the property tax law in many states. The question as to whether depletion allowances are excessive is obviously debatable. While appropriate changes in these taxes and/or their administration would seem to be preferable on theoretical grounds, the imposition of reasonable severance taxes to compensate for the deficiencies that exist is an acceptable alternative. In the case of the property tax it may also be the most practical and expedient course of action. If under-taxation is regarded as a significant factor in the imposition of severance taxes, however, it is important that a uniform basis of assessment for such properties be established and enforced. Otherwise, there is no firm basis for determining the tax differential which is to be made up.

Productivity and Ease of Administration. The productivity of severance taxes in states which have substantial mineral deposits or timber production has been fully demonstrated. Substantial revenues are derived in many of these jurisdictions. As a consequence of the relatively small number of taxpayers and the relative simplicity of the tax base (production units, sales or income), the administrative problems are not difficult or unique in character. These features, as indicated in other sections of this study, do not justify the imposition of a tax, but they are important considerations nonetheless.

State-Wide Sharing of Fiscal Benefits. The imposition of severance taxes by the state governments permits a broader distribution of the fiscal benefits from the taxation of the resources in question. By their nature these resources are usually concentrated in limited areas, and locally imposed and administered taxes necessarily mean a concentration of tax receipts in the favored areas. This situation is both inequitable and undesirable, but the legitimate needs of the local units involved must be recognized and provided for. If the severance tax is in addition to the property tax, the needs of local governments can be adequately met through the latter levy. The severance tax pro-

[4] Earl Crockett, "Should Colorado Adopt a Severance Tax?" *Taxation in Colorado*, Report No. 2, 1946, p. 38.

[5] The policy issues involved are discussed in Chapters XII and XIII dealing with the personal and corporate income taxes.

ceeds may then be used for state purposes or distributed to all local units on the basis of general formulae involving the needs and resources relationship. If the severance tax is in lieu of the traditional property tax, the bulk, if not all, of the revenues should be allocated to local governments in a manner that will assure adequate revenues to the localities in which the resources are located.

Effect of Severance Tax on Resource Development: Tax Incidence. The principal criticism of severance taxes is that they have an unfavorable effect upon resource development, and high cost production in particular. This charge is obviously a serious one and merits special attention. At the outset, it is obvious that a severance tax, with the possible exception of one based upon net income, increases production costs. In fact, all taxes based upon cost factors have this effect. That is, they either increase living costs of the individual or the operating or fixed costs of business concerns. In a broad sense, therefore, they tend to curb incentives to consume or to invest funds in the private economy. The crucial question to be answered in the case of the severance tax, or any tax for that matter, is whether it places a disproportionate or unequal burden upon the particular groups involved. The answer, obviously, is dependent primarily upon the impact of the tax system as a whole. The severance tax is only one component of the tax system and not necessarily the most important one.

There is no reason to suggest that a severance tax will seriously restrict resource development or utilization unless it is applied in a punitive or discriminatory manner. The increased costs occasioned by severance taxes, like property or sales tax costs, normally are recovered through the price charged for the product. Mineral and timber production, with minor exceptions, is carried on under monopolistic or semi-monopolistic conditions, and "administered" or controlled prices are the general rule. In such circumstances it must be presumed that the incidence of the tax is generally upon the consumer. Thus, the severance tax cannot have an unduly burdensome effect upon production, which would otherwise be profitable, if it is employed on a reasonable basis.

This conclusion is subject to two qualifications. Mineral or timber production which is definitely marginal or sub-marginal under given market conditions will be adversely affected by any increase in costs. However, the relative position of such production in the industry will not be changed by imposition of a severance or other general taxes. Needless to say, a tax based upon net income would be most advantageous for such concerns. It should also be emphasized that tax policy for any important segment of the economy cannot reasonably be predicated upon the economic status of high cost and probably inefficient producers. Nor can tax favors to an entire industry be justified on the basis of the economic woes of such enterprises. From a conservation standpoint it would also be highly undesirable to resort to tax or other subsidies to the marginal or sub-marginal properties. If an entire industry is temporarily or chronically subject to a cost-price squeeze, tax relief or other types of governmental aid may conceivably be justified. Even in this case, however, the benefits versus costs to the state as a whole should be carefully weighed.

The second qualification is that the severance tax be imposed in a manner consistent with accepted principles of tax equity. Discriminatory or unequal tax burdens, in terms of other types of production in the state or relative to those imposed by other states, upon the resources in question are indefensible in the first instance and of dubious merit in the second. However, state tax practice (including Colorado) with respect to mineral and timber resources usually reflects the other extreme of under-taxation. The tax advantages which these resources enjoy under the property and income taxes have already been noted. The analysis of interstate relationships in the severance tax field will indicate the general extent of favorable treatment in this area.

Instability of Severance Tax Receipts. The alleged instability of severance tax receipts and the problems of financing local governments which may be associated therewith is distinctly a secondary aspect of the severance tax problem. In the first place, the actual variations in severance tax yields are not as great as is often assumed, and are confined to certain specific resources usually of a minor character. Secondly, unless the severance tax is in lieu of property taxes no special problem of financing local governments is involved. If an in lieu feature is included and yields are variable, the problem is not insoluble. Under these circumstances the state has the responsibility of providing assistance to the local units on a continuing basis which is at least equivalent to the revenues that would have been obtained from the property tax. In the case of registered timber lands, for example, several jurisdictions employing severance taxes have permitted the local units to continue low level, uniform per-acre taxes, and in one instance, the state matches this amount. Thus, there are various possible approaches to this problem.

Conclusions. The case for severance taxes on mineral and timber resources is believed to be sound subject to certain qualifying conditions. It is dependent in part upon state policy,

whether the tax is employed as a substitute for the property tax or as an additional levy. In the former case, it is quite evident that the severance tax is preferable to an inefficiently and inequitably administered property tax. From the standpoint of conservation objectives it is also believed to be superior to a scientifically applied annual tax on the decreasing value of the resource.[6] Moreover, it is generally recognized that the severance tax is much easier to administer than the property tax.

The severance tax may be appropriately employed as an additional levy to compensate for irregular or low level assessments under the property tax. It is an effective measure for ensuring that mineral and timber production make a proportionate contribution to the cost of state and/or local government provided that the burden is properly correlated to that of the general and special taxes on other types of interprise. At the same time, it should not be employed as a punitive device. In this connection it should be recognized that the adoption of a severance tax program does not relieve the state of the responsibility for achieving a uniform statewide assessment of mineral and timber properties.

The questions of policy involved in the instance of a particular branch of the mining industry which is temporarily or chronically depressed are extremely complex. Certainly, the introduction of a new tax or the raising of existing taxes under these circumstances would appear to be ill-advised. Tax favors or other aids by an individual state, however, may well be ineffective in dealing with such problems.

History of Severance Taxes in Colorado

Colorado's experience with severance taxes dates back to 1913, although the first levy of major importance from a revenue standpoint was the oil and gas tax adopted in 1953. However, severance taxation has been a continuing issue of legislative concern for several decades.

The 1913 law imposed a low-rate tax on each ton of coal mined in the State—the rate currently amounts to 7/10 cents per ton.[7] The purpose of this levy was to finance State regulatory and inspection measures, and while it took the form of a charge on production, it was not intended as a general revenue source. As a consequence of declining production in Colorado's coal-mining industry, receipts totalled only $22,787 in 1957.[8]

The second severance-type tax was adopted in 1951, and is designed to finance state conservation activities in the oil and gas industries. Producers or purchasers of oil and natural gas are required to pay a tax of 2 mills per barrel on oil and 2 mills per 50,000 cubic feet of gas.[9] Payments are earmarked for a special conservation fund, and amounted to $116,295 in 1957.[10] This levy, also, is obviously of minor importance from a revenue standpoint.

The 1953 law imposed a substantial severance tax on oil and natural gas industries. It is applied to the gross income from oil and gas production.[11] This legislation marked the culmination of a long period of agitation for severance taxes. Earlier efforts to adopt such a tax in the legislature had failed, and an initiated constitutional amendment met a similar fate in 1952. The specific features of the tax are discussed in the following section of the chapter.

Several other minor taxes or charges are imposed upon the mining industry, but they are not severance taxes in the strict sense of the term. They include: (1) a tax of 1/10 of 1 percent on the assessed value of producing metalliferous mining properties;[12] (2) an ore buyer's license of $100 per year for the right to mill, sample, concentrate, reduce or purchase for sale;[13] (3) an annual license fee on producing coal mines of from $10 to $50 depending upon the level of output;[14] and (4) a royalty charge of 15 cents per ton on mining companies extracting coal from state-owned lands.[15] None of these taxes or licenses are significant revenue-wise. The first tax, however, is most productive, collections amounting to $33,404 in 1957.[16]

In view of the recent adoption of the oil and gas severance tax and its limited scope, it is evident that Colorado is still in the pioneering stage of severance taxation.

---

[6] If related to yield, as in the case of the Minnesota and Michigan taxes on iron ore, this advantage would not be operative.

Severance Tax on Oil and Natural Gas in Colorado

The Tax Base. The 1953 oil and gas severance tax, as previously noted, is based upon gross income and provides for significant credits and a specific exemption. It applies to "that portion of gross income of every person which is derived from the production or extraction of crude oil, natural gas, or both, from petroleum deposits located within Colorado."[17] The statute makes clear that "this means that entire amount realized from the sale or other disposition of all crude oil and natural gas produced or extracted during any taxable year from petroleum deposits located within the state."[18] Royalty income is expressly included within the severance tax base and a 3 percent tax on such income is withheld either by the producer or first purchaser.

Although the severance tax is based upon gross income, it was originally intended to be an additional tax with no deduction allowed in determining state personal and corporate net income tax liability. In fact, at the time the severance tax law was passed, in 1953, the income tax statute contained a specific provision denying an income deduction for any tax levied under the act. However, in the process of copying and revising State statutes in the *Colorado Revised Statutes, 1953,* which became the official law of the State, this clause was omitted. The oil and gas tax paid, therefore, is now an allowable deduction in computing net income under both the personal and corporate taxes. Considering the fact that the effective rate of the oil and gas tax approaches 5 percent of gross income for large companies, the deduction may well result in no net income tax being paid by such corporations. The effect in the case of individuals is likely to be less marked.

Property taxes, with certain exceptions, are creditable against severance tax liabilities. The exceptions are ad valorem taxes on equipment and facilities used in drilling for, production of, storage of and pipeline transportation of crude oil and natural gas. Thus, the oil and gas severance tax is for practical purposes in lieu of property taxes upon the oil and gas deposits and leasehold or royalty interests therein.

The only specific exemption is that of royalty payments to the United States government and to the State of Colorado. The first is dictated by national constitutional requirements and the latter by policy considerations.

The gross income base of the oil and gas tax reflects an attempt by the Legislature to avoid the application of the constitutional provisions allocating 85 percent of sales and other excise tax receipts for welfare purposes. Although an opinion of the Attorney General held that a severance tax on oil and gas produced in Colorado would not be an excise subject to such allocation,[19] the Legislature sought to ensure this result by enacting the law under Article 10, Section 17 of the Constitution pertaining to classified income taxes. The Attorney General's opinion also affirmed the validity of the latter approach.[20]

In spite of these precautions the constitutionality of the tax is presently in question. A test case brought by the California Company in the District Court was decided on February 15, 1958, and upheld the validity of the tax.

The decision by Judge Edward J. Keating denied the following company allegations: (1) that the severance tax denies equal protection under the law and is arbitrary and discriminatory; (2) that the severance tax is not a proper income tax and was improperly drawn; (3) that the severance tax is an unreasonable burden on interstate commerce; and (4) that the severance tax cannot be collected because most of the oil comes from federal lands located within the State. The company's contention that the act was unconstitutional because it was passed March 27, 1953, but was made retroactive to January 1, 1953, was also denied.

Following its loss in the District Court, the California Company filed an appeal with the Supreme Court of Colorado which had not been decided as of December 5, 1958. If the Colorado Supreme Court affirms the District Court decision, the California Company may appeal to the United States Supreme Court. Thus, the final decision on the constitutionality of the severance tax could be postponed for several years, given the crowded docket of the U. S. Supreme Court. In the meantime the severance tax is being paid under protest.

Another issue concerning the base of the oil and gas tax which arose in the legislature was

[17] *Colorado Revised Statutes, 1953,* Ch. 138-1-7.

[18] *Ibid.*

[19] Quoted in *The Denver Post,* February 9, 1953.

[20] *Ibid.*

whether it should be a substitute for ad valorem taxes levied by local units and the State on natural resources. This question also involved legal implications, and an opinion of the Attorney General held that:

> The ad valorem tax on leasehold rights and royalty interests is a tax on real estate and is subject to the uniformity provisions of the Constitution, so that it cannot be replaced by a severance tax or an income tax upon oil and gas production.[21]

Consistent with this opinion the law does not replace the ad valorem tax on property, but a tax credit is given for property taxes on the oil and gas deposits and rights therein.

Considering the extent and variety of its mineral resources and the practice of other states, the scope of Colorado's tax is obviously very limited. Colorado is the only state that employs a gross income severance tax base for taxing oil and gas production. (See Table 14.1.) However, this base is roughly comparable to the gross or market value measure which is employed by over one-half of the taxing states. Among the six states which include mineral and other natural resource production under their general sales taxes four also use gross income as a measure.[22] While the Colorado tax technically is not in lieu of property taxes, the credit granted for property taxes on the mineral deposits in effect achieves this result. The credit feature of the Colorado tax substantially restricts yields, but it is at the expense of the State rather than the local units. Thus, the credit approach is obviously preferable to the in lieu provision in so far as local governments are concerned.

Rates of the Severance Tax in Colorado and Other States. The rate schedule on the gross income derived from oil and gas production in Colorado is graduated as follows:

$25,000 or less	2 percent
Over $25,000 to $100,000	3 percent
Over $100,000 to $300,000	4 percent
Over $300,000	5 percent

Colorado is the only state using a progressive rate structure. This feature obviously gives the small independent operator a significant advantage, but the bulk of the production falls in the higher or maximum rate categories.

Severance taxes on oil and gas production in other states, as shown in Table 14.1, exhibit a marked variation in rates. Those which are imposed upon gross or market value of the product range from 2/5 mill per dollar in Wyoming to 6 percent in Mississippi. Among other states in this region, Montana and Nebraska levy a 2 percent tax; New Mexico 2½ percent plus a 2 percent gross income "occupational tax;" North Dakota — 4¼ percent; Oklahoma — 5 percent; Texas—4.6 percent on oil and 7 percent on gas; and Utah—1 percent. Considering the fact that the taxes in the other states noted do not include an in lieu feature, the rates of the Colorado tax are certainly moderate. Wyoming's levy, it should be noted, is primarily a conservation measure, and is not intended to produce substantial revenue.

It is apparent that rate comparisons involving the severance and related taxes on oil and gas production do not present a complete picture of relative tax burdens. The property tax and other general taxes may be equally if not more significant. Data on the application of these taxes in other states, unfortunately, are not readily available.

Oil and Gas Severance Tax Recipts. Receipts from the Colorado severance tax on oil and gas, as indicated in Table 14.2, amounted to $3,894,708 in the fiscal year 1957 or approximately 2.64 percent of total State tax collections. Thus, the severance tax ranks tenth in the complex of taxes imposed by the state government.

Table 14.2

Oil and Gas Severance Tax Receipts in Colorado, 1954-1957

Year	Severance tax revenues (net)	Severance taxes as percent of total State taxes	Per capita severance tax revenues	Severance taxes as percent of personal income
1954	$2,544,287	2.31	$1.71	0.10
1955	3,524,893	2.82	2.28	0.13
1956	3,345,567	2.41	2.08	0.11
1957	3,894,708	2.64	2.33	0.12

Source: State of Colorado, Division of Accounts and Control, *Annual Reports;* and U. S. Department of Commerce, *Survey of Current Business*, August, 1957, and August, 1958.

Receipts from the severance tax increased 53 percent between 1954 and 1957. The over-all rise in State tax collections during the same period was 34 percent. The most significant increase occurred in 1955 as a consequence of greater petroleum production in the Denver-Julesburg basin.

Administration of the Oil and Gas Tax. The oil and gas tax as it applies to individual and corporate income is administered as an integral part of the state income tax structure. These aspects of revenue administration are treated in Chapters XII and XIII, repectively. As no special enforcement effort is directed to the oil and gas tax, the increase in administrative costs occasioned by the levy is undoubtedly inconsequential.

[21] *Ibid.*

[22] Ohio Department of Taxation, *Severance Taxation, op. cit.*, Table 2.

Comparative Significance of Severance Taxation in Colorado and Other States

A comparative analysis of the fiscal significance of severance taxes in Colorado and other leading mineral producing states is obviously essential as a basis of evaluating present as well as future policies in this field. The value of mineral production is the key factor in the actual as well as potential productivity of the severance tax. This element, therefore, is considered first, followed by an examination of severance tax yields and severance tax receipts as a percentage of the value of mineral production. The importance of the severance tax in terms of total state tax recipts is also indicated.

Estimated Value of Mineral Production. The estimated value of mineral production in each of the forty-eight states for 1956 is shown in Table 14.3. It will be observed that Colorado ranks in 17th place, nationally. According to the United States Bureau of Mines, *Mineral Yearbook,* Colorado's position has declined from 15th place in 1954. In this two-year period both Arizona and Utah moved ahead of Colorado in the value of mineral output. Although ranking in 17th place nationally, the value of mineral production in Colorado amounted to over $309 million in 1956. It will be noted that seven of the top twenty-eight states with mineral production valued in excess of $100 million do not impose severance taxes. However, in the case of West Virginia, which ranks in 5th place, extractive industries are subject to heavy rates under the general sales tax system.

Total Receipts from Severance Taxes. Among the twenty-seven states which reported severance tax collections in 1956, Colorado ranked eighth in the amount of revenues collected.[23] This is in marked contrast to its position (22nd), prior to the adoption of the oil and gas income tax, and its present status (17th) in mineral production. On the other hand, Colorado's receipts amounted to less than 1 percent of the total severance tax collections of $360 million for all states in 1956.

Severance Tax Receipts in Relation to Value of Mineral Production. Severance tax collections as a percentage of mineral income are clearly more indicative of the relative emphasis upon this form of taxation. Ten jurisdictions collected taxes in excess of 1 percent of the value of mineral production in 1956. In five of these states, Minnesota, Louisiana, Oklahoma, Mississippi and Texas, receipts exceeded 4 percent of mineral income. The New Mexico and Colorado collections were slightly over 1 percent. Of the remaining states only Montana, Utah and Oregon had collections amounting to more than ½ of 1 percent of the value of their mineral output (timber in Oregon). Thus, significant applications of the severance tax to mineral production as a whole are limited to thirteen states.

Table 14.3

Mineral Production and Severance Tax Revenue, By States, 1956

State	Value of mineral production (thousands)	Severance tax revenue (thousands)	Severance tax revenue as percent of value of mineral production	Severance tax revenue as percent of total state tax revenue

[a] State has tax but no revenue reported. (See Table 14.1.)

[b] Percent of estimated value of timber production rather than mineral production which is not taxed.

Source: U. S. Bureau of Mines, *Mineral Industry Survey: Area Reports,* preliminary 1956 and 1957; U. S. Department of Commerce, *Survey of Current Business,* August, 1957; Commerce Clearing House, *State Tax Guide,* 1957; U. S. Bureau of Census, *Compendium of State Government Finances, 1956.*

[23] As later data on the value of mineral production are not available, tax collections for 1956 are employed for comparative purposes. Although Tennessee is listed as a severance tax state, no revenue was reported.

Severance Tax Receipts in Relation to Total State Tax Collections. The severance tax may be considered as a major source of state revenue in only four states—Texas, Louisiana, Minnesota and Oklahoma. It is a significant minor source, however, in seven other jurisdictions including Colorado. Needless to say, its importance in the tax system of a particular state is dictated primarily by the state's general tax policies rather than the scope and rates of its severance tax.

Relative Importance of Severance Taxes in Eleven Western States. The relative role of severance taxes in the eleven Western States is summarized in Table 14.4. Two of these states, Arizona and Washington, do not impose severance taxes and Wyoming's levy is nominal in amount. Arizona and Washington, however, tax extractive industries under their general sales taxes. Colorado's severance tax receipts are second only to New Mexico in the eight taxing states. However, the Colorado tax ranks fourth in terms of: ratio of severance tax collections to total state tax receipts; the ratio of severance tax collections to personal income payments; and in relation to per capita receipts. In general, therefore, Colorado's position is close to the average for the eight states.

Table 14.4

Fiscal Significance of Severance Taxes, Eleven Western States, 1956

(Rank order of states appears in parenthesis)

State	Severance tax revenue (thousands)	Severance tax revenue as percent of total state tax revenue	Severance tax revenue as percent of personal income	Per capita severance tax revenue
Colorado	$3,406(2)	2.36(4)	0.11(4)	$2.11(4)
Utah	2,471(3)	3.60(2)	0.19(2)	3.04(2)
Idaho	92(8)	0.19(7)	0.01(7)	.15(7)
Montana	1,660(4)	3.37(3)	0.14(3)	2.60(3)
New Mexico	7,139(1)	8.00(1)	0.59(1)	8.76(1)
Nevada	104(7)	0.36(6)	0.02(6)	.42(6)
Oregon	798(6)	0.49(5)	0.02(5)	.46(5)
California	1,131(5)	0.07(8)	[a](8)	.08(8)

Wyoming	—	—	—	—

[a] Less than .5 of 1 percent.

Source: U. S. Bureau of Census, Department of Commerce, *Compendium of State Government Finances in 1956;* and Department of Commerce, *Survey of Current Business,* August, 1957.

New Mexico's role as the leading Western severance-tax state is attributable primarily to three factors: (1) its 10th place ranking in mineral production; (2) the broad scope of its severance tax;[24] and (3) the substantial rates imposed.[25] It should be noted that the severance tax in New Mexico is not in lieu of property taxes, and that the sales tax also applies to certain extractive industries.

Utah, which ranks second in the Western State comparison in all respects except total collections, is 15th in terms of total value of mineral output (nationally); the severance tax applies to metal ores, oil and natural gas; and the rates of the tax are moderate as compared to those of the leading states in the field of severance taxation.[26] Utah's tax is also an additional levy.

Montana's severance tax, which ranks fourth among the Western States in total receipts and third in other respects, is a broad-based levy with varying rates. It is not in lieu of property taxes. The value of mineral production is substantially lower than in Colorado.

While California ranks fifth in terms of severance tax collections in the Western State group, the severance tax is designed to meet only the cost of conservation measures. The rates are re-determined annually and are nominal. Considering the fact that California is the second ranking state, nationally, in mineral production, the yield of slightly over $1 million is obviously inconsequential.

Oregon's severance tax, which is limited to timber, ranks sixth in total collections. The rate is low, and there is a 25,000 board feet exemption. The tax is not in lieu of property taxes.

The other two Western States that levy severance taxes, Nevada and Idaho, derive little revenue from this source. They rank 28th and 29th nationally in the value of mineral production, and rates are relatively low.

Conclusions; Interstate Comparisons. The varying role of the severance tax as a means of obtaining revenue from natural resource production is strikingly portrayed in the foregoing analysis. The tax has achieved a substantial degree of acceptance in the leading mineral-producing states, but even in the states that use it the relative emphasis differs markedly. This devergence in practice is evident in the eleven Western States as well as nationally. The fact that the tax is generally an additional tax and that property tax assessment policies and results vary widely from one state to another is undoubtedly a partial explanation. From a practical standpoint the strength of industry opposition may also be a determining factor in some jurisdictions.

Colorado's oil and gas tax would rank with the leaders, except for the property tax credit. The net effect appears to be a very moderate over-all tax on these resources. Among the states that impose severance taxes for revenue purposes and have a significant variety and amount of other mineral resources, the limited scope of Colorado's tax is largely unique. Unless there are compelling reasons for their exclusion,

[24] See Table 14.1.
[25] Ibid.
[26] Ibid.

therefore, the taxation of other minerals appears to be wholly logical and certainly consistent with the practice in the neighboring states of New Mexico and Utah.

Distribution of Severance Tax Burdens

The actual extent and distribution of the oil and gas tax burdens, both for corporations and individuals, obviously has an important bearing upon the desirability of the tax and particular features thereof. As the severance tax is associated with the state income tax, the study of corporate and personal tax returns undertaken in Chapters XII and XIII provides the factual data for an analysis of severance tax burdens.

The specific information concerning severance tax liability for corporate and personal taxpayers is presented in Tables 14.5 and 14.6, respectively. Corporate tax liability is shown for interstate and Colorado companies, both domestic and foreign, by asset classifications. The tax liability of individuals is depicted by broad income categories and by taxable and non-taxable returns. The taxable returns include those that showed a net tax liability after the ad valorem credit, as contrasted to the non-taxable, in which the property tax credit exceeded oil and gas tax liability.

Number and Nature of Firms Reporting Tax Liability. During the taxable year period covered by the basic income tax data, 135 corporations reported gross oil and gas tax liability. A much smaller number, 95, actually paid a net tax. The bulk of the companies reporting gross tax liability (97) as well as those which paid an oil and gas tax (67) were domiciled or had their headquarters outside of Colorado. The majority of these corporations operated on an interstate basis, 80 and 53, respectively. The predominance of the foreign and interstate companies in the Colorado severance tax picture is even more marked in the case of gross tax liability and taxes paid.

Impact of Oil and Gas Tax on Corporations. The 135 corporations reporting oil and gas income, as indicated in Table 14.5, showed a gross tax liability of approximately $5,900,000. Property tax credits against the gross tax amounted to about $2,836,000 or 48 percent. Thus, the ad valorem tax credit provision reduced the potential severance tax yield by nearly one-half, and, 40 of the 135 reporting companies paid no tax. The net tax liability reported amounted to approximately $3,214,000. While this total exceeds the difference between the gross tax and the ad valorem credit by nearly $150,000, the discrepancy is probably attributable to cases in which the credit was in excess of the gross tax liability for particular companies.

Comparing the tax liability of foreign and domestic concerns, the former accounted for 98.41 percent of gross taxes reported and 98.89 percent of net taxes. Interstate companies not headquartered in Colorado reported 90.86 percent of the gross tax, and 94.24 percent of the net tax. It is evident, therefore, that the great

bulk of the oil and gas tax burden on corporations is paid by absentee firms. The relative importance of the property tax credit for the four broad classes of firms varies significantly. The interstate concerns headquartered in Colorado receive the greatest benefit, the credit amounting to 71 percent of their gross tax; Colorado corporations not headquartered in Colorado are second with about 68 percent; the Colorado corporations headquartered in the State are third with nearly 58 percent; and the foreign interstate concerns last with 46 percent.

The data in Table 14.5 also indicate a marked concentration of the corporate oil and gas tax burden on interstate concerns with assets of $50,000,000 or more. Of the 27 corporations in this asset category, 21 accounted for nearly 91 percent of the net tax of the interstate organizations, 6 of the 27 not being subject to a net tax. The $10,000,000 to $50,000,000 asset group, which included 24 companies, was responsible for 5 percent of the total tax of interstate firms, and only 6 showed a net tax liability. Finally, the $1,000,000 to $5,000,000 asset group, involving 19 companies, accounted for 3.3 percent of the total tax for interstate companies and all others less than 1 percent.

The concentration of tax liability on firms in the larger asset classes is not nearly as marked among those operating solely in Colorado. However, the data are less revealing in that 8 companies, which were responsible for nearly 29 percent of the tax for the Colorado concerns, could not be classified as to assets. Of the remaining 33 Colorado corporations, the $100,000 to $1,000,000 asset categories accounted for nearly 14 percent of the total tax liability for such companies, and the $50,000,000 and over class nearly 55 percent.

The effective rate of the oil and gas tax in relation to gross oil and gas income exceeds the minimum tax rate of 2 percent only in the case of foreign, interstate companies.[27] It amounted to 2.68 percent for this class. Colorado corporations headquartered in other states were subject to a 1.45 percent effective rate; Colorado corporations headquartered in the State—1.32 percent; and interstate companies headquartered in Colorado—0.94 percent. The markedly higher effective rate for foreign, interstate companies may be attributed primarily to the impact of the progressive rates on the large income concerns, and the fact that the property tax credit is proportionally of lesser importance in influencing net tax liability.

Impact of Oil and Gas Tax on Individual Incomes. The results of the sampling procedure employed in the analysis of individual income tax returns (shown in Table 14.6) indicates that there were approximately 4,222 persons reporting oil and gas tax income. Of this number some 2,986 returns showed net oil and gas tax liability, and the property tax credit exceeded gross oil and gas tax liability for some 1,236 individuals. In other words, the ad valorem credit wiped out any severance tax liability for about 30 percent of the individuals receiving oil and gas income.

The total net tax liability of individual taxpayers, as reflected by the taxable returns, amounted to $214,611. Individuals, therefore, were responsible for only 6.3 percent of the total net severance tax liability. The gross tax liability for all personal returns both taxable and non-taxable totalled $503,630, and ad valorem credits amounted to $430,101 or over 85 percent of the gross tax. Thus, the property tax credit, in the case of individuals, eliminated the great bulk of potential revenue from the oil and gas tax. This substantial disparity in the effect of credit as between individual and corporate tax liability may be explained in large degree by the individual ownership of oil and gas deposits which are leased by the producing companies.

The distribution of the individual oil and gas tax burden by selected income categories, as shown in Table 14.6, reveals a broad spread ranging from about 5 percent of the total tax for the $8,000 to $10,000 income group to 38 percent for the $50,000 and over income class. The $15,000 to $50,000 income category was responsible for nearly 27 percent of the total tax; the $5,000 to $8,000 group—12 percent; the $0 to $5,000 class—nearly 10 percent; and the $10,000 to $15,000 group—about 8 percent. While the proportion of the total tax load shown for the $0 to $8,000 income classes is relatively large, it should be remembered that the great majority of individual taxpayers fall in this income range.

It will be noted that there is a marked difference in the significance of the property tax credit for different income classes in the case of the taxable returns. The range is from a credit of less than 2 percent of the gross tax for the $5,000 to $8,000 income group to slightly over 50 percent for the next income category ($8,000 to $10,000). This extreme divergence logically must be explained by differences in the nature of individual royalty rights, and, consequently, the availability of the property tax credit.

The effective rate of the oil and gas tax on the gross oil and gas income of individuals liable for payment of a tax was 1.65 percent.[28]

Although this is considerably lower than that applicable to the gross oil and gas income of foreign-interstate companies, it represents an approximate average of the rates for the four classes of corporations.

Potentialities of Severance Taxation in Colorado

The future role of severance taxation in Colorado should be governed primarily by considerations of equity and the economic impact of the tax on resource development and utilization. Revenue potentials are important, but of secondary concern.

Desirability of Extending the Tax Base and Other Policy Changes. The gross income base and rate structure of the present oil and gas tax appear to be well adapted to the purposes of this form of taxation. The progressive feature of the rate schedule provides a substantial incentive to new firms and the small operator. The principal questions at issue are the desirability of extending the tax to other types of minerals and the removal of the property tax credit which substantially reduces the burden of the tax as well as the yield.

From the standpoint of equity, the broad objective of tax policy in this field, as previously indicated, is to achieve equality of tax burdens upon different types of mineral production and as compared to other forms of productive activity. Similarly, it is desirable to maintain a reasonable relationship between the tax burdens upon such resources in Colorado and in neighboring states.

The recent report of the Legislative Council Committee on Colorado Property Assessment Methods indicates an extreme variation in the assessment base for different types of mineral production as well as highly variable results in the application of these rules. Three official bases of assessment, as explained in Chapter VII, are employed: (1) 87½ percent of the value of the gross product in the case of oil and gas properties; (2) 25 percent of the value of the gross product or the total net income (whichever is greater) in the instance of other "producing" mineral properties; and (3) a flat sum per acre (highly variable) for "non-producing" mineral holdings. The differential between oil and gas and other producing mineral properties is obviously extreme, and would be highly discriminatory except for the credit for property taxes allowed under the oil and gas severance tax. The flat sum per acre basis of assessment for various types of non-producing mineral lands is also likely to be highly inequitable. As the amount of the assessment is left to the discretion of the individual assessor this result is virtually assured.

It should be emphasized that the gross or net product bases of assessment bear no necessary relationship to capital value. They clearly result in fractional assessment in relation to such values, and in widely varying ratios. Furthermore, there is little doubt that most producing and non-producing mineral properties are subject to a much lower ratio of assessment (assessed value vs. capital value) than other types of real estate and income-producing personalty.

Considering present practices in the assessment of mineral properties, the property tax credit for oil and gas producers under the severance tax, and the highly favorable treatment of mineral production under the State net income tax, it is obvious that Colorado is not achieving equal tax burdens upon various types of mineral production or as between mineral resources and other forms of property. The present oil and gas tax involves some additional burden on these industries but falls short of the broad equality objective, and other forms of mineral production are generally under-taxed.

In terms of the practice of neighboring states, the rates of the Colorado oil and gas tax are much lower than the Texas, Oklahoma and New

Mexico levies. Utah imposes a 1 percent tax and Wyoming does not have a severance tax. Moreover, the four neighboring states taxing these resources use the severance tax as an additional levy. The property tax credit under Colorado's oil and gas levy, as indicated in the burden analysis, reduces the over-all effective burden of the severance tax by about 50 percent. Its effects as between taxpayers are capricious, though it does tend to have an equalizing influence on over-all tax burdens (state income and property taxes). If Colorado's policy is out of line with that of the leading oil producing states in the region, therefore, it involves a substantially lower rather than higher burden situation.

In considering the equity of tax burdens on mineral properties, it should also be emphasized that taxes entering into the cost of production are typically shifted to consumers in the form of higher prices. The severance tax is no exception to this rule. Under normal conditions it is shifted, and will involve some degree of regressive effect upon low and medium as compared to high income groups. As the bulk of mineral production is consumed outside the State this burden is widely diffused throughout the entire economy. Needless to say, the severance tax burden which is shifted cannot at the same time involve a direct burden upon the industry. It should be recognized, however, that special conditions may arise in a given line of mineral production which make shifting impossible either in the short-run or long-run. These conditions include a temporarily unfavorable market and the case of a chronically-depressed or declining industry. The former type of situation is not restricted to natural resource production, and should not influence the formulation of long-range taxing policy. The latter constitutes a special problem.

The effect of severance taxes upon resource development and utilization will depend upon the over-all impact of tax policy and the economic status of the particular type of mineral production involved. The first factor has been thoroughly explored. Colorado's tax policy in the general as well as severance tax areas is very liberal. It involves substantial tax favors to the industries in question, including oil and gas production. In the light of the "administered pricing policies" in these and certain other lines of mineral production and existing tax practices, a considerably heavier tax burden should not prejudice development or production activities.

The potentially undesirable effects of tax policy upon mineral development and production are limited to chronically depressed or declining areas of production. Marginal or submarginal operations in a field of production which is generally profitable as previously noted do not merit preferential treatment. The former situation, however, presents a difficult policy problem.

Once the existence of such conditions in an industry has been demonstrated and the causes ascertained, there are two primary policy issues to be resolved. First, is the industry of sufficient importance in the state's economy to justify assistance provided at the expense of the general taxpayer, and will such action contribute to a solution of the basic problem? Second, assuming a positive answer to these questions, what is the most appropriate method or methods of extending such assistance? Thus, it is quite obvious that any reasonable approach to the problem of such industries must be much broader than the tax policy aspects.

At the present time, with certain exceptions, the economic status of Colorado's mining industries is not definitely known. The specific information concerning costs, profits and/or deficits, and the relative position of Colorado producers in the over-all production or supply picture, are not available or have not been verified. Yet, these facts are essential to intelligent policy formulation. Until these data are provided through a comprehensive investigation by experts not associated with the interest groups involved, state taxation probably should be restricted to the areas in which the economic status of production is known.

In the absence of such data, strong industry claims of unprofitable operation certainly merit attention. However, if 20 to 40 percent depletion allowances are employed as a basis of calculating net income these claims obviously require further scrutiny. If unprofitable operation on the basis of actual depletion is established and if output has been declining over an extended period, the introduction of a severance tax as an additional levy would appear to be ill-advised. A revision of current policy to provide more equitable and consistent application of existing taxes is also desirable. It should be emphasized, however, that tax relief alone is not likely to resolve the problems of depressed industries. Certainly the minimal property tax burdens on mineral production in Colorado cannot be said to be a significant influence upon the economic status of the industries involved. The principle effort of the state government, therefore, should be directed to the underlying causes of unprofitable operation in the particular area of mineral production.

Conclusions

Policy Issues. In general, Colorado's present tax policies are highly favorable to producing mineral properties. They are subject to fractional assessment in varying degree under the property tax, and they receive very liberal depletion allowances under the net income tax. As compared to other forms of mineral production, oil and gas are subject to an additional burden. Thus, a discriminatory situation exists

favoring other types of minerals. In relation to the tax policies of most neighboring states, however, the severance tax on oil and gas is very moderate. This effect is a direct result of the property tax credit.

In conclusion, two changes in severance tax policy are merited on grounds of equity, and should not prejudice resource development or utilization. First, the base of the present tax should be extended to certain other lines of mineral production. A selective approach involving other major types of minerals, such as molybdenum, vanadium and uranium is indicated. Second, the property tax credit should be eliminated. Finally, it is essential that the present property assessment regulations as well as practices be overhauled to ensure consistent and equitable results.

Revenue Potential of a Broader-Based Tax. The approximate effect of the changes indicated upon tax receipts have been estimated using the basic data provided by the burden analysis. Elimination of the property tax credit would have increased 1956 receipts by slightly more than $3,000,000. Extension of the present oil and gas tax rates, without a property tax credit, to molybdenum, vanadium, and uranium would have produced approximately $2,200,000.[29] Thus, the percentage of increase factors for the two changes individually are 88 and 64.6 percent, respectively. On an over-all basis, therefore, they should increase current receipts by about three times.

It should be noted that oil production in Colorado and consequently receipts have declined during the last year. While this situation is temporary at least in part, the trend of production in the immediate future will probably remain at a fairly constant level. Barring an unforeseen acceleration in shale oil development, therefore, a substantial increase in yields is dependent upon changes in the scope and base of the present tax.

---

[29]The combined value of the product in 1956 was estimated at $57,980,000 and the calculated effective rate of the tax was 3.81 percent.

CHAPTER XV

INHERITANCE, ESTATE AND GIFT TAXES

The two principal types of death taxes employed in the United States are the inheritance tax and the estate tax. At one time the term "inheritance taxes" was somewhat synonymous with "death taxes" but in more recent times it refers to a tax levied on the beneficiaries of an estate. An estate tax is a tax, the incidence of which is on the estate and is paid before the heirs receive their shares. It is generally agreed that the estate tax is easier to administer and a more lucrative revenue producer but that the inheritance tax is more just if measured in terms of ability-to-pay.[1]

Death taxes are usually considered to be levied on the act of transferring property, not on the property itself. Hence the tax is interpreted to be an indirect tax and not subject to the problems faced by a direct tax.[2] In the past, death taxes were often interpreted as property taxes and therefore of a direct nature since early state death taxes were confined to personal property and were justified on the basis that such property had escaped taxation during the lifetime of the owner.[3]

History and Description of Death Taxes

Death taxes are one of the oldest forms of taxation, having been used in ancient Egypt and Greece.[4] The feudal system of the Middle Ages was characterized by certain forms of inheritance taxes and the more recent development of the institution of private property has resulted in the extensive use of inheritance taxes throughout the world.[5] In modern times, England stands out as the country in which death taxes have been most fully developed.

Prior to the First World War, the federal government of the United States imposed various death taxes which were temporary emergency measures. In 1916, the estate tax was permanently added to the federal tax system, although it was considered temporary legislation at the time. The early tax carried rates which ranged from 1 to 10 percent, while the present rates range from 3 to 77 percent. In 1924 abandonment of death taxes by the federal government was advocated on the grounds that it would free this source of revenue for the states.[6] Although the attempt proved unsuccessful, a provision was written into the federal law which allowed a credit up to 25 percent of the federal estate tax for death taxes paid to states. This 25 percent credit was increased to 80 percent in 1926, when federal rates were also reduced. In recent years rates have been increased but the 80 percent credit is applicable only to the basic rates of 1926. Therefore, the 80 percent credit no longer represents the degree of abandonment by the federal government of the estate tax that it once did.

Although federal estate tax collections have continually increased in recent years, the tax has remained a stable source of revenue in terms of relative fiscal importance. It can be seen from Table 15.1 that federal inheritance tax collections increased from $706 million in 1950 to $1,171 million in 1956.[7]

Even though a dozen states attempted to levy an inheritance tax in the nineteenth century,[8] the only state which enjoyed substantial success was New York, where a proportional inheritance tax was levied in 1895. In 1903 Wisconsin levied a progressive inheritance tax which was later to become a model for other state death-tax systems. During this period, several states

---

[4]William J. Shultz, "Inheritance Taxation," *Encyclopaedia of the Social Sciences*, Volume 8, p. 43.

[5]That inheritance is a necessary institution of a capitalistic society has frequently been questioned by various economists. John Stuart Mill proposed a strict limitation of the amount an individual could inherit and Jeremy Bentham advocated abolition of the institution of inheritance except for direct heirs.

[6]It has been argued that the state has the ultimate title to land and other property and is therefore in a better position to levy inheritance taxes. However, if the federal government were to abandon death taxes, competition between the states might result in death tax rates being driven to a minimum. Other arguments for federal retention of the estate tax are that inheritances are very difficult to localize or attribute to one state and that multiple taxation frequently occurs in state death-tax systems.

[7]Prior to the Second World War, the federal estate tax was of more fiscal significance than since 1950, often accounting for as high as 5 percent of total federal revenues, as in 1940.

[8]Pennsylvania imposed the first state inheritance tax in 1826 although some forms of probate duties existed in earlier periods.

attempted to attract wealthy individuals by imposing little or no inheritance tax. Florida, for example, passed a constitutional amendment forbidding the imposition of an inheritance tax. With the adoption of the federal credit in 1924, a major impetus was given to the adoption of inheritance taxes by the states because the taxpayers would pay the same amount of taxes but a substantial part of it would now be paid to the state rather than to the federal government. Accordingly, all the states, with the exception of Nevada, have adopted some type of death tax in order to take advantage of the federal credit. Although some states impose a tax equal to the federal credit only, the more common method is to impose an inheritance tax supplemented by an estate tax. The latter usually is applicable only if the inheritance tax fails to equal the federal credit. Hence, the estate tax is usually supplementary and designed only to insure full absorption of the federal credit. This technique has been adopted in 32 states, Colorado included.

Table 15.1

Federal and State Death and Gift Tax Revenues 1950-1956

(Dollar totals in millions)

	Federal				All States			
Year	Estate	Gift	Total	Death taxes as percent of total budget receipts	Inheritance	Gift	Total	Death taxes as a percent of total taxes
1950	$ 657.4	$ 48.8	$ 706.2	1.9	$167.9	$2.7	$170.6	2.1
1951	638.5	91.2	729.7	1.5	190.2	5.4	195.6	2.2
1952	750.6	82.6	833.2	1.4	207.2	3.8	211.0	2.1
1953	784.6	106.7	891.3	1.4	217.6	4.4	222.0	2.1

Source: Adapted from Analysis Staff, Tax Division, Treasury Department, "Federal and State Inheritance and Estate Taxes," September, 1957.

State death taxes are one of the most firmly established state revenue sources, as evidenced by the fact that the 47 states have retained this tax for over 25 years.[9]

A major problem associated with the inheritance or estate tax is the *inter vivos* gift (between living persons) which is made prior to death and in anticipation of the death tax. To avoid inheritance or estate tax revenue losses due to this subterfuge, twelve states, Colorado included, have adopted a gift tax. In many of the 12 states, gift tax rates are the same as the inheritance tax rates. The purpose of the gift tax is not to yield revenue, but rather to act as an administrative supplement to state death-tax systems.[10] Nevertheless, a large number of states, presumably motivated by the small gift tax revenue in other states, have failed to enact a gift tax. The inheritance or estate tax revenue loss due to this failure is impossible to estimate, but it could be substantial.[11]

Total state inheritance tax collections have continually increased in recent years, and as can be seen from Table 15.1 they exceeded $310 million in 1956. However, as a percent of total taxes, inheritance taxes have remained fairly constant in recent years, providing slightly more than 2 percent of the total taxes collected in all states.

Rationale of Death Taxes

Most of the arguments supporting inheritance taxes view these taxes as a means of achieving a desirable qualification of the institution of private property in the same manner that various laws qualify the use of private property. It has been argued, however, that inheritance taxes can be used as a vehicle for abolishing inheritance, an institution which it is held is not only unnecessary in a capitalistic society, but is socially undesirable. Confiscatory inheritance taxes could also be justified as a partial means of eliminating private property although ". . . the socialist school of writers has generally ignored the inheritance tax, viewing it merely as an undesirable palliative of the evils they are attacking."[12]

The arguments which are offered in support of inheritance taxes with something less than confiscatory rates are numerous and are presented from various points of view.

One legalistic argument is that inheritance is not a right but rather a privilege granted to the people by the state. Were there no heirs to the estate, the property would pass to the state, on grounds that the state holds *ultimate* title to all land and other property. Hence, a tax levied on the transfer of property is a payment for the privilege of being able to inherit property. Another legalistic argument is that the estate could not have been amassed had not the state provided the environment for such accumulation.

[9] L. Laszlo Ecker-Racz, "State Taxes After the 1956-1957 Legislative Sessions," *National Tax Journal*, December, 1957, p. 296.

[10] Total state gift tax collections have averaged only about 2 percent of total state death tax collections in recent years. See U. S. Bureau of the Census, *Compendium of State Government Finances*, Annual Reports.

[11] Per capita death burdens do not appear to be lower in non-gift tax states than in states which impose a gift tax. However, a per capita comparison is of questionable value as an indicator of the extent of avoidance through the use of *inter vivos* gifts because of the different state tax rates, and the differing number and extent of wealthy persons in the states.

[12] Shultz, "Inheritance Taxation," *op. cit.*, p. 45.

The point is made that the state not only provided the opportunity, but in addition protected the property once it had been accumulated. Hence, the state is viewed as a partial contributor to the estate and, therefore, as a co-owner is entitled to share in the benefits of the estate. The state's share is simply taken at a convenient time, that is, when the estate is being divided and distributed at the death of the ostensible owner. Presumably, the rates of the tax would correspond to the degree to which the state has been responsible for the accumulation of the estate. Logically it would seem that 100 percent rates could be justified on the basis that man could not exist without the state. This argument lacks force if one views the state as a product of man rather than man as a product of the state.

From an egalitarian viewpoint, inheritance taxes are supported on the grounds that they tend to reduce the inequality of income distribution. The burden of the tax is on the wealthy while the benefits of the tax are enjoyed, through the state, by all. Implicit in this argument is the belief that society would benefit if incomes were more equally distributed, a point generally agreed upon although the degree of equality desired has not been defined.

Few taxes have received support from both liberal and conservative points of view as has the inheritance tax. In addition to the equalitarian argument mentioned above, the taxes are also supported from an individualistic viewpoint.[13] It is held, for example, that unqualified inheritance creates a concentration of wealth that places the average individual at a disadvantage although he may be more competent. It is argued that an environment should be created in which individuals may excel to the full extent of their ability. Part of this environment is equality of opportunity. A sense of "fair play" dictates that individuals begin from the same "starting line."

One of the more frequently offered justifications for the taxation of inheritance is that it conforms closely to the widely accepted principle of ability-to-pay. It is held that little sacrifice is involved in inheritance taxation because the decedent, of course, incurs no sacrifice and the beneficiary incurs no sacrifice because the inheritance is in the nature of a "windfall." This justification of the inheritance tax has been subject to criticism on the grounds that ability-to-pay may or may not be present when an estate is transferred. If a dead person can incur no sacrifice it is equally true that he has no ability-to-pay. If it is the ability-to-pay of the beneficiary that is being singled out, there is doubt that inheritance necessarily indicates ability-to-pay because the financial position of the beneficiary prior to the inheritance is not taken into account. Most inheritance taxes are graduated according to the size of the inheritance and not according to the financial well-being of the inheritor.[14] The ability-to-pay principle seems to be more appropriate for justifying the progressivity of inheritance taxes than for the levying of the inheritance tax itself.

In addition to the above justifications of the inheritance tax, it is also argued that these taxes have little economic impact upon the beneficiary because the inheritance is an "economic surplus" or unearned income. In addition, it appears that the tax is easy to administer, reaches property which, due to evasion or avoidance, has previously escaped taxation, and is a tax which is relatively difficult to shift.

An argument frequently made against inheritance taxes is that they adversely affect the capital or potential capital of a country in several ways. First, it is argued that individuals will not accumulate savings if they are not allowed complete freedom in their disposition. At one time the desire to bequeth assets to one's children may have been a strong incentive in the accumulation of capital, but it is doubtful if this is significant today. If the freedom of disposing of one's assets at death acts as an incentive it is only one of many incentives.[15] It might equally be argued that in some cases the inheritance tax results in greater savings because more savings are necessary to pay the tax as well as leave an estate of some size.

Another way in which inheritance taxes are alleged to decrease the capital of the country is that capital goods must be sold to meet the burden of the tax. In some cases the sale of capital goods may be necessitated by the inheritance tax but it is fallacious to argue that this decreases the capital of the country because what one individual sells another buys and society therefore incurs no net gain or loss. Closely related to the preceding argument is the more valid contention that inheritance taxes tend to accelerate the business concentration movement partly because of uncertainty of burden at the

[13] No less of an individualist than Andrew Carnegie supported the taxation of gratuitous bequests.

[14] Inheritance taxes graduated according to the financial position of the recipient have been advocated and were actually attempted in Germany and Italy in the early 20th century. The attempts proved unsuccessful due to administrative difficulties.

[15] Even if one assumes that inheritance taxes result in decreased savings, it should be pointed out that decreased savings need not result in decreased capital; on the contrary it may result in just the opposite. The act of saving and the act of investing, i.e., purchasing capital goods are separate and usually done by different groups of people with different motivations. If inheritance taxes decrease savings, adherents of Hansen's stagnation thesis, which in its simplest form states that savings forthcoming at full employment are excessive for maintenance of full employment, would consider decreased savings an advantage of inheritance taxes.

individual's death.[16] Another factor is the fear that the estate will be in an illiquid position thereby necessitating forced sale of securities held by the estate and the probably ensuing loss, as well as the possible jeopardy to the concern in which the securities are held. Uncertainty of burden is contrary to established principles of taxation, but when it is responsible for accelerating a possible concentration movement, the undesirability is compounded. This indictment seems to have considerable merit, but applies more to the administration of the tax than to the nature of the tax itself. For example, much of the uncertainty of the burden is due to the valuation of closely held securities, and administrative improvement is possible in this area.

Another argument offered against inheritance taxes is that they fall on upper income groups which are most responsible for capital accumulation, and therefore the tax tends to decrease the potential capital of the country. This argument makes the fallacious assumption that savings and investment are synonomous, as well as ignoring the fact that the tax collections may be used by the government to purchase capital goods such as roads, dams, and so forth.

A possible effect of inheritance taxes is that they may be self-defeating. If steeply graduated inheritance taxes are added to a tax system which relies heavily on progressive income taxes, the effect would probably be to decrease the size of inheritances, thereby decreasing the tax base and tax revenues. However, it would appear that rates would need to be considerably higher than they now are. Also, one of the major reasons offered for levying an inheritance tax is to avoid undue concentrations of wealth. If this objective were fully achieved, there would be little revenue forthcoming from the tax.

A final argument against inheritance taxes is that they adversely affect gifts for educational and charitable purposes. It is argued that the continuation of private philanthropy rests on large estates and that diminuation of these estates will diminish the useful services performed by private philanthropic organizations.[17] Although inheritance taxes might have this effect in the long run, the short-run effect is probably to encourage contributions to private philanthropic organizations because they are exempt from the tax. Hence, the government is subsidizing philanthropic organizations through the inheritance tax exemption as well as the more commonly thought of income tax deductions.[18] In the long run, it appears that charitable organizations could be adversely affected by inheritance taxes, although rates would probably need to be somewhat higher than they presently are. If society deems it desirable to attempt to diminish concentrations of wealth through inheritance taxes, it should recognize that such action may adversely affect private philanthropy to some extent. The cost of this possibility must be weighed against the advantages of possible diminished concentrations of wealth.

Death Taxes in Colorado

Colorado first imposed an inheritance tax in 1901.[19] The original legislation has been amended from time to time notably in 1927 when the tax rates were increased to take advantage of the federal credit introduced in 1924 and amended in 1926. The proceeds from a additional tax of 10 percent, imposed in 1933, accrued to the pension fund of the counties but have since been made payable to the Old Age Pension Fund. In 1937 the gift tax was introduced which in conjunction with the inheritance tax presently constitutes the death tax system of the State.

State revenues from death taxes have increased generally over the past three decades. Throughout the 1930's they fluctuated around $1 million annually and in the 1940's they ranged between $1 million and $2 million.[20] A sharp raise is noted thereafter, particularly between 1954 and 1957 when revenues almost doubled, or from $2,475,000 to $4,544,000. Despite these increased revenues the ratio of death tax collections to total state tax revenues has not changed significantly. As noted in Table 15.2 this ratio has averaged between 2 and 3 percent since 1950.

As a part of total death tax revenues, the gift tax has since 1950 varied from 17 percent in 1954 to 2 percent in 1952. Inasmuch, however, as the gift tax is basically intended to prevent the avoidance of the inheritance tax a ratio of this amount is by no means insignificant. Thus, in 1954 the tax yielded over $400,000 and nearly $300,000 in both 1956 and 1957 — or amounts which otherwise might have been lost had there been no gift tax.

---

[16] For a complete discussion of this argument, see Harold M. Somers, "Estate Taxes and Business Mergers," *Journal of Finance*, 8:201-10, May, 1958; and, J. Keith Butters, Lawrence E. Thompson, and Lynn L. Bollinger, *Effects of Taxation: Investments by Individuals* (Boston: Harvard University, 1953), pp. 34, 171.

[17] One could question the implicit assumption that philanthropic organizations perform more useful services than could have been performed had the money accrued to the government in the form of taxes and been spent for similar purposes.

Inheritance Tax. Colorado's inheritance tax is quite similar to the inheritance taxes adopted in other states. Certain deductions and exemptions are allowed and the rates are graduated not only according to the value received but also according to the relationship of the inheritor to the deceased.

The present inheritance tax statute calls for a tax on the transfer of property by will, intestacy, or by gift in contemplation of death. Within the meaning of the law, every person is presumed to have died a resident of Colorado, if he has lived in the State during and for the greater part of any 12 consecutive months of the 24 months preceding his death.

The tax is imposed on all the property transferred by the decedent, in trust or otherwise, with deductions and exemptions allowed as discussed below. The tax applies to all transfers of property, whether real or personal, tangible or intangible, and wherever situated or located. The transfer of real property and tangible business property by a non-resident is subject to tax only if such property is located within the State. If intangibles are involved, the transfer is taxed if the intangibles have acquired an actual or a business situs in the State.

The statute further provides that the tax shall be based on the fair market value of the property, such value being established by appraisal at the date of death. Life insurance proceeds of less than $75,000 are exempted from the tax.

Certain other property is exempt from the tax. The pertinent provisions of the statute are that all transfers to or for the use of the United States, any state or political subdivision thereof, any public institution, corporation or association formed for charitable, benevolent, educational, or religious purposes, are exempt.

Various deductions are permitted in arriving at the fair value of the property to which a transfer is related. The deductions are limited to the following:

1. Debts of the transferor which are lawful claims against his estate.
2. Taxes:
   a. On real and personal property within the State and which were a lien and and unpaid at the date of death.
   b. Income taxes on the transferor's income up to the date of death.
3. Funeral expenses and any amount up to $500 to be spent for a memorial or monument.
4. Executor and administrator fees or commissions.
5. Administrative expense, including reasonable attorney fees, but not including clerical expenses.
6. Certain miscellaneous items.

It should be noted that Colorado does **not** allow deduction of the Federal estate tax before computing the state inheritance tax liability although twenty-five other states do allow this deduction. [21]

Table 15.3 shows the present rate structure of Colorado's inheritance tax. It will be observed that beneficiaries are classified by nearness of relationship to the decedent, Class A applying to very near relatives and Class D to unrelated persons. These classes are subject to different exemptions and rates. It will be noted also that a wife is given a $20,000 exemption while distant relatives or unrelated persons have no exemption unless the transfer is less then $500 in which case there is no tax. Rates range from 2 to 8 percent for Class A beneficiaries, and from 7 to 16 percent for unrelated persons, depending upon the value of the bequest.

Gift Tax. The gift tax in Colorado is very similar to the inheritance tax. Gift recipients are classified according to their relationship to the grantor and are subject to a graduated tax, the rates being the same as those for the inheritance tax.

The tax is imposed on all transfers of property, whether the gift is direct or indirect and whether the property is real or personal, tangible or intangible. All transfers of property within the States are taxed whether made by residents or non-residents. Gifts made to governmental jurisdictions or institutions organized for charitable, educational, or religious purposes are exempt.

Exemptions are identical to those of the inheritance tax except that Class C and D recip-

ients are allowed a $500 exemption. In addition to these lifetime exemptions, Class A recipients are allowed to annually exclude the first $2,500 received; Class B recipients, the first $1,500 received; and Class C and D recipients, the first $1,000.

Administration. Both the inheritance tax and gift tax are administered by the office of the Attorney General. Collection of the tax, however, is vested with the Revenue Department. In the United States today, only three states lodge this area of jurisdiction with the department of law. The greater number of states place the administration of the statute in the tax department or in a revenue department.[22]

The number of estates handled by the Inheritance Tax Division in the past few years has remained fairly stable between 8,000 and 9,000. Approximately two-thirds are waiver estates and about one-third are in the form of assessments. Currently, the number of gift tax returns is averaging approximately 500 per year and a little more than one-half of these are taxable.[23]

Administrative costs incurred by the Inheritance Tax Division have continually increased in recent years, nearly doubling between 1950 and 1957 or an increase from $50,833 to $95,379 (Table 15.4). However, tax collections tended to increase more rapidly than costs during the period so that the ratio of costs to collections actually declined from 2.9 percent in 1950 to 2.1 percent in 1957.

Interstate Comparison of Death Taxes

As noted in Table 15.5 thirty-seven states levy an inheritance tax and, with the exception of Oregon, these states also have a differential estate tax. The latter is designed to fully absorb the federal credit and is applied only when the federal credit exceeds the state inheritance tax. Of the remaining 11 states, 7 impose an estate tax based on the 1926 federal levy, 3 impose an independent estate tax, and one state, Nevada, does not have a death tax in any form.

Of the 37 states which impose an inheritance tax, only 11 states, including Colorado, have a

gift tax.[24] The 26 states which fail to employ a gift tax in conjunction with their inheritance tax undoubtedly experience some avoidance through *inter vivos* gifts. How much revenue is lost on this account is, of course, impossible to estimate.

* No death taxes.

Source: Reports of U. S. Treasury Department, Analysis Staff, Tax Department.

Although the federal credit has had the effect of preserving the death tax as a source of state revenue, some states continue to use the tax as a competitive device to attract or retain wealthy persons. States such as Florida and Arizona continue to follow their traditional pattern by imposing a state tax equal only to the federal credit. Nevada, as noted above, imposes no death tax at all. As long as some states continue to impose minimum death taxes, the attempt to raise substantial revenues by this means by other states could result in losses of some wealthy citizens. Although some individuals might relocate because of favorable death tax differentials, numerous other factors would play a significant part in the establishment of a residence. A desirable climate, for example, could often be more important than the structure of the death taxes within a state. In addition, it is the difference in the various state death taxes and not the total amounts that would be important as a location factor. These differences would be small in many cases, since a large portion of the death tax liability which an individual incurs is paid to the federal government and cannot be escaped by moving from one state to another.

Total death and gift tax revenues vary substantially between the states. As noted in Table 15.6 per capita collections in 1956 ranged from a high of $14.86 in Delaware to a low of $.14 in Arkansas.[25] Colorado's per capita collections were $2.44 which exceeded the 47-state per capita average of $1.75. In rank order, as noted in Table 15.6, Colorado is ninth, that is, 8 states impose a higher per capita death tax burden while 38 impose lower death tax burdens.

A substantial difference in per capita death tax burdens among the states is due not only to a difference in death tax structures, but also to wide variations in the wealth of states. Therefore, if death tax collections are taken as a ratio of a state's personal income, it is somewhat more meaningful than reducing death taxes to a per capita basis.[26] Only in Delaware do death taxes exceed ½ of 1 percent of personal income, and in many states, they are less than 1/10 of 1 percent of personal income. The average for all states is 0.09 percent. Colorado's rate of 0.13 percent is somewhat above the average for the 47 states.

Death taxes as a source of revenue play a minor role in most states, although in Connecticut, Delaware, New Jersey, and Pennsylvania, these taxes accounted for over 5 percent of total state revenues in 1956. The average for the 47 states, however, was only 2.1 percent. Colorado's 2.7 percent again places the State above the national average.

[24] It can be seen from the table that 12 states in total employ a gift tax. Oklahoma levies no inheritance tax but employs a gift tax in conjunction with an estate tax.

[25] Comparison of per capita death tax burdens should be used with caution because death taxes are paid by a relatively small proportion of the population.

[26] This method still fails to account for differences in the wealth distribution within the states.

[a] Employs an estate tax only.
[b] These states supplement their inheritance tax with a gift tax.
[c] Differs slightly from data in Table 15.1 due to different source.

Source: U. S. Department of Commerce, Office of Business Economics, *Survey of Current Business*, August 1957, p. 11; and, U. S. Department of Commerce, Bureau of the Census, *Compendium of State Government Finances, 1956*, p. 11.

Inheritance Tax Exemptions and Rates. Death tax exemptions and rates are virtually impossible to compare because of the great variation between states. Exemptions are established by the classification of heirs and these classes frequently differ widely. Rate structures are difficult to compare because of varying rates of progressivity. This difficulty is compounded by the two-way progressivity of death taxes, that is, graduation by relationship to the deceased as well as the amount of inheritance received. One method which gives some indication of the difference in exemptions and rates is to select common heirs and examine the exemptions and rates which would be applicable. Table 15.7 shows the exemptions which apply to 5 selected groups of heirs and the range of rates which apply to 4 groups. In addition, the progressivity of the rates is indicated by showing the size of the first bracket and the level at which the top rate applies for a spouse.

In reference to the exemptions which are allowed a widow, it will be noted that the most frequently allowed exemption is $10,000 (found in 14 states). Colorado by allowing an exemption of $20,000 is considerably more liberal than the average. Only 8 of the 37 states allow a higher exemption, or impose no tax at all, while 25 states allow a lower exemption for a widow.

The most frequent exemption for a minor child is $10,000 which is allowed in 14 states including Colorado. Only 8 states allow a higher exemption or impose no tax at all, while 16 states offer a lower exemption for a minor child.

The most frequent exemption for an adult child is $5,000 allowed by 11 states. Nearly as common is the $10,000 exemption found in 10 states including Colorado. This exemption for an adult child is exceeded in only 8 states while 19 states permit a smaller exemption.

The most frequently occuring exemptions for a brother or sister are $500 and $1,000 each found in 9 states. Colorado's exemption of $2,000 is exceeded in only 9 states, while 25 states allow a lower exemption or no exemption at all.

Exemptions for non-relatives are not allowed in thirteen states. Colorado, Missouri and New Jersey follow the unusual practice of not allowing an exemption if the beneficiary's share is over $500. If, however, the share is under this amount, it is exempt. Though this procedure is designed to simplify administration, some inequity results on this account in the case of gifts around $500.

All things considered, Colorado appears to be more generous than most states in regard to exemptions. Yet, as was mentioned earlier, her death tax burden appears to be greater than that of many other states. Paradoxically also is the fact that Colorado allows exemptions to be taken before the rates are applied, while 19 states deduct exemptions from the first bracket. Hence, an exemption in Colorado is applicable to the top bracket whereas the exemption is deducted from the first bracket in the other states. The latter method results in a substantially smaller loss of revenue.

A close comparison of death tax rates among the states is difficult to make because of differences which exist in rates of progression, exemptions allowed, evaluation practices, deductibility features, and other provisions of the laws. However, it would appear that Colorado's rate structure is not substantially out of line with structures in other states although it seems somewhat higher. Since Colorado allows generous exemptions, and yet has a fairly high death tax burden, the discrepancy must be explained largely by Colorado's somewhat higher-than-average rate structure.

[a] With the exception of Oregon, South Dakota and West Virginia, all states impose an estate tax in addition to the inheritance tax in order to assure full absorption of the 80 percent federal credit.
[b] Exemptions are deductible from 1st bracket.
[c] Half of the community property passing to surviving spouse is not taxable.
[d] Additional taxes, equal to 10 percent of the inheritance tax, are also imposed.
[e] No exemption is allowed if beneficiary's share exceeds the amount shown in the exemption column.
[f] The exemption shown is the total exemption for all beneficiaries falling into the particular class and is shared by them proportionately.
[g] Additional taxes, equal to 23 percent of the inheritance tax, are also imposed.
[h] Transfers of real property are taxed at ¾ths of the indicated tax rates.
[i] These rates are subject to the limitation that the total tax may not exceed 15 percent of the beneficiaries share. An additional tax equal to 30 percent of the inheritance tax is also imposed.

Source: Reports of the Treasury Department, Analysis Staff, Tax Division.

Gift Tax Rates and Revenues. Colorado and eleven other states impose a gift tax. With the exception of Oklahoma, where no inheritance tax is employed, the gift tax is used as a supplement to the inheritance tax. Gift taxes are usually graduated according to nearness of relationship and the size of the gifts. Exemptions are allowed various classes of recipients. In addition to these lifetime exemptions allowed in many states, there are also certain annual exclusions. Some states, as well as the federal government, have set gift tax rates at 75 percent of the inheritance tax rates.[27] The gift tax in Colorado is levied at the same rates as the inheritance tax.

Although it is difficult to compare gift tax rates and exemptions, an effort has been made in Table 15.8 to show exemptions and rates applicable to selected heirs. As will be noted, Colorado does not appear to be unreasonably out of line with other states although there is some evidence that rates are slightly above the average. Table 15.8 also shows the annual exclusion allowed by the states. Colorado's exclusion of $2,500 does not differ markedly from the average.

Gift tax revenues on a per capita basis vary widely. It will be seen in Table 15.9 that collections in 1956 ranged from a high of $.25 in Wisconsin to a low of $.05 in Louisiana. Colorado's revenue of $.18 was exceeded by collec-

Source: U. S. Bureau of the Census, *Compendium of State Government Finances in 1956*, p. 11; and U. S. Department of Commerce, Office of Business Economics, *Survey of Current Business*, August, 1957, p. 11.

tions in only two states, Oklahoma, and Wisconsin. It will also be noted that Colorado's ratio of death taxes to total taxes places it fourth highest among the 12 gift-tax states.

Summary. Colorado appears to have a somewhat higher death tax burden than the national average as measured by per capita revenues, the ratio of death taxes to personal income, and the ratio of death taxes to total revenues.

The relatively liberal exemptions and the deductibility feature allowed by Colorado are offset by its somewhat higher-than-average rate structure. These rates however, are not far out of line with other states so that downward revision is not indicated at this time.

CHAPTER XVI

PARI-MUTUEL TAX

The tax on pari-mutuel racing is a source of revenue in twenty-four states of which seven are located in the West. Of this total number also, four states—Michigan, New Mexico, Colorado and Nevada—have introduced pari-mutuel since World War II.

In most of these states the tax is a relatively minor source of state government revenue, the notable exceptions being Florida, New Hampshire, New Jersey and Rhode Island. In 1957 collections amounted to approximately $225 million or approximately 2.6 percent of aggregate tax revenues of the states employing this tax (Table 16.1).[1]

Although revenues from pari-mutuel are relatively small on the whole, the tax as such has been the subject of heated argument in all states where it has been introduced or where its adoption has been under consideration. This has been due to the nature of the tax which calls for the legalization of betting on racing (horses and/or dogs), an action which in the eyes of many people is contrary to public policy.

The support of legalized betting on races has come from those who see in pari-mutuel an opportunity to secure much needed additional revenue for the state treasury. This, perhaps, has been the most telling argument advanced in its favor as far as the general public is concerned. Secondly, and where applicable, the point has been made that pari-mutuel will attract tourists thus helping business as well as government by enlarging other tax bases, notably the sales tax. Thirdly, and without arguing that gambling is not an evil, it is contended that people have an innate propensity to play games of chance (which any minister of the gospel would argue applies to all forms of evil). This being so, the state may as well recognize the "facts of life" by diverting in part, some fools' money to constructive purposes (in this case the "commission" exacted by government for controlling the activity within bounds) which otherwise would go to unscrupulous bookmakers. There is the added thought that for the loser at the race tracks there is some consolation in the fact that at least a part of his losses "went for a good cause."

Opponents of pari-mutuel base their case on both economic and moral grounds. The separation is difficult to make since one is essentially a part of the other. The economic argument is premised on tax theory as well as business economics. The tax, per se, has been described as being basically unfair since its incidence is on only a small part of the population having certain tastes. In answer to this the observation can, of course, be made that the tax burden is "self inflicted" which could be avoided by not betting. A more potent economic argument is that it hits the little fellow who cannot afford to lose. Since the person of small means has presumably as much "propensity to play games of chance" as those of larger means—besides there are many more of the former than the latter—the deleterious effect of his losing is felt in a decline in neighborhood grocery sales and collections and an opposite trend in public welfare needs.

[1]U. S. Department of Commerce, *Compendium of State Government Finances in 1957.*

Morally, the argument advanced against pari-mutuel is absolute. Gambling, it is held, and in any form whatsoever, undermines both economic and moral values. Here the moral and economic considerations merge into a general indictment that a system based on betting weakens productive incentive with ensuing breakdown of economic effort and moral stamina.

Whatever the position taken in any pro and con discussion, as outlined, it needs to be recognized that pari-mutuel can, on a number of grounds, be sharply distinguished as a system of betting from such seemingly related games of chance as the slot machine and associated games most frequently identified with Las Vegas, Nevada. This stems largely from the fact that pari-mutuel is essentially a system of betting "among ourselves" in which "rigging" can be held to a minimum.

Development and Nature of Pari-Mutuel Wagering

Until the advent of pari-mutuel, wagers on racing were made either directly between persons or with bookmakers. The latter, generally outlawed in this country, is best described as a separate contract between the player and the layer of odds in which they agree on the amount wagered, the odds and the conditions of the wagers. Abuses under this system, in which the integrity of the bookmaker was generally subject to question, led to quick acceptance of "pari-mutuel"—invented in 1873 by a Frenchman, Pierre Oller, a chemist and perfumer. Pari-mutuel proved so popular that the French Government gave it legal sanction in 1887.

The word "pari-mutuel" is from the French pari, meaning "wager," and mutuel meaning "with reciprocal interests," or in common. The broad meaning of the term is to wager in common or to wager "among ourselves"—in contrast to wagering with a bookmaker or between individuals. In essence the process is essentially one of "pooling bets" cooperatively and distributing the pool to the winners in a manner decided upon by rule.

Pari-mutuel as adopted by states in this country varies little in principle from practices followed abroad. The distinctive feature of the American system is the use of three pools (one to "win," one to "place" and one to "show") rather than two as elsewhere. An added feature used now universally is the so-called "totalizer." This is a mechanical device corresponding to a huge cash register which records and computes all transactions quickly and accurately. A racing fan sufficiently grounded in mathematics and knowing the percentages which prevail locally can figure any wager within a matter of minutes and compare it with the official payoff. Such a convenience has ensured a public check on the honesty of the payoffs and has instilled confidence in the racing operations not otherwise possible. It is generally agreed that pari-mutuel wagering in the United States which had its greatest growth in the 1940's and the 1950's came partly in response to the popularity of the pari-mutuel as a system but more particularly after a "totalizer" became required equipment at race tracks throughout the country.

The manner by which pari-mutuel operates in most states both in terms of organization and in the handling of bets has been succinctly described in a recent study as follows:

> Under the Pari-Mutuel System of betting, the racing associations operate the system under regulations. The patrons purchase the tickets at windows at varying amounts, the basic tickets costing two dollars. Tickets may be bought for a horse to "win," "place" (place second or to "show" (place third), and any number of tickets may be purchased on any number of horses in a race to finish in all or any of the three successful positions. All of the money bet on horses to "win," less deductions for the state and racing associations, is prorated among the persons holding tickets on the winning horse, and all the money for second or "place" and third or "show" are similarly divided among those holding tickets on horses which finish second or third.
>
> When a patron purchases a ticket, the seller presses a button which automatically releases the ticket. The same impulse records, on an electrically operated machine known as a "Totalizer," the amount of the bet, the number of the horse selected, and whether the ticket is for "win," "place" or "show." The totalizer adds the money bet on each horse in a race in the three separate pools and accumulates the totals for each pool. All such statistics, and the odds for the different horses in the winning pool, are projected on a larger indicator in the infield in view of the public.[2]

Pari-Mutuel in Colorado

The voters of Colorado, in the November, 1948, election, passing on a referendum initiated by the 1947 General Assembly, legalized pari-mutuel wagering on races in the State and approved a pari-mutuel tax.

The law as presently constituted provides for an administrative body of three commissioners who serve without compensation except for necessary travel expense. Statutory provisions definitely prescribe stringent qualifications of applicants for licenses, or for their renewal, to conduct racing meets. Regulations also spell out in detail the conditions governing facilities used in serving the public and other matters such as the timing and duration of meets, and the licensing of personnel and participants in races. Following general state practice betting

---

[2]Legislative Research Council, *Report on Agricultural Fairs and Pari-Mutuel Racing in Massachusetts* (Legislative Research Bureau, Boston, Mass., March 12, 1958), pp. 11-12.

by minors is prohibited as is wagering other than by the pari-mutuel method.

For the privilege of conducting racing meets in Colorado a licensee (generally referred to as an "association" or "club") pays to the State 5 percent of the gross receipts of all pari-mutuel wagering (known also as "pari-mutuel sales" or "handles") with the association taking another 10 percent as permitted by law. Thus 85 percent of total wagers are returned to the winners.

Breakage set at 10 cents was originally retained by the State but since 1954 proceeds from this source have reverted to the racing associations. (Breakage represents the odd-cents surplus resulting from paying winnings in even multiples of 10 cents or 5 cents as the case may be.) For example, if a winning pool, divided among winners at track odds, equaled $6.38, payment to each winner would be reduced, on a 10 cent break, to $6.30, leaving a breakage of 8 cents.

The diversion of breakage to the associations came as a result of State Supreme Court decision which ruled that the law was unclear on the question of breakage and hence the State could not claim it. Since annual breakage after 1954 has averaged over $300,000 this decision caused a corresponding loss to the General Fund to which all pari-mutuel revenue is dedicated.

Originally also, the referendum approved by the electorate included a provision which called for a 1 percent income tax on all winnings. However, subsequent statutory revisions removed this feature. On the basis of current betting volumes income from such a tax would have amounted to over $300,000 annually.

Racing Associations. There are currently eight licensed tracks in Colorado, their names and total handle in 1957 being reported as follows by the Colorado Racing Commission in its annual report.

Name	Pari-Mutuel "Handle" in 1957
Brush Racing Association, Brush	$ 194,212
Centennial Turf Club, Littleton	9,983,519
Rocky Mountain Quarter Racing Association, Littleton	2,056,004
Cloverleaf Kennel Club, Loveland	5,774,791
Colorado Sports Racing Association, Grand Junction	767,252
Mile High Kennel Club, Derby	15,856,363
Pueblo Kennel Association, Inc., Pueblo	2,549,490
Rocky Mountain Kennel Club, Inc.	4,655,809

Aggregatively, as shown in Table 16.2, income of the race track licensees (or 10 percent of handle and breakage) has increased from a total of slightly over $1 million in 1949 to approximately $4.5 million in 1957. It will be observed also that, on the average, approximately 8 percent of total annual income after 1954 has been accounted for by receipts from breakage.

Table 16.2

Income of Racing Associations in Colorado Calendar Years, 1949-1957

Year	10 percent commission on wagers (thousands)	Breakage (thousands)	Total income (thousands)	Percent change of income from preceding year
1949	$1,106	$ 0	$1,106	—
1950	2,219	0	2,219	100.63
1951	2,614	0	2,114	—4.73
1952	3,188	0	3,188	50.80

Pari-Mutuel Wagering—General Trends. Factors affecting the dollar volume of betting or "handle" at the races and hence, state revenues derived therefrom, are essentially three, namely: (1) length of racing season, (2) attendance, and (3) average size of bets. As will be seen from Table 16.3, the length of the racing season in Colorado advanced from a total of 180 days in 1949 to 366 days in 1957. Similarly annual attendance, which started out at around one-half million persons in 1949, moved rapidly upward thereafter reaching a high of 1.3 million persons in 1956.

Increased attendance is, in turn, reflected in the aggregate amount of annual wagers which has steadily advanced in size since 1949 reaching a high of $42 million in 1956. Parallelling this advance and, in part, accounting for it has been an equally steady rise in the amount of average-bets-per-person-in-attendance, or an increase from $18.57 in 1949 to $33.41 in 1957—the latter year marking the highest figure on record to date.

Although these factors in combination reflect a generally enlarged interest in racing it is well to note that the pattern marked is not uniformally consistent when data for individual years are considered. A review of year-to-year attendance changes shown in the second column of Table 16.3 indicates that business conditions exercise a fairly strong influence on attendance. Thus, in the recession years of 1953 and 1957 the number of persons going to the races decreased sharply from the preceding year. As a result, and despite an actual increase in the average size of bets in both years, the aggregate volume of wagers declined, or at the rate of 2.11 percent from 1952 to 1953 and 4.59 percent from 1956 to 1957. On the basis of these limited data it would appear that at the first sign of a general business decline the small better is the first to stay away from the tracks while persons of larger means are not deterred, at least at the outset.

Table 16.3

Number of Racing Days, Attendance, and Pari-Mutuel Wagers, Colorado, Calendar Years 1949-1957

Year	Racing days	Attendance	Percent change from preceding year	Total amount of mutuel wagers ("handle") (thousands)	Percent change from preceding year	Average per capita wager	Percent change from preceding year
1949	180	595,159	—	$11,056	—	$18.57	—

Fiscal Importance of Pari-Mutuel Tax. As shown in Table 16.4 state revenue from pari-mutuel racing in fiscal 1957 totalled $2.1 million, a figure exceeding any preceding annual total since the inception of the tax. This figure represented also 1.47 percent of aggregate tax revenues of the State in 1957 and 4.57 percent of total general revenue.

Table 16.4

Revenue From Pari-Mutuel Tax in Colorado Calendar Years, 1950-1957

Year	Revenue from pari-mutuel	Percent of total State tax revenues	Percent of total State general revenues (General Fund)
1950	$ 738,324	0.86	2.73
1951	1,361,252	1.42	4.82
1952	1,653,947	1.63	5.36

1957	2,120,236	1.47	4.57

Source: State of Colorado, Colorado Racing Commission, *Ninth Annual Report.*

The extent to which Colorado's pari-mutuel tax produces revenue over and above expenses of administration is shown in Table 16.5. As noted therein expenditures in 1957 amounted to $157,000 which when subtracted from the State's gross take of $2,092,000 (5 percent commission) left a net balance for the treasury amounting to $1,947,000.

Since 1953 expenditures have increased faster than gross income which has been due in part to the assumption by the State of certain costs which during the earlier years of pari-mutuel racing in the State, was shared with the racing associations or licensees—a case in point being the costs involved in the laboratory testing of animals.

State Tax Rates and Fees — Colorado and Other States. As noted in Table 16.6, all twenty-four states which have pari-mutuel racing provide for breakage but differ in respect to its distribution. With the exception of California, the seven Western States permit the race track operators to keep all breakage. In the remaining states the general practice is to divide such receipts between the operators and the state, the exceptions being Florida and New Jersey which claim the entire return from breakage.

Table 16.5

All states tax total wagers on either a flat or graduated basis. Colorado's flat rate of 5 percent corresponds with the rate used in Washington, Arkansas, and West Virginia. Generally speaking, a 5 percent rate could be regarded as a fair average covering the entire twenty-four state group.

Little use is made of license fees and admission taxes for revenue. Only six states—Arkansas, Delaware, Kentucky, Louisiana, Nevada and New Mexico—use a license fee in combination with an admission tax.

Table 16.6

Structure of Assessments and Rates Applicable to Pari-Mutuel Racing in all States, 1957

State	Breakage: Breakage multiple (cents)	Breakage: State's share (percent)	Tax on total wagers (percent)	License and fee (dollars)	Admission tax

Conclusion

It is apparent that in spite of opposition legalized pari-mutuel wagering in Colorado has become a permanently established enterprise in the State. The fact that six other Western States have adopted pari-mutuel racing gives support to this conclusion. Moreover, revenues, though relatively minor, have nonetheless been a significant factor in balancing the hard pressed General Fund of the State.

Colorado's administrative as well as rate structure appears in most respects to be in line with the Western States. This also applies to the diversion of all breakage receipts to the racing associations. This feature of the law has been questioned in some quarters on grounds that such income was originally intended to revert to the State. However, developmental costs and a relatively low volume indicate that the breakage factor may spell the difference between a profit and loss to the associations. Under these conditions, a change of policy at this time may not be warranted.

CHAPTER XVII

MISCELLANEOUS STATE GOVERNMENT REVENUES

The purpose of this chapter is to present a brief review of all State government revenue sources not covered in preceding chapters. The individual subjects are variously classified as "miscellaneous taxes," "licenses," "fees," and "earnings." In large degree, the sources included are "special" levies or charges designed to recover costs of rendering certain State services or privileges granted to persons or groups of persons engaged in particular activities. Hence, the revenues derived are largely, but not entirely, earmarked for expenditure of the particular agency rendering the service in question and not available as General Fund revenue.

Although the receipts from a number of individual sources described below are relatively small they constituted, when combined with other items, a total of nearly $30 million or 13 percent of aggregate state revenues in 1957 (Table 17.1).

Table 17.1

Revenues from Miscellaneous Taxes, Licenses and Fees and Departmental Earnings and Other Sources, State Government in Colorado Fiscal Year, 1957

Revenue Source	Amount (thousands)
Miscellaneous Taxes	
Foreign and domestic corp. tax	$ 268
Coal mine tax	23
Metal mining tax	33
Oil and gas conservation levy	116
Predatory animal tax	57
Hail insurance tax	15
Safety and accident prevention tax	31
Mattress stamp tax	20
Tax for revised statutes	20
Gate admission, athletic commission	6
P. U. C.	125
Total	714
Licenses and Fees	
Game and Fish	4,035
Secretary of State	617
Department of Agriculture	735
State Board of Stock Inspection	314
Auto title	256
Penalty Assess. and J. P. Court fines	623
Dealer's and salesmen's licenses	77
Inspection stickers	80
Total	6,737
Departmental Earnings and Miscellaneous	
Educational institutions	2,331
State Highway Department	8,443
Penal and eleemosynary institutions	3,637
State lands	4,293
All other	3,565
Total	22,269
Grand Total	29,720

Miscellaneous Taxes

The individual taxes described in this section are highly limited and specialized in purpose. From some points of view most of them could be treated as license fees or charges. However, the official State reports refer to them as taxes and for the sake of consistency they are so designated here.

Foreign and Domestic Corporation Tax. In 1901 Colorado introduced an incorporation or entry fee and in 1907 an annual franchise tax on all corporations (foreign and domestic) doing business within its boundaries. The first applies to a newly incorporated domestic corporation or the first entrance into the State of a foreign corporation as the case might be, and the second or the franchise tax, applies to all business corporations operating within the State. In addition, the law provides for sundry minor corporate charges for State services in connection with such matters as filing amendments, changing corporate titles, enlarging authorized capital stock and the like. Although not a part of the basic tax rate structure, there is an additional levy of 10 percent based on the incorporation fee, the proceeds from which are directed to the Old Age Pension Fund. Otherwise all revenues are available to the State's General Fund.

Corporation franchise or privilege taxes are imposed on the theory that the privilege *to be* a corporation and *to do business* as a corporate entity has a value over and above the value of the real and tangible personal property of the corporation which is normally covered by the general property tax. The tax is also regulatory in nature since it involves some degree of control over corporate operations. For these reasons then most states have a tax comparable in nature to that in Colorado.

Administration of the tax is vested in the Office of the Secretary of State. In practice compliance in respect to paying filing and entry fees is more or less on the basis of an "honor system" in which corporations are presumed to be aware of their responsibilities and will accordingly meet their obligations to the State. This applies equally to payments of the annual franchise tax. Each corporation, for the purpose of paying the latter tax, must by May 1, of each

year, file an annual report reflecting its financial condition at the close of business for the preceding calendar year. The corporation self-assesses the tax as computed from its annual report and forwards the amount with the annual report to the office of the Secretary of State. Taxes unpaid for two years are deemed to be delinquent.

Currently the tax is producing revenues amounting to slightly over $265,000 annually which represents a gain of over $100,000 from 1950 (Table 17.2). The number of corporations reporting in 1957 came to a total of approximately 14,500[1] — a figure which in the light of recent developments can be expected to steadily increase.

Table 17.2

Revenue from Foreign and Domestic Corporation Taxes, Colorado, Fiscal Years, 1946-1957

Year	Amount
1946	$105,132
1947	114,343
1948	134,425
1949	134,427
1950	145,683
1951	151,094
1952	165,407
1953	176,063
1954	197,057
1955	215,692
1956	239,991
1957	267,841

New Legislation. In 1958 the General Assembly re-codified the corporation law of the State and also set up a new license and tax rate schedule which will go into effect January 1, 1959.[2] The rate change was designed to equalize charges between the domestic and foreign corporation without decreasing the revenues received either for the General Fund or the Old Age Pension Fund. Under the new rate schedule all foreign corporations will pay a flat sum of $60 as distinguished from the graduated fee schedule applicable to domestic corporations. Foreign corporations will, however, pay the franchise taxes on the same revised basis as the domestic corporation.

The impact of the new arrangements on potential revenues is particularly noted in the case of the smaller corporations (capitalization $100,000 and under) which account for more than 80 percent of all corporations operating in the State. Thus, a domestic corporation of say $100,000 capitalization would under present law pay a filing fee of $30 and an annual tax of $10. Under the new law, the payment would be the same for corporations with capitalization of $100,000, $75,000 and $50,000, or in each case $40.

The new rate structure will not, however, place Colorado out of line with other Western States, as noted in Tables 17.3 and 17.4, which show rates for each of the Western States for a selected sample of capitalization bases ranging from $50,000 to $100,000. Colorado's position will continue to be near the median in respect to both filing fees and annual franchise taxes.

Table 17.3

Filing Fees, by Size of Capital, of Domestic Corporations in Eleven Western States 1957

$50,000 Capital		$75,000 Capital		$100,000 Capital	
State	Fee	State	Fee	State	Fee
Washington	$50.00	Washington	$75.00	Washington	$100.00
Montana	50.00	Montana	75.00	Montana	100.00
Idaho	40.00	Idaho	75.00	Idaho	75.00
Nevada	40.00	Oregon	50.00	Nevada	75.00
Oregon	30.00	Wyoming	50.00	Oregon	50.00
California	25.00	Nevada	40.00	California	50.00
Wyoming	25.00	California	25.00	Wyoming	50.00

Coal Mine Tax. In 1913 the coal operators of the State sponsored the "Coal Mine Tax" for the purpose of establishing a state coal mine inspection department. The tax is levied on the owners and operators of coal mines and includes both a license fee and an annual tax. The present license fees range from $10 to $50 depending on the tonnage produced annually and the tax levy is 7/10 of 1 cent per ton of coal produced at each mine.[3] The State Coal Mine Inspection Depart-

[1] As reported by Office of the Secretary of State of Colorado.

[2] *Session Laws of Colorado, 1958*, Ch. 32, 123.

[3] *Colorado Revised Statutes, 1953*, 1957 Cumulative Supplement, Vol. 4, Ch. 92, 11-1.

ment collects both the fees and the tax, the proceeds being deposited with the State Treasurer in a cash fund reserved for the office of the State Mine Inspector. The chief coal mine inspector administers the fund to regulate and to enforce coal mining laws, to safeguard mining operations by examinations and inspections, and to make reports relative to all statistics on mining operations.

Although the coal mine tax was originally intended to cover expenditures of the Department it is evident from Table 17.5 that this has not been the case. In fiscal 1958, for example, the excess of expenditures over revenues amounted to $28,900. Revenue deficiency has existed since 1951 with the result that the Department has had to be subsidized since that time by appropriations from the General Fund.

Table 17.5

Expenditures and Revenues of Coal Mine Inspection Department, in Colorado Fiscal Years, 1953-1958

Year	Expenditures	Revenues	Excess expenditures over revenues
1953	$45,973	$30,673	$15,300
1954	44,673	29,334	15,339
1955	46,382	27,882	18,500
1956	48,626	30,926	17,700
1957	51,582	28,082	23,500
1958	59,475	30,575	28,900

Source: Records of State of Colorado, Coal Mine Inspection Department.

The failure of revenues to match expenditures has been caused by the increase in costs of administration and the decrease in revenue resulting from reduced coal output (Table 17.6).

There are no easy solutions to this dilemma. The State's coal mining industry is presently a sick business and there is little hope of improvement during the next ten years. An increase in the present mill levy or some other new charge would only place an additional burden on coal operators whose profits are declining. In addition, the services that the Department renders are vital to the industry and to the safety of the individual miner. The Department is apparently operating on as efficient a basis as it possibly can and yet render adequate services to the coal industry; so curtailing of services would not be prudent. In the final analysis there is little the State can presently do other than to continue to make up the deficit for the Department until the coal mining business itself recovers sufficiently to once again pay for these special state services.

Metal Mining Tax. The metal mining tax, which dates from 1921 and originally sponsored by the mining interests, is a special annual levy of one-tenth of one percent on the assessed valuation of all producing and non-producing metalliferous mining properties.[4] Levied and collected by the counties, collections, which amounted in fiscal 1956-57 to $33,404, are transferred to a State fund known as the "Metal Mining Fund" from which State appropriations are made for such purposes as may be in the interest of the mining industry.[5] Currently the Department, which is fully sustained by the tax revenues collected has a staff of four persons who are primarily engaged in keeping the industry informed on developments of mining both in the State and nation as a whole. In addition, it assists in sponsoring legislation designed to advance the mining industry in the State.

Oil and Gas Conservation Levy. This is an industry-sponsored tax imposed on every producer of oil and natural gas. The levy is two mills on each barrel of oil, and two mills on each 50,000 cubic feet of natural gas produced or marketed within the State.[6] Proceeds of the tax are used to cover costs of a special Oil and Gas Conservation Commission established to promote conservation of oil and gas on the surface or underground.

The past five years has witnessed a steady growth in the Commission's services. As a result the number of employees has increased from three to fifteen with accompanying advance in costs as noted in Table 17.7. Up to the present, revenues from the annual levy have been more than adequate to meet added costs. Indications are, however, that by fiscal 1961 tax income will not be sufficient unless services are curtailed or added revenues are forthcoming.[7] In view of the recognized importance of conservation in this area a reduction of the Commission's services is not believed to be a wise step to take in any event. There are various other possibilities. One,

[7] Based on discussion with Director of Oil and Conservation Division.

of course, would be the discovery of new oil and gas fields but this is too uncertain. Another would be to raise the mill levy to 3 or 3.5 mills, which at predicted oil production would suffice to balance receipts and expenditures. The Commission reports also that a specific fee of $25 could be required for all permits to drill, plugging forms, and petitions on bearings. Finally, it has been suggested that anuual levy could be based on total oil and gas production measured against the cost of the Commission's services.[8] This would mean a flexible rate schedule but one by which expenditures and revenues would match each year thus avoiding any possibility of having to dip into the General Fund.

Table 17.7

Expenditures and Revenues of Oil and Gas Conservation Commission Colorado Fiscal Years, 1953-1957

Year	Expenditures	Revenues	Surplus
1953	$ 28,577	$ 37,992	$ 9,415
1954	51,587	80,635	29,048

Predatory Animal Tax. This special tax, introduced in 1941, was sponsored by the stockgrowers for the purpose of financing a program of predatory animal and rodent control. The heavy toll taken by predators of sheep, cattle, and poultry has made it apparent that to be effective such a program has to be conducted on a statewide basis and financed accordingly. The original tax was fixed at a 10-mill rate on each dollar of assessed valuation of all sheep and goats except those in feed lots. In 1957 this rate was increased to 20 mills due to the decreased valuation of sheep and increased costs of services required.[9]

As currently administered the tax is collected by the county and transferred to a State fund from which disbursements are made as determined by the State Department of Agriculture. The fund as such never runs a deficit since services are stopped if funds are depleted. However, at the present tax rate, financing is deemed adequate for all purposes. In the event that additional services are needed, individual stockgrowers may secure them by paying an extra fee. Aside from these special cases, funds are allocated to counties in proportion to taxes paid.

Hail Insurance Tax. The State's hail insurance program, adopted in 1929, is financed solely from premiums on hail insurance policies, the purchase of which is optional with individual farmer. Premiums are based on classifications established by the State Agricultural Commission and on previous loss ratios.[10] Rates vary between counties and with the general crop outlook.

The program is administered by the State Department of Agriculture assisted by a technically trained staff which is augmented during the spring and summer by 50 to 75 sales representatives. Costs of the program vary from year to year depending upon the amount of insurance sold and the number of loss claims. Rates have always been adequate to cover losses and to build a small reserve fund which currently amounts to $22,500.[11]

Although the program has not resulted in any cost to the general taxpayer, and could not in any event since losses must be paid from premium collections only, the question may nevertheless be raised as to why the State has entered this business. The answer is that private insurance companies are not highly interested in writing hail insurance and when they do the rates that must be charged tend to be high. The State program was sponsored by the farmers largely for the purpose of getting lower rates which presumably has been accomplished. As noted in Table 17.8, for a sample group of counties, the comparative rates between the State Department and a large private underwriter show in each instance a substantial differential favoring the State.

Safety and Accident Prevention Tax. This tax, introduced in 1940, is imposed on all organizations including the State Compensation Insurance Fund which insures employers against liability for personal injury or death of employees under the provisions of the Workmen's Compensation Act of Colorado. The levy is at the rate of one-half of one percent of the amount of premiums collected and, in the case of self-insurers, the rate is applied against payrolls to arrive at an amount equivalent to that which would have been paid if the accounts had been insured.

Proceeds of the tax are used to cover costs incurred by the State in promoting and encouraging the adoption by industry of safety devices, standard safety methods and the continuous study and improvement of industrial safety. The activity as such is vested in the Safety Device and Method Section of the State's Industrial Commission. The law calls for an annual appropriation from a cash fund established for the purpose with the added proviso that if the balance exceeds $20,000 the tax shall be abated for a year—a situation which will obtain for the fiscal year, 1959.

Mattress Stamp Tax. This is a special tax imposed on all persons engaged in the manufacturing, the remaking, or the renovation of any article of bedding. Persons or firms so engaged pay an annual license fee of $25; in addition to which they are required to buy stamps at the rate of $20 per thousand which must be attached to the merchandise sold.[12]

This tax is administered by the State Department of Public Health, and the funds provided, which amounted to $19,910 in fiscal 1957, cover the cost of inspection service which is essentially that of seeing to it that all bedding is properly tagged, stamped and fit for sale.[13] The Department does not have a separate bedding inspection section as such, but assigns inspectors to do the work on a part-time basis in addition to their other duties in the Department. The present rate is adequately covering the costs of rendering these bedding inspection services.

Tax for Revised Statutes. This tax is a special fee of one dollar levied upon each and every civil action filed in the office of a clerk of a court of record of the State of Colorado. The purpose of this fee is to reimburse the General Fund for appropriations heretofore and hereafter made for the use of the Committee on Statute Revision.[14]

The history of the tax dates back to 1951 when the General Assembly set up a special department to compile and publish a revision of the Colorado Statutes which was completed in 1953. To date there have been 2,400 sets of the Revised Statutes distributed of which 1,500 have been sold and 900 have been distributed for use in the various State agencies.

Currently, the department has three employees engaged in preparing for publication every other year supplements to the 1953 Revised Statutes. It is presently estimated that a complete new revision will be made in 1965 which is some eight years earlier than originally planned. The current expenses of the department are running about $28,000 annually as against about $20,000 revenue.[15] In effect, the department pays two-thirds of its expenses and the General Fund pays one-third. The latter is presumably justified on grounds that the various State agencies receive one-third of the total number of publications. The State could, however, if it chose to do so, raise the levy in order to eliminate the present cost to the General Fund as well as creating a surplus to cover future planned statute revision in 1965. It is estimated that this could be accomplished if the rate were doubled—to two dollars. The increased charge would probably not deter any civil suits from being filed and would place the cost burden of revising the statutes on those persons using the facilities of the courts.

Gate Admissions—Athletic Commission. Any licensed persons who conduct boxing or wrestling contests in the State of Colorado to which an admission fee is charged must pay to the State a 5 percent tax on the gross proceeds of the contest, excluding, however, federal taxes.

The receipts and expenditure relationships including the cash balance credited to Commission activities for selected years since 1950 are as follows:[16]

Fiscal year	Receipts[a]	Expenditures	Cash balance end of year
1950	$11,867	$6,876	$ 57
1955	11,213	9,274	3,251
1956	7,689	7,063	0
1957	8,601	6,807	1,626
1958	7,466	8,498	99

[a] Includes taxes and fees.

[16] State of Colorado, Division of Accounts and Control.

Revenue from this activity is contingent upon the number of boxing or wrestling matches staged annually. The past few years have produced few contests, due primarily to the present depressed situation in professional boxing, a condition partially attributed to television.

Since the primary source of revenue is obtained from exaction of the 5 percent tax, it is relevant to consider the fee structure as a source of supplemental aid to offset increased expenditures. At the December, 1957 meeting of the Commission, it was suggested that some fees be increased and where no fees obtained to inaugurate a fee, namely: raise referee license fees from $10 to $25, manager license fees from $10 to $25, seconds' fees from $5 to $10 and to impose fees on those who are not currently charged, such as, trainers a $5 fee, announcers and judges, a $10 fee.

This schedule was suggested because amateur licenses were scaled down from $500 to $200 in 1957 and deputy commissioners fees were raised from $5 to $15 per event. Expenditures decreased somewhat, however, because the Secretary of the Commission has been the only full time employee of the Commission, and no part-time help was used.

Aircraft Ownership Tax.[17] The law places an annual specific ownership tax on all aircraft within the State except:

(1) Aircraft owned or used by a department of the federal or state government.

(2) Aircraft owned or used by air carriers as such term is defined by the federal Civil Aeronautics Act of 1938, as amended.

(3) Aircraft constituting stock in trade of a manufacturer, dealer, distributor or retailer of aircraft.[18]

The annual tax is a percentage of factory list price diminishing each year. The rate of 3 percent is applied to 70 percent of factory list price the first year, 50 percent the second, 40 percent the third, 30 percent the fourth, 20 percent the fifth, 10 percent the sixth and 5 percent of list price thereafter.[19]

In 1957 there were 175 aircraft owners paying this tax which amounted to $1,377. It is estimated that there may actually be 2,000 private planes that should be taxed. If this is the case, the State and its political subdivisions are failing to collect at least $40,000 of revenue annually.[20]

Departmental Licenses and Fees

Game and Fish Department. The Game and Fish Department came into existence because of public interest and concern in conservation. Perpetuation and continuance of game and fish resources is dependent in large degree upon revenues prorated from the sale of licenses which local sportsmen initiated as a means of providing monies for management of game and fish resources.

Beginning with the depression years of the 1930's active financial support of conservation was extended to the Department by the federal government through the Dingwell-Johnson and Pittman-Robertson Acts. According to these Acts receipts from the federal tax on firearms, fishing rods and related items may be granted to the state (contingent upon matching by state aids) according to the proportionate share of fishing and hunting licenses in the state. These grants are designed to encourage state projects relating to fish and game restoration and management. In 1957-58, Colorado received $555,000 for wildlife restoration and the General Assembly's matching share of $185,000 brought the total to $740,000, the equivalent of 18 percent of the net income of the Department.

The total gross income from the sale of licenses (hunting, fishing and miscellaneous) amounted to $4,265,966 in fiscal 1958.[21] After deduction of agents' license commissions of $144,978 or 3.4 percent of gross income, total net income amounted to $4,120,988.

Since World War II or from 1946 to 1957 departmental revenues from fees have increased from $1,047,000 to $4,266,000 or at the rate of 300 percent. This increase is attributed to a number of factors of which Colorado's continued appeal as a tourist haven and increased personal incomes are most important.

Although the increase in departmental revenues is fiscally significant, the economic value of hunting and fishing to the people of Colorado should not be overlooked. It is estimated that in 1957 a total of $81 million was spent in the State by sportsmen for hunting and fishing supplies including food and clothing but exclusive of license fees. Of this amount nearly one-half or $39 million was spent by non-residents.[22]

---

[17]This tax is essentially an ad valorem tax and is therefore not included in Table 17.1.

[18]*Colorado Revised Statutes*, Ch. 5-3-3.

[19]*Colorado Revised Statutes*, Ch. 5-3-6.

[20]In 1953 the State assigned one man to enforce the tax and as a result 495 planes were registered. In this connection it is of interest that there were, in 1958, an average of 200 privately owned planes at Stapleton airport alone.

[21]State of Colorado, Department of Game and Fish, *Annual Report, 1957-1958*, pp. 4-5.

[22]*Ibid.*, p. 3.

Continuance of this outlay is dependent on a number of factors: the continual production of fish and control of other wild life, the degree to which pollution of streams by industrial and mining wastes is reduced and the assurance of an adequate water supply for fishing streams. When these factors are related to an anticipated rapid rate of population growth, a greater influx of tourists and the constantly increasing need of recreation outlets as work-week hours decline, it is apparent that existing fees will not carry the ultimate cost. Since the benefit principle applies here, the needed expansion of facilities is dependent in large degree on what sportsmen are willing to pay in added fees.

Regulatory Boards—Department of State. A summary review of license revenues and expenditures of the various regulatory boards and bureaus in the Department of State is presented in Table 17.9. As will be noted these activities show for the period considered—from 1955 to 1958—a fairly balanced relationship between revenues and expenditures.

Department of Agriculture. The marketing of Colorado's farm products is subject to various regulatory sections under the jurisdiction of the Department of Agriculture. These sections are charged with the responsibility of enforcing statutory regulations designed to protect the public's interest. How well the public can be served is contingent upon adequate inspection facilities, assurance of which is dependent, in the main, on collecting the required fees.

In the fiscal year ending 1958, the Department collected $652,000 in licenses and fees while its expenditures totalled $609,000. It is noteworthy, and perhaps significant, that over the past three years, 1956-1958, revenues increased at the rate of 17 percent while expenditures increased by 37 percent. Of the Department's eleven sections, five showed, for the period, a decline in license revenue while, for the remainder, expenditures increased more rapidly than revenue (Table 17.10).

Dairy Section. This Section is responsible for the inspection of milk and cream receiving stations and concentrating plants. The fee schedule adopted in 1913 and modified in 1923 still applies. This calls for a $2.50 fee for the inspection of each milk or cream receiving station and a $10.00 fee for concentrating plants. Since license revenue has declined in recent years—coupled with an opposite trend in the volume of milk sold—it becomes increasingly apparent that a pre-war rate structure is inadequate to cover costs of effective inspection service.

Feed Control. This Section collected $33,300 in fees during 1958 from the $0.10 per ton State charge (to defray the cost of State feed inspection including brand inspection) on commercial feed sold in bulk or in containers. This would approximate 300,000 tons which at average market cost of $72 per ton would amount to $21.6 million. In this connection it is of interest that the U. S. Census data for 1954 (the latest date available) show a total farm expenditure in Colorado of $64.5 million for livestock and

Source: State of Colorado, Division of Accounts and Control.

poultry feed. This suggests strong likelihood that there is considerable under-reporting in this inspection area.

Fertilizer Section. In fiscal 1958, this Section collected $18,482 in revenue, of which approximately $4,000 represented registration fees of fertilizer brands. The balance, or $14,000, was collected from the State-imposed fee of $0.25 per ton on fertilizer manufactured in the State. On this basis, this would mean that 56,000 tons of fertilizer were manufactured in the State in 1958.

The head of the Fertilizer Section estimates that the amount of fertilizer reported as manufactured was about 50 percent of what actually should have been reported.[23]

Fruit and Vegetable Inspection. This Section is the single largest revenue producer under the jurisdiction of the Department of Agriculture, accounting for 51 percent of total departmental receipts. As noted earlier, in most sections expenditures are rising more rapidly than revenue, and this is notably true in the Fruit and Vegetable Section. This is reflected in expenditure and revenue projections which were submitted from 1958 to 1960 as noted below:

	Revenues		Expenditures	
Fiscal year	Estimated amount	Percent increase	Estimated amount	Percent increase
1958	$341,818	—	$333,553	—
1959	362,622	6.0	374,310	10.0
1960	416,273	15.0	471,137	26.0

On the basis of this projection the Department requested appropriation increases of $58,427 in 1958, $32,205 for 1959 and $60,000 in 1960 to take care of seasonal inspection.

This Section has discretionary power to levy fees that will cover inspection costs. But during fiscal 1958 it sought an additional appropriation of $15,000, three-fourths of which was granted to cover deficiency costs. Unforeseen developments undoubtedly arise necessitating additional funds, but since the Section has the power to levy fees commensurate with costs, the request for appropriations does not appear to be warranted on any sustained basis.

Oleomargarine. Fees collected by this Section, which is administered by the Dairy Section, are minor in amount. Collections have been and continue to be substantially in excess of expenditures.

[23] Colorado General Assembly, Joint Sub-Committee on Appropriations, "Staff Report to the Committee on Administration and Programs of the State Department of Agriculture," Budget Report 58-2, August, 1958.

Poultry and Egg Inspection. During the past three years approximately 2.5 million chickens and turkeys were sold from farms by Colorado farmers.[24] It is reasonable to assume that a substantial portion of sales were made to processing plants within the State for the domestic market. If the revenue from the sale of clips (State charge to poultry processors for inspection) is used as a criterion apparently this is not the case. The revenue from the sale of clips amounted to $1,341 in 1957, $849 in 1956 and $526 in 1955.[25] At the current charge of ¼ cent per clip per bird this means that 20 percent of the birds sold from Colorado farms in 1957 found their way into local poultry processing plants, and only 13 percent in 1956. In 1955, when approximately 3 million birds were sold from Colorado farms, the State received $526 from the sale of clips, or 7 percent of the poultry sold found its way into local plants. On this basis either most of Colorado's poultry is sold out of the State—a questionable assumption—or sales in the State are greatly under-reported—an assumption which appears more plausible.

Egg Licenses. The revenue obtained from egg licenses amounted to $43,000 in 1957. This money was derived from the license fees charged wholesalers and retailers for State inspection service.

The law governing egg licensing was initiated in 1933, changed in 1935, and modified radically, relative to licenses and fees in 1957. Antiquated provisions of the law were stricken and the fee scale graduated according to the volume of eggs processed by wholesalers and the gross sales of retailers. How well the new schedule of charges will meet changed conditions remains to be tested since the new law went into effect January 1, 1958. The bracket system of fee charges on wholesalers and retailers is a realistic attempt to graduate in accordance with volume of business. One point of contention, however, is the $2.00 fee currently charged the Class I retailer (gross sales under $50 thousand annually). This very nominal fee of $2.00 is inadequate to cover inspection costs. Egg inspectors visit each retail outlet once every five weeks, or make approximately 10 visits annually. This places the cost of inspection at $0.20 per call which is hardly commensurate with the cost of paying the inspector's salary and travel.

[24]Colorado Agriculture Statistics, *op. cit.*, pp. 89-90.

[25]State of Colorado, Division of Accounts and Control, *Annual Reports.*

State Board of Stock Inspection. Approximately 30 percent of the revenue obtained by this Board is from the 1/30 mill levy imposed upon the assessable value of all taxable property in the State. The balance, or 70 percent, is obtained from recording brands, stallion licenses and butcher licenses; the bulk of this portion of the revenue being obtained from the brand inspection. It is quite apparent that the first item is not being fully collected. The stallion fee is $5. In 1957 a total of $40 was collected on this account.

Plumbing Inspection. In 1957 fees collected for the examination of plumbers, license renewals and plumbing installation permits amounted to $21,883.[26] Of this amount installation permits amounted to approximately $11,000. Permit fees range from $0.25 for a single fixture installation to $2.00 for five fixtures. The typical one-family dwelling has six fixtures which, translated into inspection fees, should amount to $2.25.

That there is considerable under-collection of fees for plumbing inspection is clearly indicated from sample analysis. For example, in the Denver Metropolitan Area alone there were 7,513 new one-family dwelling units built in the first eleven months of 1958, or an estimated total of 8,200 for the entire twelve months.[27] Simple computation indicates that State inspection fees should have amounted to aproximately $18,440 for this construction alone. This figure is, as noted, exclusive of building in the rest of the State, and does not take into account duplexes, apartments or industrial and commercial buildings, nor remodeling of existing buildings.

Board of Standards—Child Care. Foster Boarding Homes, which include nursery schools, day nurseries and children camps that maintain a home for children under 16 years of age and are duly licensed can operate in the State without charge. In 1957 the cost of inspection for this program was $22 thousand,[28] which was borne by the State and financed through the General Fund.

During 1958 a total of 1,923 licenses were issued as follows:[29]

[26]State of Colorado, Division of Accounts and Control.

[27]*Daily Journal*, December 30, 1958.

[28]State of Colorado, Division of Accounts and Control.

[29]State of Colorado, Board of Standards.

Type of Foster Boarding Homes	Number of licenses issued
Nurseries	112
Family foster homes	1,132
Institutional foster homes	20
Children's camps	112
Welfare (children boarded in private homes)	534
State Home for Dependent Children	13
Total	1,923

These institutions cared for 19,967 children. Fifty-six percent of the children were cared for in children's summer camps of which a known 5 percent of the operators maintained an out-of-state residence.

Licensees engaged in caring for children under the above categories are doing so for profit and they could reasonably be expected, as any other business enterprise, to reimburse the State for inspection service.

Departmental Earnings, Charges and Miscellaneous Receipts. As noted in Table 17.1 state government received a total of $22.3 million in 1957 from various sources classified as earnings, "charges for services" rendered and other receipts. The latter includes approximately $1 million from the sale of land and buildings. Apart from this the total represents income or revenue receipts. In view of the many miscellaneous categories within this general topic the following discussion is limited to a brief review of several selected subjects.[30]

Educational Institutions. Earnings of the educational institutions consist essentially of tuition and fees, the total of which increased from approximately $4 million in 1952 to $5.8 million in 1957, or a gain of 45 percent (Table 17.11).[31]

Table 17.11

Tuition and Fees Collected by Institutions of Higher Learning, Colorado, Selected Fiscal Years, 1952-1957

Institution	1952	1954	1956	1957
Adams State College	$ 49,147	$ 54,743	$ 66,154	$ 70,120
Colo. State Univ.	581,076	601,441	759,683	861,017
Colo. State College	499,916	445,094	547,940	613,810

West. State College	103,849	84,878	113,519	132,091
Total	3,995,589	4,068,202	5,116,904	5,798,552

* Includes sale of surplus materials.

Source: State of Colorado, Budget Reports 1952-1957.

[30]For a statistical review of principal subjects in this category see again Chapter V, Table 5.2.

[31]The total figure for 1957 as noted in Table 17.11 is larger than its corresponding total in Table 17.1 since the latter was exclusive of tuition payments at the University of Colorado.

State Highway Department. Receipts of the State Highway Department consist mainly of reimbursements for roads services performed for other governmental units mainly smaller municipalities. In 1957 receipts of this nature amounted to $8.4 million and in 1956 the total was $9.8 million. These figures are substantially over preceding years as noted in Chapter V, Table 5.2.

Boulder Turnpike Charges. Receipts from the Boulder Toll Road currently average around one-half million dollars. Since 1952 annual collections have been as follows:[32]

Fiscal Year	Collections
1952	$146,207
1953	437,109
1954	483,137
1955	462,203
1956	488,077
1957	519,519

Penal and Eleemosynary Institutions. Earnings from various activities at the state institutions increased from $1.2 million in 1952 to $3.6 million in 1957, or a gain of 200 percent. By institutions the 1957 aggregate was distributed as follows:[33]

Institutions	Earnings
Colorado State Hospital	$2,469,416
Colorado State Penitentiary	547,890
State Home & Tr. Sch.—Ridge	95,438
State Home & Tr. Sch.—G. Jctn.	76,496
Colorado Sch. for Deaf & Blind	37,943
Colo. St. Soldier's & Sailor's Home	29,848
State Industrial Sch. for Boys	8,303
Colorado State Childrens' Home	6,371
State Home for Aged	5,747
Unclassified	359,548
Total	3,637,000

State Lands. Receipts from the income and sale of lands owned by the State have since 1950 changed as follows:[34]

Year	Receipts
1950	$1,213,300
1954	2,534,396
1956	4,024,966
1957	4,292,878

State lands, originally acquired by grants from the Federal Government are set aside by law to create funds for specific purposes. By far the most important of these is education which is reflected in the following inventory of State lands as of June 30, 1956:[35]

[32]State of Colorado, Division of Accounts and Control.

[33]*Ibid.*

[34]*Ibid.*

[35]State of Colorado, *Report of State Board of Land Commissioners.*

Fund	Acres
School and Indemnity School land	2,774,220
Permanent Fund Lands (Foreclosed)	53,736
Agricultural College Lands	26,695
Internal Improvement Lands	164,775
Penitentiary Lands	8,601
Public Building Lands	4,517
Reformatory Lands	520
Saline Lands	15,089
University Lands	4,266
State Forest	71,000
Total	3,123,419

The terms of the grants from the Federal Government provide that the proceeds from the sale of lands shall go into permanent funds to be invested. Only the interest therefrom and the income derived from the administration of the unsold lands can be used for the benefit of the schools or such special interests as provided in the original grants.[36]

[36] For further discussion on this point see Chapter XX on "Sources of Revenue for State Aid."

CHAPTER XVIII

THE TOBACCO TAX

History and Description of the Tax

A special excise tax is levied on the consumption of tobacco products by the Federal Government, forty-two states, the District of Columbia, and municipalities in several states. Annual revenue exceeds two billion dollars, most of which is due to the tax on cigarettes.

The two unusual characteristics of the demand for tobacco have historically made the product a favorite object of special taxation. First, the consumption of tobacco is not altered significantly if the selling price is increased. Therefore, the levying of a relatively high tax, which will increase the selling price, will not deter consumers from buying the product, thereby destroying the tax base. The second unusual characteristic of the demand for tobacco is that consumption is not significantly altered with a decline in the income of the buyers. Hence, the first characteristic results in a lucrative source of revenue, and the second characteristic results in a relatively stable source of revenue irrespective of fluctuations in business activity.[1]

The indirect manner in which tobacco is taxed may also explain its historical popularity in the taxation field. The tax is levied either on the manufacturer or on the wholesaler which not only results in a lower collection cost than would be incurred if the tax were levied on consumers, but also provides substantially less resistance to the tax.

Consumption of tobacco has continually increased due to changing social customs and population growth. A stigma is no longer generally attached to the cigarette smoker, even in the case of the female smoker, as was once true. Population growth has also resulted in increased tobacco consumption although population composition has a significant impact on consumption and its changing nature may occasionally offset any absolute population increase.

The "cancer scare" resulted in a decline in tobacco consumption in 1955. A substantial shift from regular cigarettes to filter-tip cigarettes has mitigated this fear and tobacco consumption is again on the increase with filter-tip cigarettes now accounting for about 40 percent of the cigarette market.[2] Three-fourths of those states which levy a cigarette tax showed an increase in consumption in 1956.[3]

Although the Federal Government taxes other tobacco products in addition to cigarettes, many states tax only cigarettes. The consumption of other tobacco products such as cigars, smoking tobacco, chewing tobacco, and snuff have declined in their relative importance in recent years. Although cigarette consumption increased in 1956, consumption of other tobacco products did not.[4]

Tobacco Taxation by the Federal Government. The federal tax on tobacco is levied on manufacturers at the rate of eight cents per pack of cigarettes and an ad valorem rate is applied on other tobacco products.

Since the tax is levied only on manufacturers, a relatively small cost of collection is incurred. There were only about 1,000 tobacco, cigar, and cigarette manufacturers in the United States in 1956, and of this number over 800 were cigar manufacturers.[5]

The tax eventually makes its way to the consumer in the form of higher prices. The levying of a tax on a manufacturer runs the risk of "pyramiding." If each seller in the merchandising chain marks up the produce as a percent, each seller would be realizing a profit on the tax and the increased price paid by the consumer would therefore exceed the initial tax. This danger is reduced in the case of the states, which usually levy the tax on the wholesaler.

Federal tobacco tax revenues have displayed a continually rising trend in the past two decades. As can be seen in Table 18.1, however, a

---

[1]The unusually low price and income elasticity of tobacco has frequently been observed. Although numerical elasticity estimates are subject to methodological qualifications, one writer estimates price elasticity at minus .1 and income elasticity at plus .5. See Frank H. Maier, "Consumer Demand for Cigarettes Estimated from State Data," *Journal of Farm Economics*, November, 1955. For a complete discussion of the relation between tobacco consumption and income, see Seymour M. Sarkin and Arthur G. Conover, *Tobacco Smoking in the United States in Relation to Income* (Marketing Research Report No. 189, U. S. Department of Agriculture, Agricultural Marketing Service, Washington, D. C., 1957).

[4]*Ibid.*

[5]U. S. Treasury Department, *Statistics Relating to the Alcohol and Tobacco Industries* (Washington, D. C., 1957), pp. 64-66.

decline was recorded in 1954 as well as in 1955. Tobacco receipts as a percent of total receipts reached over 3 percent throughout the 1940's but declined to less than 2½ percent in the early 1950's. This decline is due to a number of factors of which the recent "cancer scare" may be one.

Table 18.1

Internal Revenue Collections and Federal Tobacco Tax Yields in the United States Selected Years, 1936-1956

Period or year	Total internal revenue collections (millions)	Tobacco tax yield (millions)	Tobacco tax yield as percent of total
1936–1940 (av.)	$ 4,871	$ 562	1.15
1941–1945 (av.)	25,342	865	3.41
1946–1950 (av.)	40,213	1,271	3.16
1951–1955 (av.)	64,270	1,550	2.41
1953	69,687	1,655	2.37
1954	69,920	1,580	2.26
1955	66,289	1,571	2.37
1956	75,113	1,613	2.15

Source: Bureau of the Census, *Statistical Abstract of the United States: 1957*, p. 368.

Tobacco Taxation by the States. Beginning with Kansas in 1909, the number of states using a tax on tobacco has continually grown. In 1955, Missouri approved a cigarette tax in a general election and effective January 1, 1956, became the 42nd state to impose a cigarette tax. Eleven of these states also impose a tax on other tobacco products. Fifteen states adopted a tobacco tax during the depression and eleven states have adopted a tobacco tax since the end of the Second World War.[6] Most state adoptions of cigarette taxes have not been on a temporary and emergency basis, as has been true of the adoption of many other excises, especially on the federal government level.[7]

Some states have earmarked the receipts from the tobacco tax for various purposes. Illinois, for example, attempted to float bonds for a Veterans' Bonus, the additional revenue to be provided through increasing the rate of the cigarette tax.[8] Washington earmarked a one-cent rate increase for the servicing of school construction bonds. Some states also credit a portion of the receipts from the cigarette tax to a special fund which is apportioned to local governments. In Minnesota for example, one-fourth of the revenues are appropriated for local apportionment, with three-fourths accruing to the General Revenue Fund.[9] Florida also has an arrangement whereby local governments share in the tobacco tax receipts.[10]

Were Colorado to adopt a tobacco tax, either of the above arrangements would probably be unconstitutional, since the Colorado Constitution presently provides that 85 percent of the revenues from any additional excise tax must accrue to the Old Age Pension Fund.[11]

A more complete discussion of tobacco taxation in the states and in Colorado will be found in later sections of this chapter.

Tobacco Taxation by Municipal Governments. Taxation by municipalities in the United States is not extensive. Several states, Wyoming for example, have denied municipalities the power to tax cigarettes when the state utilizes this source of revenue. In other states, however, a state cigarette tax has been imposed in addition to the existing tax levied by municipalities.

Municipalities in eleven states (Alabama, Colorado, Florida, Illinois, Maryland, Missouri, New Jersey, New Mexico, New York, Tennessee and Virginia) have the power to levy a tax on cigarettes.[12] Widespread use of the cigarette tax by municipalities in these states is not common, however. Illinois does not permit municipalities to levy a cigarette tax in addition to a sales tax; therefore, the cigarette tax is presently not in use by any Illinois cities. Only a few municipalities utilize the cigarette tax in New Jersey, New York, Tennessee, and Virginia.[13] New Mexico permitted municipalities to tax cigarettes prior to 1955, at which time authority was withdrawn unless the municipality had previously issued bonds to be financed by the cigarette tax. At present only a limited number of New Mexico municipalities continue to levy the tax. Although municipalities in Florida levy a tax, it is an offset against the state levy and is collected by the state.

Numerous municipalities in Colorado and Maryland levy a cigarette tax but these states do not employ a cigarette tax. In only Alabama and Missouri is there a state tax and a more than limited use of the tax by municipalities.

[13] L. Laszlo Ecker-Racz, "State Taxes After the 1956-1957 Legislative Sessions," *National Tax Journal*, December, 1957, p. 295.

The cigarette tax applied by all municipalities in the country has been estimated to yield approximately $40 million annually.[14]

Colorado Municipalities. About 28 municipalities in Colorado levy a cigarette tax; most of these municipalities adopted the tax since World War II. Approximately one and one-quarter million dollars was collected by municipalities from this source in 1954.[15] A tax of from one to three cents per pack is levied as well as a retailers' and wholesalers' fee.

A major criticism of the use of a tobacco tax by a municipality is that it results in consumers' purchasing cigarettes in areas outside the city where the tax is not applicable. A saving of 20 cents or 30 cents per carton may be sufficient inducement to cause consumers to patronize a non-taxed establishment. Although a loss in sales by city merchants with the introduction of a tax has not been completely verified, there is some evidence to indicate that out-of-city establishments enjoy an increase in sales.[16]

Denver provides a good example of the competitive nature of the tax. Although many surrounding municipalities have imposed a cigarette tax, the rates tend to be lower than the Denver rate.

Rationale of the Tax

Sumptuary Considerations. The traditional rationale for the taxation of tobacco is that the consumption of tobacco is undesirable, from a social and an individual point of view, and should therefore be discouraged by levying a heavy tax on tobacco. It is argued that tobacco is undesirable from a social viewpoint in that smoking involves a tremendous social cost in the form of fire losses and the maintenance of preventive and protective measures. Tobacco is also considered undesirable from the viewpoint of the individual since it is believed to be detrimental to proper health. At one time tobacco was considered undesirable from a moralistic viewpoint in the same way as narcotics, and often, liquor, are viewed today.

Careless smoking is undoubtedly responsible for a substantial social cost. The adverse effect of tobacco on the health of an individual is less definite and considerably more controversial.

Even assuming that tobacco consumption is undesirable, a substantial amount of controversy exists concerning the effect of a tax on tobacco consumption. It is argued that high taxes will not in fact discourage the consumption of tobacco. Since the tax is usually levied on the manufacturer or wholesaler, it must be assumed that this tax burden reaches the consumer in the form of higher prices if the consumer is to be discouraged from buying tobacco. Although the incidence of a tobacco tax will usually rest with the consumer, it is possible that due to competitive conditions, some absorption may occur at various stages in the merchandising chain. Another alternative, however, is that the higher price paid by the consumer may exceed the amount of the tax. This occurrence could be due to "pyramiding" or simply price increases in excess of the initial tax.

If the reasonable assumption is made that a tobacco tax will reach the consumer in the form of higher prices, there is still considerable doubt that tobacco consumption will be substantially decreased. If higher prices are to discourage the consumption of a product, the demand curve for that product must be elastic; that is, the product must have reasonably close substitutes. Although some smokers may be able to substitute other products for tobacco, this substitution does not seem likely for the average smoker. Higher tobacco prices may, however, have a certain discouraging effect on the non-smoker who might otherwise acquire the habit. If the objective of a tobacco tax is to discourage the "undesirable" consumption of tobacco, the attempt could prove abortive because individuals may consume the same amount of tobacco, but the higher price of tobacco will necessitate curtailed purchase of other goods, perhaps "desirable" goods.

A closely related approach to the sumptuary rationale of tobacco taxation is the contention that tobacco is a luxury and should therefore be heavily taxed. If a rigorous attempt is made to define "luxury" or "necessity," the approach becomes untenable.

Equity Considerations. In the area of equity considerations, the most common indictment made against tobacco taxes is that they are regressive, that is, a higher proportion of income is taken from lower income groups than from higher income groups. This characteristic is the reverse of the widely accepted principle of ability to pay. A possible rejoinder is that although the tax is regressive, it is not as regressive as is often contended. Although empirical estimates of the regressivity of tobacco taxes are hazard-

---

[14] *Minnesota Tax Study*, *op. cit.*, p. 384.

[15] Colorado Municipal League, *Selected Non-Property Revenues of Colorado Cities and Towns* (Boulder, Colorado, 1955), p. 11. For additional discussion of the cigarette tax as a municipal source of revenue in Colorado see Chapter XX.

[16] Colorado Municipal League, *op. cit.*, p. 11.

ous, one author estimates that tobacco taxes are roughly proportional below the $3,000 income level and regressive thereafter.[17] Even if this estimate is assumed to be reasonable, it is difficult to argue that regressivity, in itself undesirable, becomes desirable simply because it is not extreme.

Another argument often advanced to extenuate the regressivity of the tobacco tax is the need for diversity in a tax structure. Although the tobacco tax is regressive, it is offset by an income tax which is basically progressive. Hence, it is argued that the structure remains progressive although certain individual taxes are regressive. The tobacco tax is not advocated to the exclusion of all others, and presumably diversity is needed to tax those individuals who escape the income tax or other taxes in the system.

One approach to analyzing the equity of a given tax is to rely on a pragmatic "social concept," that is, is the tax favored or opposed by the public. Although the public tends to favor progressive taxation, several surveys indicate that the cigarette tax is considered to be a "fair tax."[18] This paradoxical position of the public is difficult to explain but should perhaps be taken into consideration when viewing the tobacco tax.

A classic summary of consumption taxes and the equity criterion has been made by Henry C. Simons:

> The plain fact, to one not confused by moralistic distinctions between necessities and luxuries, is simply that taxes like the tobacco taxes are the most effective means available for draining government revenues out from the very bottom of the income scale.[19]

The tobacco tax has been subjected to such widespread criticism in the area of sumptuary and equity considerations that emphasis has shifted to administrative considerations.

Administrative Considerations. The consumer meets the burden of a cigarette tax by paying a few cents each time he purchases a pack of cigarettes. For this reason the tax is considered to be relatively "painless" and easy to collect as opposed to collecting the same annual amount at one time. This reasoning seems to resemble the principle of the "most feathers for the least squawking," and although this principle must undoubtedly be relied upon to a certain extent in the financing of modern government, there may be a tendency for public expenditures to become extravagant if the public is constantly taxed in numerous subtle ways. Convenience of payment, however, has long been a meaningful criterion in measuring the desirability of a revenue source; and most taxes are subject to a charge of subtlety, for example, to some extent the withholding technique of income taxation.

Any tax must, of course, be subjected to the test of adequacy of yield. The ease of payment associated with the tobacco tax makes it possible to levy a rate sufficiently high to make possible a sizable yield. It should be pointed out that one cannot logically argue that the tax will discourage consumption of an "undesirable" product, and at the same time argue that the tax will yield well, since the objectives are contradictory —if one succeeds the other must fail. The tobacco tax has notably fulfilled the adequacy test in the past.

Closely related to the adequacy concept is the criterion of stability. A tax which has a flexible yield, such as the income tax, is often viewed as a favorable factor in federal finance since it tends to act as a "built-in stabilizer" in times of business fluctuations. On the state government level, however, it is argued that stability is a necessity since the state lacks the power and flexibility possessed by the federal government to maintain existing services. The tobacco tax has adequately displayed its stability in the past. Between 1929 and 1933, National Income declined by 55 percent whereas the federal tobacco tax receipts declined by only 7 percent.[20]

Tobacco Taxation by the States

In addition to subjecting cigarettes to a special excise tax, as is done in forty-two states, cigarettes may also be included in the base of the state sales tax. Of the thirty-three states which have a sales tax, seventeen include cigarettes in the base. Fifteen of the remaining sixteen states exempt cigarettes from the sales tax base, but subject them to a special excise tax. The one state which exempts cigarettes from the sales tax base and does not employ a special excise tax on cigarettes is Colorado.

As can be seen from Table 18.2, fourteen states tax tobacco both with a sales tax and a special

---

[17] Warren A. Law, "Tobacco Taxation in the Revenue System," *National Tax Journal*, December, 1953, p. 373. Another study taken from older data shows tobacco taxes to be regressive throughout. See Senate Interim Committee on State and Local Taxation, *State and Local Taxes in California: A Comparative Analysis* (California Legislature, 1951), p. 345.

[18] For a discussion of public attitudes with regard to the tobacco tax, see Hadley Cantril (ed.), *Public Opinion* (Princeton, 1951), pp. 852-854.

[19] Henry C. Simons, *Personal Income Taxation* (Chicago, 1938), p. 40.

[20] National Income declined from $85.1 billion to $46.6 billion, and federal tobacco tax receipts declined from $434.4 million to $402.7 million. Data from Department of Commerce, Bureau of the Census, *Historical Statistics of the United States* (Washington, D. C., 1949), p. 12 and p. 302.

excise tax. Three states tax tobacco only under a sales tax, and twenty-eight states tax it under a special excise tax only. Of the forty-eight states, there are only three states which subject tobacco to neither a sales tax nor a special excise tax—Colorado, Oregon and Virginia; the latter two states having no sales tax.

Virginia has numerous plants and many employees engaged in the manufacture of cigarettes and other forms of tobacco.[21] Oregon, in November, 1956, defeated a cigarette tax proposal in a general election. This action marked the fifth time the electorate rejected a cigarette tax proposal over a period of fourteen years.[22] Colorado's failure to adopt a cigarette tax is probably due to the constitutional provision which would earmark 85 percent of the proceeds for the Old Age Pension Fund. This point will be more completely discussed in a later section.

Interstate Comparison of Rates. With the exception of New Hampshire and Washington, the cigarette tax is levied on either a per cigarette or per pack basis. Rates vary from two cents to eight cents per standard pack of twenty cigarettes. Some states apply a higher rate if the length or weight of the cigarette exceeds certain set standards. Only a few minor brands, however, exceed the requirements, and the standard rate therefore applies to the large majority of cigarettes sold. The practice of using a specific rate results in a regressive rate structure, since a pack of cigarettes carries the same tax irrespective of its selling price. New Hampshire has attempted to overcome this inequity by levying the tax on an ad valorem basis—15 percent of the intended retail sales price.[23] Washington has also attempted to apply the rate on the basis of the selling price. It has been specified by the State, however, which brands are subject to the standard rate of five cents per pack. Most cigarettes sold fall into this category.

In an attempt to improve the cigarette tax, from the viewpoint of equity, it has been suggested that states adopt a proportional rate structure similar to New Hampshire's, or even a progressive rate structure.[24] Although this innovation would result in some improvement, the market price of the major cigarette brands does not vary sufficiently to result in a substantial improvement. Such improvement in equity as would result would be at the expense of administrative ease, especially if an attempt were made to adopt a progressive rate.

Chart 18.1 shows those states which have adopted a cigarette tax and the rates applied to a standard pack of cigarettes. Arizona and Missouri have the lowest rate, two cents per pack, while Montana and Louisiana have the highest rate, eight cents per pack. Of the six states which do not employ a special excise tax, California, North Carolina and Maryland subject cigarettes to a general sales tax.

Table 18.3 is a summary of the various rates and it can be seen that five cents per pack is the most common rate, being employed by fifteen states. The second most common rate is three cents which is employed by thirteen states. The median rate is slightly more than four cents.

[21] North Carolina is also a major tobacco producing state but cigarettes are included in the sales tax base. This method of tobacco taxation results in a substantially lower rate than if a special excise tax were employed. See Tennessee Taxpayers Association, *Trends in Public Finance* (Nashville, 1956), p. 24.

There has been a trend in the post-war period toward adoption of a cigarette tax by the states. In addition, a trend toward increasing rates culminated in seven states increasing rates in 1957.[25] Occasionally, a rate is increased with the intention of using the funds for a special purpose and the rate increase is therefore on a temporary basis only.

Revenues Collected by the States. The forty-two states levying a tobacco tax collected $514.7 million from this source in 1956. This amount represented slightly less than 4 percent of the total taxes collected by all states.

Table 18.4 illustrates the extent to which states have relied on the tobacco tax in the past two decades. Collections from this source in every year exceeded collections in the previous year. This increase is due to increasing consumption and tax rates as well as an increasing number of state adoptions. Tobacco tax collections as a percent of total taxes continually increased until 1950 when they exceeded 5 percent of total taxes. Since 1950, more reliance has been placed on other sources of revenue.

Bureau of the Census, *Compendium of State Government Finances in 1954*, pp. 11-12; and data on number of states using tax taken from *Tax Administrators News*, January, 1957, p. 1.

Collections from the tobacco tax compared to total taxes collected gives an indication of the relative extent to which each state relies on the tobacco tax as a revenue source. Table 18.5 shows that some states rely rather heavily on the tobacco tax. The average percent represented by tobacco tax collections in the forty-two states utilizing the tax was 4.8. New Hampshire, however, with 9.7 percent received more than twice the 42-state average. New Jersey and Maine also relied rather heavily on the tobacco tax in 1956. In 1953 the three states relying most heavily on the tobacco tax were New Hampshire with 11.4 percent, New Jersey with 10.4 percent, and Massachusetts with 8.8 percent.[26]

Taxation of Other Tobacco Products. The taxing of tobacco by the states is limited primarily to cigarette taxes. In several states, however, the taxing of other tobacco products yields substantial revenues. Although ten states receive revenues from non-cigarette tobacco taxes, seven states do not segregate collection data between cigarette and non-cigarette levies. Three states, Minnesota, Oklahoma and Tennessee, do segregate the data however.

It can be seen from Table 18.6 that Minnesota and Oklahoma collect over one million dollars annually from taxes levied on tobacco products other than cigarettes. These collections represented about nine percent of the total tobacco tax collections. Tennessee collections represent about five percent of tobacco tax collections. The percentage of tobacco tax collections derived from non-cigarette tobacco taxes for all states employing such taxes is estimated to range from ten to fifteen percent.[27]

One estimate places the non-cigarette tobacco tax collections total for all states at approximately $8 million in 1955.[28] These collections rep-

resented 8.7 percent of the total state tobacco tax collections in that year.

Most states tax the consumption of cigars, smoking tobacco, chewing tobacco, and snuff. Several states, however, confine the levy to cigars only. Contrary to the specific tax placed on cigarettes by most states, other tobacco products are usually taxed on an ad valorem basis.

Just as the rationale for a tobacco tax rests more on revenue requirements, political expediency and lack of alternatives, than on equity considerations, the exclusion of other tobacco products by most cigarette taxing states is untenable from an equity viewpoint. Discrimination between the cigarette smoker and the cigar or pipe smoker is presumably mitigated by the inconvenience of collection and low yields resulting from levies placed on the latter groups. The fact that ten states continue to tax other tobacco products tends to qualify this rationale, however.

Administration of the Tax By the States

The cigarette tax is administered in most states by selling stamps to the "first handler" of cigarettes, usually the wholesaler, who is required to affix the stamps to the packs of cigarettes. In return for affixing the stamps, which will show that the tax has been paid, the wholesaler is given a discount when the stamps are purchased. The discounts vary from 1 percent in Michigan to 10 percent in Mississippi and South Carolina. Table 18.7 shows the discounts which are given by the various states. Several states allow different discounts, depending on whether the dealer is a vending machine operator, a wholesaler, a jobber, or a retailer. Also discounts vary slightly in several states depending on the quantity of stamps purchased by the dealer.

The discounts must of course be taken in relation to the various rates if the money amount allowed by each state to the dealer for affixing stamps to a given number of cigarette packages is desired.

Michigan and Massachusetts do not utilize stamps in the administration of their cigarette tax. Individuals responsible for the tax are required to file monthly and pay the tax liability at that time. Since dealers are not required to affix stamps, discounts are low and given only for compliance. Michigan allows a 1 percent discount, and Massachusetts gives no discount but the Commissioner has the power to grant a discount if the dealer incurs unusual compliance costs. Without the use of stamps it would seem that these states would be faced with an evasion problem. Enforcement of the tax, however, has been rigorous and consumption data would indicate that the enforcement has been effective.[29] Michigan's per capita annual consumption of 2,408 cigarettes and Massachusetts' consumption of 2,462 both exceed the national average of 2,356.[30]

Table 18.7

Source: National Tobacco Tax Association, *Comparative Tobacco Tax Collections, Per Capita Tobacco Tax Collections, Per Capita Cigarette Consumption, By States for 1956*, pp. 6-8.

The Governor's Minnesota Tax Study Committee recently recommended that Minnesota abandon the use of stamps and the allowing of discounts.[31] It was estimated that such action would increase annual revenue by some $500,000.[32]

---

[29] Consumption data are computed on the basis of tax receipts. Interstate comparisons are therefore usually meaningful as a measure of evasion.

[32] *Ibid.*, p. 391.

Collection Costs. The cost of collecting a tobacco tax is usually considered to be relatively low as compared with other taxes. It has been argued, however, that tobacco taxes are not inexpensive to collect on the state government level since the dealer discounts should be included in the costs.[33] From the taxpayer's viewpoint, the difference between the amount he pays and the amount the state receives would seem to be a cost of collection. If discounts of approximately 5 percent are included, collection costs are estimated to range from 6 to 7 percent.[34] This amount is somewhat in excess of the hypothetical 2 to 5 percent range which is considered to constitute a "good tax." If discounts are excluded, collection costs are well below the 5 percent maximum.

Evasion. Evasion of the cigarette tax is primarily achieved in four ways: interstate shipment directly to consumers by firms in non-tax states, individuals bringing untaxed cigarettes into the state for personal use, bootlegging cigarettes to be sold, and abuse of the tax-free provisions granted to military installations.

Direct shipment by mail order houses at one time constituted the most serious problem of evasion. A use tax, carrying the same rate as the cigarette tax, was imposed in most states, but enforcement agencies were unable to discover many of the interstate shipments. With the passage of the Jenkins Act in 1949, this source of evasion was substantially curtailed. This law requires interstate shippers to notify the state into which shipments are being made. There is undoubtedly some evasion of this type still occurring but the effectiveness of the Jenkins Act has been praised by many groups.[35]

The imposition of the use tax and tax adoptions by nearby states has probably discouraged individuals from bringing in cigarettes from other states.

Bootlegging of cigarettes would necessitate a retail outlet. Since stamps are affixed to cigarette packs and retailers are periodically checked in addition to having their books audited, few retailers would be willing to undertake the risk involved. Extensive smuggling would also appear unlikely, considering the profit to be realized by either the bootlegger or the retailer. Even if the entire tax represented clear profit, the margin of only thirty dollars (using the most common rate of five cents) per case of sixty cartons, would not seem sufficient to attract many smugglers.

Cigarettes sold to military installations and Veterans Administration facilities are exempted from the tax. Some cigarettes undoubtedly escape taxation by abuse of this exemption. Although estimates of the revenue loss due to this form of evasion are obviously tenuous, one writer has estimated that Florida loses some one-half million dollars annually.[36]

The evasion problems involved in the administration of a cigarette tax seem to have been overemphasized. The National Tobacco Tax Association estimates that evasion of state cigarette taxes in 1956 amounted to only 2.4 percent of the national consumption figures.[37]

Colorado and The Tobacco Tax

Colorado stands with a small minority of states which do not levy a tax on the consumption of tobacco. The primary reason for Colorado's failure to adopt a tobacco tax can probably be found in the constitutional provision which would earmark the bulk of the proceeds of the tax for the Old Age Pension Fund. Prior to the constitutional amendment in 1956, the tobacco tax was not an alternative to be considered if a way was being sought to provide additional revenues for the General Fund. Although the Constitution still provides that the Old Age Pension Fund shall receive ". . . eighty-five percent of the net revenue derived from any excise taxes now or hereafter levied upon the storage, use, or consumption of any commodity or product . . . ,"[38] the amendment provides for a basic pension payment and the establishment of a medical care fund and contingency reserve. After these requirements are fulfilled any additional receipts will overflow into the General Fund. The Budget Office estimates that there will be a small overflow in the fiscal year 1960, and an increasing amount thereafter. Hence, the revenues resulting from the adoption of a cigarette tax by Colorado would in the future accrue largely to the General Fund rather than to the old age pensioners in the State.

Potential Yield of a Cigarette Tax in Colorado. The potential yield of a cigarette tax can be computed by multiplying the estimated population times the estimated per capita cigarette consumption times the tax rate. Since estimat-

[33] Law, *op. cit.*, p. 375.

[34] *Ibid.*

[35] The National Tobacco Tax Association at its annual meeting in 1956 applauded the curtailment of evasion effected by the Jenkins Act. See *Tax Administrators News*, March, 1956, p. 31.

[36] Dillingham, *op. cit.*, p. 22.

[37] National Tobacco Tax Association, *Estimated State Cigarette Tax Evasion in 1956* (Chicago, 1957), p. 1.
For a lengthy discussion of the history and present status of state tobacco tax evasion, see Warren A. Law, "Evasion of State Tobacco Taxes," *National Tax Journal*, June, 1954, pp. 164-176.

[38] *The Constitution of the State of Colorado*, Revised to May 1, 1958 (Denver), p. 77.

ing the tax yield involves several other estimates and several assumptions, the final figures should be considered approximations only.[39]

The 1960 population has been estimated at 1,801,000.[40] Per capita cigarette consumption in 1956 is estimated at 2,462.7 cigarettes.[41]

Assuming that per capita cigarette consumption in 1960 does not vary from that of 1956, the approximate revenues that would be effected by the application of different rates are as follows:

Rate (cents per pack)	Revenue (thousands)
2	$ 4,435
3	6,653
4	8,871
5	11,088
6	13,306
7	15,524
8	17,741

The range of rates in the Rocky Mountain States is from two cents in Arizona to eight cents in Montana. Of the states which border Colorado one state (Wyoming) has a three cent rate, three states (Nebraska, Kansas and Utah) have a four cent rate, and two states (New Mexico and Oklahoma) have a five cent rate. A four cent rate would, therefore, be the most appropriate if comparability with bordering states is to be a major consideration. If Colorado municipalities are taken into consideration, a State rate of only 2¢ per pack would be appropriate. Although this comparability is usually the case there are exceptions, such as Montana with an eight cent rate bordering on Wyoming with a three cent rate; or Arkansas with a six cent rate bordering on Missouri with a two cent rate.

The estimated revenues above are gross and several deductions would be necessary, such as administrative costs, to arrive at a potential net revenue estimate. Although many states utilize stamps and allow dealers discounts, an alternative procedure, which was discussed earlier, would be to require dealers to file a return monthly and pay the tax at that time. The auditing that would be required under such a procedure might be combined with the auditing that is now done for the sales tax. Another possible reduction which should be considered would be the decrease in sales tax revenues which might result from the imposition of a cigarette tax. Assuming that consumers decreased their purchase of goods now subject to the sales tax in order to meet the tax on cigarettes, some loss in sales tax revenues would occur. Considering the relatively low sales tax rate, however, any loss would appear to be slight.[42]

Potential Yield of Tax on Other Tobacco Products. Many states which impose a cigarette tax do not levy a tax on other tobacco products such as cigars, smoking and chewing tobacco, and snuff. From an equity viewpoint, other tobacco products should be taxed to avoid discriminating against the cigarette smoker. However, from a productivity and administrative standpoint, as mentioned earlier, many states presumably feel that the tax is unjustified.

Attempting to estimate the potential yield of a tax on other tobacco products is difficult. However, it appears likely that in Colorado a tax on cigars, smoking and chewing tobacco, and snuff would yield between $600,000 and $700,000 in gross revenue annually.[43]

If adoption of the tax were being considered, the desirable equity effects and the potential revenues that could be obtained would have to be weighed against the problems involved in the administration of a tax on other tobacco products.

---

[39]The first year revenues of a cigarette tax in Missouri exceeded their estimated potential yield by approximately one million dollars. See *Tax Administrators News*, February, 1957, p. 18.

[40]William Petersen, *A Critical Survey of Several Forecasts of the Population of Colorado*, State of Colorado, Department of Natural Resources, July, 1957, p. 31.

[41]Computed from data reported in National Tobacco Tax Association, *Estimated State Cigarette Tax Evasion in 1956* (Chicago, 1957), pp. 7-8. This estimated consumption figure compares with a national average in 1956 of 2,356, the average for the Rocky Mountain States (Utah excluded) of 2,400, and the Wyoming average of 2,494. See National Tobacco Tax Association, *Comparative Tobacco Tax Collections, Per Capita Tobacco Tax Collections, Per Capita Cigarette Consumption, By States for 1956* (Chicago, 1957), pp. 6-7.

[42]Even assuming that the total revenue raised under a cigarette tax resulted in a decrease in purchases subject to the sales tax of an equal amount, the loss in sales tax revenue would be equal to only two percent of the cigarette tax revenue.

[43]With the exception of Minnesota, Oklahoma, and Tennessee, collections from the taxation of other tobacco products are not segregated from total collections which include cigarettes. The estimate of $600,000 to $700,000 is based on estimated Colorado population in 1960 and the average per capita yield of the taxes imposed by the above three states on other tobacco products. If the estimate is to be reasonably accurate, it must be assumed that consumption of other tobacco products in Colorado is comparable to that in these three states and that a comparable average rate is utilized.

CHAPTER XIX

FEDERAL GRANTS

Federal grants to states may be defined as payments in money, land or in kind in order to encourage some activity by state government. If the grant requires matching funds by the state, it is usually referred to as a grant-in-aid. Grants-in-aid are by far the largest part of total federal grants. Other types include grants for employment security administration, grants to specific state government agencies, and funds paid to the state treasurers to be directly disbursed to local governments. Excluded from federal grants, as here defined, are direct payments to individuals and to local governments or institutions, amounts paid to state governments for distribution to unemployed persons, payments to business organizations, salary payments to government employees, and direct payments to state institutions such as land-grant colleges.

History of Federal Grants

Federal grants originated in 1787 with the Northwest Ordinance which allocated the 16th section of each federal township to the states in order to encourage public education. The Morrill Acts of 1862 and 1890 made grants of land and later money for college facilities in the agriculture and mechanic arts. A money grant was authorized in 1879 to purchase educational material for the blind, and in 1887 money grants were made for agricultural experiment stations. A year later, in 1888, Congress instituted similar payments to the states to assist in the development of homes for disabled soldiers and sailors.

Grants in money for varied activities have replaced the early system of land grants for education. The Smith-Lever Act of 1914 for agricultural extension work, and the Highway Act of 1916 signalled the emergence of the modern federal grant system. The great depression of the 1930's caused grants to increase sharply in both amount and type. The Social Security Act of 1935 introduced three vital forms, namely: public welfare, public health, and unemployment compensation administration. The encouragement offered to states by federal grants, for example, in the area of public welfare, is reflected in the fact that by 1938 virtually every state had programs covering old-age assistance, aid to dependent children, aid to the blind, unemployment insurance, maternal and child health, crippled children and public health.

Rationale of Federal Grants

Grants and their expansion have found support and justification on a number of grounds. In general terms grants have been pointed to as importantly assisting in the solution of problems common to all states and localities, with the result that the nation as a whole is strengthened. On this general premise advocates of the grant system hold that federal aid is perhaps the only effective means by which minimum standards of public services (such as highways and welfare) can be established. Closely related thereto is the argument that new and vital programs requiring interstate cooperation (i.e., highways) are possible only by some degree of federal intervention and financial assistance. Finally, federal grants are also said to have a healthy social effect since they are financed by progressive taxes, the proceeds from which are, in some degree, distributed to the states on the basis of need.

Principal opposition to the federal grant system has grown from the feeling that federal control follows as a consequence of aids and deprives the states of their sovereign right of self-determination. It is believed also that enlarged federal authority tends not only to dull state and local initiative but, what is perhaps equally important, tends to starve certain public activities of needed financial support because of a tendency to use an excessive amount of the states' tax resources for federal matching purposes.

Trend and Current Pattern of Federal Grants in United States

As noted in Table 19.1 federal grants for the country as a whole increased from a total of $228 million in 1932 to more than $5 billion in 1958. It will be further noted that the year-to-year changes during this period in the amount of grants (measured in relationship to total federal expenditures) have varied widely depending on whether the country was at war or peace, in depression or prosperity. Currently it appears that grants in relation to annual federal budgets are increasing, as evidenced by a 7 percent ratio in 1958 of grants to annual federal budgets—which is the highest since 1940.

Table 19.1 also shows that federal grants have become an important revenue source for state and local governments. Since 1934 grants have

varied from 7.9 percent to 31.2 percent of total state-local revenues with a recent tendency to stabilize at about 12 percent.

Table 19.1

Federal Grants in Relation to Federal Expenditures and to State and Local Revenues From Own Sources Selected Fiscal Years, 1932-1958

Year	Federal grants (millions)	Federal grants as percent of total federal expenditures	Federal grants as percent of state and local revenues from own sources
1932	$ 228	4.9	3.3
1934	1,848	27.6	27.8
1936	2,318	27.3	31.2
1938	2,180	32.1	25.9
1940	2,401	26.5	27.8
1942	1,826	5.4	19.2
1944	1,009	1.1	10.2
1946	901	1.5	7.9
1948	1,629	4.9	10.7
1950	2,226	5.6	12.2
1952	2,393	3.7	10.7
1954	2,986	4.4	11.7
1955	3,126	4.8	11.5
1956	3,642	5.5	11.9
1957[a]	3,943	5.6	N. A.
1958[a]	5,201	7.0	N. A.

[a] Payments from the Federal-aid highway trust fund are included in both the grant total and the Federal expenditure total. The amounts for 1958 are budget estimates published in January, 1958 (the budget for 1959).

Source: House Report No. 2533, *Federal-State-Local Relations: Federal Grants in Aid*, Thirtieth Report by the Committee on Government Operations, 1958.

As shown in Table 19.2 the pattern of federal grants has changed markedly over the past decade. Taking 1946 and 1956 as years of reference, it will be observed that aids for highways which accounted for 8 percent of total aids in 1946 amounted to 24 percent in 1956. On the other hand, public assistance for the same years declined relatively (but not absolutely) from 54 percent to 48 percent of total federal grants, while "other" aids decreased from 25 percent to 16 percent.

Table 19.2

Composition of Federal Grants to All States 1946 and 1956

Type of Grant	1946 Amount (thousands)	1946 Percent of total grants	1956 Amount (thousands)	1956 Percent of total grants
Public assistance[a]	$432,000	54.00	$1,670,951	47.98
Education	99,000	12.38	344,077	11.37
Highways	66,000	8.25	738,695	24.41
Other[b]	203,000	25.37	272,931	16.24
Total	800,000	100.00	3,026,654	100.00

[a] Public assistance includes old-age assistance, aid to dependent children, aid to blind, and aid to needy disabled.

[b] The category "other" includes grants for defense, health and hospitals, non-highway transportation, natural resources including agriculture employment security administration, and miscellaneous items.

Federal Grants in Colorado

In 1957 federal grants to Colorado as noted in Table 19.3 totalled $55.5 million—an amount equal to approximately 23 percent of total revenue receipts of the state government. Of this amount highway grants accounted for 28 percent, public assistance for 49 percent, and all other, 23 percent. Old age assistance alone constituted 35 percent of total grants and 71 percent of all grants for public welfare.

Probably the most significant change in the federal grant picture which has taken place in Colorado in recent years is the step-up in highway grants which, between 1950 and 1957, increased at the rate of 82 percent. The corresponding increase in public welfare payments was 40 percent.

The increase of federal funds for highways reflects the accelerated activity in road building generally and the initiation of the interstate highway system. On the other hand, the smaller rate of increase in public welfare payments may be attributed to the early institution in Colorado of relatively adequate standards for receiving old age benefits; consequently sizable aids were available to the State prior to 1950.

State Comparisons

As shown in Table 19.4, Colorado's per capita total federal grants in 1957, amounting to $36.55, placed it in 8th leading position among the forty-eight states and in 5th position in relation to the eleven Western States.

Table 19.4

Federal Grants in 48 States, Fiscal Year, 1957
(Rank order of states appears in parenthesis)

State (By income groups)[a]	Per capita grants — Total	Public assistance[b]	All other[c]	Grants as percent of personal income	Grants as percent of total state revenue

[a] States are listed in rank order and by groups according to average-per capita personal income from 1954 to 1956. The three income groups listed are as follows: "high-income group" (per capita income range from $2,630 to $1,874); "middle-income group" ($1,827 to $1,560); and "low-income group" ($1,546 to $926).

[b] Includes old-age assistance, aid to dependent children, aid to the blind, and aid to the permanently and totally disabled.

[c] Includes unemployment insurance and employment service administration; distribution to state accounts in unemployment trust fund of certain tax collections; maternal and child health services, services for crippled children, and all public health education, agriculture, veterans, housing, natural resource conservation, and defense grants.

Source: House Report No. 2533, *Federal-State-Local Relations: Federal Grants in Aid*, Thirtieth Report by the Committee on Government Operations, 1958.

In per capita grants for public assistance Colorado was surpassed nationally by only three states, Louisiana, Oklahoma and Missouri. In per capita grants for purposes other than public assistance Colorado ranked 13th in the nation being exceeded by all of the other Western States except California and Washington.

In comparison with the sixteen "middle income" states as classified in Table 19.4, Colorado's ratio of federal grants to total state governmental revenues, amounting to 24 percent in 1957, was above this general group average of 22 percent. Similarly, Colorado's federal grants as a ratio of the State's total personal income, amounting to 2 percent, was above the general group average of 1.5 percent.

Colorado's relatively high ranking position as a recipient of federal aid can be attributed to a number of factors, principally its greater-than-average old age pension payments which have more than matched the maximum federal aids possible under the national old age pension program. Apart from welfare, Colorado ranks well above the average in "other" aids, of which grants for highways is the principal component. Since the distribution of highway grants is based on a formula in which the size of a state's area is an important factor, it follows that Colorado which embraces a relatively large area — as is generally true for all Western States — has an advantage.

The nature and scope of federal aid as summarized in preceding sections is further described below in which specific grant programs are considered as a whole or in terms of their related parts. The order of presentation follows the subjects as listed in Table 19.3 and includes a general description of each program as well as a statement of its meaning in fiscal terms to Colorado. In this latter connection the reader is reminded that federal grants as shown in Table 19.3 are the actual receipts for a given year but not necessarily the expenditures from this source in that year. In the analysis which follows it is the latter which is the subject of principal interest.

Highways and Roads

Federal money grants for highway construction were inaugurated by the Federal Aid Road Act of 1916 which authorized appropriations for rural post roads. Since then Congress has gradually widened and greatly increased federal aid which currently calls for regular appropriations for a three-fold system of highway development namely: (1) the federal-aid primary system which ordinarily is allotted 45 percent of total appropriations; (2) the federal-aid secondary system which is allocated 30 percent of the total; and (3) the federal aid extension of these sys-

tems into urban areas, which usually receives the remaining 25 percent. Allocation to particular states is determined by size of the state in area, population and certain urban and rural factors. Federal funds are available to finance from 50 to 55 percent of the total costs of highways including the entire cost of eliminating railway-highway crossings, up to specified amounts.

In addition, provision is made for the establishment of a National System of Interstate Highways, not to exceed 40,000 miles in length. This was extended to 41,000 by a 1956 amendment (which was supported by Colorado officials in order to permit adding a Denver to Salt Lake City designation). Sums for 1958 and 1959[1] were apportioned mainly according to population and land areas, but sums for the fiscal years 1960 through 1969 are to be apportioned among the states in the ratio which the estimated cost of completing the Interstate System in each state bears to the estimated cost of all the states.

The federal share for projects on the National System of Interstate Highways is 90 to 95 percent. The Act of 1956 authorized reimbursement to states for public moneys spent on relocation of public utilities necessitated by the construction of federal-aid highway projects. State legislation to authorize such use of public funds in Colorado was vetoed by the Governor in 1957 as an unjustified use of Colorado taxes.

In the 1956 calendar year the Colorado Highway Department reported current receipts of $48,752,447, of which $13,261,442 represented federal grants.[2] In 1957 Colorado's apportioned federal aid amounted to $28,876,985 which was allocated for the following purposes: interstate system, $15,976,461; primary system, $6,713,614; secondary system, $4,484,240; and urban, $1,702,-670.[3]

Public Welfare[4]

Public welfare grants are the second major category of aids received by Colorado and cover a wide variety of assistance programs of which old age assistance is by far the largest. Aggregate expenditures from federal grants for all welfare purposes in 1957 amounted to $29,804,-670 or 38.1 percent of the State's total welfare payments of $78,161,392. The relative federal contribution to welfare expenditures by individual program ranged from a high of 59.4 percent in the case of aid to dependent children to no contribution in two cases (general assistance and tuberculosis hospitalization) as shown in Table 19.5.

Basis and Conditions for Receiving Welfare Aids. The various bases or conditions by which states receive federal aids can best be reviewed in terms of the individual components of the over-all welfare program. In their essentials these are as follows:

Table 19.5

Expenditures for Public Welfare, by Programs and Sources of Funds, in Colorado, Fiscal Year 1957

(Dollar amounts in thousands)

Program	Total expenditures	Source of Funds: From state and county funds	Source of Funds: From federal grants	Federal aid as percent of total expenditures
Old age assistance	$57,475	$36,213	$21,262	37.0
Dependent children	7,992	3,244	4,748	59.4
Foster care of children	552	546	6	1.2
Aid to blind	336	202	134	39.9
Aid to permanently and totally disabled	3,702	1,593	2,109	57.0
General assistance	3,497	3,497	0	0.0
Tuberculosis hospitalization	473	473	0	0.0
Administration	4,134	2,588	1,546	37.4
Total	78,161	48,356	29,805	38.1

Source: State of Colorado, Department of Public Welfare, *Colorado Public Welfare Fiscal Report, 1956-1957*, p. 41.

(1) Old age assistance. Federal grants for old age assistance cover 80 percent of the first $30 paid to each recipient 65 years of age and over; 50 percent of the next $30; 50 percent of medical care expenses paid by the state but not to exceed $3 per month per person; and 50 percent of necessary administrative expenses.

(2) Aid to dependent children. The federal government will finance monthly payments of $32 for the relative with whom the dependent child lives, $32 for the first dependent child and $23 for each other dependent child; medical care payments in the case of dependent children cannot exceed $3 per adult (with whom the child lives) aided, and $1.50 per child.

(3) Foster care of children. Federal aid is offered to states with approved plans of child welfare services for the protection and care of homeless, dependent and neglected children and children in danger of becoming delinquent, and for the return of runaway children. The program makes federal allotments largely on the basis of rural population under 18 years of age.

[1] Unless otherwise indicated, yearly totals in this and succeeding sections of this chapter are for fiscal years ending June 30.

[2] The other two major categories of receipts were highway user taxes of $25,702,876 and bond and anticipation warrants of $8,000,-000. (See *Colorado's Annual Highway Report for 1956*, p. 1 of statistical appendix).

[3] State of Colorado, *Annual Highway Report for 1957*.

[4] Data included in the text of this section are from State of Colorado, Department of Public Welfare, *Colorado Public Welfare Fiscal Report, 1956-1957*, p. 41.

(4) Aid to the blind. Grants are made to states with approved plans of financial aid to the needy blind to encourage each state to help such individuals attain self-support or self-care. The allotment formula is similar to that for old age assistance. Aid to the blind includes money payments, medical care, remedial care recognized under state law but excludes payments to or care of persons in certain institutions.

Rehabilitation projects for blind persons were provided in the Vocational Rehabilitation Amendments of 1954, which authorized the U. S. Office of Education to cooperate with states in acquiring vending stands or other equipment and initial stocks and supplies for use by the severely handicapped, including the blind.

(5) Aid to the permanently and totally disabled. Since 1951 federal payments have been made to states with approved plans offering financial assistance to needy individuals eighteen years of age or older who are permanently and totally disabled. States are encouraged to help such individuals attain self-support or self-care, but aid does not cover the dependents of such persons. The formula for determining the federal contribution is the same as for old age assistance.

(6) Administrative cost grants. Federal absorption of some part of the administrative costs of public welfare services is determined by the U. S. Department of Health, Education and Welfare.

Public Health

Federal aid programs for public health cover five principal areas as follows:

(1) Public Health Service Grants. These are available for use in the control, prevention and treatment of venereal disease, tuberculosis, heart disease, mental disease, cancer, and for establishing general health services at state and local levels. All types of health grants except for venereal disease control are allotted to states according to population, per capita income and special health problems. Funds for venereal disease control are awarded on a project basis and do not require matching. With the exception of the program for the treatment of tuberculosis for which grants must be matched dollar for dollar, all other grants call for a state and local payment of $1 for every two federal dollars.

In 1957 in Colorado total expenditures by the State Health Department amounted to $1,475,433 of which funds from federal aid covered 59.16 percent or a total of $872,878.

(2) Water and Air Pollution. Grants for this program are available to the states, on a state or an interstate basis, to aid in meeting the costs of controlling water pollution. Allotments to the states are on the basis of population, the extent of the water pollution problem, and financial needs. Matching requirements are determined by each state's per capita income level. Grants are also available to states or other agencies for construction of treatment works to prevent the discharge of untreated or inadequately treated sewage or other waste into any waters. Population and income determine these grants which cannot exceed $250,000 to a single community.

In 1957 a total of $21,308 of federal grant money was expended for water pollution control activity in Colorado. Grants are also made to states and other agencies for the prevention and abatement of air pollution. No grants of this kind were made to Colorado until 1957 when $6,025 was allocated to the State to be used in fiscal 1958 and part of 1959. No state funds are available for this purpose.

(3) Hospital Surveys and Construction. Grants are made for surveys of diagnostic or treatment centers, chronic disease hospitals, rehabilitation facilities, and nursing homes. Such grants require matching expenditures and are made according to population and per capita income.

In 1957 Colorado received $3,000 in federal grants for administration of hospital surveys, consultation, etc., and $903,710 for hospital construction. The latter figure is not included in the total of federal grants received by the Colorado State Department of Health since the money is paid to the construction firms involved.

(4) Maternal and Child Health Services. Federal grants are used to enable states, especially in rural areas and in economically depressed areas, to provide maternal and child health services. Allocations to states are made according to number of live births and other indices of need. Some grants must be matched by the state dollar for dollar. Grants to Colorado of $138,643 in 1957 were used for such purposes as dentistry, social services, nursing, premature births and other related purposes.

(5) Crippled Children. Congress has provided for federal grants to states to aid

[5]Data included in the text of this section were obtained from the State of Colorado, Department of Public Health.

crippled children, particularly in rural and economically depressed areas. The aid provides services for locating crippled children, and for medical, surgical, corrective and other services and care, and facilities for diagnosis, hospitalization and after care for children who are crippled or who are suffering from conditions which lead to crippling. Expenditures from federal funds for these purposes in Colorado in 1957 amounted to $139,379.

Education[6]

Federal aid for education consists of eight distinctive programs as follows:

(1) Vocational Education. Since 1917 a federal program for vocational education has included training in agriculture, distributive occupations, home economics, trades and industry, practical nursing and fishery trades. Federal grants, which require equal matching by states and localities, are determined by population formulas which vary depending upon the type of training program established. In 1958 expenditures from federal grants for vocational education in the State amounted to $351,663 while the State contributed for the same purposes a total of $243,199.

(2) School Lunch Program. The Secretary of Agriculture, since the National School Lunch Act of 1946, makes allocations of funds and food to public and non-profit school systems. State and local units match federal grants which are determined by school-age population and per capita income in the states. The Commodity Credit Corporation makes direct distribution of food to the schools in lieu of cash and allocates other perishable food acquired under the price support program.

In 1957 expenditures in Colorado from federal grants for school lunches totalled $662,605 while commodity distributions based on cost to the U. S. Department of Agriculture totalled $1,216,000. State cash contributions for administration were $46,695 and district and local units made cash expenditures of $195,320.

(3) School Milk Program. The U. S. Department of Agriculture makes money grants to the states to increase the consumption of fluid milk by children in non-profit schools of high-school grade and under and in summer camps and similar non-profit institutions which are devoted to the care and training of underprivileged children. No matching requirements are included in the Act. In 1957, expenditures from grants to the State for school milk amounted to $436,000.

(4) Cooperative Research in Education. The U. S. Commissioner of Education is authorized under an act of 1954 to enter into contracts or jointly financed cooperative arrangements with universities, colleges and state educational agencies for the purpose of conducting research, surveys and demonstrations in the field of education. Colorado receipts from this source to date have amounted to $34,500 which are being used to finance a study of migrant labor in the State.

(5) Education of the Blind. An annual federal appropriation is made payable to the American Printing House for the Blind, for the manufacture and distribution of books and other materials to public institutions in which blind people are educated. Allocation to the states is made on the basis of the number of blind persons in public institutions. The value of materials received by Colorado in 1957 amounted to $1,300.

(6) Public Library Services for Rural Areas. A total of $7,500,000 is available each year for grants to states which have approved plans for extension of public library services to rural areas. Grants are determined by rural population and per capita income and require matching expenditures by the states. Colorado's expenditures from federal grants amounted in 1958 to $65,987.

(7) A major source of federal funds for educational purposes are grants for school construction and operation in areas where activities of the federal government have had a significant influence upon school population. In 1957, expenditures from federal grants to Colorado for school construction totalled $2,385,072 and for school operation, $2,319,325.

(8) Grants were begun in 1920 to aid states in preparing disabled persons for gainful employment. Grants are used for training, counseling, placement, the provision of artificial appliances, and physical restoration. The amendments of 1954, while expanding the amount of federal grants, require the states to gradually assume a larger part of the cost of the program. Funds are allocated on the basis of population and per capita income by the Office of Vocational Rehabilitation in the Department of Health, Education and Welfare. Federal grants expended in Colorado in 1957 totalled $222,397.

[6]Data included in the text of this section are from the State of Colorado, State Department of Education.

Veterans[7]

Since 1888 grants of $700 a year for each disabled veteran in state homes have been made on a matching basis. On this basis Colorado in 1957 spent for its Soldiers and Sailors Home in Monte Vista $105,106 of which total federal grants accounted for $24,000.

Additional federal aid amounting to $35,000 was received by Colorado in 1957 for purposes of conducting studies of eligibility requirements for veterans' vocational and rehabilitation programs.

Agriculture

Federal grants for agriculture are, for the most part, made directly to particular state institutions, notably to Colorado State University for such purposes as agricultural extension work and agricultural marketing and research. Since direct financing is involved and federal funds do not pass through the State treasury, the programs covered are not further considered here.

There have been, however, certain emergency programs in which direct grants have been made to the State for agricultural purposes. In 1955, for example, a federal grant of $500,000 was paid to the State to assist in an emergency induced by the drought and resulting farm shortage of hay. The funds were used to cover shipping costs of hay that had to be imported into the State. In 1957 drought conditions resulted in an additional grant of $1,500,000.

Game and Fish

Receipts from the federal tax on firearms, fishing rods, and related items may be granted to states according to their proportionate shares of fishing and hunting licenses in all states. Grants are designed to encourage state projects relating to fish and game restoration and management and may be withheld in the absence of certain state laws governing the wildlife and fish conservation policy. The federal contribution, administered by the Fish and Wildlife Service of the Department of the Interior, is limited to 75 percent of the cost of approved projects.

In the calendar year 1956, net income of the Colorado Game and Fish Department was $3,987,427 and total expenditures were $3,084,905. Federal grants were $113,760 for fish management and $485,843 for wildlife management, a total of $599,603, or 15.04 percent of the Fish and Game Department's net income, and 19.43 percent of its total expenditures.[8]

[7]Data included in the text of this section are from the State of Colorado, Division of Accounts and Control.

[8]State of Colorado, Game and Fish Department, *Annual Report, 1956.*

Employment Security Administration

Federal grants for public employment office administration and grants for the administration of unemployment compensation systems were begun by the Wagner-Peyser and Social Security Acts of 1933 and 1935. These two programs constitute the states' employment security programs. Administrative expenses of plans approved by the Bureau of Employment Security in the Department of Labor are paid entirely by federal grants. (See Table 19.3 for grants to Colorado.)

Other Federal Funds Allocated to State Departments

In addition to the preceding programs, federal funds are available to the states for a series of miscellaneous purposes of which forest conservation and civil defense are examples.

Federal aid for forest conservation began in 1911 and is designed to effect state and private forestry cooperation. The U. S. Department of Agriculture's Forest Service assists in forest fire problems, reforestation and other activities directed toward more effective management of woodlands. Federal grants require matching but no funds were granted to Colorado under these programs in 1957.

Under the terms of the Federal Water Power Act of 1920 as amended, 37½ percent of the charges arising from water power licenses for the occupancy and use of national forests and public lands within any state is to be paid to that state. The Federal Power Commission makes the grants which, however, have been relatively limited in amount.

The Federal Civil Defense Act of 1950 authorizes the Federal Civil Defense Administrator to make grants to the states on the basis of individual project applications for the purchase of civil defense materials and for the training of civil defense workers. Grants require dollar-for-dollar matching, and totalled $57,000 in Colorado in 1957.

Federal Funds for Distribution to Counties[9]

Apart from federal aids directed to over-all state functions certain aids are specifically labeled for the use of counties and other local governments. Purposes for which funds are dedicated are various as noted by the programs briefly reviewed below.

Under present federal law, 25 percent of national forest receipts, inclusive of receipts from mineral deposits on national forest lands, are allocated to the states in which forest reserves are located.

[9]For the amounts received in Colorado under these various authorizations see Table 19.3.

The Flood Control Act of 1941 provides that 75 percent of receipts from leasing of lands acquired by the federal government for flood control, navigation, and related purposes are to be paid to the states for schools and roads of the counties in which the property is located, or for defraying costs of county governments.

The Mineral Lands Leasing Act of 1920 provides that 37½ percent of the receipts from bonuses, royalties and rentals from lease of certain public lands containing certain mineral deposits is to be paid to the states in which the leased lands are located. These proceeds are used for roads or schools and are administered by the Department of the Interior.

The Taylor Grazing Act of 1934 provides that 12½ to 50 percent of the grazing fees collected under the terms of the Act will be paid to the states in which the lands are located. Similar provisions apply to Indian lands ceded to the United States; proceeds from the sale or use of which may be used for school and road purposes in the counties.

An act of 1950 authorized federal grants to states and local governments in case of major disaster such as flood, hurricane, drought, earthquake, etc., which, in the opinion of the Federal Civil Defense Administrator as delegated spokesman for the President, warrant disaster relief. Contributions may be in the form of money, property, services, construction, etc.

Since 1947 the departments of Interior and Agriculture have been authorized to dispose of mineral and vegetable materials on public lands, allocating the money receipts from such disposal in roughly the same manner as money received from the sale of public lands.

The Housing and Home Finance Administrator is authorized to make urban planning grants to state planning agencies, the federal grant to cover no more than 50 percent of the costs of the work for which the grant is made.

Funds for survival plan studies are available from the Civil Defense Administration. Funds from this source have recently financed a Colorado study of possible survival procedures in the event of military or other disaster.

Other Federal Aid Programs

A number of federal grant programs, mostly of recent origin and which are either not currently used or used only on a limited basis in Colorado, are enumerated below for whatever interest they may have for purposes of expanding federal financial aid to the State.

(1) Public assistance programs were enlarged by the Social Security amendments of 1956 which provided funds for training welfare personnel.[10] Appropriations were also authorized for cooperative research or demonstration projects between the U. S. Department of Health, Education and Welfare and the individual state welfare departments.[11]

(2) Congress in 1956 enacted legislation which would assist states in promoting natural resource conservation through soil-building and soil and water projection projects,[12] forest land tree planting and reforestation,[13] prevention of erosion and reduction of damage from floodwater and sediment in small watersheds,[14] and construction of small reclamation projects.[15]

(3) Apportionment of revenues in the Upper Colorado Basin Fund to Colorado, Utah, Wyoming and New Mexico in specified percentages can be used to defray certain construction costs of participation projects in these four states.[16]

(4) The Housing Acts of 1949 and 1954 authorize grants to localities for clearance and redevelopment of slum areas and the rehabilitation and conservation of blighted areas. Although grants for these purposes are directed specifically to local communities, the latter derive their authority from specific state enabling acts or from amendments to state housing legislation.

Summary and Conclusion

Comparatively, and measured by various criteria, Colorado ranks high among the forty-eight states as a recipient of federal grants. This is due to a combination of factors of which a sparse population is one; another factor is the relatively large State old-age pension pro-

gram which gives full implementation to federal aids for this type of public welfare. Coupled with this is the fact that highway aid is a function of size of area and Colorado, as one of the largest states in area, is favored accordingly.

However, a relatively favorable federal aid position does not necessarily indicate that Colorado is taking full advantage of federal assistance in the various programs eligible for financial aid. Whether such a state policy is desirable is an open question since aids are obtained at a price and the price may be high. Nevertheless a recognition that participation in jointly financed state-federal programs can and frequently does relieve pressure on state finances calls for a careful and continuous review of federal aid legislation as it is enacted and amended from time to time. Thus, an oversight here, or lack of understanding there, which could cause valuable grants to be lost to the State, is as important to the taxpayer as other oversights in government operation.[17]

---

[17]Staff review of Colorado's administrative operation indicates that information on federal aid programs is scattered and not studied in any one place in whole or in part as to its full potentials and possibilities. It has been suggested that affected departments should each delegate to some person in the department the responsibility for gathering information and analyzing federal legislation with the view of assertaining the economy of securing additional grants. As an alternative to deparmental specialists it has been suggested that this function be centralized to serve all agencies including the General Assembly. Either of these alternatives should accomplish two primary objectives. First, a department head would have access to complete information of federal grant availability, restrictions, and requirements of programs as these might affect his particular department. Second, legislators could depend on precise data when budget requests were made. For example, a department would be able to say that in order for the State to receive federal support for a given project, a specified number of State dollars would be needed. The legislature could make its decision on the need and desirability of the projects proposed. Neither departmental nor legislative policymakers would be operating on a partial basis of information which could result in inappropriate legislation.

The problem can be illustrated by citing an example from recent State action. In fiscal 1958, allocations of federal grants to Colorado for vocational rehabilitation amounted to $520,148. This required State matching-funds of $309,433 of which only $186,553 was forthcoming. Thus $197,236 of federal fund allocations "died on the vine" for want of $122,880 State dollars.

Perhaps this was calculated state policy and reflected a decision by the General Assembly that certain vocational rehabilitation projects were not needed or at least not pressing. However, the organization of information to insure that such was the case does not now appear to be established on a basis to achieve the best results.

CHAPTER XX

STATE-LOCAL RELATIONS

A total of approximately 1,700 local governments share with the State the responsibility for governing in Colorado.[1] Although the local units derive their powers from the State, existing law allows them a high degree of administrative authority including the power to tax and to spend. In this complex of jurisdictional arrangements, wherein wide variations also exist in the economies of the individual governing units, clashes of interest between state and local government as well as between individual local units are bound to occur. The task of coordination is therefore a difficult one but one that must be done effectively to assure stable and responsible self-government.

Inter-governmental relations concern matters that are both fiscal and non-fiscal in nature.[2] Fiscal considerations are paramount, however, since they involve the capacity of government, at both the state and local levels, to develop and carry out effective programs of public services while, at the same time, preserving financial stability. Close fiscal cooperation and balance here is primarily dependent upon state law in which the State must assume the principal role in laying the basis for a sound local tax system supplemented by shared taxes and grants which will be both equitable and adequate in meeting the expenditure needs of each of the local units established.

The role of the state in providing a local tax base commensurate with locally assigned functions is by all odds the most vital consideration in state-local relationships as these are presently constituted. Rapidly mounting costs in the post-war years, in the face of a more or less "boxed-in" tax structure at the local level, has caused the responsibility to become a matter of primary concern for all jurisdictions.

The policy of state payments to local governments has resulted also in a problem area of increasing importance. A fundamental question arising therefrom is the part that the state should play in the supervision of local spending of funds allocated by the state. If it is recognized that the state has a responsibility here, the question of how far state supervision can go without unduly restricting local self-determination finds no easy answer. Added to this are a host of issues involving questions of equity in the distribution of aids, of formulas used, and of judgments as to who, and what, shall be aided and why.

A complete discussion of these highly involved and controversial fields of fiscal policy would reach beyond the scope of this study. Accordingly, the following analysis is limited essentially to a descriptive review of the local tax base and the aid structure with some reference to problem areas that have developed therein.

Total Revenues of Local Government

In 1956[3] local governments (counties, school districts and municipalities) in Colorado derived, in the aggregate, 61 percent of their total revenue receipts from local tax sources while the remainder or 39 percent came from state-local shared taxes and state grants (Tables 20.1-20.3).[4]

Table 20.1

Total Revenues of Counties[a] in Colorado, 1956
(In thousands)

Revenue source	Amount (thousands)	Percent
Property tax[b]	$ 21,034	20.05
Other local revenue[c]	19,777	18.85
Shared taxes		
Highway User Tax Fund	11,819	11.26
Specific Ownership Tax A	250	0.24
Motor vehicle penalty assessment	75	0.07
Liquor	49	0.05
Total	12,193	11.62
Grants-in-aid		
Public welfare	49,370	47.06
All other[d]	2,535	2.42
Total	51,905	49.48
Grand Total	104,909	100.00

[a] Excludes City and County of Denver with exception as noted in "d" below.

[b] Excludes county levies for public schools.

[c] Estimated from representative sample of individual county audits.

[d] Includes firemen's and policemen's pensions amounting to $1,056,000 payable to both counties and cities. Since it was not possible to divide this amount between these jurisdictions (including Denver) the aggregate is shown for counties.

Source: Audit reports of individual counties and State of Colorado; State Tax Commission, *Annual Reports;* and records of Division of Accounts and Control.

[1] Data particularly pertinent as background for this chapter are found in Chapters I-IV.

[2] In this and succeeding sections of the chapter special improvement districts are excluded from the discussion of local governments.

[3] Latest date for which complete data are available.

[4] Ratios derived are based upon data shown in Tables 20.1-20.3 plus receipts by Denver from specific ownership Tax A and state aid for public welfare which were excluded from the table as given. (See also footnote "c," Table 20.3.)

Table 20.2

Total Revenues of School Districts in Colorado 1956

Revenue source	Amount (thousands)	Percent
Property tax[a]	$74,751	76.99
Other local revenue[b]	2,000	2.06
Grants-in-aid		
Basis of distribution:		
Aggregate days of school attendance	9,333	9.61
Classroom units	9,643	9.93
Junior colleges	287	0.29
Special assistance	210	0.22
School lunch, etc.	870	0.90
Total	20,343	20.95
Grand Total	97,094	100.00

[a] Includes county levies for schools.
[b] Extimates from Colorado State Department of Education.

Source: State of Colorado, State Tax Commission, *Annual Reports;* and records of Division of Accounts and Control.

The relative degree of dependence on local revenue sources, or conversely the relative reliance on shared taxes and aids varies considerably between the three principal classes of local government. Thus for 1956 the counties (exclusive of Denver)[5] depended upon their own local resources for 38.9 percent of their revenue requirements, while the comparable ratios for the school districts and municipalities[6] were 79.0 percent and 95.4 percent, respectively (Tables 20.1-20.3). The third-ranking position of the counties is attributed largely to the fact that the state payments to the counties for welfare accounted for nearly one-half of the total county receipts.

Local Property Taxes

In the over-all, local property taxes are the principal means by which locally raised reven-

[5]Because of the dual city-county position of Denver it is convenient to exclude this governmental unit from county analysis but to include it under municipalities with certain state aids omitted as noted in footnote "c" of Table 20.3.

[6]Excluding state aids to Denver for public welfare.

[a] Includes all cities and towns (excepting six) in Colorado with a population of 1,000 and over. Population data used are those reported by the U. S. Census for 1950.
[b] Includes transfers to general funds from city-owned utilities.
[c] For airports only. Excludes firemen's and police pensions which are included in county summary (Table 20.1). Also excluded (for City and County o Denver) are receipts from specific ownership tax and from state aids for public welfare amounting to $72,000 and $19,343,000, respectively. These receipts for Denver were excluded since other cities and towns do not have comparable receipts. Their figures are, however, included in the text discussion as indicated by footnote 4, Chapter XX.

Source: Audit reports of individual cities, 1956; and State of Colorado, Division of Accounts and Control.

ues are obtained. As will be seen in Table 20.4, property taxes in 1956 accounted for 74.3 percent of all local revenue. Here again, however, considerable difference in revenue patterns exists between the various classes of local government. Thus, property tax revenue accounted for 97.4 percent of locally raised revenue for the support of school districts, 58.0 percent for municipalities, and 51.5 percent for the counties.

While variations from these average ratios necessarily obtain for individual jurisdictions, the dispersion is perhaps most marked between cities and towns (municipalities) where non-property tax alternatives exist in greater extent than for either the counties or school districts. As noted also in Table 20.4 the relative importance of the property tax to other local sources tends to vary inversely with the size of the city. However, Denver shows a higher rate (58.8 percent) than either Pueblo or Colorado Springs. It is also greater than the average (49.9 percent) for the 11 cities with a population from 5,000 to 10,000. This latter group includes several cities, notably Longmont and Loveland, who depend heavily on income from publicly owned utilities.

Table 20.4

Relative Importance of Property Taxes as a Source of Locally Raised Revenue, by Units of Government in Colorado, 1956

Unit	Total revenue from local sources (thousands)	Revenue from property taxes (thousands)	Revenue from property taxes as percent of total revenue from local sources
County[a]	$ 40,811	$ 21,034	51.5
School districts	76,951	74,751[b]	97.4
Municipalities			
Denver	35,578	20,922	58.8
Pueblo	2,856	1,395	48.8
Colorado Springs	2,431	1,100	45.2
7 cities (pop. 10,000-20,000)	4,707	3,014	64.0
11 cities (pop. 5,000-10,000)	2,289	1,142	49.9
14 cities (pop. 2,500-5,000)	1,356	870	64.2
37 cities (pop. 1,000-2,500)	1,647	1,049	63.7
Total	50,864	29,492	58.0
Grand total	168,626	125,277	74.3

[a] Excludes City and County of Denver.
[b] Includes county levy for schools.

Source: Derived from Tables 20.1 and 20.3.

Legal Limits. Apart from economic considerations the law has in varying extent placed certain limits as summarized below on the power of local units to levy a tax on property.

County

General Fund Board of County Commissioners is authorized to fix rates of levy annually for county general fund, but rates are limited by total assessed valuation in county, ranging from 12 mills for counties with value less than $1,000,000 to 1 mill for counties with valuation of $300,000,000 and over. C. R. S., 1953, Ch. 36-3-1).

Contingent Fund Board is authorized to establish a contingent fund for expenditures caused by a public enemy, or some contingency that could not have reasonably been foreseen at the time of budget, and to redeem outstanding warrants issued, and to fix rates of the levy annually for such fund (C. R. S., 1953, Ch. 36-2-7).

Public Works Fund Board is authorized to create a public works fund for the construction of specified public buildings or additions thereto or to supplement bond issue for same and to levy annually therefor a tax not in excess of 3 mills without a vote of the taxpayers, or to levy a special tax in an amount submitted to and approved by the taxpayers of over 3 mills (C. R. S., 1953, Ch. 36-3-3).

Public Welfare Fund Board is authorized to levy at such a rate as will provide for budget estimates of county welfare department, but such levy shall be within certain limitations fixed by law, ranging from a maximum of 6 mills to a minimum of 2.5 mills on assessed valuation per capita. (C. R. S., 1953, Ch. 119-3-6.)

Road and Bridge Fund Board is authorized to levy a tax on general property for a county road and bridge fund in a sum sufficient to provide necessary funds, in addition to other sources of revenue, to cover county road and bridge budget estimates (C. R. S., 1953, Ch. 120-1-3).

Public Hospital Board is authorized to levy not to exceed 1 mill each year for the establishment and maintenance of a public county hospital (Sec. 1, Ch. 110, L. 43).

Public Schools Board is required to levy a tax of 12 mills annually for purpose of paying county's share of cost of public school finance program under the "Public School Foundation Act," but may be reduced to the extent of the requirements of classroom unit values as calculated under the Act (C. R. S., 1953, Ch. 123-26-7).

School Districts

Special School Tax School board is directed to certify to board of county commissioners the aggregate amount necessary for the operations of the school district for the ensuing year. Board of county commissioners is required to levy such rate (taking into account revenues from school fees paid by the game and fish commission), as allowed by law, as will produce this amount. School board may include in its certification an amount for library purposes but not to exceed 0.1 of 1 mill (C. R. S., 1953, Ch. 123-3-1).

High Schools School board is directed to certify to the county commissioners for the maintenance of any high school district a levy not to exceed 10 mills on the dollar. An additional levy of not to exceed 2 mills may be made if approved by a majority vote at a

special election called for the purpose of submitting question of such additional levy. (C. R. S., 1953, Ch. 123-14-15 as amended by Ch. 123-14-17).

Municipalities

General Fund City council or board of trustees are authorized to levy taxes on general property for general and special purposes. State law imposes no rate limitation as such. However, individual city charters may, and frequently do, establish limits in one degree or another. (C. R. S., 1953, Ch. 139-32-1.)

Park Fund City council (in cities of first and second class) is authorized to levy not more than 1.5 mills on assessed valuation for a "park fund." (C. R. S., 1953, Ch. 139-88-15.)

Municipal Library Fund City council is authorized to levy a tax of not more than 1.5 mills for establishment and maintenance of a municipal library (C. R. S., 1953, Ch. 84-1-15).

Firemen's Pension Fund (1) City council (in city or city and county of over 100,000 inhabitants and having a paid fire department) is requried to impose an annual tax of 5 cents on each $100 valuation for the firemen's pension fund. (C. R. S., 1953, Ch. 139-80-3.)

(2) City council (in each city of 50,000 to 100,000 inhabitants) shall levy a tax of 0.5 mill or so much thereof as may be required to raise the firemen's pension fund to $125,000. (C. R. S., 1953, Ch. 139-50-6.)

Policemen's Pension Fund City council (in each city or city and county of over 100,000 inhabitants) shall levy an annual tax of one cent on each $100 of value of taxable property if the sum credited to the policemen's pension fund is less than $300,000. (C. R. S., 1953, Ch. 139-81-3.)

Coincident with these limitations is the statutory provision that no tax jurisdiction in the State (regardless of ceiling rates) can impose a mill levy which would cause currently budgeted revenue to exceed that of the previous year by more than 5 percent.[7]

Legal Limits Intended or Unintended. Rate limitations must also be viewed in relation to the valuation bases which exist. Presumably when most limits were established the measure of "full" or "true" value of property was intended. Under existing practice, the average assessment ratio is evaluated at 28 percent.[8] In other words, nearly three-fourths of the potential of the tax base is not being utilized. This situation has, particularly in recent years, worked to the disadvantage of fast growing communities where the need for additional income has become increasingly acute. Thus, in Denver, to take a case in point, the county maximum levy of 1 mill for general fund outlay brings in (on a current 33 percent assessment basis)[9] approximately $1 million which, for fiscal 1959, fell short by about $4 million of covering the operating needs of strictly "county" functions amounting to over $6 million.[10]

To correct assessments to derive greater revenue would appear to be the obvious answer. However, and as noted in Chapter VII, Denver's current assessment ratio is higher than the average. To make it even higher than it now is would, in view of the state levy and the school aid formulas, cause Denver taxpayers to be penalized relative to taxpayers in other counties.

Average Mill Levies—Counties, Schools and Municipalities. The capacity and adequacy of the property tax for financing the revenue requirements of the three classes of local government is difficult to measure because of varying economic factors and assessment ratios employed. One general measure is to note the relative size of tax rates and their change over time. In the latter case, an increase would reflect added pressure on the base with a consequent reduction in its elasticity and potential for further use.

In the over-all, as shown in Table 20.5, local tax rates have increased substantially in recent years as has been equally true of the tax base itself. Thus, from 1953[11] to 1957 the average county levy increased from 8.69 mills to 9.72 mills, or an increase of 12 percent, while the school levy (including the county school levy) increased from 23.58 mills to 29.82 mills, or at the rate of 26 percent. Similarly, the average municipal rate advanced from 11.48 mills to 12.94 mills, or an increase of approximately 13 percent. For the same period also, assessed values for the State as a whole increased by 23 percent.

Variation of Mill Levies by Individual Local Units. A more detailed insight into what the trends have been may be had by noting changes

in levies for all purposes—county, school and municipal—as they have occurred in each of Colorado's 78 cities having a population of 1,000 or more as shown in Appendix Table 20.A and as further summarized in Table 20.6. In the latter tabulation it will be seen that from 1953 to 1957 county levies decreased in 31 cities with a maximum increase ranging up to 4 mills in 41 cities.[12] Similarly levies declined in 19 cities, remained constant over the period in 15 cities and increased in 44 cities with the most frequently occurring individual gains amounting to a maximum of 4 mills. In the case of the schools (including the county school levy) tax rates declined in only 6 cities while the remaining 72 cities experienced an increase ranging most frequently up to 8 mills.

From these trends and relationships it is apparent that the over-all local pressure on Colorado's property base is due essentially to the public school system which in 1957 accounted also for approximately two-thirds of property tax revenues (Table 20.5). On the other hand the relatively low county levies may be attributed to a fairly limited expenditure requirement in which growth demands have not been particularly marked. Similarly, municipal rates are also relatively low and have held fairly constant in recent years. The municipal picture is deceptive, however, when interpreted in the light of municipal expenditure trends and revenue requirements. In the largest cities growth has been extremely rapid and on the face of it pressures on the property base should have reflected this accordingly. This paradox can be explained in part by rate limitations imposed by city charters and in part by city opportunity—not available to either counties or school districts—to utilize other than property tax sources. The fact that alternative revenue sources have been increasingly used by the cities, as noted in later discussion, is of itself significant since it indicates that the property base is no longer capable of supporting all hands.

[12]The record of mill levy change for Colorado's 62 counties (exclusive of Denver which is included in the tabulation for municipalities) when considered within the frame of a sample of 78 cities and towns, results in some duplication. However, this is held to a minimum since all counties are represented in the 78-city sample.

The Over-All Local Property "Tax Burden". Although no "general rule" or single index exists for determining when a property tax in a given locality has reached its practical "maximum," it has been quite generally assumed that an over-all rate beyond 2 percent (20 mills) on the *sales value* of property would cut into

capital and become economically unjustified.[13] On the basis of an average assessment ratio of 30 percent (which is slightly above the general state average) a prohibitive rate by the preceding assumption would be 60 mills—which may be compared with the over-all average rate for counties, school districts and municipalities (but exclusive of the State levy and special districts) amounting to 52 mills in 1957.

Admittedly the assumption of a "2 percent maximum" is subject to question in view of the many variables in any given case. Among these, economic capacity and the use of other taxes are important criteria of judgment. However, it is, in any event, suggestive of the burden on property which for Colorado would seem to be at least nearing its limit for local government use.

Local Non-Property Taxes

Apart from certain miscellaneous income items (e. g. fees, fines and earnings) not ordinarily regarded as taxes, counties and school districts in Colorado rely on property taxation as their principal source of local revenue. Hence, a discussion of local non-property revenue sources is pertinent only to municipalities.

As was noted above, the adoption of other sources of municipal revenues has been more or less forced upon the cities, a fact not peculiar to Colorado, however, but general throughout the nation. As shown in Table 20.7 over $1 billion in non-property taxes was collected in 1955 by all cities in United States with a population over 10,000. It will be further observed that in terms of number of cities, the most popular non-property taxes are public utility receipts, sewer and refuse service charges, admissions and amusement taxes, business gross receipt taxes, and sales taxes.

In Colorado the most commonly used non-property taxes are those imposed on tobacco, utilities and liquor. Generally employed also are a miscellaneous variety of licenses and permits which in the aggregate are relatively important.[14] The sales tax is also used but, as noted below, is limited to Denver and Pueblo.

Municipal Sales Tax. Nationally the municipal sales tax is becoming increasingly important which is particularly true in California

Table 20.7

Municipal Non-Property Taxes and Service Charges, (All cities with population over 10,000 in United States) 1955

Tax or service charge	Number of cities imposing tax	Total yield from tax (millions)	Per capita yield
Admissions and amusements	197	$ 22	$ .86
Business gross receipts	189	145	5.74

where 290 municipalities (and 38 counties) are now imposing a sales tax.[15] Among the larger cities (cities over 250,000) most recent data show that 9 municipalities, including Denver, have a general sales tax (Table 20.8).

While not generally used in Colorado, the considerable importance of the municipal sales tax for Denver and Pueblo is evidenced by total collections in 1956 amounting to $4,896,000 and $574,000 for these two cities, respectively, or 13 percent and 19 percent of their total locally collected revenues (Table 20.3).

Municipal Sales Tax in Denver. The sales tax, adopted as a permanent measure by Denver in 1948, came as a result of the inability of the property tax to cope with the rapidly increasing needs of combined city-county government and the school systems. The sales tax has been a successfull tax despite early apprehension on grounds that it was a "layered tax," that it was "regressive"; and that "it would drive business out of the city." As a revenue producer, the tax has proved itself. Its regressivity has been reduced (though not entirely) by selected exemptions. It has, in instances, undoubtedly hurt certain business units near the suburbs. Though not measurable, the over-all negative effects on this account are not believed to be considerable. Compliance has been good and perhaps better than experienced by the State.[16]

[13]The calculations and the basis for the 2 percent maximum may be illustrated by a quick proof as follows: Take annual rentals at 11 percent of sales value, which is an average relationship; assume next that 6 of the 11 percentage points are required for interest on the mortgage or for capital return as the case may be; and 2 and 1 percentage points, in addition, for depreciation and maintenance costs, respectively. This leaves 2 percent available for taxes. To tax more than that would be to levy against capital rather than against return to capital. (For further discussion on this see *Financing Municipal Government in Denver*, City and County of Denver, 1955, p. 7.)

[a] Similar rate is imposed on sales by manufacturers, wholesalers, and professionals.

Source: Commerce Clearing House, *State Tax Reporters* (Chicago, 1957); U. S. Bureau of the Census, *Compendium of City Government Finances in 1957* (Washington, 1957), p. 28.

The tax, as presently administered, calls for a levy of 1 percent on the purchase or exchange of tangible personal commodities, and a few services, at retail. The tax is computed separately and added to the price of the commodity. The retailer is specifically forbidden to advertise or indicate that the tax is assumed or absorbed in any way. Hence, the tax is a consumer-type tax and not a "hidden tax" as are many specific sales taxes.

As distinguished from the State sales tax, the Denver tax exempts from the base all foods other than restaurant meals. This effort to reduce the regressive features of the general sales tax does, however, reduce potential revenues by an estimated 20 percent.[17] Other exemptions include prescription drugs; personal and other services except local telephone and telegraph, gas, electricity, and other heating fuels; articles sold to manufacturing, processing, mining, construction and railroad enterprises to be used outside the City; sales to governmental, religious, and charitable institutions; and sales of feed, seed, livestock, poultry and other special farm items.[18]

Municipal Sales Tax in Pueblo. A municipal sales tax was approved by Pueblo voters in the 1955 general election. Reasons for the introduction of this tax were much the same as those noted for Denver, namely rising costs for both the city and schools and this in the face of an overworked property base no longer capable of sustaining both.

Provisions of the Pueblo tax are quite similar to those for Denver. The tax rate is 1 percent and the major exemption is food. Unlike Denver, however, Pueblo has a 1 percent use tax. The latter levys on the privilege of storing, using or consuming articles of tangible personal property purchased at retail from sources outside the cooperate limits of the city.[19]

Municipal and State Levies—Interstate Comparisons. The imposition of a municipal sales tax must be made with due regard for comparable taxes in other cities but particularly so in the event that the state itself has a sales tax. One of the reasons for the limited use of the sales tax by municipalities in Colorado is the fact that the State also has this tax. Hence, the 1 percent tax in Denver and Pueblo is a "layered tax" which, without allowing for differences in the composition of the tax base, means that the combined state and local levy amounts to 3 percent.

In other states, municipal rates range from ½ to 3 percent but not all of these places are located in states where a state levy is imposed. Thus, for all cities over 250,000 population the relationships—state and local—are as follows: (See also Table 20.8).

City	Sales tax rates — Municipal	State[20]	Total
New York	3.0	none	3.0
Los Angeles	1.0	3.0	4.0
Washington	2.0	none	2.0
San Francisco	0.5	3.0	3.5
Pittsburgh	0.2	3.0	3.2
New Orleans	1.0	2.0	3.0
Denver	1.0	2.0	3.0
Oakland	1.0	3.0	4.0
SanDiego	1.0	3.0	4.0

As can be see, the combined Denver and Colorado rate of 3 percent places Denver somewhat below the four listed California cities but on the same leval with two cities—New Orleans

[17] *Ibid.*, p. 109.

[18] *Ibid.*, p. 108.

[19] City of Pueblo, Colorado, *Retail Sales and Use Tax Ordinance No. 2189*, Section 20.

[20] See Chapter VIII, Table 8.4, for state rates.

and New York. Only Washington D. C. has a rate lower than the combined Denver-Colorado rate. Should, however, either Denver (or the State) increase rates such action would likely place Denver near or above the top in this inter-city comparison group — a distinction which, in view of the regressivity of the tax could be regarded as a dubious one at best. This, of course, is not only a matter which affects municipal tax policy but one which is equally applicable to tax policy decisions at the state level.

Future Outlook for Municipal Sales Taxes in Colorado. Home-rule cities in Colorado have undoubtedly the power to adopt a sales tax. The likelihood that cities other than Denver and Pueblo will introduce this tax in the future is contingent not only on future revenue requirements and the potentialities of existing revenue sources but on possible State action that could, should the tax be increased by the State, prohibit its use, or restrict larger use by municipalities. This possibility is a hazard now faced by Denver and Pueblo, and all cities are aware of it. Here state-local fiscal cooperation in tax policy determination is entirely absent—lack of which creates uncertainty in tax structuring by both the state and municipal governments.

The possible loss of business to a non-taxed community is another factor which tends to discourage local adoption of sales taxation. Although, as earlier noted, the City of Denver has lost some business to the suburbs on this account, it is clear that the attraction of a large central market has tended to overcome this development to a high degree.[21] However, smaller communities might find no offsetting advantage and could be severely hurt. In Some states, such a limitation could be eliminated by establishing a centrally administered tax, collected by the state and distributed to the local communities. However, in Colorado, the constitutional provision that 85 percent of state-collected excise taxes must be earmarked for the Old Age Pension Fund would likely prohibit the use of this alternative. Moreover, aside from this legal stumbling block, it is possible that communities would be forced under such an arrangement to accept sales tax revenues even if the revenues were not needed or in cases where the citizens were opposed to the tax in principle. The latter would, in this circumstance, violate local autonomy and home rule concepts.

Cigarette Tax. Colorado is one among eleven states (Alabama, Colorado, Florida, Illinois, Maryland, Missouri, New Jersey, New Mexico, New York, Tennessee and Virginia) which authorizes cities to levy a tax on cigarettes.[22] Some states, however, do not permit a local tax but instead, as in Minnesota, impose a state tax which, in turn, is shared with the municipalities.[23]

Of the eleven states authorizing local taxation, extensive municipal use of the cigarette tax occurs in only four, Colorado being one of them. Widespread use of the tax by Colorado municipalities, 37 in all, is probably due to the failure of the State to utilize the tax—a fact perhaps attributable in large extent to the constitutional provision that 85 percent of state collected excise taxes must be diverted to the Old Age Pension Fund.

In 1958 total collections from the local cigarette tax (called an "occupation tax" in Denver and in a number of other cities in the State) amounted to $1,612,465. Although varying in relative importance, revenues have tended to be fairly substantial in most of the cities and towns using the tax. As noted in Table 20.9 revenues from this source in 1956 ranged from a high in Cortez of 42.42 percent of property taxes levied to a low in Denver of 5.49 percent. Denver collections of nearly $1 million accounted for approximately 60 percent of aggregate municipal collections in the State.

Further examination of Table 20.9 shows that present rates imposed by Colorado cities range from 1 to 3 cents per pack, with the large majority of cities using a rate of 2 cents. Since the tax is usually collected by the sale of stamps to business firms, a discount is usually given, presumably to cover the cost incurred in attaching the stamps to the cigarette packs. In most cases these discounts are 8 or 10 percent. It is of interest that state cigarette tax discounts average only about 5 percent. An immediate increase in municipal tobacco taxes could, of course, be effected by giving less liberal dealer discounts.

In addition to levying a tax on cigarettes, the cities generally provide for a tax, via a license, on cigarette wholesalers and retailers. Most wholesalers license fees are $5, while those for retailers range from $1 to $5.[24]

Special Problems. The cigarette tax, when used by municipalities, tends to become somewhat competitive. As in the case of the general sales tax, but on a more limited basis, if a taxing municipality borders a non-taxing area, consumers tend to patronize the latter whenever possible. A good example of the competitive nature of the tax is presented in the Denver Metropolitan Area, where Denver taxes cigarettes at 2 cents per pack, while Aurora and Englewood undercut this figure by one cent per pack. The differential may not be sufficiently great to substantially divert the cigarette businesses to the suburbs. It does show, in any event, that a "competitive tax" has potentials that could importantly distort trade channels to the advantage of some retailers but at the expense of others.

Again, as in the case of sales tax, the answer would seem to lie in a state collected and locally distributed cigarette tax. But for the same reasons as noted in the case of a general sales tax, such an arrangement would likely be defeated, even if desirable, by existing constitutional limitations.

Liquor Tax. The origin of the local liquor tax in Colorado can be traced to the adoption of the Old Age Pension Amendment in 1936. Prior to this date the State collected revenue from an excise tax on the sale of alcoholic beverages and the issuance of licenses to liquor manufacturers, wholesalers, and retailers. At the same time, municipalities imposed a separate license fee and retained the revenues locally. In 1938 the Supreme Court ruled that the provisions of the 1936 Old Age Pension Amendment applied to these locally collected and retained license fees.[25] Hence, 85 percent of the locally collected fees had to accrue to the Old Age Pension Fund. As a part of this ruling, the court also held that municipalities can collect liquor license fees only for the State since regulation of the sale of alcoholic beverages must be performed exclusively by the State. The effect of this ruling is that municipalities now retain only 15 percent of the state liquor license fees they collect which, in 1957, amounted to $98,431.[26]

Still faced with the local costs associated with the sale of alcoholic beverages, municipalities turned to the Colorado laws which give cities of the first and second class, and incorporated towns, the power to license, regulate and tax business establishments. [27] On the basis of this law, a number of municipalities proceeded to impose a license fee on retail liquor dealers, not as a regulatory but as a revenue measure. In 1948 the State Supreme Court upheld a Grand Junction ordinance imposing a local liquor license for revenue purposes. The court held that such licenses did not come under the Old Age Pension Amendment as long as they were solely for revenue purposes and did not infringe upon the State's exclusive right to regulate the sale of alcoholic beverages.[28] Following this favorable ruling, municipal adoption of occupation taxes on liquor dealers be-

[25] Denver v. People, 103 Colorado 573, 88 Pac. (2d) 89.

[28] Post et, al., v. City of Grand Junction, 195 P. (2d) 958.

came widespread. In 1958 52 Colorado municipalities collected revenues from such an "occupation tax."[29]

Current rates of local liquor licenses vary from $25 to $1,050, averaging approximately $392. Licenses which allow the sale of liquor for on-premises consumption tend to carry a higher rate than those which permit the sale of liquor for off-premise consumption. Since the basic rationale for the collection of local liquor license fees is that the locality incurs certain added expenses due to the sale of liquor, the graduation in rates would suggest that a greater cost results from the sale of liquor for on-premises consumption than for off-premises consumption.

The range of rates imposed on various types of dealers is as follows:[30]

Type of license	Range of rates
On-premise consumption	$2 - $1,050
Hotels and resturants	2 - 1,500
Sale by the drink	2 - 1,500
Off-premise consumption	2 - 750
Clubs and lodges	2 - 400
3.2 Beer outlets	2 - 375

The rates imposed by some of the larger Colorado cities are as follows:[31]

Type of License	Pueblo	Colorado Springs	Grand Junction
On-premise consumption	$500.00	$350.00	$250.00
Hotels and resturants	500.00	350.00	250.00
Sale by the drink	500.00	350.00	250.00
Off-premise consumption	200.00	350.00	250.00
Clubs and lodges	200.00	140.00	100.00
3.2 Beer outlets	75.00	75.00	100.00

The license rates in the larger cities and towns tend to exceed the state license fee while the situation is reversed for the smaller towns. For example, the locally collected State license fee for a hotel or restaurant is $325 while Pueblo and Englewood collect a fee of $500, and Holly and Aspen collect only $200.

It should be noted that local liquor occupation taxes have been confined to retailers, thereby omitting manufacturers and wholesalers. Although the inclusion of manufacturers and wholesalers would not provide any significant revenue for many cities and towns, it could be quite important in several of Colorado's larger cities.

Englewood, Aurora and Littleton employ local liquor taxes, but Denver as yet has not adopted this revenue source, which it is estimated could enlarge Denver's budgeted income by approximately $240,000.[32]

Franchise Taxes. A total of 77 municipalities in Colorado levy a so-called franchise tax on private utilities. As can be seen from Table 20.3 revenues from this source including income derived from publicly owned utilities amounted to approximately $3.4 million or 6.2 percent of total local collected revenues.[33]

Franchise taxes are defended on grounds that they constitute a charge for the privilege of using streets and other municipal services. In addition, public utility companies commonly have a monopoly and the tax is considered a payment for this right. While these special taxes tend to be good revenue producers, the justification for their imposition is not completely tenable. The singling out of this type of business for special taxation is somewhat arbitrary, and more significantly, the tax tends to result in higher prices for public utility services and is therefore little more than an added tax on public utility consumers.

The three types of utilities most frequently taxed in Colorado are gas, electric, and telephone companies. In addition, a few municipalities collect revenues from other public utilities such as closed circuit television, transit, and telegraph companies.

Three principal methods of taxing public utilities are employed. The most common is to charge the company a percent of the gross receipts which are earned within the city limits. A second method is to charge a flat rate which is collected annually or monthly. Another method occasionally used is to require the utility to furnish free services to the municipality in lieu of any special taxes. These methods are often combined, such as requiring the utility to provide free services to the municipality as well as levying a tax on the basis of gross receipts.

Utility taxes are usually effected through a franchise, by ordinance (usually as an occupation tax), or through an agreement between the municipality and the public utility.

Rates generally range from 1 to 3 percent of gross receipts. Occasionally, however, a lower or higher rate is employed, as in Denver where the rate on telephone utilities is ½ percent of gross receipts, or in Manitou Springs where the rate on electric utilities is 8 percent of gross receipts.[34]

Income From Municipally Owned Utilities. In addition to franchise taxes imposed on privately owned utilities a limited number of Colorado cities derive sizable general fund income from the operation of municipally owned utilities. An example is Colorado Springs, which,

[30]*Ibid.*

[31]*Ibid.*

[32]*Financing Municipal Government in Denver, op. cit.*, p. 173.

[33]Colorado Municipal League, *Municipal Utility Taxes in Colorado*, 1958, p. 1.

[34]*Ibid.*

in 1956, transferred to its general fund $620,000 from its "Utilities Division in Lieu of Taxes." This amount represented approximately one-fourth of the City's total locally collected revenues. Other cities drawing heavily on "profits" from publicly owned utilities, as shown by 1956 transfers to the general fund, are Boulder ($40,000); Fort Collins ($57,000); Lamar ($66,000); Longmont ($185,590); and Loveland ($100,000).[35]

Aside from the rationale of socialization upon which revenue collections in these cases are premised, it should be noted that, in effect, municipalities are taxing the user of a specific service to cover general costs of government. As such the collection becomes a consumer tax with a feature that tends to defeat the idea of socialized benefits equitably distributed.

To some a preferable policy would be to provide utility services at cost thus giving the benefit to those who use the services rendered. This would also obviate the hazard of paying out capital for general use because of a possible inadequate depreciation and maintenance policy.

Proponents of general fund financing from profits of publicly owned utilities argue, however, that "general costs" are involved in operating a publicly owned utility and to ignore this fact would be unfair to the general taxpayer. Hence an "in lieu" tax is equitable and justified. However, when the "in lieu" tax is clearly excessive the rationale of such a charge must obviously rest on some other basis. Here presumably "expediency" and "productivity" would constitute the major reasons advanced.

Licenses and Permits.[36] Receipts from licenses and permits are generally classified as "non-tax" revenues. While taxes are a compulsory contribution levied and the revenue spent for the general welfare without regard to benefits for particular individuals, non-tax revenues are characterized by the more or less voluntary choice on the part of the individual as to whether or not he will receive the benefit and pay for it.[37]

Use of licenses and permits by Colorado municipalities varies widely. In general, however, permits are usually confined to building permits while licenses take the form of specific occupation taxes. In addition, a few municipalities employ a general occupation tax requiring all business firms to purchase a license. Although most license fees are levied primarily for revenue purposes, regulatory objectives are occasionally involved. The most common types of business licenses are discussed below.

Amusement Machines. Juke boxes and pinball machines are the most frequently regulated amusement machines. Approximately 50 Colorado municipalities levy a license fee on this type of business.

Operators and dealers are usually differentiated and licensed separately, with the fee generally higher for the operator. In addition, a fee is usually charged on a per machine basis. The most common fee is $10 per machine, although a substantially higher rate is occasionally employed.

Auctioneers. Approximately 30 municipalities regulate auctioneers through licensing. Annual fees vary from $5 to $200, with a fee of $25 being the most common. Some fee schedules also include a per day rate for auction firms which do not operate on a continuous basis. These fees vary from $1 to $25 per day, the most common fee being $5 or $10. Occasionally auctioneers handling new merchandise and transient auctioneers are differentiated and required to pay a higher fee.

Barbershops. Barbershop licenses are required in 8 communities. An annual flat fee is usually charged which varies from $1 to $20. Rates are also based on the number of chairs used.

Billiard Halls. Billiard hall licenses are required in virtually every community in Colorado. Rates are usually on an annual flat-rate basis with an additional fee for each table used. Annual fees average $25 while table fees range from $5 to $60 for the first table and $5 to $30 for other tables.

Builders and Contractors. Approximately 15 cities require contractors to purchase a license while about 40 communities require electricians and plumbers to purchase a license. A carpenter's license is also required in several cities.

License fees for limited contractors range from $10 to $50, while the fees for unlimited contractors range from $25 to $100. Electricians' fees average $35, and plumbers' fees $12. An additional fee is occasionally charged electricians and plumbers on the basis of whether they are masters or journeymen.

Carnivals and Circuses. Carnival and circus licenses are required in about 40 Colorado cities, with rates varying substantially. The most common rates are $25 or $50 per day, although a

[37] William H. Anderson, *Taxation and the American Economy* (New York: Prentice Hall, Inc., 1951), pp. 488-89.

substantially higher rate is occasionally employed, as in Denver which has a rate of $200 per day.

Dance Halls. Dance hall licenses are required in about 30 cities. Rates are based on daily and/or yearly rates. These licenses produce little revenue and are primarily for regulatory purposes.

Gasoline Stations. Gasoline station licenses are required in 9 communities. In most cases annual fees are based on the number of pumps. The fee schedule (first pump) ranges from $5 to $25.

Pawnbrokers. Pawnbroker licenses and fees are collected in 18 communities. Rates range from $25 to $400 annually, with the larger amount applicable to Denver and Boulder.

Photographers. Photographers are required to purchase a license in 27 communities. Permanent photographers are frequently differentiated from itinerant photographers, with a higher rate being employed for the latter. Annual rates for permanent photographers vary from $5 to $50, while rates for itinerant photographers are generally $5 or $10 per day.

Theaters. Theater licenses are required in 42 communities. Annual flat rates are usually employed and vary substantially. Rates of $50 to $200 are common in the larger cities, while lower rates are generally employed in the smaller towns.

Trailer Courts. Trailer court licenses are required in 26 communities. Fees are usually on an annual basis with a charge for each trailer. Annual fees vary from $2 to $100, while trailer changes range from $2 to $20 per trailer.

Court Fines. Fines, fees, and forfeits are voluntary and involuntary payments to the municipalities for services rendered through the courts. The rationale for the use of fines and fees is primarily to cover the expenses incurred by the courts, although many fines are punitive in nature. Traffic court fines, however, frequently offset deficits incurred by other courts. In Denver, for example, revenue from traffic fines carries the "burden" of Denver's total court costs—county, district, municipal, and juvenile.[38]

Court fines for all cities accounted for $2,757,000 in 1956, or over 5 percent of total local revenues (Table 20.3). It should be pointed out, however, that the expenses incurred by the courts often exceed revenues, and the revenues from court fines are therefore not available for general revenue purposes.

[38] *Financing Municipal Government in Denver, op. cit.*, pp. 131-132.

Parking Meters. As shown in Table 20.10 revenues from parking meters have become increasingly important in recent years. Currently twenty-five municipalities in the State have parking meter charges which in 1956 amounted in the aggregate to $1,174,000 or slightly over 2 percent of total local revenues. (See Table 20.3.)

Although parking meters involve a sizable original cost, as well as installation and maintenance expenses, they are nevertheless a fair revenue producer. However, the justification for parking meters is that they are regulatory in nature and are closely related to the subject of traffic control.

Interestingly, parking meters have become somewhat competitive in nature. Denver, for example, receives substantial revenues from this source while Englewood and Aurora do not utilize meters at all. As traffic becomes more congested and municipal revenue needs continue to grow, the use of parking meters will undoubtedly increase.

Table 20.10

Receipts from Parking Meters, Selected Cities in Colorado, 1949 and 1956

City	1949	1956
Denver	$366,300	$ 403,728

Alternative Municipal Revenue Sources. The municipal income tax, wheelage taxes, and refuse collection fees have gained a certain popularity in other states. While the first two are not utilized by Colorado cities and the last on a limited basis only, the growing needs of municipalities for additional revenue may necessitate considering these sources in the future. For this reason, a brief discussion of these revenue sources as they are found in cities throughout the country is presented below.

Municipal Income Tax. The municipal income tax, as it is generally employed, is a levy on the gross income of residents, and the income of non-residents which is earned within the taxing jurisdiction. Provisions allowing for personal exemption and deductions are uncommon.

In 1955, an income tax was imposed by 48 municipalities with populations over 10,000, and about 350 other local units of government.[39] The majority of these jurisdictions were in Pennsylvania where boroughs and school districts as well as cities enjoy the power to tax income. In addition, 16 cities in Ohio, 4 cities in Kentucky, and 1 city in Missouri employed a tax on income.

Several advantages have been attributed to the income tax as a local source of revenue. Since it is usually based on gross income, substantial amounts of revenue can be effected by the imposition of relatively low rates. Another advantage is that the tax requires suburban citizens to contribute a part of the revenue needed to finance services which they enjoy by working in the city.

The tax is criticized on the basis of administrative complexity and evasion possibilities. Since all forms of income cannot be subject to withholding, some income undoubtedly escapes reporting. The major criticism of the tax is that in practice it tends to be regressive. Certain types of property income are often excluded, exemptions and deductions are uncommon, and a proportional rate is usually employed. The tax, however, need not be used in a regressive manner. Exemptions and deductions could be allowed and a progressive rate structure could be used. Were the tax employed in such a manner, the smaller base would necessitate higher rates to effect the same revenue. If taxpayers are more concerned with tax rates than with tax bases, this procedure might be unpopular. Even if exemptions and deductions are not allowed and a proportional rate structure is used, the tax is still probably less regressive than other local sources of revenue.

The Colorado Supreme Court recently ruled that municipalities in Colorado do not have the power to levy a tax on incomes. Considering the advantages attributed to the tax and the growing municipal revenue needs, however, enabling legislation may eventually be enacted which will permit the use of this local source of revenue.

Wheelage Taxes. Wheelage taxes are local levies on motor vehicles using city streets. Commonly a flat rate per vehicle or a fee based on weight or horsepower is charged.

This local source of revenue is employed by 134 cities with populations over 10,000 and several hundred smaller cities in 12 states. Three-fourths of the larger cities in the group are located in Illinois, Missouri, Virginia, and North Carolina.[40]

The justification for the local taxation of motor vehicles is based on the benefit principle. Since automobile and truck operators derive special benefit from the city streets, it is argued that they may be called upon to make a contribution to the cost and maintenance of these facilities. Consistent with this rationale is the common practice of earmarking the proceeds from wheelage taxes for the support of expenditures on streets and city access roads or traffic control functions. Only occasionally are the proceeds available as general revenue.

Wheelage taxes have been criticized on the grounds that they involve double taxation because motorists are subject to a variety of federal and state taxes related to the ownership of motor vehicles. In addition, it is somewhat untenable to contend that only the motoring public receives benefits from city streets.

Another complaint against the tax is that it is difficult to enforce, especially if rates are more than moderate. To overcome this latter difficulty, local administration is occasionally related to state registration programs. Some cooperation between taxing jurisdictions would appear to be a prerequisite to effective administration of these taxes.

Although local vehicle taxes involve certain theoretical and administrative problems, they have achieved considerable popularity in some states and may become more widely utilized in the future.

Refuse Collection Charges. Approximately 310 cities in the country with populations over 10,000 impose a fee or charge for the collection of refuse from residences and business concerns. In 1956, the estimated revenue from these charges was $40 million (Table 20.7).

Commonly, refuse collection is done by the city and financed from general revenue. Although the imposition of a fee for this service may be rationalized on the benefit principle, a more frequent justification is simply the need for additional municipal revenue.

In practice, there is little uniformity as to either the base or rates established for refuse collection. The fee is often confined to garbage collection but occasionally includes rubbish, ashes, and other classes of refuse. Charges are assessed on either an annual or a monthly basis, though the latter is the more common. Rates vary from $4 a year in Little Rock, Arkansas, to 90 cents a month in Dallas, Taxas.[41]

While refuse collection charges and similar fees have been referred to as "nuisance taxes," their popularity may continue to grow unless cities find alternative revenue sources to meet their growing needs.

State Payments to Local Governments — General

The practice of transferring state funds for local use is premised on a series of reasons or objectives, all of which have, in one degree or another, played a part in establishing the rationale of the over-all aid structure found in any given state. The principal of these may be listed as follows:

(1) The division of functions between the state and local governments, desirable as any given arrangement may be, does not of itself assure a similar division of financial means to support governmental functions. Indeed it is likely that at the local level, where access to various tax resources are limited, funds will be short whereas at the state level they may be more than adequate. As a compromise, a state may assume more functions or transfer additional funds to the localities. In practice, where such imbalance occurs states have followed either one or a combination of both methods with no consistent pattern indicated.

(2) State-local transfers are also widely used because they represent an acceptable way of influencing local units of government to act in support of certain statewide objectives. Thus, the Social Security Act has caused counties, as in Colorado, to adopt standards of performance otherwise not possible.

(3) Transfers or grants have been adopted in order to equalize the level of service offered by communities with gross differences in tax-paying capacity. Thus, it is quite generally recognized that all children in the state should have the same opportunity to achieve a basic minimum level of education. A similar concept attaches to the provision for public welfare such as the care of the aged, dependent children and related social service functions.

(4) Grants-in-aid are also justified on grounds that certain services provided by local governments benefit persons other than those who contribute directly to their tax support. Thus, in the case of public highways and schools the interest and benefits received are statewide. This being so, it is held that over-all state support is called for as a partial compensation to the communities for direct costs incurred.

(5) In some cases certain taxes cannot be effectively administered at the local level although the proceeds therefrom "belong" to the communities. Here state administration is called for with appropriate returns made on some equitable basis. An example in Colorado is the specific ownership tax "Class A" which is a levy on commercial vehicles allocated to counties in proportion to the distance travelled by such vehicles within each county.

(6) Finally, grants-in-aid are used as a device for meeting rising costs of certain locally administered governmental service thus relieving the strain upon a heavily burdened local property tax. This is supported on grounds that, unlike the state, most local units have no alternative to the property tax.

Table 20.11

State Payments to Local Governments in Western States

On the basis of 1956 Census data, as shown in Table 20.11, state government in Colorado paid a total of approximately $106.5 million to local governments on programs for education, welfare, highways and miscellaneous other locally administered programs. This amount accounted for 47.8 percent of the State's total expenditures — a ratio exceeded by only one other state, California. Further examination of Table 20.11 shows, however, that 6 states make no grants to local government for public welfare. That is to say, in these instances the state paid the whole cost of the welfare program directly rather than through the county treasurers as in Colorado and California. Hence the over-all ratios for both these states are magnified to that extent. Differences in financial administration are also apparent in the case of highway programs which in the case of Montana shows no state-local payments on this account.

For comparative purposes more reliable data are indicated for aids to education. Colorado, with a ratio of 9.35 percent of total state expenditures directed to public school aid, places last in the comparison group of eleven Western States which is led by New Mexico with a ratio of 29.7 percent. Colorado's comparative position in the West is further indicated in Table 20.12 which shows state aids on a per capita basis. It will be seen that Colorado with a per capita figure of $12.92 again places last in the eleven-state group with New Mexico in a leading position with a per capita total of $52.77.

Table 20.12

State Payments to Local Governments in Colorado

Table 20.13 presents in detail aggregate state payments to local units of government in Colorado for 1957.[42] As will be observed, the total state-local transfer amounted to $111.3 million of which $32 million — channeled mainly through the State Treasury — came from the federal government and the remainder or $79.3 million consisted of state collected but locally shared taxes and grants from general state revenues. In all cases the moneys distributed were dedicated to specific functions as required by state or federal law. The principal function financed was public welfare which accounted for nearly two-thirds of the total or 62.5 percent. Other functions in order of relative amounts distributed were for education, 22 percent; highways, 12.7 percent; and all other, 2.8 percent. Viewed in terms of class of local governmental unit receiving funds, the distribution of the total was as follows: counties 76.1 percent, school districts 22.0 percent, and cities and towns 1.9 percent.

Shared Taxes and Grants-in-Aid

Payments to local units of government are generally categorized as either shared taxes or grants-in-aid. By usual definition shared taxes constitute a transfer of revenue from earmarked taxes without limitations as to the use of the funds, while grants-in-aid are payments from state revenues or from federal grants to be used by the local governments only for a specified purpose.[43] This definition does not, however, fit all cases. In Colorado, for example, the state-collected motor fuel tax is apparently a "shared tax" and is so called. However, its use is specified and, in that sense, constitutes (by definition) a grant-in-aid.

Consistent with state usage of terms, but recognizing that any classification must be somewhat arbitrary in any event, the following will be identified and discussed as shared taxes: payments from the highway user fund, specific ownership tax A, motor vehicle penalty assessments, and the liquor tax. All other payments, mainly for education and public welfare, will be considered as grants-in-aid.

Shared Taxes in Colorado

In 1957, a total of $14,770,000 was transferred from the State to cities and counties in the form of shared taxes (Table 20.13). Payments from the highway user fund accounted for $14,-180,000 or 96 percent of the total. The other shared taxes (Specific ownership tax A, motor vehicle penalty assessments, and the liquor tax) together accounted for the remaining 4 percent,

[42] Unless otherwise indicated the discussion in this and succeeding sections is based on data for 1957 as distinguished from preceding analysis which, in the main, covered the year 1956.

[43] Harold M. Groves, *Financing Government* (fourth edition; New York: Henry Holt and Company, 1954), pp. 467-468.

or a total of only $590,000. Hence, a discussion of shared taxes in Colorado is concerned primarily with payments from the Highway User Fund.

The Highway User Fund. The receipts from the motor fuel tax, the gross ton-mile tax, motor vehicle license fees, and operators' and chauffeurs' license fees are ear-marked and accrue to the Highway User Tax Fund. After administrative costs and the expenses of the highway patrol have been met, this fund is allocated to municipalities, counties, and the state highway fund for designated road and street purposes.

In 1957, the Highway User Fund amounted to $43,057,000 after administrative expenses had been met but before the costs of maintaining the highway patrol and inspection stations had been deducted. Of this total, revenue from the motor fuel tax accounted for $32,098,000 or nearly 75 percent of the Highway User Fund. The gross ton-mile tax accounted for $5,748,000 (13 percent) and the motor vehicle license fees for $5,122,000 (12 percent). Operators' and chauffeurs' fees were relatively insignificant, amounting to $89,000 or .2 percent of the total.

After deducting expenses of the highway patrol and the motor vehicle inspection stations totalling $2,533,000, the net amount of the Highway User Tax Fund to be distributed to municipalities, counties, and the state highway fund was $40,519,000.[44]

Allocation of the Highway User Tax Fund. The Highway User Tax Fund is allocated on the basis of 56 percent to the State Department of Highways, 30 percent to the counties and 5 per-

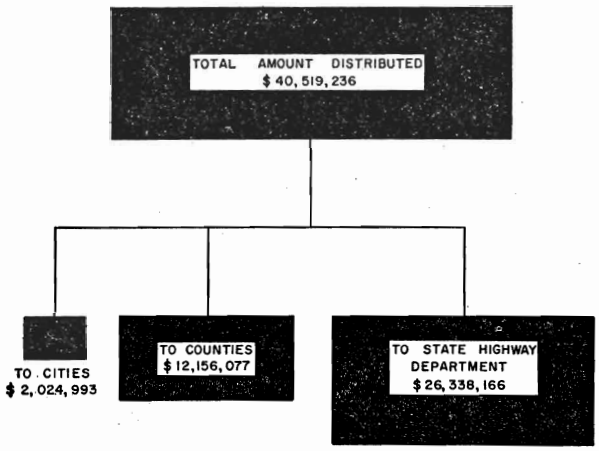
cent to the cities and towns.[45] In fiscal 1957, the amounts distributed from the Highway User Fund were as follows: State Highway Fund, $26,338,166; counties, $12,156,077; and cities, $2,024,993 (Chart 20.1).

DISTRIBUTION OF COLORADO HIGHWAY USER FUNDS, 1957



SOURCE: State of Colorado, Division of Accounts and Control

CHART 20.1

The county share of the fund is divided among the 62 counties according to a formula based on mileage and vehicle registrations in each county. Eighty percent of the county share is apportioned according to county road mileage adjusted to reflect differences in terrain and building and maintenance costs. The factor used for each county ranges from 1 to 3. For example, Kit Carson County in Eastern Colorado is designated as a "plains" county and therefore an adjusting factor of only 1 is applied. Garfield County, however, is a "mountainous" county and therefore an adjusting factor of 3 is used.[46] The remaining 20 percent of the fund is apportioned on the basis of the registered rural vehicles within each county. Mileage of state highways, city streets, and city vehicle registration are not considered in the allocation of the county share. For purposes of county allocation, the City and County of Denver is not considered a county.[47]

The city share of the user fund (or 5 percent) is allocated on a somewhat different basis. Eighty percent is distributed on the basis of "adjusted" urban vehicle registration. The actual number of urban vehicles registered in each municipality is adjusted "to reflect the increased standards and costs of construction resulting from the concentration of vehicles in cities and incorporated places." The adjustment factor ranges from 1 to 2. Municipalities with an actual registration of 500 vehicles or less receive an adjustment factor of 1.0 while municipalities with a registration of 185,001 vehicles or more are given an adjustment factor of 2.0. Municipalities with registration between these two extremes are rated accordingly on the basis of a statutory graduated scale.

The remaining 20 percent of the municipal share of the fund is allocated on the basis of the urban mileage which lies within each municipality. State Highway mileage is excluded in this computation.

Criticism of Highway User Fund Allocation to Cities. The allotment of only 5 percent of the user fund to cities has become a major criticism of the allocation formula. Denver as a city-county has a special problem in that it receives funds as a city only.

The case for revising the formula to allow cities a larger share is based on a series of interrelated arguments. One argument, prominently advanced, is premised on a kind of a user doctrine that "he who pays should receive." Thus it is argued that since a larger part of the user fund is contributed by urban residents, cities should accordingly participate in the fund to a degree greater than now obtains. Although it is difficult to accurately estimate the urban residents contribution, it is known that approximately two-thirds of the motor vehicles currently registered in Colorado belong to city and town residents.[48] Hence, it is not unreasonable to assume that urban residents account for more than one-half of the payments into the highway fund. From this, it may then be argued that the 5 percent city allocation represents a significant inequity in highway user taxation.

A second argument favoring a larger city share is based on the thesis that relative costs

[45] *Colorado Revised Statutes, 1953*, Ch. 120-12-6, 7, and 8.

[46] State of Colorado, Department of Highways, *Colorado's Annual Highway Report for 1956*, p. IX.

[47] *Colorado Revised Statutes, 1953*, Ch. 120-12-7.

[48] Conrad L. McBride, *County Road Administration in Colorado* (Denver: Bureau of State and Community Service, 1958), p. 17.

of highway construction and maintenance as between the state, county and cities should be a consideration in the allocation formula. By such reckoning, and based on 1956 data, cities in Colorado are found to have accounted for approximately 18 percent of all highway and street expenditures in the State.[49]

Neither of these arguments standing alone can adequately supply either a theoretical or practical basis for revising the city formula as it now exists. The argument based on "so much paid . . . so much received" relies on the benefit principle without fully recognizing either benefits received or ability to pay. Nor does the argument based primarily on the criterion of "need" add much to the city case.

More substantial, however, is the position premised on a more realistic interpretation of the "theory of basic access." In essence this theory holds that users should bear the costs of all primary roads while non-users should cover costs of all access roads. Historically, Colorado has tended to place the liability for the cost of state roads on highway users while that of city streets has been laid largely on the non-user, that is, by taxation unrelated to the use of primary highways, such as the property tax. Historically, also, counties and "county roads" have tended to occupy a kind of middle position being financed by both user and non-user groups.

Basic access, as narrowly construed in the past, has however ignored the tremendous revolution in highway traffic which has increasingly converged on cities. Increasing traffic congestion has not only become a number one problem for the cities but has also importantly affected the use and efficiency of the entire primary network of the interstate as well as intrastate highway systems. Under these circumstances the city street problem has become one which can no longer be regarded realistically as essentially a local problem, but one which deserves recognition as being also a State problem and, therefore, a cost properly assessable to the highway user. Failure to recognize this, accounts for the relatively low city share of highway funds—an anachronism which has and continues to hurt not only the cities but the entire transportation system of the State.[50]

The Administrative Role of Counties A second major criticism is indirectly related to the allocation formula in that it questions the capacity of the counties to adequately finance and administer the "county road" system as presently constituted. In effect this argument calls for an extension of state administration to encompass a larger responsibility for county roads with county participation in the highway fund modified accordingly. A recent definitive study on county road administration in Colorado by Professor Conrad L. McBride of the University of Colorado presents the case for reorganization along these lines as follows:

> In summary, certain important facts emerge clear and unequivocal. First, the costs of maintaining an adequate system of county highways and roads is now and will be an excessively expensive obligation upon many of our counties. This is owing in part to the fact that county road responsibilities bear no relationship to the relative capacity of the counties to meet the financial requirements involved in providing an adequate road system. Basically, the counties were organized at a time when the motor car was a myth, not a standard of transportation. Consequently, counties were not established with modern road problems in mind . . .
>
> Second, the major financial burden for developing and sustaining the road system in the state devolves upon the taxpayers and highway users in the urban areas of the state. While it is not unusual for governments to redistribute wealth through tax devices, neither is it inappropriate nor unusual for those who contribute the major share of the funds to insist upon effective accountability and efficient administration of public programs. Since the state, in this case, is the collecting and redistributing agency, it inevitably assumes primary responsibility for protecting the interests of those upon whom the financial burden falls . . .
>
> The third fact is that the organizational structure of county government is not well adapted to road administration. While it is true that the three electoral districts in the counties may provide for strong local control over the members of the board, it is also true that such local control frequently results in fragmentation of programs and lack of coordination among the commissioners. Moreover, local controls tend to abridge and frustrate the basic non-local considerations which are equally deserving of recognition by the board.
>
> The present organization also facilitates the depositing of authority and responsibility over technical or professional matters in the hands of laymen. To be sure state statutes provide for the appointment of trained, competent, professional supervisors to administer road affairs in the various counties; but, the flexibility of the statutes has permitted many boards of commissioners to ignore statutory intent and to proceed under systems which reject the very premises of professionalization.
>
> Finally, the present system is such that city-county cooperation and county-county cooperation is virtually non-existent, and county-state coordination often becomes involved in excessive negotiation and red tape. In this connection perhaps the strongest argument against current arrangements at the county level is that boards of commissioners

[49] State of Colorado, Highway Department, *Annual Report for 1956*, pp. 11, 23 and 39.

[50] For further discussion on this point see Chapter X of this report.

almost never recognize any responsibility to residents of municipalities in road matters . . . By direct assertion, fortified by a variety of data, county spokesman have affirmed the author's contention that most county roads are genuinely part of the state road system. These affirmations have been in evidence primarily as arguments for increased state financial aid to the counties. Secondary evidence is revealed by the fact that Colorado is a favorite haven for tourists who seek to explore many of the out-of-the-way places in the state, and also by the fact that sportsmen, both resident and non-resident, make enormous use of rural roads during summer and autumn months. There can be little doubt that the state as a whole benefits from tourism and the wanderlust of sportsmen. But, good roads are vital to the continued growth of both of these activities. Economy and efficiency are, therefore, of first priority importance . . .

Since the basic functions of counties lie mainly in the category of ministerial services performed at the local level in behalf of the state, since the great bulk of operating revenues in many counties are state distributed funds, and since many of these same counties exhibit neither the capacity nor the desire to maximize efficiency and economy in the road field, we are led to the conclusion that the state has an undeniable obligation to remove responsibility for all "state roads" from the jurisdiction of counties as they are presently constituted.[51]

The case for local autonomy is stressed in opposition to any change of the present system. Many problems, it is argued, are local in nature and should be dealt with locally without undue supervision and interference from the State.

Although it is beyond the scope of this report to fully analyze the preceding arguments, there is evidence that the present system of financing is costly and, in part, needless. The essential question which must be answered is how high a price are the people willing to pay for the degree of local autonomy which the present system affords.

Specific Ownership Tax "A." The specific ownership tax "A" is a state collected levy on commercial carrier vehicles. The revenues from this tax are returned "to the counties in proportion to the distance traveled across each county as compared with the total distance of the route within the state of Colorado."[52] This procedure of state collected levies being returned to the counties is due to the fact that carrier vehicles seldom confine their operations to one county. Hence, there is a need for some type of allocation mechanism.

In determining the amount to be paid by each Class A taxpayer, the Tax Commission takes into account the length of time for which the vehicle is operated in intra-or interstate commerce and the total number of miles of operation. Consideration is also given to any reciprocal agreements between Colorado and other states which relate to property taxation of motor vehicles.

Table 20.14 shows the rates and bases that are utilized in levying the tax. It will be noted that the rate remains constant (3 percent) while the base decreases with the passage of time. In addition, the base is expressed as a percent of "established tax value" which is, in turn, a percent of actual value.

Table 20.14

Specific Ownership Tax "A" Schedule of Rates and Bases, Colorado, 1958

Period	Tax rate (Percent)	Legal value (Percent of established tax value) [a]	Tax rate as percent of original value
1st year	3	70	1.575
2nd year	3	50	1.125
3rd year	3	40	0.900
4th year	3	30	0.675
5th year	3	15	0.338
6th year	3	15	0.338
7th year	3	15	0.338
8th year	3	15	0.338
9th year	3	15	0.338
Thereafter	3[b]	—[c]	—

[a] Established tax value is 75 percent of delivered price of vehicle, state and local taxes excluded.
[b] Minimum of $1.50.
[c] Value to be determined by State Tax Commission in accordance with market value, not to exceed 15 percent of established tax value.

Source: *Colorado Revised Statutes, 1953*, Ch. 13-5-5.

In 1957, $375,000 was returned to the various county road funds from the state collected specific ownership tax "A".[53]

Motor Vehicle Penalty Assessments. Vehicle penalty assessments include the receipts collected from certain highway traffic violations. These fees are applicable only when another penalty is not provided for and do not apply to any violation which is tried in a court.[54] The recipient of a ticket involving these violations pays the specified amount to the State Revenue Department. These moneys are paid to the State Treasurer, who in turn pays "one-half of the receipts to the state highway fund and one-half to the county treasurer of the county in which the violation took place."[55]

[54] *Colorado Revised Statutes, 1953*, Ch. 13-4-132.
[55] *Colorado Revised Statutes, 1953*, Ch. 13-4-133.

Receipts from vehicle penalty assessments are a relatively unimportant source of county revenue, amounting to a total of only $115 thousand in 1957 (Table 20.13).

Liquor License Fees. Two state license fees are collected from each liquor retailer in Colorado. One fee is collected and retained by the State while another fee is collected by the municipalities, or by the counties if the retailer is located outside the corporate limits of a municipality.[56] In accordance with the Old Age Pension Amendment, 85 percent of the locally collected license fees accrue to the State Welfare Fund, while the remaining 15 percent is retained by the municipalities and counties.[57] Since these revenues are shared by the State and cities and counties, they may be classified as shared taxes. However, it will be noted that the fees resemble a "shared tax in reverse" since they are collected locally and shared with the State rather than the more common procedure of the state collecting the fees and sharing them with the local units of government.

The rates of locally collected liquor license fees vary depending on the type of retailer involved. The annual amount of these fees range from $325 for a hotel or restaurant to $100 for a private club (Table 20.15).

Table 20.15

State Liquor License Fees, Colorado, 1959

Type of business	State license fee collected by State	City	County*
Manufacturer-liquor	$1,000	$ 0	$ 0
Manufacturer-beer	250	0	0
Wholesaler-liquor	1,000	0	0
Wholesaler-beer	500	0	0
Retail liquor store	50	150	250
Drug store	50	150	250
Beer and wine only	25	150	250
Hotel and restaurant	25	325	325
Club	25	100	100

* Applicable only if retailer is located outside city limits.

Source: *Colorado Revised Statutes, 1953*, Chapters 75-2-17, 75-2-18, 75-2-19, 75-2-20, 75-2-21 and 75-2-23.

While the State collects a fee from liquor and beer manufacturers, and wholesalers, locally collected licenses are confined to various types of retailers.

Due to the fact that 85 percent of the locally collected fees are constitutionally allocated to the State, they represent an unimportant local source of revenue. The total state liquor fees collected by cities and counties and the respective state and local shares are shown in the following tabulation.[58]

Year	Total revenue	State share	Local share
1954	$650,000	$552,500	$97,500
1955	656,135	557,735	98,400
1956	658,225	559,493	98,732
1957	656,206	557,775	98,431

It can be seen that revenues of approximately $98,000 when divided among 63 counties and over 200 municipalities, result in a small amount for each recipient. For example, the following tabulation shows the amounts received by several selected cities in 1957:[59]

Denver	$27,066
Pueblo	5,948
Colorado Springs	2,021
Grand Junction	1,159
Trinidad	1,624
Durango	994
Lamar	498
Englewood	608
Loveland	218

The present system by which the State receives 85 percent of the locally collected state license fees has been criticized on the grounds that local units of government incur a substantial cost due to the liquor business and they should therefore be allowed to retain a larger share of the fees they collect. Although there is merit to this argument, the State's share is, in any event, constitutionally determined under the present system. Hence, it appears that cities will have to rely on local occupation taxes to help pay the additional costs associated with the liquor business or seek the passage of a constitutional amendment exempting certain license fees from the old age pension earmarking.

Grants-in-Aid in Colorado

In 1957, a total of $96 million was transferred from the state to local governments in the form of grants-in-aid (Table 20.13). Functionally and on a relative basis this total was distributed as follows: welfare, 72.1 percent; education, 25.3 percent; and all other 2.6 percent. Of the total amount, also, 33.1 percent came from federal sources (mainly by direct grants to states) and the remainder or 66.9 percent from the State's own resources—the distribution by major functional groups being the following:

Function	Source of funds—percent of total Federal	State	Total
Welfare	42.0	58.0	100.0
Education	5.5	94.5	100.0
All other	56.0	44.0	100.0
Total	33.1	66.9	100.0

[56]The state license fee collected by municipalities or counties is not to be confused with the occupation liquor license fee collected by some Colorado cities.

[57]For additional discussion of the effect of the pension amendment on local liquor taxes see the previous section of this chapter concerned with local non-property sources of revenue and the chapter on the state liquor tax.

[58]Annual Reports of the Colorado Liquor License Division.

[59]Colorado Municipal League, *Municipal Non-Property Revenues*, April, 1959, pp. 6-9.

Worthy of note is the fact that aid for education is primarily a state-financed function and, therefore, subject to little, if any, federal determinations. In contrast, welfare is, and will undoubtedly continue to be, a program importantly assisted (and controlled) by the Federal government.

Public Welfare.[60] State payments (from federal and/or state funds) for welfare cover the following individual programs: (1) old age pension, (2) aid to dependent children, (3) aid to the blind, (4) aid to needy disabled, (5) child welfare, (6) tuberculosis hospitalization, and (7) administration. Not included as an aid program is "general assistance" which is financed exclusively by the counties. Apart from this program, the financing of welfare in Colorado is a responsibility variously shared by the federal, state and county governments depending upon the program in question. By formula, the combined federal and state shares compared with county participation is as follows:[61]

Program	Federal-State share (percent)	County participation (percent)
Old age pension	100	0
Aid to dependent children	80	20
Aid to blind	80	20
Aid to needy disabled	80	20
Child welfare	50	50
Tuberculosis hospitalization	50	50
Administration	80	20

The application of this formula to welfare expenditures in 1957 is shown in Table 20.16.[62] This presentation is somewhat more revealing since it gives a breakdown of the contributions to the individual programs by each of the three governmental units—federal, state and local. It will be observed that Colorado's total welfare expenditures, amounting to $81 million in 1957, were covered by federal funds to the extent of 38.1 percent, while the state and local contributions were 52.4 percent and 9.5 percent, respectively.

With the exception of old age pensions, which are paid entirely out of state and federal funds, all other welfare aids require some outlay by the counties. Although direct payments to beneficiaries from state and federal funds are made by the counties, basic administrative policy rests with the State.

[60]On this subject see also Chapters III and XIX.

[61]The formula presented is from State of Colorado, Department of Public Welfare, *Colorado Public Welfare Fiscal Report, 1956-1957*, p. 7.

[62]See also Chapter XIX, Table 19.5.

Table 20.16

Expenditures for Public Welfare, by Programs and Sources of Funds, in Colorado Fiscal Year, 1957

Program	Total expenditures (thousands)	Source of funds (percent) Total	Federal	State	County
Old age pension	$57,475	100.0	37.0	63.0	0.0
Aid to dependent children	7,992	100.0	59.4	18.3	22.3
Aid to blind	336	100.0	39.9	37.5	22.6
Aid to needy disabled	3,702	100.0	57.0	20.6	22.4

Source: State of Colorado, Department of Public Welfare, *Colorado Public Welfare Fiscal Report, 1956-1957*, p. 41.

The various titles of the Social Security Act, creating the so-called "categorical aids," each require that if a program is administered by the local units of government, it becomes uniformly mandatory upon them. State law which embodies federal conditions of administration therefore dictates the basic outlines of the public assistance programs and the counties are to a significant extent merely administrative agents for the State and Federal government. Thus, any person applying for public assistance via a duly constituted county welfare department may, if such application is denied, appeal to the State Welfare Department. A ruling for or against the appellant would, in any event, be binding upon the county.

Viewed in this light, the welfare program at the county level is not so much a county program supported by state and federal aid but rather a state-federal program supported by state, federal and, in most cases, by county funds. This distribution is important since it points to the very narrow limits within which counties have any freedom of choice.

Old Age Pensions. As noted earlier, Colorado's pension program is one of the most liberal in the country.[63] For fiscal 1957 the average monthly amount paid was $82.36 per eligible person over 65 years of age. This figure placed Colorado in the 6th leading position among the states. To make such payments possible (including payments to eligible persons in the age bracket from 60 to 65—a program financed by

[63]On this and other aspects of the pension program see again Chapter III.

the State exclusively) the State provided funds, mainly from the sales tax, in the amount of $36 million to which the federal government added $21 million according to the following formula:[64]

80% of first $30 paid to each recipient 65 years of age and older

50% of next $30

50% of medical care expenses not to exceed $3 per month per person

50% of administrative expenses.

Thus, for 1957 a grand total of $57 million was paid out for old age pensions in Colorado.

Effective as of January 1, 1957, an amendment to the State Constitution fixed a "basic minimum award of $100 monthly"[65] and, in addition, provided for a health and care program for eligible pensioners fixed at a yearly maximum cost of $10 million.

The administration of the program as a whole is essentially a responsibility of the State Department of Public Welfare although payments are made through each of the 63 county welfare departments. Thus, the latter serve simply as arms of the State making no financial contribution to the program as such. However, the counties are required to cover 20 percent of administrative costs for all state-federal supported welfare programs.

Aid to Dependent Children. The "ADC" program is contained in Title IV of the Social Security Act and provides federal aid, the terms being that the federal government will pay $32 to the relation with whom the dependent child lives; $32 for the first dependent child and $23 for each other dependent child; and medical care payments not to exceed $3 per adult aided (with whom the child lives) and $1.50 per child. Federal aids plus state funds are then used to reimburse the counties up to a maximum of 80 percent of their reported needs based on federal-state standards of dependence..

In 1957, aid to dependent children amounted to $8 million of which the federal-state-county contributions were $4.7 million, $1.5 million, and $1.8 million, respectively.

The extent of need is evidenced by 1957 data reported by the State Department of Public welfare[66] which shows that, on the average, 12.03 families out of every thousand in the State were recipients of aid. For Denver, which accounted for slightly over 40 percent of the average monthly case load, there were 14.3 families in every thousand who received aid.

For 1957, also, the average monthly payment per family was $112.20 for the State as a whole or a cost of $4.94 per capita for the year. Highest cost per capita was in Huerfano County at $17.20. Denver County's cost was $6.61 per person living in Denver.

Aid to Blind. Title X of the Social Security Act provides federal aid for the needy blind on terms equivalent to those for old age pensions. However, as in the case of aid to dependent children, state funds were added to reimburse the counties up to 80 percent of their reported needs, the remaining 20 percent constituting, therefore, the county cost on the program. In 1957 aid to the blind amounted to $335,628 of which the federal, state and county contributions amounted to $133,341, $125,688 and $76,599 respectively.

Aid to Needy Disabled. The 1950 amendments to the Social Security Act added Title XIV to that Act providing aid to the "permanently and totally disabled" (APTD), called in Colorado, "Aid to Needy Disabled" (AND). Before 1951, persons between 18 and 65 years of age, disabled and in need, not covered by ADC, aid to the blind or old age pensions, were forced to rely upon a program of "General assistance," later described. The provision of the federal amendment in 1950 caused Colorado to begin in 1951 a program of Aid to Needy Disabled which in 1957 had an average monthly case load of 5,218 and an average monthly payment of $58.99.[67]

Federal aid on the program is equivalent to that applicable to the old age pensions. Federal and state contributions are designed to reimburse up to 80 percent of the total outlays reported by the counties. In 1957, total expenditures in the program amounted to $3,702,084 of which the federal, state and county participations were $2,108,665, $762,923, and $830,496, respectively.

Child Welfare. Expenditures for the care of children in approved foster homes and institutions are shared equally by the State and county. Care includes a rate per day (the median in 1957 was $1.75) paid to the foster homes and allowances, personal supplies and clothing as needed by the individual child. Care in an unapproved home, and the costs of transportation, hospitalization and medical care, are financed entirely from county funds.

As distinguished from the preceding programs, child welfare receives support of an emergency character only from federal funds.

---

[64]On this see also Chapter XIX.

[65]This figure is subject to upward adjustment contingent on a cost of living factor.

[66]State of Colorado, Department of Public Welfare, *op. cit.*

[67]*Ibid.*, p. 29.

In 1957, total costs of the program amounted to $552,231 of which the federal share was only $6,330[68] while the state and county costs were $253,953 and $291,948, respectively.

Tuberculosis Hospitalization. Colorado provides assistance towards the cost of tuberculosis hospitalization of needy tubercular patients in an approved sanitarium. The State and counties share costs on a 50-50 basis. Expenditures for the fiscal year 1957 totaled $472,995.

General Assistance. The general assistance program is a sort of "residual" program in that it covers cases of need excluded from preceding programs. It is also distinctive in being a locally financed program without benefit of either state or federal aid.

State aid was available for general assistance until 1952 when only the "tag ends" of the funds available were paid out. It may be that the State's decision to abandon aid for general assistance grew out of the fact that the State had, during the same year, assumed an obligation on the new federal program of Aid to the Needy Disabled. It had been stated publicly by various welfare officials that the bulk of the general assistance cases at that time were actually disabled persons who would become eligible under the new APTD or AND programs. Experience unhappily did not fully justify this optimistic view. It may also be that optimism over the high level of employment prevailing in 1950 and 1951 led to the belief that state aid for general assistance was not needed, on the premise (contrary to fact) that any person over 18 or under 65 could get a job.

A review of the scope of general assistance points to the fallacy of any assumption that as a "residual" program it can be taken in stride by local financial effort.

In many cases general assistance is needed for resident persons who still cannot qualify for one of the existing welfare programs. This applies particularly to aged persons who lack residence to qualify for the Old Age Pension. In many cases, also, persons who do qualify under these programs need supplemental aids to carry them through. Finally, the transient problem is one that falls heavily on certain communities, particularly the larger cities.

As a result then of these "uncovered" areas of need, a continuing and sizable demand is placed on local funds for this purpose which, in 1957, amounted to a total of approximately $3.5 million or nearly one-half of county financed welfare payments on all programs of welfare. Yet the average monthly payment per person for general assistance was only $11.88 with individual county payments varying from a low of $3.52 to a high of $30.44.

The lack of state and federal aid in these cases means, therefore, (and aside from its fiscal implications for local finance) that a kind of "built-in" inequity exists in present welfare programs in the State. Thus, the needs of persons whose requirements may be equal from a personal budgetary standpoint are met at different rates depending upon the program applying in any given case. The old age pensioner will have his needs covered most fully. The ADC, AND, and AB cases will be covered reasonably well thanks to an 80 percent state-federal reimbursement. Below these categories, however, welfare becomes essentially a matter of how much is available for the purpose. That a less than minimum subsistence allotment is made per applicant is evident from county experience generally—a fact which points strongly to the need for reconstituting this aid program on a more realistic basis than now exists.

Education. In recent years approximately 20 percent of Colorado's public school expenditures, including debt service have been financed by state aids in one form or another (Table 20.17). This ratio may be expected to increase as a result of the School Foundation Act adopted in 1957. In this Act, the product of considerable

[68]This amount was paid in three "extreme hardship cases" reported for Huerfano, Costilla and Las Animas counties. (Source: State Department of Public Welfare.)

Table 20.17

Public School Expenditures and State Aid in Colorado
Fiscal Years, 1951-1957
(Dollar amounts in thousands)

Year	Current expenditures	Debt service	Total expenditures (current expenditures and debt service)	State aid	State aid as percent of total expenditures	Enrollment
1951	$46,975	$ 5,549	$ 52,424	$10,093	19.2	224,056
1952	51,377	5,728	57,105	10,000	17.5	231,533

Source: State of Colorado, Department of Education, *These are the Facts*, January, 1958.

research by an interim committee of the Legislative Council, the General Assembly redefined the minimum or foundation program in more realistic terms than had existed previously. The classroom unit values were raised, classroom sizes were changed and local support was computed on a higher county mill levy and divided among the districts in the county on the basis of school attendance. The State agreed to make up the difference, to the extent it has funds available, between the minimum support program and the yield of the established 12-mill county school levy.

Because of the considerable public interest which attaches to this program and its future fiscal implications for both the state and local governments, a review of its principal features are presented below in some detail in terms of (1) the sources of funds used for state aid, and (2) the state aid plans as presently constituted.

Sources of Revenue for State Aid. State aid funds are derived from two principal sources, namely: The Permanent School Fund, and general revenue from other sources as appropriated by the General Assembly. These have been described by the State Board of Education as follows:[69]

> (1) *Permanent School Fund*—The principal of the Public School Fund, June 30, 1957, amounted to $21,813,329 in cash and investments in bonds and farm loans. The State still owns 2,800,000 acres of school lands, most of which are leased. No appraisal value has been established for these lands. In addition, there are about 100,000 acres under certificate of purchase. Proceeds from the sale of school lands, estates that escheat to the State, gifts and grants to the state for educational purposes, are added to the principal of the fund. Such additions amounted to $1,013,274 in 1956-57.
>
> The net income from the fund (as a whole), including interest on investments and royalties on lands, transferred to the State Public School Fund was $3,473,609 in 1956-57 and $3,818,889 in 1957-58. The gross income is first subject to payment of premiums upon investments, the purchase of necessary school district reporting supplies, pamphlets and school laws. The quarterly balance of the Public School Income Funds are paid into the State Public School Fund to be held as an accumulative "direct grant reserve" distributed on May 1 each year to all eligible school districts upon the basis of the aggregative days of attendance in the preceding school year.
>
> (2) *Legislative Appropriation*—All State school funds, except the income from the permanent school fund and lands, and from Federal mineral leases, are now provided through legislative appropriations from the General Fund. Budgetary estimates, as described in the State aid programs (later described) are used by the Legislature in determining the amounts of the appropriations. Special purpose appropriations are distributed through the General Fund of the State.

State Aid Plans

A. General Purpose Flat Grant

(1) *State Public School Fund—Aggregate Days Attendance Distribution.* To participate in the distribution of the State Public School Fund, the school board must elect to accept the terms of the Act; must maintain school for at least 170 days during 1956-57 and 172 days during the school year thereafter; and must pay teachers not less than sixty-five percent of the classroom unit value for the type of certificate held. For the full-time teacher holding a graduate certificate, the minimum salary is $3,380 and for the teacher holding other than a graduate certificate, $2,925 is the minimum salary. The county is required to levy twelve mills for the Foundation Program. Participation is available to all public school districts except Junior College districts with no district mill levy required.

The distribution is to permit all school districts to participate in the revenue from the public school lands upon a general-purpose flat grant basis. On May 1, 1958, the money available for 1957-1958 was apportioned to 51,016,256 aggregate days of attendance during the 1956-57 school year in the amount of 6.23700976 cents per aggregate days attendance. Funds received are to be used for current expenses as implied by the law which reads: "No funds received from the State Public School Fund shall be used by any school district for debt service or capital outlay."

(2) *State Public School Fund—Junior College Distribution.* To participate in this distribution, the district having a junior college organized under the Junior College Act must report to the State Board of Education the number of students and the hours of credit earned by these students for the preceding regular academic year.

The State Board of Education allocates $1,050 for each seven students carrying an average of 45 quarter hours or 30 semester hours of credit for the preceding school year.
Fund is to be used in the same manner as noted in paragraph (1) above.

B. General Purpose Equalizing Grant

(1) *State Public School Fund—Minimum Equalization Program Distribution.* The requirements for participation are the same as for the Aggregate Days of Attendance Distribution as described in paragraph (1) above.

The State Board of Education allocated to local school districts the deficiency, if any, between (1) the value of classroom units to which the district is entitled by calculations, and (2) the amount raised by a twelve mill levy upon the county, apportioned among the districts in proportion to their total classroom unit values. Under (1) the calculations provided classroom units which average 85 percent of the certified personal employed. The value of the classroom unit is $5,200 for those served by teachers holding graduate certificates; remainder units for those served by

[69] The principal data and discussion on state aid in this section of the report are quoted in whole or in part from releases of the State of Colorado, Department of Education, Division of Finance, Forms SF-1.1-3, June, 1958.

teachers holding graduate certificates; remainder units have a value of $4,500, if served by teachers holding other than graduate certificates. Under (2) the obligation of the State is met by prorated payments to the extent that the funds available permit. The proration factor for 1957-58 was 81.8379708 percent of the total State Equalization obligation.

The aggregate days of attendance (limited to 180 school days) of the preceding year are divided by 172 for all districts. The calculated A. D. A. thus derived provides one classroom unit for the first 15 A. D. A., one additional classroom unit for each of the next 20 A. D. A. and additional classroom units for each of the next three 20 A. D. A. and additional classroom units for each 25 A. D. A. thereafter. Calculations are to the nearest major fraction of one-tenth, with no district having less than three-fourths of a classroom unit if a teacher is employed.

Certified professional personnel must actually be employed in support of the calculated units. Pupils in attendance for one-half day, or less, count as one-half day of attendance and kindergarten pupils also count as one-half day of attendance.

If a school district has an increase during the first twelve weeks of the current year in excess of seven percent over the first twelve weeks of the preceding year, the A. D. A. in excess of seven percent provides additional classroom units at the rate of 25 A. D. A. per classroom unit.

If high school districts have fewer than 150 pupils or districts maintaining twelve grades have attendance centers of fewer than 300 pupils, the State Board may make a determination and grant additional classroom units needed to carry out a desirable educational program not to exceed three additional units for each attendance center.
Fund is to be used in same manner as noted in paragraph (1) above.

(2) *State Public School Fund—Emergency Distribution.* The requirements for participation are the same as for the Aggregate Days of Attendance as described in paragraph (1) above.

The State Board of Education is required to withhold from normal distribution 1.5 percent of the appropriation as a "contingency reserve." The State Board of Education has the authority to make payments from the Contingency Fund for (1) financial emergencies caused by an act of God, (2) sudden increases in enrollment, (3) temporary enrollment, (4) efforts of the district to provide sufficient funds for its own use, and (5) standards of education maintained by the district.

Any balance remaining in the State Public School Fund on May 31 becomes available for equalization proration.

Fund is to be used in same manner as noted in paragraph (1) above.

C. *Special Purpose Flat Grant*

(1) *Public School Transportation Fund.* To participate in this distribution, a school district must have spent for maintenance and operation for transportation of pupils to and from the residence and a school maintained by the district, a sum in excess of the amount which would be produced by a levy of one-half mill.

The State Board of Education allocates eight cents for each mile traveled in the transportation of pupils as described, together with an allocation of four cents for each pupil day of transportation. In addition, there is provision of fifteen cents per pupil day for board in lieu of transportation. The payments are in respect to events in the preceding year.

Entitlements are limited to seventy-five percent of the actual expenditures. In case of a deficiency, the fund is prorated on a straight-line basis. For 1957-58, the proration factor was 91.5641568 percent.

No restrictions prevail as to the use of the fund since it is in effect a reimbursement for transportation expense.

(2) *Education of Physically and Mentally Handicapped Children Appropriation.* A school district is reimbursed for actual "excess cost" (as determined by formula) for providing educational facilities for physically and mentally retarded children between the ages of 6 and 21 years.

(3) *Vocational Education Appropriation.* A school district is partially reimbursed by the State for programs of vocational education meeting the standards prescribed by the State Board of Vocational Education.

(4) *State School Organization Fund.* Each legally formed school planning committee in each county organized under "The School District Organization Act of 1957" is entitled to receive an amount not to exceed $500 for expenses incurred.

Issues and Outlook. Currently school districts are receiving about 80 percent of the amount of state aid needed to fully implement the foundation program as defined in the 1957 law. As interpreted, the law does not compel full or "100 percent implementation" since the obligation of the State is presumably met by prorated payment "to the extent that the funds available permit." Decision of the last General Assembly not to appropriate the full amount, which would have called for an additional General Fund expenditure of approximately $10 million was based on several considerations among which the lack of funds for the purpose was undoubtedly the major one. Militating also against full implementation was executive and legislative belief that further state assistance should await the outcome of the Legislative Council study of assessments and such correction of assessment inequalities as the study might reveal. The importance of uniformity of valuation in the administration of the state aid program is clear when it is recognized that state aid payments are designed to fill the gap between the requirements of an established minimum support program and the yield of a 12-mill county school levy. Since the school aid payments are premised on the imposition of a 12-mill county levy, which will be uniform

also in terms of the assessment base, any variation in assessment ratios between counties would obviously cause an inequitable distribution of aids.

The wisdom of instituting full implementation was also questioned on grounds that funds expended would not be utilized effectively in view of the excessive number of school districts. Holding back state aids pending further consolidation, as called for by the School Reorganization Act of 1957,[70] appeared therefore as an appropriate step to take to force districts to move faster than might otherwise obtain.

Conceptually, Colorado's state aid formula, as now established, is believed to be sound. Unfortunately it is based on an assumption of uniform assessment that will likely continue to plague its effective implementation. Moreover, its use as a club to force consolidation creates certain differences that probably will be resolved in time.

Whatever these problems may be and how they will be met, the case for full implementation at an early date is undeniably strong. This has its main support in the clearly demonstrated need witnessed by a sharply increased public school enrollment and average costs per pupil as earlier noted in Chapter III of this report.[71] Moreover, future enrollment trends and aggregate outlays therefor are expected to continue at an increasing rate. In the light of these developments, plus a clear sign that the local property tax base is nearing its maximum utilization, it is apparent that the part played by school aid in Colorado (which in the past has probably been relatively less in relation to school population than any other Western state as noted earlier) must become increasingly important.

Public Health.[72] Local expenditures for public health in fiscal 1958 are reported by the State Department of Public Health to total $2,154,962. The State and federal budgeted aid amounted to $170,141 or 7.9 percent of the total. In 1957, state and federal aids amounted to $154,000 of which the federal government contributed $113,000 and the State $41,000. (See Table 20.13.)

Three kinds of grants are being made currently to local departments of public health. These are:

(1) "Organized"[73] local health departments, with a full-time director and staff, are given funds (budgeted to the amount of $158,000 for state and federal aid for fiscal 1958) on the basis of historical development, need, and the availability of funds. Areas designated as being served by organized health departments are, (1) Boulder, Mesa, Otero and Weld counties; (2) City-County El Paso, Northeast Colorado, Pueblo—City-County, San Juan Basin, Tri-County and Denver City-County. These areas as a whole include 22 counties and embrace the major portion of the State's population.

(2) "Unorganized" local health departments (budgeted to the amount of $12,267 in state and federal aid for fiscal 1958) are found in the remaining 41 counties. Aids are distributed on a basis which will pay up to one-third of the salary (but none of the other expenses) for the number of nurses shown in the following schedule:

County population	Number of nurses[a]
Less than 2,500	½
2,500 - 12,500	1
12,500 - 25,000	2
25,000 and over[b]	1

[a]A county may employ more nurses than indicated in the schedule but the State will contribute only for the number shown.

[b]Counties of this size should have full-time health departments to which the State contributes on a different basis.

(3) Reimbursements to mental health clinics (budgeted to the amount of $70,000 for state and federal aid for fiscal 1959), are alloted to counties on a formula basis in which population and per capita assessed valuations are the principal factors. Counties qualifying for aid must have local mental health programs. Currently only 10 counties are so established.

Record of State Aid for Public Health. It is notable that the State allotted locally $217,326 to Public Health in 1953 but in the following year, 1954, this allotment was cut to $153,830 and was further reduced to a low of $150,555 in 1956 (Table 20.18). These restrictions represented a cut of both federal and state allotments, and it is only in this year's 1958-1959 budget that the State Department of Public Health is again approaching what had been a standard figure ($190,000). Also worthy of note is the continual increase in local funds which have been available for public health purposes in recent years.

[70]See Chapter II.

[71]See Chapter III.

[72]Data included in this section are from State of Colorado, Department of Public Health.

[73]"Organized" health departments which are listed by name have been set up according to the 1947 Section Law and are administered through a local board, a medical officer, and in all instances employ sanitarians and nurses. Departments not meeting these standards are not named but generally referred to under the general designation of "unorganized departments."

Table 20.18

State Allotments[a] to Local Departments of Health in Colorado, Fiscal Years 1951-1958

Year	Organized counties	Unorganized counties	Total
1951	$182,048	$11,516	$193,564
1952	103,096	8,451	211,547
1953	210,073	7,253	217,326
1954	146,405	7,425	153,830
1955	148,089	5,941	154,030
1956	144,305	6,250	150,555
1957	142,216	9,727	151,943

[a] Exclusive of allotments to mental health programs.

Source: State of Colorado, Department of Public Health.

Thus $1,281,794 was expended locally in 1953; in 1958 the local departments spent $2,154,962.

Conclusions. Insofar as significant areas of the State remain without the benefit of local or district full-time health programs, it is clear that Colorado needs to re-examine its existing aid structure both in terms of amounts paid and coverage. While the legal initiative should come from the local areas, the financial inducement and organizing help is clearly a state responsibility.

Appendix Note (Chapter XX)

In as a broad a review of state and local fiscal policy relationships as presented in the preceding analysis it was obviously impossible to consider specific situations of individual tax jurisdictions. Admittedly all communities, urban and rural, face more or less similar problems of public finance both in respect to the adequacy of their tax bases in the face of mounting expenditure requirements as well as in their relationship to state aids. However, these problems may vary substantially in individual cases both in degree and scope. Most marked perhaps are those found in the State's larger urban centers where rapid population growth has forced adjustments of which not all are fiscal in nature.

The staff of this study has recognized that the importance of the "urban problem" requires certain illustrative case analysis to bring out more fully the specific issues involved. Accordingly city officials were requested to submit principal problems relative to city finance as they saw them and to suggest possible solutions. From a series of communications received in response thereto, two have been selected for their representativeness and are presented below in the exact form that they were received. The first, from Dr. Leo C. Riethmayer, Professor of political science at the University of Colorado, and Mayor of the City of Boulder, points to certain problem areas which can be regarded as typical of those found in the medium-sized city in the State. The second communication from J. D. Arehart, a member of the staff of the Department of Revenue of the City and County of Denver, describes, as he sees it, the fiscal problem of Denver. Opinions and conclusions given are those of the writers only and do not necessarily represent the viewpoint of the city governments with whom they are associated nor are they necessarily the conclusions of the staff of this study.

MUNICIPAL PROBLEM IN COLORADO[1]

In accordance with your recent suggestion I am listing a number of items which in my opinion should be considered as part of the tax study project which you have in progress.

As you know the Constitutional provisions and laws which provide for our local governments, their relationships with the state government and with one another, their respective roles, and their sources of revenue were enacted when Colorado was an agrarian state. With more than 70 percent of its people now living in cities and towns, Colorado has become essentially an urban state, and the old governmental arrangements are no longer adequate, and the taxing patterns are highly inequitable. You know, of course, that urbanization has brought demands for municipal-type services, and for the need of a proper and equitable system of obtaining revenues for providing these services.

Here are some of the very pressing problem areas and some thoughts on possible solutions.

1. The inequity of existing legal provisions under which counties (in all counties other than Denver) levy the same property tax rates within city limits as on property outside city limits. In certain fields, such as highways, the counties spend all of the money collected outside of city limits, and in a number of fields, such as law enforcement, they generally spend most of the money collected outside of city limits. Consideration should be given to the enactment of legal provisions which would limit the power of counties to levy taxes inside of city limits to rates which are only a certain fraction of the rate which is imposed outside of city and town limits. Legal provisions which provide for a differential of a certain type exist in the State of Iowa (in general, counties may not levy more than ⅝ of one mill inside of city limits, *Iowa Code Annotated*, 1958, Section 309.7), and as is well known, there is complete separation of cities of certain size from counties in the State of Virginia, with, of course, no taxes at all levied in the city by the county.

Another way of approaching this problem is to consider the withdrawal of the state (the county is a mere subdivision of the state through which the state is acting) entirely from the property tax field, particularly in the field of property taxation for county road purposes. Such a move should also be accompanied by the transfer of the construction, maintenance and general administration of those state roads which are now known as county roads to the State Highway Department.

2. The inequity of existing legal provisions which permit counties to perform certain municipal-type functions (e.g., the paving of local streets) in unincorporated urban fringe areas and to finance such activities from tax funds

[1]By Leo C. Riethmayer, Professor of Political Science, University of Colorado and Mayor of City of Boulder.

supplied largely by property owners in cities and in genuinely rural areas. Consideration should be given to possible legal provisions which would prohibit counties from providing municipal-type services unless those services are paid for directly by those persons who received the services. At the same time efforts should be made to avoid unnecessary duplication of governmental units and service areas at the local level by considering the limiting of the activity of counties to enter the municipal-type service field to areas which cannot be annexed to an existing municipality, or if the area is removed from an existing municipality, it is unable to incorporate and support a municipal government. The creation of special districts should be prohibited except under very special conditions.

3. The inequity of the present practice of assessing railroad property on a mainline track mileage basis.

4. The present county practice of charging fees of up to two percent for the collection of property taxes for other local governments. As county taxpayers whose property happens to be located inside of city limits, those county taxpayers are already paying a substantial part of the county taxes (e. g., the county taxpayers having property inside the city limits of Boulder pay approximately 40 percent of the property tax bill in Boulder County).

5. The present legal provisions under which only five per cent of state highway user fund monies are allocated to municipalities.

6. The present legal provisions governing the distribution of specific ownership tax receipts to units of government.

7. The present legal provisions which provide for the allocation of only 15 percent of the receipts of state liquor license fees and taxes to municipalities. Costs of enforcement and other problems which are associated with liquor outlets are largely the responsibility of the municipalities which receive such a small fraction of the revenues.

8. The present practice of the state government when it demands that municipalities meet certain standards and that they pay for the capital improvements necessary to meet those standards exclusively from their own funds, i.e., sewage treatment works which must be constructed to certain specifications by order of the state government without state financial assistance even though the benefits of pollution control accrue to many individuals and properties outside of the cities in various parts of the State.

DENVER'S FISCAL PROBLEMS[2]

Within the next year Denver must take one or both of two courses of action neither one of which could be regarded as anything but disagreeable from both an administrative as well as a popular point of view. These actions have been stated simply as (1) a decrease in the level of municipal services and/or, an increase in taxes.

The purpose of the following analysis is to describe some of the factors which have contributed to Denver's problem and to suggest measures which might be taken.

Denver's Economic and Fiscal Position in the State

As the largest city in Colorado and containing over 30 percent of the State's population, Denver can be looked upon as the major focal point of economic activity in the State as well as the region. The wide discussion elicited by the City's recent attempt to enact a municipal income tax (which developed as the result of the City's recent major atttempt to solve what it considered to be a local revenue problem, via a municipal income tax), attests to this fact. The reasons for the particular interest shown by the counties adjacent to Denver is evident from Table 1. As indicated, an estimated 200,000 people reside within the urban periphery of the City and County of Denver. Although the City itself contains but one-third of the State's population, the City's day-time population swells by an additional 60,000 workers from the suburban area. As an industrial and commercial center, Denver offers employment to more than 40 percent of the State's population.

Although accurate figures are not available as to the relative importance of Denver to the State's total fiscal picture, state retail sales tax figures are available and are significant. As indicated in Table 2, Denver has consistently accounted for over 40 percent of the State's annual revenues from this source. This may be taken as indicative of the importance of Denver

[2]By J. D. Arehart, Department of Revenue, City and County of Denver, formerly research consultant on two major city studies entitled, *Working Denver* (1953), and *Financing Muncipal Government in Denver* (1955).

Table 1

Population of Denver and Urban Periphery, 1950 and 1958

	1950	1958	Percent increase
Denver	415,786	530,000[a]	27.5
Urban Periphery[b]	80,000[a]	200,000[a]	150.0
Colorado	1,325,089	1,679,675[a]	26.70

for other sources of revenue such as the state income tax, state gosoline tax, and state liquor tax, to name a few.

As the locus of economic activity for nearly one-half of the State's population, Denver's fiscal problem is essentially a State problem and as such calls for state-wide action in which both constitutional revision and legislative action are called for.

The specific problem areas discussed below cover (1) the limitations of the property tax as a source of Denver's revenue, (2) the state aid formulas as they affect Denver, and (3) city growth and the question of annexation.

Urban Finance and the Property Tax

Uniform Assessments. Owing to the fact that the State levies a tax upon property for building programs for the State's institutions, the lack of uniformity in the assessment procedures has penalized those counties in which valuations more nearly approach market value. The dollar volume is relatively small because of the low rate which the State imposes and is not as fiscally important as it is unjust. Other discrepancies arise because of the lack of uniform assessments, however, not the least of which arise from the method of allocating state aid discussed in a later section but more particularly in respect to the location of industry.

Recent studies have indicated that national locational shifts by commerce and industry in the long run are not dictated by the tax bill. It can be demonstrated that given sufficient time, taxes tend to "catch up." Indications are, however, that locational shifts are prevalent within an urban economic entity which is jurisdictionally fragmentized (Table 11) and where there is a significant degree of latitude either in the rates of taxation or assessment practices. The lack of uniform assessments of real property and of inventory in the Denver Area is evidence of this fact. The City and County of Denver has witnessed the exodus of many firms because of lower assessments in adjacent jurisdictions.

There can be no doubt that business firms will and must seek their minimal tax bill so long as there is no danger in decreasing output. Tax colonies within an urban economic entity are conducive to such a development. With modern means for quick and flexible motor-truck transportation, no firm is substantially affected by shifting its location from Denver to, say Adams county even though the firm's sales are 100 percent within the former.

So long as the *ad valorem* tax is the cornerstone of municipal finance and so long as fractional assessment practices prevail, the exodus of firms required to stock large inventories will continue.

Two remedies are apparent: (1) uniform assessments within an urban economic entity and enforced by the State Tax Commission must be mandatory in fact, or (2) the urban entity should fall under a single assessment jurisdiction.

Allocation of Railroad Assessments. This particular element in the property tax structure of the State of Colorado has received too little publicity, but it is one of the most commonplace inequities. Although the allocation of railroad assessments creates no special problem, it does place an extra burden upon the Denver taxpayer and in effect constitutes a hidden subsidy to the remainder of the State.

The subsidy arises from the method of allocation and not from under-assessment of property. The Colorado State Tax Commission, as the assessing authority, must distribute to the counties the assessed value of railroads according to the relation which the miles of main line track within each county bears to the firm's total mileage within the State. The value of rolling stock of firms other than railroads is

Table 2

State Retail Sales Tax Collections Colorado, Selected Years, 1950-1957

	1950	1954	1955	1956	1957

allocated according to the relationship between the miles traveled within each county and the total miles traveled within the State.

As the smallest county in the State in geographical terms, the City and County of Denver is credited with less than eight miles of main line trackage and ranks last in railroad assessments per capita in an array of Colorado's seventeen largest counties. As shown in Table 3 Denver was allotted, in 1957, railroad assessments amounting to $1,657,510 or $3.00 on a per capita basis. Applying the Denver 1958 mill levy of 50.15 mills, Denver collected, on this basis, $83,-124 from railroads for municipal and school purposes.

Source: State of Colorado, State Tax Commission, *Annual Report, 1957.*

It may be argued, and rightly so, that the terminal facilities supply an economic advantage which other counties do not enjoy, e.g., payrolls. The fact cannot be discounted, however, that governmental expenditures are also higher as a consequence. Not only must the local government police the facilities, but it must also provide the usual municipal services such as sewerage, fire protection, education, health and sanitation services for which, under current methods of allocation, $83,000 is small recompense, indeed.

Remedial measures have been suggested which would require an amendment to the present law. The State Tax Commission, for example, would proceed to assess all railroad property as it now does, but it would place a value upon all real property not used in conjunction with trackage and allocate such value to the assessments rolls of the county in which such real property is located. All real property used in conjunction with trackage would be allocated as is presently done, i. e., on the basis of the ratio of trackage in the county and the total trackage in the State. Rolling stock assessments would be continued on the present basis.

In this manner, the counties, and cities in which non-trackage real estate is located, would realize revenue as recompense for the governmental amenities enjoyed by such firms. Other counties would not be penalized by the amendment for they are now receiving an amount in excess of the real costs of the community services rendered to railroads and their employees.

Property Tax and Need for Alternative Sources of Revenue. Whatever utility the property tax contains, it was established in an era when there was some semblance of correlation between property ownership, municipal services and ability to pay or benefits received. Since that day, however, economic progress has advanced to the point where many incomes are neither related to nor dependent upon, the ownership of property. This is particularly true in urban areas whose economies are of the non-industrial type, i.e., services and professional. The more highly developed an economic system becomes, the more independent it becomes of property.

In regard to municipal services, real property's demand for services is primarily related to fire and police protection, but their owners and occupants demand and are entitled to municipal services which are totally unrelated to property or property values.

The contemporary municipality is required and expected to provide the latest in technological and scientific developments such as sanitation, health, sewage treatment, freeways, educational facilities, and police and fire protection. In addition, and completely independent of property, the State requires the City and County of Denver to maintain a system of Courts in which all attorneys may practice regardless of residence, an institution of confinement, a District Attorney, a Juvenile Hall and, moreover, to meet certain standards established by law which are unrelated to property income or economic status of the owner, e. g., secondary sewage treatment.

The inference to be drawn from the above, is that the value of any municipality is best measured by the income generated by its economy and its corollary, the proper level of municipal expenditures is best determined by the number and income of its economic citizens. Neither of these may be determined by property holdings or values yet the maximum level of taxation, the maximum level of debt and allocation of state grants-in-aid are premised thereon.

Perhaps the best evidence of the unrealistic fiscal premise from which the City and County of Denver must function lies in its continuous efforts which are per force required to circumvent the economic anachronism which threatens

its existence. Denver, however, is not alone in its endeavors to seek revenues from non-property sources. Other municipalities in the State have taxes on cigarettes, liquor, parking spaces, occupations, and so forth in order to provide a proper level of community services.

If the maximum property mill levy in Denver must remain at 15 mills, and there is evidence that it should because of the property tax needs of public schools, municipalities and Denver in particular must be given further fiscal latitude in the non-property area. This has been accomplished in many other states after their large municipalities reached an impasse in financial affairs. In addition, the debt limit of cities should either be based on full market value or related to ability to pay. (For example, a per capita debt figure of $100 could be used as a maximum limit, or perhaps a percentage of municipal outlay based upon a five-year average could be used. Either of these would be a more realistic premise than 3 percent of property at a fraction of its market.)

Shared Taxes and State Aids

The Highway User Fund. The Highway User Tax Fund was created by the Legislature as a device to finance Colorado's highways by the imposition of a tax upon highway users. Revenues to the fund are derived from a 6-cent per gallon motor fuel tax (excepting motor fuel consumed by non-highway users), vehicle registration or license fees, and the ton-mile and passenger-mile tax on commercial vehicles.

The principal source of revenue is the motor fuel tax which accounts for over 70 percent of the fund's total receipts. Figures are not available as to the amounts paid to the fund by counties, but it may be assumed that a large portion of the receipts originate within the City and County of Denver. Using the number of automobiles registered as a basis, it is estimated that Denver citizens contribute 27 percent of the receipts to the Highway User Fund (Table 4).

Data showing the distribution of monies from the Highway User Tax Fund are available and are presented in Table 5. As can be seen, Denver receives $1.96 per capita from the fund and is last in the array of seventeen of Colorado's largest counties. This may be compared with nearly $17 per capita received by residents of Las Animas County. It should be noted that all counties but Denver participate in the distribution on the same basis. Denver is not considered as a county and participates only as a city.

Table 5

Distribution of State Highway User Tax Fund Seventeen Largest Counties, Colorado, 1958

County	Amount received	Per capita
Las Animas	$ 404,180	$16.63
Logan	331,070	15.69
Delta	245,258	13.62
Fremont	231,382	11.99
Morgan	257,898	11.62
La Plata	233,440	11.50

Arpahoe	363,181	3.82
Pueblo	404,919	3.49
Denver	1,011,131	1.96

Note: These figures include state aid to incorporated places within these counties.

Source: Colorado State Highway Department.

The intended purpose here is to reveal the obvious inequities in the current distribution of funds. For comparability, therefore, all figures include both the funds allotted to counties and to each incorporated city within each county.

The inequity of the current formula can be readily seen in Table 5 which shows the estimated proportions contributed to the fund and the shares allotted to the several agencies from the fund. Cities in Colorado, including Denver, contribute 68 percent to the fund but receive only 5 percent in return. In addition to the 27 percent which it contributes to the Highway User Tax Fund, the City and County of Denver

Table 4

Contribution and Allocation of Highway User Tax Fund, and Expenditures for Colorado State, Counties and Cities, 1958

Government unit	Contributions to highway fund[a]		Allocation of highway fund		Expenditures for streets and highways	
	Amount	Percent	Amount	Percent	Amount	Percent
Colorado total	$52,722,946	100	$42,818,516	100	$104,271,695	100
State highways	—	—	27,832,035	65	65,694,788	63
Counties (except Denver)	16,871,343	32	12,845,555	30	21,284,706	20
Cities (except Denver)	21,616,408	41	1,129,794	3	7,945,034	8
Denver	14,235,195	27	1,011,131	2	9,347,167	9

expended from local revenue sources in excess of $8 million for streets and highways in 1958. Total street and highway expenditures by Denver alone accounts for 9 percent of the State's total for such purposes.[3]

From the above discussion, it could be argued that Denver should receive from the fund an amount equal to its proportionate expenditures on the entire State's highway system, or 9 percent. Such a share, in 1958, would have raised Denver's allotment from an estimated $1,011,131 to $3.8 million or nearly one-third its annual outlay for such purposes. As can be seen, in Table 6, Denver's current one to nine ratio does not approach the one to two ratio now enjoyed by the remainder of the State. An increase in Denver of one to three would still fall short of the average.

Table 6

Per Capita Highway User Receipts and Per Capita Expenditures For Streets and Highways, Denver, Colorado, 1958

	Amount recorded per capita	Amount spent per capita	Percent aid
Denver	$2.00	$18.00	11.1
Counties in Colorado (excepting Denver)*	12.00	25.00	48.0

* Includes incorporated cities' share of fund.

State Aid to Education. Although not a jurisdictional problem of the municipal government of the City and County of Denver, the distribution of state aid to education has a direct bearing upon the municipal taxpayer to whom the city must look for revenue. As such, any remedial measures attained with respect to the existing distribution of educational funds must alleviate somewhat the Denver taxpayers' total governmental burden.

As shown in Table 7, Denver is not only the largest county in terms of population, but is also the largest in terms of students in the public schools. For purposes of discussion and to eliminate the lower extremes in a total county array, Table 7 contains the seventeen largest counties each of which contains at least one percent of the State's total population. As indicated, the Denver Public Schools are educating 24 percent of the students in Colorado, but receive only 10 percent of the aid to education.

It may be argued that Denver is justified in receiving a disproportionate share owing to its economic wealth. On the surface this appears true, but in light of the sales-assessment ratios recently published by the Legislative Council, Denver's per capita burden is larger than all but four of the largest counties in the State. As shown in Tables 8 and 9, when property assessments are adjusted to full value, Denver's mill levy to meet local school costs is exceeded by only four other counties.

Table 7

Distribution of Population, Students and State Aid to Education, Seventeen Largest Counties Colorado, 1957

County (Population*)	Percentage of population	Percentage of students	Percentage of school aid
Denver (515,000)	30.2	24.2	9.9
El Paso (118,000)	6.9	6.9	7.4
Pueblo (116,000)	6.8	7.3	8.4
Jefferson (105,000)	6.2	6.3	7.6
Arapahoe (95,000)	5.6	6.9	8.1
Weld (75,500)	4.4	4.9	5.6
Adams (75,000)	4.4	4.2	5.7
Boulder (60,000)	3.5	3.4	3.1
Mesa (53,200)	3.1	3.4	5.1
Larimer (49,500)	2.9	2.9	2.6
Otero (25,800)	1.5	2.1	3.0

This is true notwithstanding the fact that Denver spends less per capita upon public education than eleven of the seventeen counties considered. The per capita burden in Denver is relatively high for the sole reason that state aid to education is distributed upon a base which does not completely reflect local need and ability to pay. For example, as shown in Table 8, seven of the larger counties in the State have a higher per capita property assessment based on full value than Denver, yet in each instance these counties receive more state aid per capita than is received by the Denver taxpayer. Further evidence of the maldistribution is shown in Table 10. In the array of seventeen larger counties, Denver ranks last in state aid received per student.

It may be concluded from the data presented herein, that the present method of allocating state aid to education is not only unjust in respect to proportionate shares of students or population, but also is more burdensome upon the Denver taxpayer than any other in the State. This may be pointed up by the fact that if Denver were to double its aid per capita from $4.00 to $8.00, the City would still rank last in the array of seventeen counties. If distribution were made upon true property values as established by the sales-assessment ratios published by the

[3] To further point up the magnitude of Denver's highway costs, it may be noted that upon two occasions within the last two years, a citizen's "Capital Improvements Budget Committee" has recommended the city expend nearly $5 million per year in addition to its current street outlay. For this, Denver would receive no direct aid from the State. The method now being utilized by the State for allocation of the fund gives no recognition to such contributions made to the state highway system by municipalities in heavily urbanized areas.

Legislative Council rather than upon actual assessments as now obtains, Denver's share would be more equitable.

State Aid to Counties for General Assistance. One of the most costly undertakings now being administered by the larger counties in Colorado is the general assistance category of the welfare program. Under the current law, Colorado's counties must provide, from local revenue sources, general assistance to the needy not qualified for other types of assistance. The expenditures for such purposes amounted to $3,709,762 in 1957.[4] Denver alone spent $1,399,462 in 1957, or 38 percent of the total general assistance expenditures of all counties of the State.

A recent amendment to the Constitution concerning the old age pension program entitles the State's General Fund to the surplus from the state sales and excise tax in excess of the amount necessary to administer the program. Recent estimates indicate that the surplus may approach $15 million by 1965.

In view of the financial restrictions and limitations placed upon county governments, some relief may be attained by state participation in the county general assistance program. The "spill over" in the old age pension program could be used as a matching grant on, say, a 50-50 basis, or an 80-20 basis as is now done to assist counties in meeting the cost of administering the State's

welfare program. State participation along these lines would alleviate the local burden of county general assistance expenditures. Under such a program, Denver would receive about $700,000 on a 50-50 basis or $1,120,000 on an 80-20 basis.

Historically the revenues from the sales tax have been used for causes akin to welfare, such as the old age pension. It appears only just, therefore, that all welfare problems be partially mitigated prior to the diversion of such funds to other worthy purposes.

Annexation of Territory

The current statutes regulating annexation of territory to municipalities have fiscal implications which have not been adequately recognized in the State of Colorado. This specific problem is of concern to all of the larger cities in the State and is not alone a problem peculiar to the City and County of Denver, although it is perhaps more urgent there than in any other city in the State.

As the core of a large urban area which surrounds it, Denver is confronted with jurisdictional paralysis imposed by the limitations provided in the State annexation statutes. The limiting factor in current annexation law is the provision which prohibits a municipality from annexing territory without petition and approval of the property owners and qualified electors therein. Prima-facie, this appears to be compatible with the principles of democracy. Upon examination, however, it may be seen that such a law is the matrix of governmental confusion within any given urban area. The provision permits any group of citizens however large or small to initiate tax colonies upon the borders of the core city which supplies the economic life-blood of the entire area and to which the colonies owe their very existence.

Further examination will reveal that such a procedure is not democratic at all for it permits segments of the economic entity to escape its fundamental responsibility to the social and economic area of which it is inextricably a part.

Furthermore, the colonies create an intricate pattern of commingled problems, the solution of which can be attained in no other way short of governmental consolidation. It is ironic that a community which works and must necessarily think alike is prohibited from seeking its common ground in the business of government.

The fiscal problems generated by the fragmentation of the economic and social entity are obvious. The entire urban area creates a demand for the usual municipal services and has little respect for jurisdictional boundaries established by law. Such demands call for revenues which the economic entity must forfeit for such purposes. Political subdivisions block the necessary flow of income into a single government, however, and each subdivision tends to become unbalanced both economically and financially. Therefore, no jurisdictional fragment of the entity is fiscally capable of meeting the problem alone, yet the laws permit no alternatives.

To illustrate the significance of this problem, one need only to look at the states of Texas and Virginia. These states have recognized that the fundamental purpose of municipal government is to provide social amenities to people and to exact taxes from all who benefit directly or indirectly from such amenities. As such, the State of Texas permits municipalities to annex territory by ordinance so that those who enjoy the fruits of the municipality may also participate in its continuance. In Virginia, the municipality petitions the district court for permission to annex its periphery when such can be identified as urban and when the municipality is capable of servicing the area.

In the field of international affairs there is a term "balkanization" which everyone interprets as the converse of stability. In Colorado's municipal affairs, however, balkanization is defended as virtuous and preferable. It would appear that as the metropolitan area grows, the more virtuous balkanization becomes. Witness the crop of incorporations and special districts that have sprung up in the territory that was once Denver's hinterland. (See Table 11.)

Table 11

Units of Government in Denver Metropolitan Area 1957

Unit	Number
Counties	4
Incorporated places	21
School districts	52
Special districts	124
Total units of government	201

Source: Colorado State Tax Commission, *Annual Report, 1957.*

The consequences, of this pattern of local government, which has been and is being established within Colorado's urban areas, must lead inexorably to inefficient use of government, excessive and needless taxes, the loss of democratic government on the local level, and urban chaos.

Much could be done to avert this headlong rush to an end which no one really wants. Some urban problems are in fact superficial and self-imposed merely for the lack of a realistic approach to the jurisdictional conflict between a municipality and its economic and social spheres. More liberal laws to permit annexation prior to the urban build-up in the periphery would solve many problems.

A great deal could be accomplished by the State Legislature in this regard, for it must be recognized that the municipality is a bona fide instrument of government and if it is not, legislation should be enacted to abolish it for an acceptable substitute.

In an age when most thoughtful people are pleading for a return of "local" government, it is logical and right for a superior level of government to assist the metropolis in its efforts to seek its salvation.

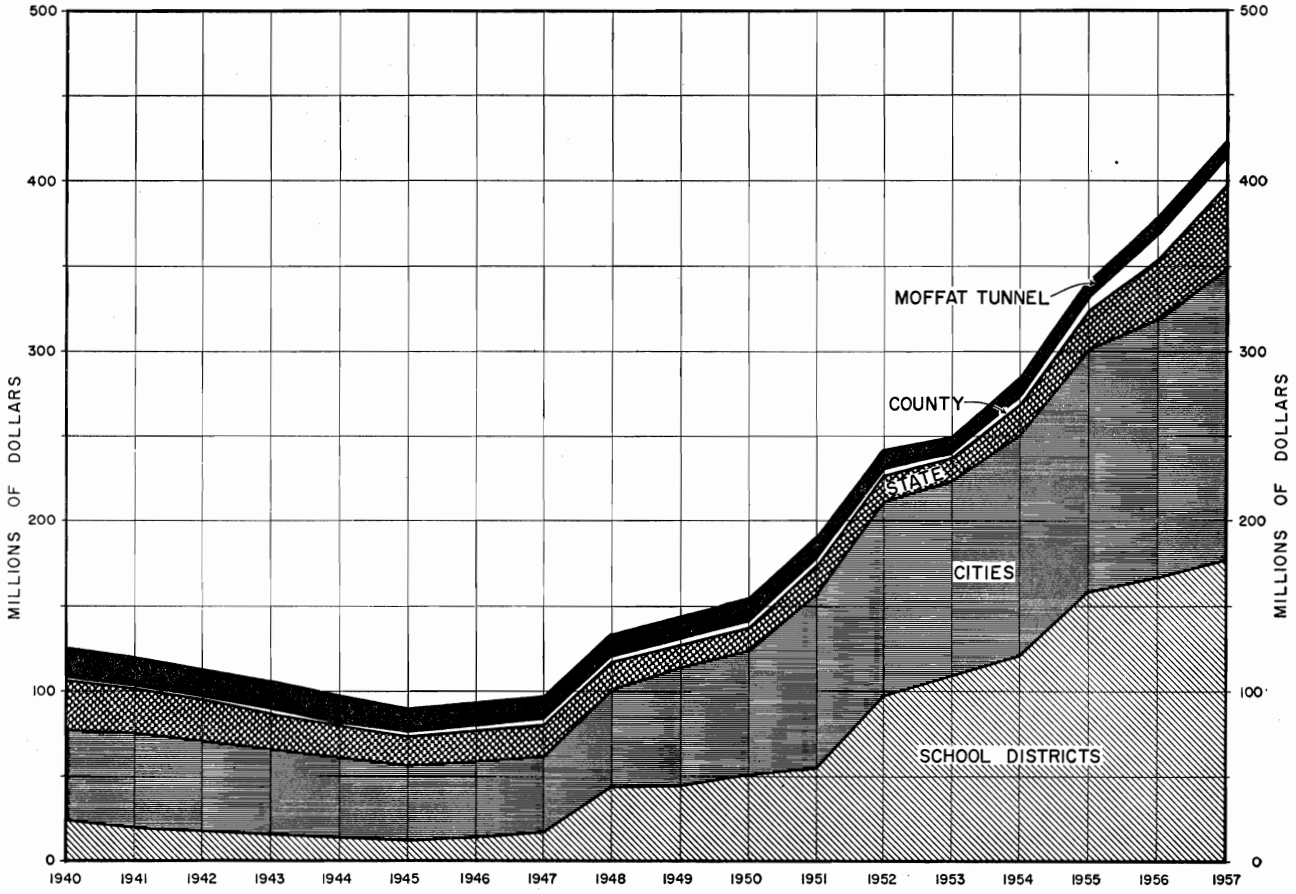
CHAPTER XXI

STATE AND LOCAL DEBT

Rapid post-war growth of Colorado's industries and population has resulted in a corresponding increase in the need for public facilities such as highways, schools and other public structures at both the state and local levels of government. Although operating budgets have been balanced on the whole, capital programs have, in the main, necessitated borrowing on a scale heretofore unknown. Thus in 1957 Colorado's aggregate state and local debt[1] reached an all-time high of $421 million—a figure nearly four times what it was before World War II and nearly three times the figure reported for 1950. Much of this increase is associated with the financing of schools and municipalities which, in the aggregate, accounted for 80 percent of

[1]In the discussion of the public debt in this chapter short term debt is excluded.

BONDED DEBT, BY UNITS OF GOVERNMENT IN COLORADO
1940 – 1957



SOURCE: Colorado State Planning Commission, Colorado Year Books, 1940–1958 and 1958 Report on Bonded Indebtedness in Colorado; and U.S. Bureau of Census, Compendium of State Government Finances, 1940–1957.

CHART 21.1

total outstanding debt in 1957 (Table 21.1 and Chart 21.1).

In the following analysis this over-all change is reviewed for each of the various levels of government in the State covering the period from 1940 to 1957. As a part of the review principal features of the law controlling public debt for each unit of government are also presented.[2]

State Debt

Legal Basis. As a state jurisdiction Colorado is not permitted to contract any debt except to meet casual deficiencies of revenue, to provide for the construction of public buildings and to borrow for such emergencies as suppressing insurrection, defending the State, and assisting in defending the United States. Colorado (including its subdivisions) is further restricted in contracting public debt by a prohibition against pledging the State's assets or credit for the benefit of individuals or private enterprises. In no case may a debt be created except by a law which is irrepealable until the indebtedness has been fully paid or discharged. The law must specify the purpose of the funds and must also provide for a tax sufficient to pay the principal and interest within the specified time limit of the debt. Funds arising from taxes so provided may not be used for any other purpose. Debts contracted for the construction of public buildings or deficient revenue may not have a maturity of less than ten years, nor a maximum maturity of more than fifteen years.

The State Constitution also contains restrictions on the amount of debt that can be contracted. Thus debt incurred to meet a revenue deficiency may not exceed eight hundred and fifty thousand dollars. Moreover, debt incurred for the erection of public buildings may not exceed one-half mill of each dollar of assessed valuation; and the aggregate amount of such debt may never at any time exceed the sum of fifty thousand dollars. However, section five provides that debt for the purposes of erecting public buildings may be created, in the aggregate, to an amount exceeding three mills on each dollar of assessed values; provided, that before going into effect, the law is approved by the vote of the majority of the qualified electors. To exceed these limits a popularly approved constitutional amendment must be enacted.

Preceding debt limitations do not apply, however, in the case of institutional or "non-guaranteed" debt, of which debts of the State Highway Department, and institutions of higher learning are principal examples. Thus the Department of Highway can issue revenue anticipation bonds and warrants payable solely from revenues derived from taxes or projects but such issue may take place only with the affirmative majority vote of the Highway Department and the approval of the Governor.[3] In this case no direct

[2]The laws pertaining to the borrowing powers and restrictions of the State of Colorado are primarily contained in three sections of Article XI, of the State Constitution. Section three of this Article sets forth the limitations of the debt of state government. Section four deals with the laws creating debt in general, while section five covers the creation of debt for public buildings. Reference to county indebtedness is found in section six. Sections seven and eight refer to debt for school buildings and municipalities, respectively. Additional rules relating to other agencies are contained in the Colorado statutes.
In the absence of citations the discussion in this Chapter pertaining to the legal basis of state and local debt is based upon these named sections of the State Constitution.

liability attaches to the State or the Department of Highways other than the obligations to apply the taxes assigned for debt retirement. Similarly revenue bonds can be issued to finance the construction of toll roads with net revenue so derived applied to the debt.[4]

Much in the manner of the Highway Department the State's colleges and universities can, for purposes of constructing school facilities, issue tax anticipation warrants or pledge for retirement of debt contracted the anticipated net revenues from the facilities acquired. The debt may take the form of bonds, certificates, or warrants and these may be refunded at the discretion of the governing board of the institution in question.[5] Although the State is not liable for debt repayment from general revenues it can be presumed that such would be the case should default occur.

Outstanding Bonded Debt. In reviewing the State's outstanding long-term debt it is well at the outset to recognize its two forms namely, "general" debt and "non-guaranteed" debt. The first is serviced from general revenue and is said, therefore, to be backed by the "full faith and credit" of the State. Non-guaranteed debt is represented primarily by issues of the various state agencies (i.e., Highway Department and colleges and universities) and are not a direct liability of the State. Such obligations are, however, covered, as noted in the preceding section, by special revenues or tax levies established by law.

Colorado's state government debt in 1957, amounting to $47.4 million, was the largest on record, being nearly four times what it was in 1950. As can be seen in Table 21.1, state debt since 1940 forms a U-shaped pattern with 1940 and 1957 marking the upper points and 1950 the lowest during the 1940-1957 period.

As noted in Table 21.2, the State has had no general debt since 1950. Accordingly, its outstanding indebtedness in 1957 consisted entirely of non-guaranteed obligations issued by its various departments, institutions and other agencies.

Table 21.3 shows the purposes for which state debt has been contracted. It will be observed that, of the total of $47.4 million outstanding in 1957, highways accounted for $23.1 million, colleges and universities, $23.5 million and all other purposes $.8 million.

Highway Debt. Historically the financing of highways has accounted for the bulk of the outstanding debt of the State. Since 1954, however, the aggregate obligations of the State's colleges and universities have exceeded that of the Highway Department. In 1957 the outstanding debt of these two general groups was about evenly divided, each having slightly over $23 million outstanding. Together, they accounted for 98 percent of the total debt of the State.

Current highway debt, while larger than it has been for many years, was still under that reported for 1940—a fact which in view of price inflation means that in "real" or in uniform-purchasing-power terms present highway debt is much below that of the immediate pre-war years.

Colorado's highway obligations presently outstanding fall into three general categories, namely: highway anticipation warrants payable from motor fuel and motor vehicle revenues, highway building authority bonds issued to

finance the construction of the State Highway Office Building in Denver also payable from motor fuel and motor vehicle revenues, and Denver-Boulder Turnpike revenue bonds payable from highway tolls.

The issue of highway warrants was authorized to the amount of $35 million by popular vote in 1954. Provisions of governing law limits their issue to $8 million per year until 1960. As of May 1, 1957 a total of $15.4 million of warrants were outstanding.

The second category of outstanding highway obligations is the Highway Building Authority bonds which in May 1, 1957 amounted to $7.9 million. In the third category, or the Denver-Boulder Turnpike revenue bond issue, a total of $5.6 million was outstanding on May 1, 1957. However, collections from tolls has built up a sizable surplus which has to be invested because of penalties imposed for early bond retirement.[6]

Colleges and Universities. As distinguished from highway debt the presently outstanding issues of the State's colleges and universities, which in 1957 amounted to $23 million, exceed any previous year on record. This is attributed to the rapid growth of student population and the need therefore for dormitory facilities.[7] Since the latter are revenue producing, their financing by bond issue supported by anticipated income from these facilities has been a natural financing device adopted by the institutions generally. As noted below nearly all of the current (June 30, 1957) outstanding institutional debt is in this form.[8]

University of Colorado	
Dormitory revenue bonds	$6,493,000
Student apartment revenue bonds	1,025,000
Faculty dormitory revenue bonds	333,000
Student Memorial Center revenue bonds	1,600,000
Stadium revenue bonds	300,000
Total	9,751,000
Colorado State University	
Dormitory revenue bonds	5,082,000
Refunding and improvement revenue bonds	839,000
Dormitory and student union building bonds	1,055,000
Total	6,976,000
Colorado State College	
Girls' dormitory bonds	76,000
Men's residence hall revenue bonds	140,000
Dormitory revenue bonds	2,750,000
Total	2,966,000
Western State College	
Dormitory revenue bonds	1,654,000
Colorado School of Mines	
Dormitory revenue bonds	487,000
Adams State College	
Dormitory revenue bonds	833,000
Grand total	22,667,000[9]

These data are exclusive of tax anticipation warrants which have been issued in certain cases by various institutions against continuing property levies for building purposes.

Other State Agencies. Two other state agencies have outstanding debt (exclusive of tax anticipation warrants) these being the State Board of Control for State Homes and the Department of Employment. The first agency, created by law in 1957, has authority to finance the construction or acquisition of homes for aged persons through the issue of warrants in amount not to exceed $1,000,000 and payable from income derived from the operation of the homes.[10] A total of $848,000 in warrants was issued in 1955.

The second agency, or the Department of Employment, was authorized to issue bonds for the construction of a building at E. 12th Avenue and Sherman Street in Denver. Bonds outstanding to date total $1,710,000.[11]

Finally, a number of other state agencies exclusive of the colleges and universities, as previously noted, have issued anticipation warrants against state property taxes earmarked for them. Among these institutions are the State Fair Commission, the State Penitentiary, the State Reformatory, the State Training School for Girls, the State Home and Training School at Ridge, the State Military and State Capitol buildings.[12]

Debt Service. The cost of financing state activities by borrowing amounted in 1957 to slightly over $1 million—a figure which like the

[11]This total does not, however, appear in the figure reported for total state debt shown in Table 21.3.

[12]Total tax anticipation warrants against property taxes amounted to $1,998,174, a figure not included however in the figures on long-term debt of the State as shown in Table 21.3.

debt principal is the highest on record. However, in light of increased expenditures, interest costs, relative to say 1940, appear to be modest indeed. As reported in Table 21.4, State outlay for interest in 1940 amounted to $873,000.

Table 21.4

Interest Cost of Bonded Debt of State Government in Colorado Fiscal Years, 1940-1957

State Debt in Western States. Colorado's per capita state government debt in 1957 placed it in 6th position in the comparison group of eleven Western States as shown in Table 21.6. It will be observed also, as shown in Table 21.7, that in the aggregate educational institutions had an outstanding debt of $592 million, or a total representing about one-third of the eleven-state debt for all state purposes. It will be further noted that whereas all the states had some debt outstanding for education this was not as generally true for highways. Here five of the eleven states did not have any highway debt at all; these states being Utah, Idaho, Wyoming, Arizona and Nevada.

Moffat Tunnel District

The Moffat Tunnel District which comprises Grand, Routt, Moffat and parts of six other counties (Denver, Adams, Boulder, Jefferson, Gilpin and Eagle) was originally authorized to issue bonds to the amount of $6,720,000 to cover cost of tunnel construction. Subsequent authorization added $8,750,000 to the original amount. Of the aggregate of $15,470,000 authorized and issued a total of $8,571,000 has been retired leaving a current outstanding debt of $6,899,000. To date the Moffat Tunnel Commission (a five-member management board elected every two

years, has paid interest amounting to $24,269,000. By the date of final retirement in 1983, it is estimated that total interest payments will have amounted to $44,000,000 bringing the total outlay, interest and principal, to almost $60,000,000.[13]

The Denver and Rio Grande Western Railroad will eventually pay $18,270,000 of the total cost; their 1957 payments alone having amounted to $404,000. The Denver Water Board pays $10,000 annually and the Western Union $500 a year. Aside from these payments the general taxpayer covers the remainder.

County Debt

Legal Basis. The State Constitution provides that a county can contract debt for the construction of public buildings, roads and bridges. It limits, however, the amount of debt that can be contracted in any one year to one dollar and fifty cents of each thousand dollars of assessed valuation in counties having assessed valuation in excess of five million dollars. Counties with taxable property of less than this amount are limited to three dollars on each thousand dollars of assessed value.

The total amount of county debt outstanding for all purposes is limited to twice the yearly contracting limit. However, with the majority approval of the qualified voters, additional debt may be contracted by the commissioners of any county. Such addition can be to an amount which will not increase aggregate debt to a total exceeding six dollars per thousand dollars valuation in counties valued at over 5 million dollars and for counties with a valuation of less than this amount aggregate debt cannot exceed twelve dollars per thousand dollars of assessed property value. Any bonds issued may not have final maturity dates later than twelve years from issuance.[14]

Funding may take place in any county with a floating indebtedness of over five thousand dollars. Such action must have the majority consent of the voters. Refunding bonds may also be used, without voter consent, however, so long as the interest rate does not exceed 5 percent.[15]

Outstanding Bonded Debt. County government has had no occasion to borrow on a long-term basis in recent years as evidenced by a total outstanding debt of only $400,500 on December 31, 1957.

[13] *Denver Post*, July 27, 1958.
[14] *Colorado Revised Statutes*, 1953, Vol. II, pp. 969-970.
[15] *Ibid.*, pp. 965 and 971.

Special Improvement District Debt

Legal Basis. Numerous special improvement districts exist in Colorado which may be broadly classified as improvement districts in cities and towns, and all other including principally water, sanitation, irrigation, fire and safety protection districts.[16] Improvement districts are governed by boards which have the authority to issue bonds. However, the boards must respect various legal limitations relating to maturity and interest payment dates, purposes for which debt may be incurred, specific minimum and maximum issues and approval of the persons to be benefited and who will ultimately be assessed for the cost. Where applicable special improvement districts are also governed by special charter provisions of cities and towns.

In the case of improvement districts in cities and towns bonds may be issued up to 25 percent of the assessed value of the district and must be payable serially within three years after issuance and may not have maturities of more than twenty years. An election must be held whenever a special improvement will result in a debt greater than five thousand dollars. Ad valorem taxes may be levied on all taxable property within the district in an amount sufficient to pay off the indebtedness when due. However, such debt may not be considered as a liability of any municipality in which the special district is located.[17]

Bond issues of special districts, other than those in cities and towns, are subject to limitations closely resembling the provisions as outlined above.

Outstanding Bonded Debt. Special improvement district debt (exclusive of districts located in municipalities and where district bond issues are recorded by the city treasurer) amounted in 1957 to a total of $16,864,000, which, when added to county debt of $400,000, results in a 1957 total county and district debt of $17,264,000. This figure greatly exceeds totals reported annually prior to 1956 as noted in Table 21.1.

Recent large increases in special district debt (exclusive of district debt in cities) have occurred primarily in Adams, Arapahoe and Jefferson counties, which together in 1957 accounted for $10,400,000 or 60 percent of total special district debt outstanding.[18] These counties having experienced a very heavy population increase have presumably attempted to provide

[16] On the nature of special districts see again Chapter II.
[17] *Colorado Revised Statutes, 1953*, Vol. 4, pp. 561 and 567-568.
[18] See Table 21.9.

services such as water, sewage and safety protection on a scale which would be required of a large metropolitan community which these areas really are in large degree.

Outstanding debt of special districts located entirely within cities amounted to $12,572,388 of which $8,156,000 were issues of the City and County of Denver.[19]

School District Debt

Legal Basis. The board of education of any school district cannot contract debt for school buildings without approval of a majority of the qualified voters of the district. First- and second-class school districts may not have a total bonded indebtedness greater than 10 percent of assessed property value and third-class districts may not exceed seven percent. However, the board of education of a school district may apply to the State Tax Commission for permission to raise the limit to 15 percent of assessed value in first- and second-class districts and up to 10 percent in third-class districts. First-class districts must have more than one thousand students, while the dividing line between second- and third-class districts is three hundred and fifty students.

The School District Reorganization Act of 1949, as amended, limits the bonded debt of any new school district to 10 percent of assessed valuation. An appeal provision of an additional 5 percent is included in the Act. The District Organization Act of 1957 makes similar provisions.

County high school districts, as well as union high school districts of incorporated towns, may combine bonded debt with the approval of the voters. The limit is set at 5 percent of assessed valuation with a possible increase to 10 percent upon appeal to the State Tax Commission.

Outstanding Bonded Debt. As of December 31, 1957, the outstanding bonded debt of all the public school districts in the State amounted to $177 million or 42 percent of aggregate State and local debt for all purposes. The school debt though broadly distributed was highly concentrated in the four county Denver Metropolitan Area, which as a unit accounted for 60 percent of the all district total as shown below:

Public School Districts Denver Metropolitan Area	School debt	Percent of total
Adams	$ 8,771,500	4.94
Arapahoe	18,076,800	10.18
Denver	65,172,000	36.72
Jefferson	13,908,200	7.84
All other areas	71,559,500	40.32
Total	177,488,000	100.00

[19]Colorado State Planning Division, *1958 Report on Bonded Indebtedness in Colorado*, p. 11.

The public school debt, which has more than doubled since 1950, reflects the sharp advance in school enrollment which between 1950 and 1956 increased from 227,000 to 308,000.[20] A contributing factor also was the backlog of needs which developed during the wartime and immediate postwar period.

Municipal Debt

Legal Basis. Municipalities may contract long-term indebtedness only by the use of an irrepealable ordinance. The ordinance must state the purpose for which funds are to be acquired and must provide for the levy of a tax, no greater than twelve mills per dollar of assessed valuation, sufficient to pay principal and interest when due. Maturities on municipal obligations may be no longer than fifteen nor less than ten years.

The creation of debt within a city or town must have the majority approval of the voters. Furthermore, debt may not be created in excess of three percent of the assessed valuation of the municipality.

Bonds may be issued for the purpose of funding any floating indebtedness of a municipality, provided a majority of the electors approve the issue. The term floating indebtedness does not include outstanding interest-bearing bonds. Any issuance of funding bonds must be preceded by an ordinance which established the date, interest rates and maturity dates. Maturity dates must be at least five and not more than twenty-five years from the issuance date.[21] Refunding bonds may be issued, without popular consent provided that interest rates are not increased.

Debt limitations defined by the State Constitution[22] as above noted do not however apply to debts contracted for supplying water. Excluded from these limitations also is the debt of special improvement districts within a city or town[23] and obligations to be retired out of revenues from special projects.[24]

Outstanding Bonded Debt. The character and amount of municipal bonds outstanding on December 31, 1957, consisted of the following:[25]

Bonds	Amount
General obligation	$ 42,678,000
Revenue	116,898,200
Total	159,576,200

[20]See Chapter I.

[25]Colorado State Planning Division, *1558 Report on Bonded Indebtedness in Colorado*, p. 11.

If to this amount is added the outstanding special improvements bonds amounting to $12,572,000 issued by special districts located within the cities, the municipal debt considered in this broader sense amounted to $172,148,588—or a total slightly under the total school district debt in the State in 1957. As was noted also for the school districts, the municipal debt including that of the special improvement districts located within the municipalities is highly concentrated in the Denver Metropolitan Area which in 1957 accounted for 69 percent of the total; the distribution by cities and towns in the Denver Area being as follows:[26]

Denver Metropolitan Area	Municipal debt
Brighton	$ 577,000
Aurora	4,839,000
Commerce Town	718,000
Westminster	1,126,000
Thornton	0
Englewood	4,093,000
Littleton	734,000
Sheridan	58,000
Denver	100,640,090
Arvada	1,334,000
Edgewater	4,093,000
Golden	270,000
Total	118,482,090
All other municipalities	53,666,498
Total municipalities	172,148,588

Distribution of Local Government Debt: Cities and Towns vs. Rural. Tables 21.8 and 21.9 present in detail the distribution of local debt between cities and towns (municipalities) and rural areas (exclusive of cities and towns). In each case special district and school district bonded indebtedness has been allocated to each of these two divisions on a basis as described in the footnotes of the tables. Table 21.8 shows the allocated grand total local debt of cities and towns of 2,000 population or more and Table 21.9 the "rural area debt by counties."

In the over-all, the highest per capita debt is found in the cities and towns which in 1957 had a total per capita average of $270 as compared with the rural area average of $128.

On a per capita basis also the ten cities and towns having the highest debt were the following:

City or town	Per capita debt
Commerce Town	$884
Walsenburg	395
Colorado Springs	383
Cortez	328
Trinidad	325
Denver	322
Englewood	317
Brush	302
Littleton	288
Grand Junction	287

For the rural sections the leading areas (by counties) were:

County	Per capita debt
Arapahoe	$267
Adams	239
Dolores	232
Logan	223
Jefferson	198
El Paso	191
Moffat	181
Pitkin	175
Montrose	169
Lake	167

Summary and Conclusion

Financing debt implies added future tax payments magnified by interest cost. When the need for heavy capital improvements is pressing, which usually obtains in a rapidly growing community, borrowing within reasonable limits of future tax capacity is the only means to quickly cover expenditure requirements.

Colorado's present debt at both the state and local levels of government does not in the aggregate indicate excessive use of credit. Outstanding issues of the State government are largely for the construction of highways and college and university dormitories, and, as such are self-liquidating. Moreover, they appear to be adequately covered by anticipated income. Interstate comparisons show also that per capita state government debt is presently at the median average for the eleven Western States.

At the local level debt consists essentially of issues of the school districts and municipalities which together accounted in 1957 for 80 percent of total state and local debt. In turn, nearly two-thirds of this ratio was applicable to the four-county Denver Metropolitan Area where the most rapid population growth has occurred. It is in terms of this development and the adjustment of public expenditures thereto that much of the present indebtedness of the State and local governments as a whole can be explained.

[a] Includes all special improvement district debt upon which records are kept by city treasurer.

[b] The amounts shown for county and school district bonds represent only the city's share of the total debt of the district or county bond issue. The city's share is calculated by using a ratio of the assessed valuation of the city to the assessed valuation of the school district or county.

[c] Based on estimated population reported for July 1, 1957 by Colorado State Planning Commission.

[d] The amount shown as special improvement district bonds for the cities indicated by this footnote include the city's share of water, sanitation, or recreation district bonds. Retirement of these bonds is the obligation of the district rather than the city. The city's share is calculated by using a ratio of the assessed valuation of the city to the assessed valuation of the special district.

[e] Includes an amount of $6,278,090 representing Denver's share of the Moffat Tunnel District bonds.

State of Colorado

EXECUTIVE CHAMBERS

DENVER

JOHN A. LOVE
Governor

Under authorization of and funding by the Legislature, and by appointment of the Governor, some one hundred of Colorado's leading citizens embarked in 1963 on an intensive study of the problems and trends of local government within the State. A wide range of experience, great competence, and much dedicated effort was brought to this most important task.

The study to date has resulted in much effective legislation, many challenges, and great insight into the future direction of government in Colorado.

It is with deep gratitude to the members of the Local Affairs Study Commission that I commend this report to all who are interested in the future of Colorado.

Sincerely,

John A. Love

John A. Love

FOREWORD

This document is entitled a report, it is really a story. It is written by the Governor's Local Affairs Study Commission, but the people of Colorado produced the subject matter and the figures. These people, by their way of life, their ambitions and their work, their finances and their politics, their dreams for the future, and their belief in America, have molded a system of government which extends from Washington, D.C. to every city, hamlet, and farm in this state. The report is about those governments—with emphasis on counties, municipalities, and special districts—and their relationships with each other.

This story has no ending. The people of Colorado will continue to write new chapters; the very nature of democracy and the character of our state make it imperative that we never cease to be concerned with government and that no plan be so rigid that it will fail to meet the needs of the people it serves.

House Bill 466, First Regular Session of the Forty-Fourth General Assembly, was signed into law on April 3, 1963 by Governor John A. Love. Thus began an important chapter in the governmental history of this state. Under this law the governor appointed one hundred citizens to "study the problems of local governmental units in urban areas and their relationship to each other; accumulate factual information; and develop proposals for enabling legislation to provide local governments of the state with means to solve their problems on a local basis."

How well did the Commissioners carry out their task? To study the problems of local government, the Commission divided itself into three major committees: the Metropolitan Committee, the State-Wide Committee, and the Finance Committee. Each committee assumed a specific study responsibility and organized its own approach to its task.

The Metropolitan Committee, under the leadership of Gale Sellens, Representative Allen Dines, and Mrs. Sally Jordan, directed its attention to the problems of the Denver urban community. The members surveyed the multiplicity of governments in the area and how well they worked together. They interviewed citizens who lived in the community to find out what they expected from their government. Every public service offered to these citizens was analyzed, and the efficiency and cost of their performance were recorded. After the committee found out what the people had and what they expected, these conclusions were projected on the growth patterns established by demographers who were looking at Colorado in the future. Their estimates and the committee findings pointed clearly towards some form of metropolitan government that would cut across traditional boundaries and make available certain basic government services to all within the urban area on equal terms. To carry out this plan the committee proposed certain statutory and constitutional changes that would provide methods for solution by the people themselves.

The State-Wide Committee chose its own method and pace for proceeding. It studied local governments outside of the metropolitan areas and went immediately to the people in developing this study. With John Holloway, the late Senator Wilkie Ham, and Representative Betty Miller chairing the meetings, this group held regional hearings throughout Colorado. Committee members looked at the makeup of local government and inquired into its operations on a local basis. This study lent itself to some immediate solutions, and this committee soon developed legislative proposals that were quickly enacted into law. The members did not, however, overlook the "long pull" and, through cooperation with the Metropolitan Committee, a proposal for local government reorganization to meet the specific needs of rural areas was developed.

The third major committee organized was the Finance Committee. Under the guidance of Farrington Carpenter (succeeded by Joe Lacy), Raymond Danks, and Miss Jean Evans, this group assumed the monumental, if somewhat frustrating, task of finding a sound and equitable financial basis for local government operations. The members assigned first priority to a review of all local government budgets during a specified period preceding their study. As these fiscal facts were being accumulated, it was decided to feed

them into data processing machines. Here, they were mechanically organized for analysis, comparison, and projection by the staff and committee members.

It is interesting to note at this point a change in philosophy that resulted from this study. Originally, the Finance Committee aimed at finding logical sources of revenue for local government and at developing recommended patterns for spending these funds. It was assumed that when this formula was developed, the structures of local government would be designed to carry it out most effectively. It soon became evident that the people must decide first what they want from government and how they want it done before the source of funds and the method of spending them is provided.

The Finance Committee agreed that the ad valorem tax on property was exceeding the growth of the valuations on which it was levied and that a broad-based substitute should be made available as a partial replacement for this tax. It recognized the impact of programs imposed upon local government from above and the resulting fiscal problems. These intergovernmental problems were assigned to a new committee for study. Even as this report is being written, this latter group continues its work.

This brief review of three years' work indicates the extent of the Commission's concern to carrry out the law under which it existed. Its study of the "structure and powers of local government units" and "their relationships to each other" was built on a foundation of factual information and included broad public participation in the deliberations of the committees. Each Commissioner was appointed because he or she could lend judgment based on experience, as well as individual identity with a geographical area, an economic group, a political philosophy, or a background in public service itself. They became spokesmen for their communities or groups; by taking the problems under consideration to their communities and groups and bringing back the feelings of those they represented, the Commission became a true forum for public opinion.

The Commission worked under a set of rules developed and adopted by its members. As each committee completed a segment of its study, a report was written covering the facts, the findings based on those facts, and the course of action indicated. These proposals were directed to the General Assembly, the local governments, or the citizens at large. Each report was then reviewed by the one hundred members and discussed at a session of the full Commission. With the right of amendment and dissent, these proposals were accepted or rejected. Their disposition, in many instances, is now spread upon the statutes of Colorado or embodied in an administrative change in some local government.

The local affairs study was a unique approach to one of the most pressing problems in government today. Its initiation by legislation showed state recognition that something had to be done. The study was established under the executive branch of state government. At the outset it was decided that the study should not be aimed at giving the state government new power or responsibility. As the study progressed, however, some problem areas seemed to indicate greater state responsibility and participation in the local areas as an alternative. History will show which course the people will choose to follow.

The Commission found itself cast in the role of coordinator between various local governments. With no attempt to interpret the law, the study of the statutes uncovered some powers that were not being used by various local governments or which were used differently throughout the state. This information has resulted in more uniformity and, in some instances, in clarifying legislation.

One of the difficulties confronted early in the project was suspicion of the motives behind the study. If the state government wasn't seeking new powers, what reason did the Commission have for looking at individual local governments and seeking to uncover problems that weren't statewide in their effect? The Commissioners themselves soon overcame these suspicions in most instances. Their objective approach and unprejudiced solutions to the problems presented indicated their sincerity.

With a two party political system involved in state government, while municipal elections are conducted on a non partisan basis, there was always the concern that "politics" might become involved. A few critics felt that one or the other party might try to gain some advantage from the results of the study. Both party organizations cooperated fully with the work of the Commission in any phase where they were asked for help. The conduct of the meetings was such that party philosophy was a secondary factor to the overall objective. Each individual Commissioner freely indicated what he thought, and if these ideas were predicated on a particular political approach, then this was expressed. Without exception, however, every recommendation of the Commission has had broad support from members of both parties.

This report cannot show all of the results of the study. It cannot indicate new public awareness with problems of government. The very nature of the Commission membership, as already indicated, made the public an immediate ingredient. The news media followed the Commission's progress and reported fully on its deliberations. Local groups were formed in some areas to report on problems. The memoranda from the staff, the data compilations and charts, the interim reports, and the proposed bills for the General Assembly were circulated throughout Colorado and the nation. A series of press releases, an information

pamphlet, and a film strip added a more simplified approach to these materials. Finally, many local government officials began to look at their own units with the help of cooperative citizens; using in many instances comparative data developed by the Commission, these officials and citizens are making their own community studies.

The General Assembly was most responsive in its acceptance of the study results. In some instances, the recommendations were not followed; others were modified; and a third group were accepted almost without change. The General Assembly, however, gave each proposition a thorough appraisal. The standing committees of the House and Senate which deal with the bills concerning local government were busy committees. They held public hearings and long work sessions. When the Commission-recommended legislation moved out of these committees to the floor of either house, the bills often engendered heated debate and always serious consideration. Each individual legislator became much more aware of the problems of his own area and the related problems of other communities. Rural representatives gained a new insight into urban problems, while urban members found fresh awareness of problems from the less populated areas. Many provincially fostered prejudices completely vanished. In essence, the study and deliberation of the one hundred Commissioners was supplemented by an equal concern and thought by the one hundred members of the General Assembly.

The research, data, and statistics developed by the Commission staff, together with the thorough analysis of the statutes and constitution, stand as a landmark in governmental studies. This staff under a highly competent director, included a fiscal analyst, an attorney, an office manager, a statistician, stenographer, and intermittent assistants.* Each staff member was assigned to one of the three major committees, in addition to his general responsibilities. The committee chairmen and members directed the staff into areas of research and reviewed progress at regular intervals.

All policy decisions and recommendations were made by the Commission membership based upon the facts and figures developed. The proposals were not written by the staff and then accepted or rejected by the Commission. Instead, they were hammered out in open meetings and drafted into final form after each point had been covered, discussed, and approved. Each member of the Commission could become as well versed in the subject matter of the research as was the staff member who presented it.

This report tells of the past in local government and inventories the present. New laws are on the books as a direct or indirect result of this study.** The Commission decided early in its life to strengthen those existing governments serving rural and urban communities which were comprehensive governments. The new annexation law recommended by the Commission gives municipalities a method of extending their services and boundaries, while statutory limitation on the formation of illogical municipalities clears legal roadblocks from the path of planned growth. The patchwork quilt pattern of single-purpose district governments has been directed towards systematic development by special district control legislation making the boards of county commissioners the coordinating and approving authority over district formation. The auditing of public accounts is now mandatory for all local governments, and uniform methods of keeping these accounts are being outlined as directed by another Commission recommended law. County governments have taken on new powers and have new tools available to carry out those powers.

In their final form, the recommendations of the Commission establish a renewed faith in the ability of the individual Colorado citizen to determine his own government on the local level and to participate in that government. Several outside factors have had an influence on this attitude. Judicial decisions, the press of urbanization, demands for education, the changing economy of the state, and a more affluent citizen with time to participate are but a few of these factors.

Several legal experts assisted the Commission and staff in drafting legislative and constitutional proposals. Of special note are the contributions made by John C. Banks, Regional Attorney, U. S. Department of Agriculture; Robert S. Wham, Shoemaker and Wham, Attorneys; Professor Howard Klemme, University of Colorado Law School; James G. Willson, Jr., Tallmadge, Tallmadge, Willson, and Lamm, Attorneys; C. Edward Palmer, Dawson, Nagel, Sherman and Howard, Attorneys; and James C. Wilson, Jr., State Legislative Reference Office.

**The following legislation was proposed by the Commission and adopted by the General Assembly in 1965:*

- *House Bill 1056—Special District Control Act*
- *House Bill 1057—Speed Regulation on County Roads*
- *House Bill 1059—Repeal of Authorization for Police Protection Districts*
- *House Bill 1060—Local Government Audit Law*
- *House Bill 1061—Local Government Uniform Accounting Law*
- *House Bill 1284—Continuance of County Services to New Municipalities*
- *House Bill 1288—Police Courts in Statutory Municipalities*
- *House Bill 1289—Capital Improvement Fund Authorization for Statutory Municipalities*
- *Senate Bill 121—Relating to the Provision of Municipal Water Service to Unincorporated Areas*
- *Senate Bill 122—Municipal Annexation Act of 1965*

Legislation proposed by the Commission in 1965, but not adopted, included:

- *House Bill 1058—County Authority to Regulate Road Excavations*
- *House Bill 1273—Countywide Local Option Sales Tax*
- *House Bill 1321—Prevention of Illogical Municipal Incorporations*

Two measures were proposed by the Commission in 1966: House Bill 1032, regulating municipal incorporations, was adopted in amended form; and Senate Bill 18, creating the Division of Local Government, the major provisions of which were added to Senate Bill 23, which was adopted.

The Commission feels that modern, flexible, and efficient government in the cities and counties of Colorado must be patterned along lines that are tailor-made for each area. The logical pattern makers are the people themselves. This is the objective of the home rule provisions that the Commission-recommends.

Even while governments are being structured to meet special situations, they have to lend themselves to cooperation with their neighbors. Lateral and vertical agreements between governments can result in broad application of modern methods, with substantial savings through sharing of services and equipment. All of the Commission proposals are aimed at providing the legal tools to let local governments solve their problems on a local basis.

Much lies ahead in the work started by the Commission. Some of the ideas propounded have not found general acceptance; some have found active opposition. Many areas of important research had to be bypassed for lack of time. The climate of reform has, however, been established. To those who take up the work, this report is dedicated and directed.

Representative JOHN G. MACKIE
Vice Chairman
June 11, 1966

I

COUNTY GOVERNMENT

Origin and Development

A county may be defined simply as "the largest territorial division for local government within a state."

County government has had a long and interesting history. When American colonies first became settled, England was divided into "shires," which in turn, were subdivided into parishes, hundreds, manors, and boroughs. This system was transplanted to the colonies, but in time the term "shire" was replaced by its synonym "county." The county was first instituted in Virginia and soon became the primary unit of local government and administration in the south. The Middle Atlantic states introduced both townships and counties. The New England states utilized towns and counties, but the latter were relegated to a subordinate position of responsibility.

This general pattern of counties, towns, and townships was repeated as the nation grew westward. In the western states, counties assumed major importance as subdivisions of state government for the administration of state programs.

At the present time, counties exist in all states, except Rhode Island, Louisiana, Alaska, Hawaii, and Connecticut. Rhode Island has not established county units because of its small geographic size. Louisiana has a county system, but refers to these units as "parishes." Alaska divided its territory into somewhat larger local units referred to as boroughs. Hawaii, consisting of a group of islands, does not use county units at all. Connecticut abolished its eight counties in 1960, but towns have always been more important local units.

The number of counties in each state varies from three in Delaware to 254 in Texas, with an average of over sixty. Each state has established criteria for determining the number and size of counties. The largest in size is San Bernadino in California (20,131 square miles), the smallest are four in Virginia, with one square mile each. Los Angeles County is the largest in population with 6.3 million, while Hinsdale County (Colorado) is one of the smallest, if not the smallest, with 200 people. Historically, once a county is created, it has seldom been abolished or merged with another county. The number of county governments in the United States decreased only three in the 1930's; only one county was eliminated in the 1940's; and only two counties were eliminated in the 1950's. In Colorado, some early counties were dissolved, but the total number of county units increased after statehood in 1876.

Historical Development of Colorado Counties[1]

There are presently sixty-three counties in Colorado; however, there has not always been this many. The historical development of Colorado counties is an interesting study in the juggling of boundaries by territorial and state legislatures. Many of the early counties are no longer in existence, and some still in existence were subdivided into other counties during Colorado's early history. The creation and growth of county governments in this state can best be summarized chronologically.

Territorial Colorado. Prior to 1861, what is now Colorado was composed of portions of Kansas, Nebraska, New Mexico, and Utah territories. In 1861, Kansas was admitted to the Union, and Colorado Territory was carved out of Kansas and the other three territories. Colorado's first territorial assembly met in 1861 and established seventeen counties: Arapahoe, Boulder, Clear Creek, Costilla, Conejos, Douglas, El Paso, Fremont, Gilpin, Huerfano, Jefferson, Lake, Larimer, Park, Pueblo, Summit, and Weld. Figure A shows the counties and county boundaries in existence in 1861.

Eight more counties were created in the fifteen years prior to statehood. In 1866, the territorial legislature created Saguache County out of the northern part of Costilla County. At the same time, Las Animas County was established from the southern portion of Huerfano County. Bent County was created in Eastern Colorado by an act of the Territorial Assembly in 1870. Then in 1874, five other new counties were established: Elbert, Grand, Hinsdale, La Plata, and Rio Grande.

Early Statehood. Figure B shows the counties and county boundaries as they existed upon Colorado's entry into the United States of America.

By 1876, there were twenty-five counties. Following the creation of San Juan County in 1876, thirty-seven new counties were added by subsequent General Assemblies, as follows: 1877, Custer, Gunnison, Routt;

FIGURE A
COUNTY BOUNDARIES
First Territorial Assembly, 1861
(17 counties)

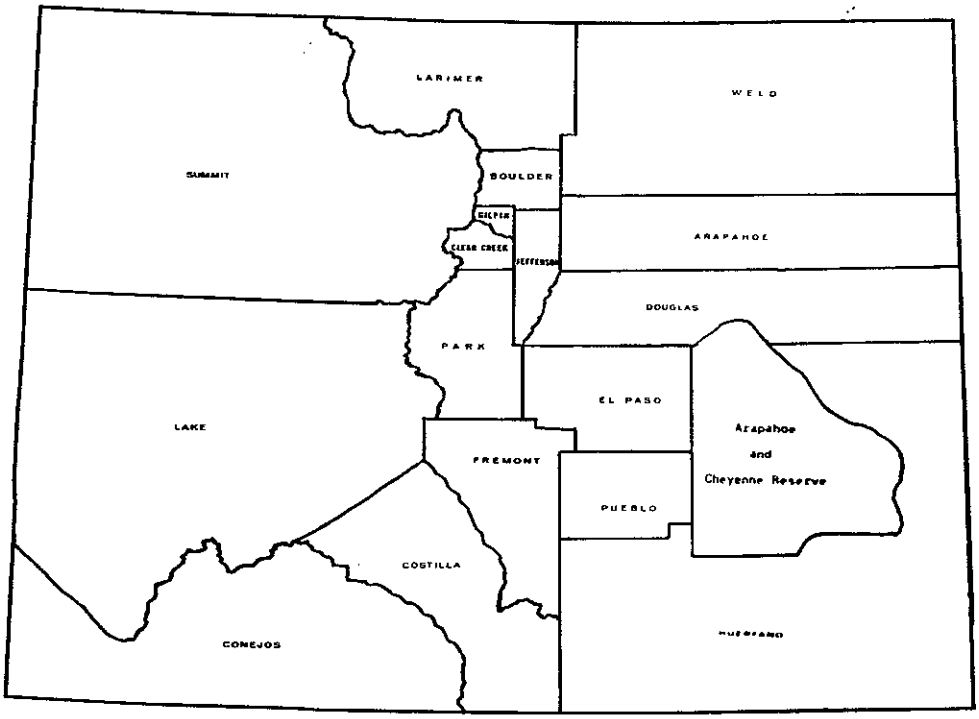

FIGURE B
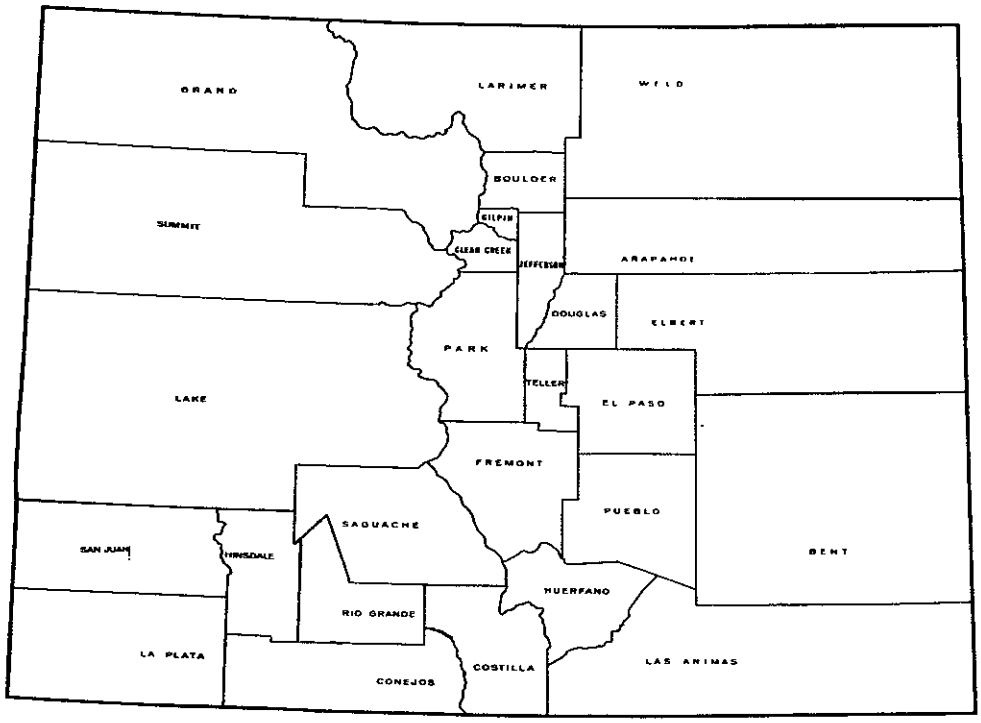
COUNTY BOUNDARIES
Eleventh Territorial Assembly, 1876
(25 counties)



1879, Chaffee; 1881, Dolores, Pitkin; 1883, Delta, Eagle, Garfield, Mesa, Montrose, Ouray, San Miguel; 1885, Archuleta; 1887, Logan, Washington; 1889, Baca, Cheyenne, Kiowa, Kit Carson, Lincoln, Montezuma, Morgan, Otero, Phillips, Prowers, Rio Blanco, Sedgwick, Yuma; 1893, Mineral; 1899, Teller; 1902, Adams, Denver; 1909, Jackson; 1911, Crowley, Moffat; 1913, Alamosa.

As the dates indicate, many of Colorado's counties were created in the 1880's during the fabulous growth of the state's mining industry and the development of the mountainous areas of the state—presumably, so that no person would have more than one day's ride by horseback to a county seat. The City and County of Denver was carved out of Arapahoe County by the passage of Article XX of the Colorado Constitution in 1902. Adams County also was created from the northern portion of Arapahoe County by the General Assembly in 1901, but the actual establishment of Adams County was contingent upon the creation of the City and County of Denver and the passage of Article XX. Adams and Denver counties were formally established on December 1, 1902 by proclamation of the Governor that the amendment (Article XX) had passed. At that time, there were fifty-nine counties in Colorado as shown in Figure C.

Alamosa County was established in 1913, and no new counties have been added since that date. Figure D illustrates county boundaries substantially as they exist at the present time. It should be noted that the county boundaries in Figure D are not precisely correct, inasmuch as annexations to the City and County of Denver have altered them to some extent since the date of the map.

Population

Colorado's counties range in population from 527,000 (City and County of Denver) to 200 (Hinsdale County) as follows:*

Population	No. of Counties
over 100,000	6
50,000-100,000	4
10,000-25,000	13
5,000-10,000	15
2,500-5,000	14
1,000-2,500	7
less than 1,000	4

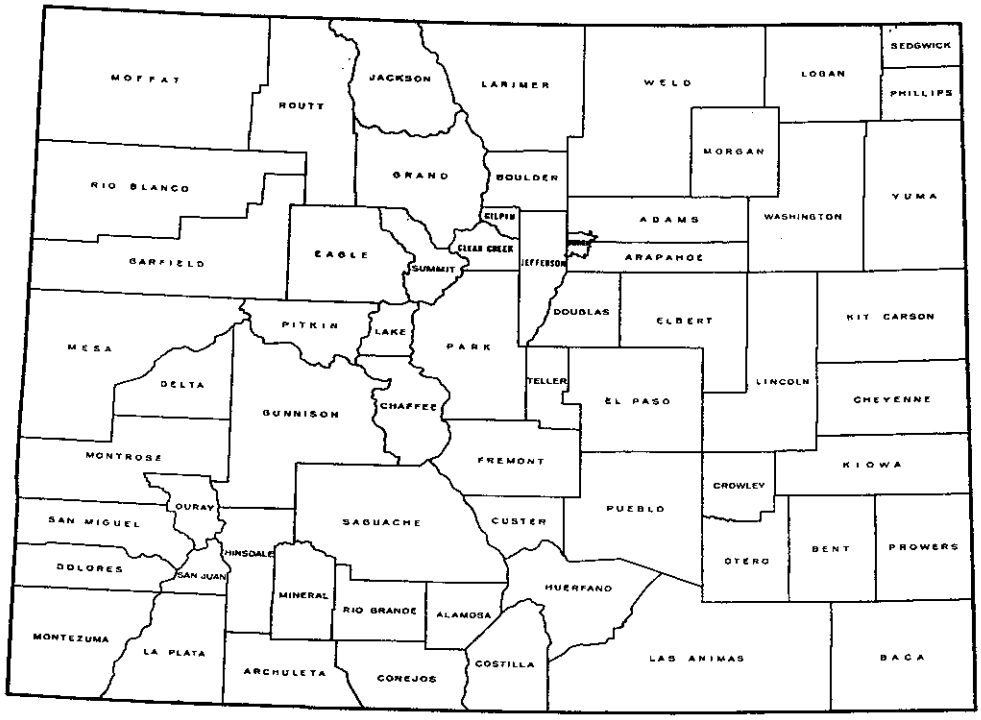
FIGURE D
PRESENT COUNTY BOUNDARIES, 1963
(63 counties)



What Is A County?

Traditionally, a county is considered to be a local subdivision of state government for the administration of state programs. This concept, as applied to county government in Colorado, has been described by John C. Banks, an authority on local government law in Colorado, in the following terms:

> Counties are not municipal corporations, but are quasi corporations. They are mere subdivisions of the state for general governmental purposes. The distinction between municipal corporations and counties is that a municipal corporation is created by its request, and under our constitution by the act of the citizens resident within the territorial limits thereof, for their local advantage and convenience; whereas, counties are created by the legislature for the purpose of exercising a part of the political power of the state.
>
> A county is merely a subdivision of the state for the purposes of state government. It is nothing more than an agency of the state in the general administration of the state policy. Its powers are soley governmental. It does not, like a municipal corporation, possess a complete local government of its own, executive, legislative and judicial. It is clothed with certain executive powers but these are only such as are specially granted to it by the state.
>
> A county is created by the legislature without reference to the will of its inhabitants. It has no power of local government or independent authority of any kind whatever. Its officers, although elected by its people, are virtually officers of the state, and are charged with the administration and execution of the laws of the state. It is merely a subdivision of the state for the purposes of state government.[2]

This traditional concept of county government has changed somewhat over the years; it is now considered by many to be a separate unit of local government. This view on the legal status of counties has been summarized by Dr. Conrad McBride, professor of political science, University of Colorado, as follows: "The county in a legal sense is a subdivision of the state. But in addition to being a legal entity, it is a going concern and historically, in Colorado, it is older than state government itself. The county has a dual nature: In certain ways it acts as part of the state government performing functions on behalf of the state; but it is also a unit of local government . . ."[3]

Colorado statutes declare a county to be a "body corporate and politic." Although a county is not incorporated as such, there can be no doubt that it is a legal entity and an integral part of the state's local government system.

Relationship to Other Governments

Although originally designed primarly to serve rural areas, county boundaries include both incorporated and unincorporated areas. Present county government in Colorado is charged with the responsibility of performing functions and serving all areas of the county, both urban and rural. Other local units of government, such as municipalities, special districts, and school districts, operate within county boundaries and property located within a county is subject to taxation by one or more governmental units, in addition to the county. The county has particularly close relationships with several state agencies which have authority to prescribe rules, regulations, and standards for the performance of many county functions.

Constitutional Basis

Counties, like other units of local government, have their legal basis established in the state constitution. However, counties are the only local governmental units in the state which have their organization and structure provided specifically in the constitution. Article XIV of the Colorado Constitution establishes the organization and officers of county government. Although there are references to counties throughout the constitution, there is no provision which actuall defines how counties are to be created. Article XIV, Section 1, provides that: "The several counties of the territory of Colorado as they now exist, are hereby declared to be counties of the state." Apparently this provision has never been interpreted by the Colorado Supreme Court, and it is not clear whether the existence of the original twenty-six counties at the time of Colorado statehood is constitutionally guaranteed or whether their status can be altered by legislative enactment. The constitution does not enumerate by name any county (except the City and County of Denver and Arapahoe County, which is referred to as a quasi municipal corporation), nor does it define county boundaries.

The Colorado Supreme Court has held that the legislature may create new counties out of the territory of counties already in existence,[4] and all of the counties added since 1876, except the City and County of Denver, have been established by the General Assembly. There are a few constitutional references to the duties of certain county officers, but, in general, the functions and powers of county government are not enumerated in the constitution, leaving them for determination by the General Assembly.

Miscellaneous Constitutional Provisions. Article XIV contains several interesting sections concerning counties. Section 2 provides that the General Assembly shall have no power to remove the county seat of a county without the approval of a majority of the voting electors in the county; this proposition may not be submitted more than once every four years, and a resident must have resided in the county for six months in order to vote on this question. Section 3 of Article XIV provides that no part of any county shall be stricken off and added to an adjoining county without approval of a majority of the electors in the county from which territory is to be taken. The stricken portion must pay its portion of liabilities and debts existing in the old county.

Structure and Organization of County Government

The organization and structure of county government is also established by Article XIV of the Colorado Constitution. In general, the basic organizational pattern of county government is the same throughout the sixty-three counties of the state, except for the City and County of Denver, which has its organization established by city charter, pursuant to Article XX of the constitution. Because counties are primarly an administrative branch of local government, they have no court system of their own, nor do they possess any inherent legislative powers, other than those delegated by the General Assembly. Figure E shows the organization and structure of county government.

Board of County Comissioners[5]

The board of county commissioners constitutes the chief administrative and policy-making body for the conduct of county activities, except where other provision is expressly made. The board is composed of three members who are elected for four-year terms, two of whom are elected at the general election in presidential election years and the other elected at the next general election. The constitution makes it permissible for counties of more than 70,000 population to have five commissioners, but no county of this size has exercised this prerogative.

Commissioners represent districts, but are elected at large. Vacancies on the board of county commis-

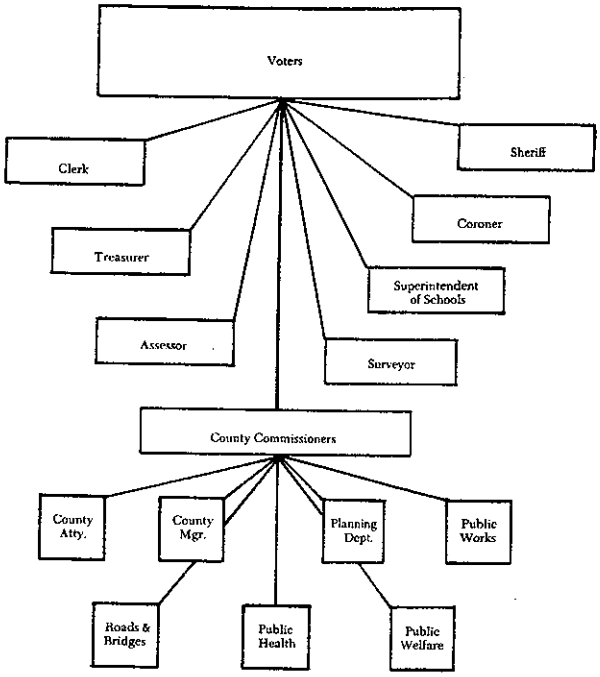
COUNTY GOVERNMENT ORGANIZATIONS IN COLORADO



sioners are filled by gubernatorial appointment, but vacancies in other county elected offices are filled through appointment by the board. Commissioners may not be removed by recall any time after being in office six months and may not be subject to more than one recall election during each term of office. The law requires that a candidate for the board must have resided in the county for at least one year preceding the date of the election. Upon election, a commissioner must post a bond ranging from $5,000 to $25,000, depending on the size of the county, and he is also required to take the standard oath of office for both federal and state constitutions.

State law prescribes certain times when the board of commissioners must meet, depending on the size of the county. The board of county commissioners sits as the board of equalization in processing property assessments.[6*]

Other County Constitutional Officers[16]

In addition to the commissioners, there are eight others considered to be constutional county officers.[7] With the exception of one, all of these officers must be residents of the county for one year prior to election, are elected for four-year terms, and must take the standard oath of office. A brief description of the qualifications and duties of each office follows:

Other powers and functions of the board of county commissioners are described in greater detail in subsequent sections of this chapter.

County Clerk.[8] The constitution requires the county clerk to be the recorder of deeds and clerk of the board of county commissioners. By law and practice, the county clerk is actually the primary administrative officer in most counties. In order to be eligible for this office, a candidate must be a qualified elector of the state and have resided in the county for one year preceding his election. Upon election, he must execute a bond with two or more sureties in an amount of not less than $5,000, as approved by the county commissioners. The clerk must appoint a deputy to act in his absence or disability.

The office of the clerk is directly responsible for administering a number of state laws. He is the authorized agent of the State Department of Revenue and is charged with the responsibility of carrying out many state laws relating to certification of automobile titles, drivers' licenses, motor vehicle registrations, and licensing under the ton mile tax. He collects a multitude of license fees and charges due the state.

The clerk in all counties, except Denver, is the chief election officer of the county and has administrative responsibility for all primary, general, and special elections held in the county, including such duties as registering voters, publishing notice of elections, appointing election judges, and printing and distributing ballots. In addition, the clerk issues marriage licenses, maintains various records and books for the board of county commissioners, and performs other duties such as furnishing deed abstracts upon request.

County Treasurer.[9] The county treasurer is responsible primarily for the receipt, custody, and disbursement of county funds. He is the public trustee except in first and second class counties. The treasurer performs tax collecting duties for the state and other local governmental units, as well as counties; for example, the constitution requires the county treasurer to collect and disburse school funds belonging to school districts in the county. He mails out notices and collects the property taxes for all local units in the county and then refunds the receipts due each unit, after deducting a statutory collection fee. Various fines from criminal violations also are collected by the treasurer and forwarded to the state treasury. The treasurer performs many duties in connection with the sale of property for delinquent taxes and must issue treasurer's deeds to purchasers at tax sales.

County Assessor.[10] The basic duty of the county assessor is to value real and certain types of personal property for ad valorem taxation. The assessor must execute a bond in the amount of $6,000, approved by the commissioners, and also another bond to the State of Colorado, as approved by the state director of revenue. If required by the county commissioners, the assessor can divide the county into assessment districts

and appoint a deputy for each district. The assessor's office also has miscellaneous responsibilities, such as the collection of agricultural statistics, and local duties in connection with the state hail insurance program.

County Sheriff.[11] A bond is required in an amount of $5,000 to $20,000, as required by the commissioners. The sheriff is the chief police official in each county and is charged with keeping the peace and enforcing all state laws. Specifically, he is charged with enforcing state gambling, liquor, and fish and game laws. He must pursue persons suspected of committing crimes in his jurisdiction, attend sessions of the courts of the county, and is required to serve and execute all processes, subpoenas, writs, and orders directed to him by the court. The state also has vested the sheriff with a number of responsibilities in connection with the sales of land and personal property for the satisfaction of debts or tax liens. He is the keeper of the county jail and must maintain and feed the prisoners entrusted to his care. In addition, he must witness executions at the state penitentiary of persons convicted of crimes in his county and act as fire warden in case of prairie or forest fires in the county.

County Coroner.[12] The coroner is elected for a four-year term and must execute a bond in an amount of $250 to $5,000, with sureties approved by the commissioners. The principal duty of the coroner is to investigate causes of death where the reasons are unknown. A coroner's inquiry must be held in any case involving violent death to determine the cause of death and whether a crime was committed. The coroner is required by law to act as sheriff when there is no sheriff; when the sheriff is disqualified for being partial, prejudiced, or an interested party; or until a new sheriff is appointed. Like the sheriff, he is empowered to seize gambling devices and exercise other police powers. His miscellaneous duties include conducting an inquest in any fatal mine accident and issuing death certificates for persons who die in motor vehicle accidents within the county.

County Superintendent of Schools.[13] To hold this office, a person must: 1) have a teaching certificate during the period of his election; 2) have taught in Colorado public schools for at least eight months; and 3) post a bond of at least $2,000. The primary responsibilities of the superintendent are to complete reports for the State Board of Education and to keep various types of registers, records, and maps required by the state. The superintendent of schools also performs various functions in connection with elections for the formation of county high schools and carries out ministerial duties under the School District Organization Act of 1957.

An amendment to the constitution adopted in the 1964 general election made this office mandatory unless abolished and the term of office four years instead of two. This amendment also makes it possible for any county to abolish this office upon majority approval after submission of the question at a general election. Legislation to implement this amendment was adopted in the 1965 session.

County Surveyor.[14] The county surveyor must post a $1,000 bond. His statutory duties are few. He executes surveys to settle boundary disputes when directed to do so by a court or other interested parties. He has authority to survey for the location of markers and monuments and for the approach and width of toll roads. In addition, the surveyor has responsibilities in connection with the construction and inspection of reservoirs.

County Attorney.[15] The constitution provides that the county attorney may be elected or appointed; however, state law requires that he be appointed, making the county attorney the only appointive officer of the county. In order to be eligible, he must be at least twenty-five years old and admitted to practice in Colorado. Besides advising other county officers on all legal matters, he has the statutory duty to represent the county in mental competency and commitment proceedings.

Other County Offices[16]

The county commissioners have authority to appoint to a number of other boards and positions, most of which relate to particular county functions such as road construction, welfare, health, planning, etc. The commissioners of a county may appoint a county manager to carry out administrative duties assigned to him by the board; only a few metropolitan counties have established this position or its counterpart (county administrator). In addition, county commissioners have authority to fill a vacancy in the office of county judge until the next election. Statutes also provide authority for the appointment of a public defender and the manager of the county fair grounds, with corollary authority to set the compensation for these positions. Various other minor positions may also be established, but do not warrant description here.

County Classifications—Salaries

The constitution (Article XIV, Section 15) requires the General Assembly to classify counties on the basis of population for the purpose of setting the compensation of county officers. Pursuant to this authority, the General Assembly has established six basic classifications of counties, with subclassifications, as follows:[17]

Class	Counties
I	Denver
II	Adams, Arapahoe, El Paso, Jefferson, Pueblo
IIA	Boulder, Weld
IIB	Larimer, Mesa
IIC	Otero
IID	Fremont, Las Animas, Logan, Morgan
IIE	La Plata, Montrose
IIF	Delta, Garfield, Montezuma, Prowers, Rio Grande
III	Alamosa
IIIA	Chaffee, Conejos, Huerfano, Yuma
IIIB	Baca, Bent, Kit Carson, Lake, Moffat, Routt, Washington
IIIC	Douglas, Eagle, Gunnison, Lincoln, Rio Blanco
IV	Phillips, Saguache, Sedgwick
IVA	Costilla, Crowley, Elbert, Grand, San Miguel
IVB	Archuleta, Cheyenne, Clear Creek, Kiowa, Pitkin, Teller
IVC	Dolores, Park, Summit
V	Custer, Jackson, Ouray
VI	Gilpin, San Juan
VIA	Hinsdale, Mineral

The annual salaries of county commissioners range from $6,500 in Class II counties to $720 in Class VIA counties.* The annual salaries of the county clerk, treasurer, assessor, and sheriff range from $7,500 in Class II counties to $2,760 in Class VIA counties.

Other Classifications

Counties are also classified by statute for at least three other purposes, each law providing a somewhat different grouping of counties:

1) **Compensation of County Clerks and Assistants.** These statutes merely classify counties in groups, but do not set statutory salary limits.[18]
2) **Fees of County Officials.** Counties are divided into five classes for the purpose of setting some of the fees which are assessed by county officials, for example, the property tax collection fee charged by the county treasurer.[19]
3) **Qualifications of County Judges.** Counties are divided into four classes for the purpose of setting qualifications for the office of county judge.[20]

Powers and Limitations

General Powers

As the primary policy-making agency of county government, the board of county commissioners has been delegated considerable authority. In addition to specific powers, the board of commissioners has the general statutory power to:[21]

1) make such orders concerning county property as it deems proper;
2) examine and settle all receipts and expenses of the county and to settle all accounts or claims against the county;
3) keep in repair, build, and insure county buildings and, if there are no county buildings, to provide suitable quarters for county purposes;
4) levy and apportion taxes and incur debt for the construction or repair of public buildings, roads, and bridges when so authorized by a vote of the people;
5) manage the business and property of the county in all cases except when management is otherwise specifically delegated by statute;
6) establish and alter precinct boundaries;
7) establish voting places in each precinct as may be required by law;
8) grant business licenses and perform such other related duties as may be required by law;
9) acquire land, contract for, and maintain airports and landing strips and lease or determine rental charges for such facilities;
10) provide for county dumping grounds;
11) enter into contracts with municipalities for joint use and occupation of buildings;
12) negotiate with boards of county commissioners of other counties and with the State Board of Agriculture of Colorado State University for agricultural extension services to be financed on a pro rata share by the counties receiving such services; and
13) adopt a resolution creating the office of county manager, administrative assistant, budget officer or, any office as may in their judgment be required for the efficient management of the county. (The board has the power to make the appointment, and fix the compensation from the county general fund of all officers so created, and the persons appointed serve at the commissioner's pleasure.)

Other Powers

Although it is generally true that boards of county commissioners have only those powers conferred upon them by the state, the courts have held that they possess such implied powers as are necessary to carry out their assigned functions.[22] In most cases, specific powers delegated to the county commissioners relate to

Denver does not have a separate board of county commissioners as such, and the salaries of its officials are prescribed by charter and ordinance.

some function, program, or service which the county is required to perform. For example, the county commissioners have legal authority to condemn property for road acquisitions[23] and to issue various types of licenses, as permitted by state law. The biggest non-fiscal limitation on county government would appear to be the absence of any inherent police power, i.e., the power to establish criminal violations to protect public health, welfare, and safety. As subdivisions of the state for the performance of governmental functions only, counties are immune from any tort liability resulting from negligence in the performance of these functions.[24]

Fiscal Powers and Limitations

The county is vested by constitution and statutes with a number of powers to finance the operations of county government. It also is subject to certain limitations on its power to tax, issue bonds, and incur indebtedness.

Sources of Revenue

The only source of revenue available to counties, aside from various kinds of fees and federal and state grants-in-aid is the ad valorem tax. It produces revenue for almost all of the different funds which finance county activities.

Budget and Finance Procedure[25]

All counties, except Denver, are subject to the provisions of the Local Government Budget Law. The budget must contain expenditures for the previous fiscal year, estimated expenditures for the current and ensuing fiscal years, and a classification of expenditures for each fund. The budget must be published, and it must be considered at a public hearing prior to approval and adoption by the board of county commissioners.

The county fiscal year starts January 1, and the budget for the next fiscal year may be adopted at any time during the last quarter of the current fiscal year. In estimating anticipated revenues, unexpended surpluses from the previous year must be considered. Property tax levies in the new fiscal year must not produce revenue in excess of five percent more than the previous year, except for debt retirement. If more than a five percent increase is needed, the commissioners must obtain approval for the increase from either the State Tax Commission or the qualified voters of the county. Except for unforeseen emergencies, expenditures other than those appropriated may not be made.

The county commissioners must publish a monthly statement of the claims and expendiutres of the county. In addition, state law requires publication of a semi-annual financial statement showing all collections, disbursements, transfers, and delinquent taxes during the period. The board of county commissioners must also provide for an annual audit, itemizing information about the status of county finances and comparing expenditures with the budget.

Indebtedness

Article XI, Section 6 of the constitution limits the amount of indebtedness which counties may contract. Counties with less than $5 million of assessed valuation may not incur debt in excess of six dollars for each $1,000 of valuation; counties with more than $5 million of assessed valuation may not exceed three dollars for each $1,000 of valuation. These limitations may be exceeded by popular vote, but total county indebtedness still may not exceed twice the above amounts.*

Bonds and Securities[26]

The county is empowered by the constitution and state laws to issue general obligation bonds for constructing roads and bridges, public buildings, and airports. These bonds may not be outstanding for more than twenty years and are limited to a maximum interest rate of ten percent. They may be sold by the board of county commissioners, but such sales must be for cash and at a discount rate of not more than fifteen percent of par value. The commissioners must levy a tax sufficient to meet principal and interest payments on the bonds. In order to issue bonds, the question must be submitted to and approved by the qualified voters of the county. The board of county commissioners may issue refunding bonds for general obligation bonds without an election, if interest rates on such bonds do not exceed five percent. Commissioners have additional powers to issue anticipation warrants for public works—not subject to constitutional debt limits—in accordance with specific statutory requirements. Warrants in excess of $5,000 may be refunded by the issuance of bonds, if petitioned by fifty taxpaying electors of the county.

Contracts[27]

Only the county commissioners are permitted to contract for county supplies and services. State supplies are preferred in all contracts, but contracts for supplies must be issued on a bid basis.

**This provision (as is true of many old constitutional and statutory provisions), is extremely vague and is subject to a number of different interpretations.*

General Fund

The county commissioners are authorized to set mill levies for the general fund in accordance with a schedule based on the assessed valuation of the county; the schedule runs from a maximum levy of 12.0 mills for counties with less than one million dollars of assesse dvaluation to a maximum of 5.0 mills for counties with assessed valuation in excess of $100,000,000.[28] Appropriations may be made from the general fund for all ordinary county purposes including: 1) administrative offices; 2) libraries; 3) agricultural extension services; 4) county fairs; 5) fire protection; 6) health; 7) airports; 8) rodent control; 9) water conservation; and 10) weed control.[29]

Judicial System. The county's share of operating district and county courts is also financed from the general fund. The board of county commissioners, however, have no direct control over court budgets, as is the case with other general fund functions.* The Colorado Supreme Court has held that necessary and reasonable judicial expenses must be paid by the county commissioners.[30]

Other Funds

There are a number of other funds which are either required or which may be established at the discretion of the commissioners to finance county operations:

Public Welfare Fund. Each county must establish a county welfare fund to finance its share of various welfare activities. The welfare mill levy must be set by the commissioners according to a statutory schedule based on per capita assessed valuations; the schedule varies from a maximum of six mills for counties with less than $800 per capita assessed valuation to a maximum of two and one-half mills for counties with over $2,600 per capita assessed valuation.[31]

Road and Bridge Fund.[32] Costs for the construction of county roads may be paid from the general fund, road fund, or emergency fund as the commissioners may decide. A separate road and bridge fund must be established in each county, consisting of the county's share of the state highway users' tax, federal highway monies, and additional levies made by the commissioners, as may be needed.

Public Works Fund. The board of county commissioners may levy up to three mills for public works; no vote is required but a public hearing must be held.[33] Building programs requiring more than a three mill levy must be approved by the county electorate, and such additional levy would be subject to the constitutional debt limitations.

Public School Fund. In order to qualify for participation in the state minimum equalization program, each county must provide $200 for each actual classroom unit to which the school districts in the county are entitled under state law.[34]

Miscellaneous Funds. The county commissioners also are authorized to set up a variety of other funds. They may establish a bond redemption fund to pay off the principal and interest of county bonds.[35] Commissioners are authorized to create an agricultural fund and make an agricultural levy.[36] A county hospital fund may be established in counties of 3,000 population or more if petitioned for by 500 property owners of the county; a mill levy of up to one mill may be made for operation and maintenance of the hospital.[37]

**Judicial system finances and intergovernmental relationships are discussed in Chapter VII.*

Programs and Services

The primary purpose of the operational and fiscal powers briefly described in the preceding section is to enable the county to administer state programs and perform a number of services required by law. There are also various programs and services conducted by county government, other than those handled by the constitutional officers of the county.

Roads and Bridges*

One of the primary functions of county government since its inception has been to construct roads and bridges. The county's responsibility in this field is governed to a large extent by the 1953 State Highway Act, which established a formal system of county primary and secondary roads.[38] The board of county commissioners selects the county primary system on the basis of those roads which in their judgment are the most important. The commissioners must advertise and then hold a public hearing on this determination; subsequently, a map designating primary and secondary roads must be completed and filed with the State Highway Department. The county commissioners have responsibility for construction and maintenance of the county road systems, but are required to employ road supervisors and may divide the county into road districts. They set the amount of money which may be spent in road districts, but the amount expended in any district may not be less than fifty percent of the tax collected in the district. In carrying out its responsibilities for construction of county roads, the boards of county commissioners are vested with the authority to let contracts (on a sealed bid basis) and may condemn private property when necessary.

Welfare*

Welfare constitutes a major county program with many component programs. State law requires each county to establish a welfare department on its own or in cooperation with other counties.[39] The board of county commissioners serves as the county board of welfare. If two or more counties form a district welfare department, the welfare board may consist of one or more commissioners from the participating counties. The county welfare department is charged with the administration of all forms of public assistance in the county, including aid to dependent children, home relief, aid to the blind, the tuberculosis program, care and treatment of handicapped children, and such other welfare activities as may be required or delegated to it by the state department of public welfare. The county department also investigates and approves all applications for admission to and discharge from county institutions.

**Road construction and maintenance and public welfare are covered in more detail in Chapter VII.*

The federal and state governments regulate the administration of these programs and reimburse the county for most of the costs involved. In addition, the federal and state governments provide eighty percent of county welfare administrative costs. County welfare departments also assist in the administration of the old age pension and medical care programs.

Health and Sanitation

Counties may establish a health department by resolution approved by the county commissioners, or two or more counties may combine to form a district health department.[40] A board of health consisting of five members for five-year terms may be appointed by the county commissioners. District health department boards consist of seven members appointed by a committee consisting of one county commisioner from each county. County health departments have the authority to: 1) administer and enforce the state health laws, including rules, regulations, and standards promulgated by the State Department of Public Health; 2) control epidemics and communicable diseases and enforce quarantine and close public gatherings when necessary for the protection of the public health; 3) abate nuisances to protect public health; 4) establish and maintain laboratories for the investigations necessary to preserve public health; 5) purchase and distribute to licensed physicians and veterinarians such vaccines and serums as may be necessary to combat epidemics and diseases; 6) carry out general health programs deemed necessary or desirable for the protection of public health and disease control; 7) collect and compile statistical information relating to marriages, divorces, annulments, births, and deaths and require persons to submit such information; and 8) conduct sanitary and health investigations, as may be necessary.[41] If the county has a hospital, the commissioners may appoint a hospital board consisting of seven trustees.

Agriculture and Soil Conservation[42]

The county commissioners have considerable statutory authority to conduct various agricultural and soil conservation programs. Commissioners are vested with extensive power to promote agricultural research, including powers to purchase land for experimental research and to enter into cooperative agreements with other governmental agencies and institutions. The county also may engage in programs to control and eradicate rodents, weeds, and pests. A bee inspector may be appointed by the commissioners, in accordance with qualifications set by the State Department of Agriculture, if petitioned by a majority of beekeepers in the county.

Under a 1954 soil conservation act, the county has power to undertake certain soil conservation programs when it is determined that soil blowing from particular property is injurious to adjacent lands or public health.[43] The law provides a procedure by which the commissioners may issue an order to the landowner directing the type, nature, and date of soil treatments which should be undertaken; if the property owner does not comply with the order, the State Department of Agriculture may direct the county commissioners to perform the necessary work and to assess the costs against the property treated.

Planning and Zoning

Counties have had authority to perform planning and zoning functions since the passage of a 1939 statute. Pursuant to this legislation, the commissioners are authorized to provide for county zoning, but such zoning may include only the unincorporated areas of the county.[44] To carry out planning and zoning activities, the commissioners are authorized to appoint a planning commission composed of five members with four-year terms; compensation is set by the commissioners. The commissioners themselves may act as the planning commission in counties of less than 15,000 population. The planning commission may develop building regulations subject to approval by the commissioners and may appoint a building inspector to enforce them.[45] If a zoning ordinance is enacted, the commissioners must appoint a board of adjustment to hear appeals under the ordinance; the board of adjustment may be composed of three to five members, not more than half of whom are on the planning commission.[46] Regional planning may be undertaken with the cooperation of adjacent counties or cities.[47]

Licensing

The county commissioners perform a variety of licensing functions on behalf of the county, many of them quite important and time consuming.

Liquor and 3.2 Beer Licenses. Under the State Liquor Code of 1935, the board of county commissioners is designated as the local licensing authority for unincorporated areas of the county.[48] In considering and granting such licenses, the board is required to consider the needs of the neighborhood and the desires of the inhabitants. A hearing is required for each application; the license, if approved, is subject to a fee ranging from $200 to $1,000, depending on the type of license, eighty-five percent of which is refunded to the state for deposit in the Old Age Pension Fund. Commissioners are also charged with the responsibility of approving 3.2 malt beverage licenses in the unincorporated areas of the county.[49] Pursuant to amendatory legislation passed in 1963, county commissioners may establish rules and regulations governing the operation of 3.2 beer establishments and issue conditional licenses.

Mercantile Licenses. The commissioners may grant licenses for merchants to conduct retail activities in the county.[50] The license fee may vary from $5 to $100, as set by the commissioners. The license may be issued by the clerk when the county commissioners are not in session, providing the license is approved by the commissioners at their next meeting.

Transient Dealers. Under a very old law, peddlers doing business in the county must obtain a transient dealer's license issued by the county clerk.[51] License fees are based upon the peddler's mode of conveyance—$15 on foot, $25 for a tricycle or bicycle, $100 for automobile, etc. Actually, commissioners have no part in the licensing process or the enforcement of this law.

Dance Hall Licenses. No person may operate a dance hall without first obtaining a license from the county commissioners. Commissioners have discretion to approve such a license upon payment of a $25 application fee.[52]

Other Licenses. Certain other licenses may be issued by the board of county commissioners. For example, each board may require dogs over six months of age to be licensed ($2 for males and spayed females and $3 for unspayed females.)[53]

Special Districts[54]

Counties have no part in the management or operation of various special districts organized in Colorado. However, the county commissioners do have some responsibility in the process of forming certain types of districts, in addition to levying the taxes set by the district board for the operation of the district. The county commissioners have various duties to perform in connection with the organization or the elections for the formation of disposal districts, domestic waterworks districts, cemetery districts, and irrigation districts.

The Special District Control Act, adopted in 1965, requires county commissioners to review and approve a service plan for each new special district providing municipal-type services. Such approval is a prerequisite for incorporation of a special district by the district court.

Revenues and Expenditures

County government in Colorado is a multimillion dollar operation. In 1964, county government (excluding the City and County of Denver), collected and spent more than $80 million. The total cost of county government (excluding Denver) increased almost forty-six percent between 1958 and 1964. The rate of increase was much more pronounced in the five counties over 100,000 population—demonstrating the effect of large scale urban growth.

On a per capita basis, county government revenues and expenditures have risen at a much lower rate, slightly less than twenty-four percent between 1958 and 1964, per capita analysis shows a startling contrast in the cost of operating county government among counties of different population sizes. In 1964, per capita operating expenditures were less than $40 in counties over 100,000 population, over $105 in counties between 2,500 and 5,000 population, and over $183 in counties with less than 2,500 population.

The legal basis for county revenues and expeditures has already been discussed. The following sections describe briefly where counties get their funds, how much, and the purposes for which they are spent.

Revenue

County government, excluding Denver, collected $83.1 million in revenue in 1964. The property tax accounted for almost forty-seven percent of the total and state aid for slightly more than thirty-seven percent. Almost ten percent came from charges for current services. All other revenues, including court fees and fines, accounted for six percent.

The revenue collected in 1964 represented a 45.6 percent increase over 1958. Figure F shows the amount of revenue by major sources collected by counties (except Denver) in 1958 and 1964.

Per Capita. Per capita figures provide a much more meaningful way of comparing counties of different sizes than do total dollar amounts. Per capita revenues increased 23.9 percent between 1958 and 1964 (from $34.07 to $42.22). Table 1 shows per capita revenues in 1964 by major source for counties grouped according to population.

COLORADO 1958-1964

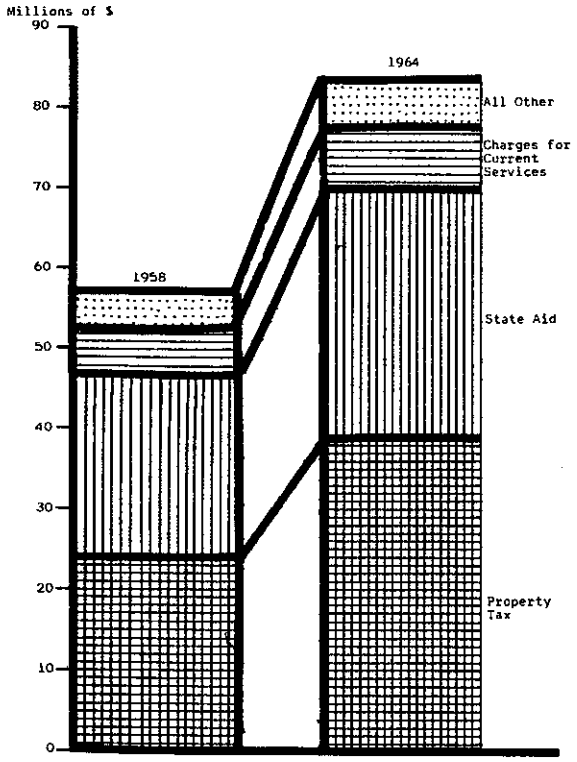

TABLE 1
PER CAPITA REVENUES, 1964
Counties Grouped by Population

Counties	Property Tax		State Aid[a]		Charges[b]		All Other[c]		Total
	$	%[d]	$	%[d]	$	%[d]	$	%[d]	
Over 100,000	$21.46	52.6%	$12.51	30.0%	$ 4.37	10.8%	$ 2.56	6.6%	$ 40.90
50,000 - 100,000	24.83	47.9	21.56	39.8	3.77	7.0	3.01	5.3	53.17
10,000 - 25,000	28.97	42.3	29.73	43.4	5.92	8.8	4.00	5.5	68.67
5,000 - 10,000	41.55	39.4	47.81	40.5	14.27	12.2	6.21	7.9	109.84
2,500 - 5,000	49.48	42.4	52.35	43.2	6.65	10.1	8.92	4.3	117.40
Under 2,500	83.00	40.1	81.38	45.1	15.80	8.2	12.96	6.6	193.14
All Counties	$19.71	46.7%	$15.77	37.3%	$ 4.13	9.8%	$ 2.61	6.2%	$ 42.22

[a]primarily highway users' funds and public welfare (which includes federal funds)
[b]primarily clerk's, assessor's, and treasurer's fees
[c]court fines and fees, interest, rentals, sales of assets
[d]percent of total per capita revenue

As can be seen from Table 1, per capita revenue tends to increase as county population decreases. This is true for all major revenue sources, except charges for current services, which are substantially greater in counties between 5,000 and 10,000, than in those between 2,500 and 5,000.

Property Tax. Property taxes provided almost forty-seven percent of all county revenue in 1964. Revenue from this source increased at a higher rate from 1958 to 1964 (62.3 percent) than did total county revenue. The largest counties depend much more on the property tax than do the others. Counties over 100,000 population received 52.6 percent from this source, and counties between 50,000 and 100,000 received 47.9 percent. As shown in Table 1, counties in the other groups received forty-two percent or less from this source.

State Aid. The second most important source of county revenue is state aid, which is composed primarily of highway users' funds and welfare funds.* State aid is a much more important source of revenue in the small counties; for example, counties over 100,000 population received only thirty percent from this source in 1964, while those with less than 2,500 population received 45.1 percent. State aid increased at a lesser rate than all county revenues between 1958 and 1964—37.3 percent.

Charges and Other Revenues. Included in this category are court fines and fees, fees of the county clerk and other county offices licenses, permits, rents, sale of assets, interest, etc. Sixteen percent of all county revenues came from these sources in 1964. There is no apparent relationship between county size and the degree of dependence on these revenue sources, although per capita revenue tends to increase as county size decreases.

Expenditures

County government, excluding Denver, spent almost $81.3 million in 1964. Public welfare and highways accounted for the greatest proportion of county expenditures, 27.5 percent and 26.9 percent respectively. General administration and capital outlay accounted for 11.2 percent each. Five percent of the total was spent for justice, primarily district and county courts, and 4.8 percent for public safety (sheriff's office and civil defense). All other county expenditures comprised 13.4 percent of the total.

For the purposes of this analysis federal and state welfare funds have been combined, because they are distributed by the State Department of Public Welfare.

Total county government expenditures increased 45.6 percent between 1958 and 1964. During the same period, public welfare expenditures increased almost sixty-seven percent. Justice and public safety expenditures, although only a small portion of the total, rose more than eighty percent. County highway expenditures increased only slightly more than twenty-five percent. The rate of increase for capital outlay was also less than the over-all rate of increase, while general administration costs rose at a slightly higher rate.

Figure G shows the amount of expenditures by major function for all counties, except Denver, in 1958 and 1964.

Per Capita. Per capita expenditures for all counties except Denver, increased 23.6 percent between 1958 and 1964 (from $33.41 to $41.31). Table 2 shows per capita expenditures in 1964 by major function for counties grouped according to population.

Public Welfare	11.38	27.5	12.80	31.6	19.57	34.7	19.98	30.2	17.19	15.3	17.47	15.2	15.10	7.5
Justice[e]	2.08	5.0	2.74	7.0	2.36	4.2	2.98	4.4	3.17	3.0	4.60	3.7	7.65	3.9
Capital Outlay	4.60	11.2	4.59	12.1	7.28	14.5	4.93	7.7	9.32	8.3	12.63	10.4	24.23	13.3
All Other[f]	5.53	13.4	4.70	12.9	6.13	12.3	7.57	11.7	15.56	17.5	13.85	15.0	24.35	13.1
Total	$41.31		$39.05		$55.60		$67.25		$105.43		$113.56		$183.56	

[a]Percent of total expenditures
[b]Includes commissioner, county clerk, assessor, treasurer, county attorney, personnel administration, elections, etc.
[c]Highway and bridge maintenance and construction, including administration and road equipment.
[d]Indludes sheriff's office, coroner, county jail, civil defense.
[e]Includes district and county court, probation, district attorney's office.
[f]Includes public health, planning and zoning, county airports, extension service, county hospitals.

As can be seen from Table 2, the per capita cost of county government tends to increase substantially as county size decreases. The most marked increases occur between counties of 10,000-25,000 population and those of 5,000-10,000 population, and between counties of 2,500-5,000 population and those with less than 2,500 population. These per capita cost differences raise some major questions concerning the operational efficiency of smaller counties because of their size, especially those with less than 2,500 population.*

General Administration. General administration per capita expenditures, were much higher in smaller counties in 1964 than in those over 10,000 population. These expenditures also account for a larger proportion of total costs in these counties than in the large ones. In part, this can be explained by the fact that smaller counties are required by the constitution to have as many elected officials as the larger ones. While the statutes provide for salary differentials according to population, the differences in salary levels are not as marked as the differences in population.

Highways. Per capita expenditures for road and bridge maintenance and construction were almost eleven times greater in counties of less than 2,500 population than they were in counties with more than 100,000. Table 2 shows that there is a direct inverse relationship between county population and both per capita highway expenditures and the proportion of total expenditures for this purpose.

Public Safety. Per capita expenditures in 1964 were greater in counties over 100,000 than in those in the next two population groups, emphasizing the greater degree of law enforcement required in the largest counties, which have substantial unincorporated urbanized fringes located around major municipalities. Counties with less than 10,000 population, however, had higher per capita costs for public safety than the largest counties, although these expenditures account for less of the total.

Public Welfare. The pattern of public welfare per capita expenditures is somewhat different from other county functions. While the largest counties have the lowest per capita costs, those in the next two largest population groups had the highest. Welfare costs account for more than thirty percent of total county expenditures in the three largest population groups but fifteen percent or less in the three smallest, indicating the concentration of welfare caseloads in more populous areas.

Justice. Per capita expenditures in 1964 for maintaining district and county courts and the district attorney's office were highest in the smaller counties, but constituted a greater portion of total expenditures in the larger ones.

Capital Outlay and All Other Expenditures. With one exception (counties between 50,000 and 100,000 population), capital outlay per capita costs in 1964 increased as county size decreased. There appears to be no relationship, however, between county size and the proportion of total expenditures spent for this purpose.

All other expenditures include, but are not limited to, public health, planning and zoning, county airports, county hospitals, and extension service. While the greatest total expenditures for these functions were made by the larger counties, per capita costs tended to increase as county size decreased.

In this connection, it should be noted that forty of Colorado's sixty-two counties (excluding Denver) have less than 10,000 population: fifteen are in the 5,000-10,000 group; fourteen are in the 2,500-5,000 group; and eleven have less than 2,500 population.

County Government Problems

In Colorado, as in other states, county government was created primarily to meet the needs of a rural society and to serve as an adjunct of state government in administering certain programs. County government, basically unchanged in structure and organization since statehood, cannot deal adequately with conditions and problems caused by urban growth. It is also not legally possible to reduce or consolidate the number of county officers in smaller counties to provide more efficient and less costly county government. Low salaries, the absence of merit systems, inadequate fringe benefits, and an antiquated government structure have made it difficult to attract and retain qualified personnel in key positions.

County government powers in a number of instances are not sufficiently broad to meet the demands placed upon it. In other instances, county powers are adequate but are insufficiently exercised. Most counties are in financial difficulty because of having to rely excessively on the property tax, not only to finance functions which should be a local responsibility, but also to finance the counties' share of programs assigned to them by the state. Statutory limits on the amount of property tax which may be levied have compounded this difficulty.

Structure and Organization

Unlike municipalities which may adopt home rule or which have a certain amount of statutory flexibility, counties are unable to change basic administrative structure and organization because of constitutional requirements.

The commission form of government does not lend itself to centralized administrative responsibility and coordination, especially with many functions being the responsibility of other elected officials.

This structure reduces the administrative effectiveness of the board of county commissioners, and effectiveness is further reduced by the lack of any clear-cut division between administrative and legislative authority and responsibilities. Although service on the board may make almost full-time demands on commissioners in the largest counties, the position is still considered to be a part-time one (as it is in smaller and rural counties) as evidenced by lower statutory salaries than those set for other elected officials: clerk, assessor, and treasurer.

While the appointment of a full-time county administrative officer has been authorized by law since 1961, only two counties have done so. Even if administrative officers are appointed, their authority cannot encompass vitally important functions performed by elected officers, such as assessment and tax collection.

It is not only the large counties that suffer from the rigidity of county administrative structure. Smaller counties could have more efficient and less costly government if administered by a few full-time officials rather than the number presently required by the constitution.

The great variation in population, geography, and other factors among Colorado's counties requires flexibility not now possible in the structure of county government. Very closely related to the need for flexibility is the question of self-determination. The present legal framework of county government does not encourage or even permit county voters to exercise local initiative and imagination toward reform which could achieve a more responsive, efficient, and democratic form of government.

County Powers

Any evaluation of the adequacy of county powers and authority must take into account the county's dual role as an agent of the state and as a local government unit. With respect to the former, counties have little control over welfare programs and personnel and no longer have control over district and court budgets and personnel; at the same time, counties have to help finance these functions through property tax levies, increasing county fiscal difficulties.

It is not likely in either instance that county powers can or will be expanded. The welfare program is financed almost ninety percent at the state and federal levels and is subject to federal and state control at least to the same extent. The independence of the judiciary from budgetary control by the county commissioners was determined by the Colorado Supreme Court, and, as a matter of constitutional interpretation, cannot be modified by the General Assembly. One possible solution to this situation is to transfer the entire fiscal and administrative responsibility for both of these functions to the state level, and this possibility is currently under study.

Urban Services. Far more important from the standpoint of the county's role as a local unit is the authority or lack thereof to deal with problems of local concern, especially in urbanized areas.

Counties have no power to provide municipal-type services in unincorporated areas and tax only those people who receive such services. This absence of authority has been one of the factors in the rise in the number of special service districts and has hampered county control of subdivision development in unincorporated areas. The Special District Control Act passed in 1965 gave county commissioners some control over district formation, but did nothing concerning the direct provision of services by counties.

At the present time demands on counties for municipal-type services in unincorporated areas are either unmet or if provided (e.g., paved streets and increased police protection by the sheriff), the financial burden falls on all county taxpayers, including those residing within municipalities and already paying for these services on the municipal level.

Excavation Control and Licensing. Counties have no power to control excavations. Many growing counties incur thousands of dollars of annual expense in repairing county roads which have been torn or cut by private or other public agencies to lay utility lines. County authority to license and regulate commercial establishments in unincorporated areas is minimal, impeding regulation and limiting the potential of a possible source of revenue other than the property tax. Counties also have no authority to exercise police powers through the passage of ordinances or resolutions protecting the public health, welfare, and safety.

Exercise of Present Power. On the other hand, counties have planning and zoning powers and the authority to enact and enforce building codes. Counties also have the power to set speed limits on county highways and require the regulation and leashing of dogs in urbanized unincorporated areas. In a number of instances, however, counties have either not exercised their authority in these areas, or such exercise has been minimal.

Of special benefit to smaller counties is the authority to form welfare and public health districts or to combine for road maintenance and construction purposes, thereby gaining the possible advantages of larger administrative units without the more drastic and unpopular step of county consolidation. There has been resistance to the formation of welfare districts, although such formation is gaining impetus in some areas through the efforts of the state welfare department. Counties in two areas of the state (northeast and San Juan Basin) have joined in district health units, but apparently there is little interest in similar units in other less populated areas.

No counties have combined for road maintenance and construction. In fact, a majority of counties still operate their road programs on a commissioner district basis rather than as a county unit, even to the extent that they may have three sets of equipment, three garages, and three road materials batch plants.

The need for expansion of county taxing powers to include revenue sources other than the property tax depends to a large extent on what the role, organization, and structure of counties should be in the future and whether certain functions which are primarily of state concern are transferred entirely to the state.

County Home Rule

Definition of Home Rule

Constitutional permission for counties to adopt home rule charters is generally considered as a basic and major step in modernizing county government. Although only fourteen states provide constitutionally for county home rule, this approach has received renewed national interest and support in recent years. The term "county home rule" is subject to a variety of definitions. In general, county home rule has taken two forms: 1) administrative or structural home rule, which permits counties to exercise local self-determination over government organization and structure; and 2) functional home rule, which, in addition to government organization, permits counties to exercise local self-determination over at least some county powers and functions.

Administrative Home Rule. Some states make available, either through constitutional or statutory authorization, alternate forms of government which a county may adopt, thus permitting the exercise of local self-determination as to which of several prescribed options is most desirable for a particular county. Other jurisdictions permit a county to develop and adopt a charter which establishes a form of government particularly tailored to its needs. Home rule charters may be derived from direct constitutional authority or specific legislative enactment. If the authority is derived directly from the constitution, then it can be argued that local home rule, although more rigid, is also more secure from legislative interference or control, assuming this is desirable. This is the form permitted by most of the states providing constitutionally for county home rule.

Functional Home Rule. Functional home rule can be described as local authority to define and determine the functions to be performed and the powers to be exercised by the county. Complete functional home rule has not been provided nor recommended in any state, since all counties are required to perform state functions on the local level in a manner prescribed by the state legislature.

A few states, however, have permitted counties to exercise home rule authority in deciding the scope of their functions and powers, in addition to exercising some choice on the form and structure of their government. Such functional authority may include the power to perform urban services on a special taxing district basis; the taxing district requirement is included in order to protect municipal residents from paying the costs of urban services in unincorporated areas.

This type of home rule authority may be granted either by the constitution or through legislation enacted pursuant to broad constitutional authorization. Functional authority may be provided generally or by specific enumeration of the functions, services, and powers which a home rule county may undertake.

Only one state (Oregon) permits counties to have full local control over functions and powers of local or county concern, although New York grants a great deal of authority in this respect.*

County Home Rule Attempts in Colorado

There have been three unsuccessful attempts in Colorado to amend the constitution to provide for county home rule.

1958 Proposal. In 1958, a constitutional amendment was proposed which would have permitted alternative forms of county government upon approval of county voters. This amendment would have allowed counties to adopt a "home rule" charter, but counties could exercise only those powers authorized by the General Assembly. A "local taxing district" provision was included which would have given counties the authority to create and operate special districts for local improvements. The amendment lost in the general election 241,636 to 158,666.

1960 Proposal. Another constitutional amendment was placed on the ballot in 1960. This amendment would have repealed section 15 of Article XIV and would have amended sections 8 and 12 of the same article. Basically, the measure would have permitted all counties with a population of 75,000 or more, upon voter approval, to modify county organizational structure including: 1) extending elective terms of office to four years; 2) basing salaries of county officials on factors other than population; 3) paying county officials' salaries from sources other than fees; and 4) permitting either the appointment or election of county attorneys. This amendment was defeated 328,241 to 231,025.

1962 Proposal. In 1962, the third county government amendment was placed on the ballot. The proposal would have: 1) permitted the change of county and precinct officials' salaries at any time; 2) authorized the payment of salaries rather than compensation by fees for certain officials; 3) permitted establishing county salary schedules on factors other than population; 4) enabled the General Assembly to establish terms of office longer than two years; and 5) allowed any county to change or abolish any county office with the approval of the electorate. This amendment received much attention prior to the 1962 general election and was recommended by the Legislative Council's interim committee on county salaries in 1961. The amendment was barely defeated 208,867 to 207,442.

Commission Recommendations

The Governor's Local Affairs Study Commission recommendations concerning county government fall in two categories: 1) those which provide more immediate but piecemeal help to counties and which can be accomplished by legislation; and 2) those which would provide fundamental and long-range solutions, most of which require constitutional revision. In addition, there are several matters which are recommended for further study, because time limitations precluded the Commission from giving them more cursory examination.

In the first category are recommendations for the extension of county powers to include regulation of county road excavations, including the licensing and bonding of excavators; speed limit control on county roads; and control over the formation of special districts. The last two measures were enacted in the 1965 session of the General Assembly, but the first was not adopted. A potential source of great help to counties, as well as other local units of government, is the creation of a division of local government as part of the executive branch of state government. This agency was recommended by the Commission and established by the General Assembly in 1966.**[55]

The major emphasis of the Commission's study and the resultant findings and recommendations, however, has been directed toward fundamental and long-range solutions of county government problems and apply primarily to government structure and organization, ability to deal with problems of urbanization, stimulation of local participation in county government, alleviation of county fiscal burdens, and revision and recodification of statutes pertaining to county government.

See Chapter VII for a more comprehensive description of county home rule in other states.

***This agency and the type of assistance to local government it is designed to provide is covered more fully in Chapter VI.*

Local Government Home Rule Amendment

The Commission's major recommendations concerning changes in county government structure and organization and increasing counties' ability to meet the challenge of urbanization are embodied in a comprehensive revision of the constitutional provisions concerning county and municipal government known as the "Local Government Home Rule Amendment."*

This amendment provides two forms of home rule for counties which may be adopted on a permissive basis. The first, known as "urban county" would apply in any area with a population of 100,000 and an average population density of 100 people per square mile. Designed to meet the needs of heavily populated areas, it is explained in detail in Chapter V: Metropolitan Problems. The second (identified as non urban county home rule to differentiate it from "urban county") may be adopted in any county, except the City and County of Denver, and is explained below.

Non Urban County Home Rule. This portion of the proposed amendment would become Section 8 of Article XX of the constitution and provides that any county (except those adopting the urban county form of government) may adopt a home rule charter establishing the organization and structure of its government. The procedures for adopting a home rule charter would be specified by statute, but at least five percent of the qualified electors of the county would have to initiate a home rule petition.

It would also be possible for one or more adjacent counties to join in the formation of one home rule county, provided that both the petition to form a home rule county and the charter are approved by a majority of those voting in each of the counties concerned.

The charter would be required to provide for a county board of supervisors of at least three and no more than nine members and also for an elected or appointed chief executive. In addition, the charter would provide for other elected and appointed officials, their duties, responsibilities, and compensation.

Non urban home rule counties would continue to derive their authority and powers by statute, including, but not limited to, the provision of services and improvements in unincorporated areas. Nothing would preclude a county from adopting this form of home rule and then becoming an urban county, or a portion thereof, at a later date, if it meets the eligibility requirements.

Objectives. This proposal for county home rule would accomplish several things with respect to county government problems:

1) It would make it possible for any county upon the initiation of its citizens to provide the county government structure best suited to its particular needs, while at the same time it would require a separation of legislative and executive functions and assure that there would be a chief executive, whether elected or appointed. (Figure H shows one way in which a home rule county might be organized.)
2) Adoption of a home rule charter would make it possible for any county on its own prerogative to reduce the number of elected officials (other than members of the board), eliminate them entirely, combine positions, and carry out any other inventive and imaginative changes in government organization that are acceptable to the electorate. Counties adopting a charter would be able to set their own salaries for county officials and would no longer be dependent on the General Assembly, which is required to consider only population as a factor in setting these salaries.
3) It would make it possible for counties to consolidate easily, if they wished to do so, without requiring consolidation on a mandatory basis. The wishes of each participating county would be given equal weight both in the consolidation phase and in charter approval, so that no large county could impose its will on a smaller one, either in forcing consolidation or in dictating the structure and organization of the consolidated county government.

County Service Area Authority. The Local Government Home Rule Amendment would also remove several potential constitutional impediments to the creation by statute of special service areas or districts under county operation to provide services in unincorporated areas now served by specail districts. It would do this by removing several constitutional limitations now placed on counties, including: 1) the requirement of uniform taxation throughout a county; 2) limitation on amount and purposes of county bonded indebtedness; and 3) limitation on the pledging of county credit.

County Powers

There are several reasons why the Commission's recommendations on county home rule in the Local Government Home Rule Amendment do not include "functional" home rule, as previously defined.

The major problem is inadequacy of county government structure and organization in meeting present and future needs. Expanded functional authority or legislative powers, similar to those which might be granted under home rule, can be delegated by statute to county government or county officers without additional constitutional revision, and the General Assembly would be more inclined to broaden county powers in this way if government reorganization takes

*See Appendix A, for complete text of the proposed amendment.

place. Further, the county has traditionally been a subdivision of the state for the performance of state functions, so that any delegation of power would have to be provided in such a way that counties would still be required to conform with state standards in the administration of state programs. Legislative delegation is much more susceptible to modification in this respect, if needed, than would be a broad grant of constitutional power.

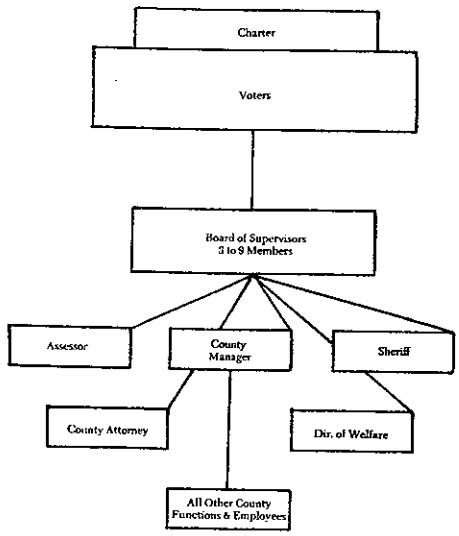
The Commission is of the opinion that logical urban growth in non metropolitan areas can be achieved best by municipal annexation and service to areas that are municipal in nature. The constitutional extension of broad functional home rule authority to non urban counties could cause conflicts if county governments are authorized to perform urban functions and exercise municipal powers, without the General Assembly serving as a mediator between county and municipal interests. In such a situation, municipal annexation might prove unattractive, and municipal growth could be impaired.

In this connection, it should be pointed out that the form of non urban county home rule contained in the Local Government Home Rule Amendment is designed to fit in with the amendment's provisions for urban county home rule and municipal home rule. To avoid conflict and provided the maximum of flexibility to meet changing situations without further constitutional revision, the General Assembly is required to balance the interests of the state and its various home rule and statutory local units, and this can best be done under the form of county home rule set forth in the amendment.

Urban Services in Unincorporated Areas. While the Commission believes that urban services can best be provided by municipal governments, it recognizes that not all unincorporated areas can be so served. This void has been filled by the creation of special service districts, and other than planning and zoning authority, counties have little control over urban development in unincorporated areas. A transitional step toward broadening county authority in this respect was taken with the adoption of the Special District Control Act recommended by the Commission.

The Commission recommends that the next step should be the adoption of legislation authorizing counties to establish subdistricts under the supervision of the county governing body to perform those municipal-type services in unincorporated areas now provided by special districts.[56] Existing special districts could be transferred in an orderly way to county control and gradually phased out. Centralized control in county hands (if county and municipal interests are properly balanced) should promote orderly development and make transition to municipal status easier when possible through incorporation or annexation.

FIGURE H
POSSIBLE HOME RULE COUNTY GOVERNMENT ORGANIZATION UNDER PROPOSED LOCAL GOVERNMENT HOME RULE AMENDMENT



This recommendation is in keeping with the Commission's basic philosophy that, aside from school districts, counties and municipalities should be the basic local government units in Colorado.

As previously indicated, certain provisions of the local government home rule amendment would make it easier to enact legislation to create county service areas or districts. With adoption of the amendment there would no longer be any question that counties could levy taxes on a district basis, so that those receiving a service would pay for it rather than all residents of the county. The authority of a county to incur bonded indebtedness on behalf of a special taxing district would also be clarified, as would county authority to pledge its full faith and credit behind such bond issues to obtain more favorable discount and interest rates.

Even without the Local Government Home Rule Amendment, however, it is possible to develop legislation to accomplish the objectives of the county service area recommendation, although somewhat limited and more cumbersome. To overcome legal obstacles on debt purposes and tax uniformity, it appears that special taxing districts would still have to separate corporate entities, but the board of county commissioners could be designated by law as the board of directors of each district so created, and control and coordination could be provided in this way.

Structural Change. The changes in county government structure made possible under the permissive home rule authority provided in the Local Government Home Rule Amendment would make it possible for counties to exercise their present range of powers in a more effective way, as well as encourage the ex-

pansion of county authority by the General Assembly in response to local needs. The adoption of home rule may be a slow process, however, as evidenced by the small number of counties with home rule charters in other states where home rule is possible. If local people do not take the initiative in this respect, a further examination may be necessary of possible organizational changes which may be provided by law to assist counties in carrying out their responsibilities.

Fiscal Problems

Considerable study has been made of all aspects of county finance, and further study is continuing to determine whether county fiscal burdens may be eased best by either greater state assumption of the costs of state programs, such as welfare and courts, in which counties participate or by assumption of complete responsilibity at the state level. Should counties be relieved of some or all of this burden, it may not be necessary to raise mill levy limits or provide counties with other sources of revenue. Otherwise consideration should be given to both these alternatives, including the imposition of a state-collected locally-distributed tax. Possible constitutional obstacles to this latter approach are also eliminated by the Local Government Home Rule Amendment.

Subjects for Further Study

Several subjects are recommended for further study, so that specific proposals may be developed. Some of these concern county administrative and personnel practices and include: 1) the use of data processing equipment, perhaps on a multicounty basis; 2) centralized purchasing, both within and among county governments; and 3) development of merit systems for county employees.

Officials of many local governments have expressed concern over the possible loss to local governments of their traditional immunity from tort liability. This problem is also sufficiently important to warrant extensive study, directed toward legislation which would achieve a balance between the protective interests of the public taxpayer and the compensatory interests of the private victim of governmental negligence.

The need for and desirability of county consolidation is also recommended for further study. Transfer of functions such as welfare and judicial administration entirely to the state, should this occur, and cooperative arrangements among counties on other functions have to be considered in relation to this study. Another important factor is the provision of the Local Government Home Rule Amendment which permits counties to join together in forming a home rule county.

Statutory Revision and Recodification

Last but not least among the Commission's proposals is the recommendation that the laws pertaining to county government be revised and recodified. The laws relating to county government are scattered throughout the eight volumes of the Colorado statutes. Because many of these provisions are antiquated—dating back to the nineteenth centry—interpretation and summarization are difficult. To a large extent, the laws relating to county government do not present an accurate reflection of present county operations, developed over many years by custom and practice.

In completing its work, the Commission has prepared a detailed outline of what is required in the revision and recodification of county laws, including alternative methods of carrying out this important task.

MUNICIPAL GOVERNMENT

Historical Development of Colorado Municipalities

More than seventy percent of Colorado's residents live in incorporated cities and towns, of which there are 248. Nine of these 248 municipalities were incorporated before Colorado became a state; the oldest of these is Denver, incorporated in 1861.

Between the achievement of statehood in 1876 and 1900, Colorado experienced its greatest period of municipal incorporation, when 100 of the cities and towns now in existence were formed. Many of these are now among Colorado's largest and most thriving municipalities, such as Colorado Springs, Durango, Grand Junction, Fort Collins, Greeley, Longmont, Loveland, and Pueblo. A few which were incorporated as a result of the mining boom are now little more than ghost towns, although some have enjoyed a revival with the expansion of tourism.

Considerable municipal incorporation also took place during the first two decades of the twentieth century. Fifty-six cities and towns were formed between 1900-1910., and forty-two were created between 1910 and 1920. Since 1920, relatively few municipalities have been formed: thirteen between 1920 and 1930, seven during the depression years of the 1930's, seven during the 1940's, and thirteen between 1950 and 1960. The last municipality to be incorporated was Broomfield in 1961; however, there were a number of unsuccessful incorporation attempts after 1960, most of them in the Denver metropolitan area.

It is interesting that Colorado's great population growth after World War II has not been accompanied by large-scale municipal incorporations, although four of the cities formed since 1950, including the two largest ones (Commerce City and Thornton), are in the Denver metropolitan area. Generally, the bulk of Colorado's population incerase has been in existing municipalities and in unincorporated suburbs, although a number of these unincorporated areas have been annexed, wholly or in part, by existing municipalities.

Colorado's municipalities range in population from 527,000 (Denver) to several with less than 100 people as follows:*

Population	No. of Municipalities
Over 100,000	1
50,000-100,000	4
25,000-50,000	4
10,000-25,000	11
5,000-10,000	13
2,500-5,000	45
500-1,000	54
100-500	87
Less than 100	16

What Is a Municipality?

As a general rule, a municipality is a creature of the state and has no inherent powers except those delegated by the state. State law outlines the form and procedure for the incorporation of cities and towns, as well as the powers which such units may exercise. The courts have traditionally construed narrowly the powers delegated to municipal corporations. The significance of this practice is that while a state constitutionally may exercise any power not forbidden to it, a city must have specific authorization for the exercise of any power. This doctrine has become known as Dillon's Rule and has been expressed as follows:

> It is a general and undisputed proposition of law that a municipal corporation possesses and can exercise the following powers, and no others: First, those granted in express words; second, those necessarily or fairly implied in, or incident to the powers expressly granted; third, those essential to the accomplishment of the declared objects and purposes of the corporation, . . . Any fair, reasonable, substantial doubt concerning the existence of power is resolved by the courts against the corporation and the power is denied.[1]

The legal basis for this rule is that the legislature intended to grant only those powers which it expressly granted or which are necessarily or incidentally implied. It is precisely this setting which gave rise to the home rule movement. Cities sought freedom from con-

**January, 1965 estimates, State Planning Division.*

trol and restraint by the state legislature over their own governmental organization and over the matters of their own local concern.

Definitions and Origin of Home Rule

Home rule in its broadest context means simply "self-government." It is an outgrowth of a desire for independence and self-determination.[2] It means local control and local decision-making over the organization and the operation of government activities at the local level. In the United States, the doctrine has been traditionally applied to municipal government, although it has also been used to a limited extent in connection with county government.

The desire for local independence and control has been present since the rise of the nation-state. On the local level, home rule for municipalities has been practiced for many years. In England, it has been traced back prior to the Magna Charta. The principle of self-government is alleged to have been inherent in the Great Charter for the City of London.

In America, the first application of municipal home rule occurred in the Missouri Constitution in 1875. The concept soon spread to other states, and, by 1900, had been adopted in California, Washington, and Minnesota. Colorado was one of the early states (1902) to authorize home rule for its municipal corporations. Municipal home rule has now been adopted to a greater or lesser extent in more than thirty states.[3]

Colorado Municipalities: Structure and Organization

In general, Colorado municipalities fall in two broad categories: 1) general law or statutory municipalities, over which the legislature retains direct authority and which have their organization, powers, and operating procedures specifically provided by statute; and 2) home rule cities, which have been granted a large measure of local autonomy and self-government by the state constitution. In addition, three municipalities—Central City, Georgetown, and Blackhawk—continue to operate under charters granted by the territorial legislature prior to Colorado's statehood in 1876. These specially-chartered municipalities are recognized in the state constitution; their charters are subject to legislative approval and review and may be changed only by the General Assembly. The legal status of territorially-chartered cities, and the degree of control which may be exercised over them by the General Assembly, is not entirely clear and is subject to litigation from time to time.

The constitution authorizes the General Assembly to establish by general law the classification and organization of cities and towns. Article XIV, Section 14, provides that the number of classes shall not exceed four and that the powers of each class are to be defined by general law, so that all municipal corporations of the same class possess the same powers and restrictions. Pursuant to this authority the General Assembly has established three classes of municipal corporations which are based on population, as follows:[4]

First class cities—Those with a population exceeding 70,000.

Second class cities—Those with a population greater than 2,000.

Towns—Those with a population of less than 2,000.

First Class Cities

At the present time, there are only three cities—Denver, Pueblo, and Colorado Springs—which qualify as cities of the first class; however, these three communities operate under local home rule charters and are not subject to the general statutes relating to cities of the first class.

Existing statutes governing cities of the first class make it virtually impossible for a city to operate under this classification. First class cities are limited to a single organizational form—the so-called "weak mayor-council" plan, under which the voters must elect a mayor, a council, a city attorney, a city treasurer, a city clerk, a city auditor, and a city engineer. The voters of the community have no voice in determining the scope of authority of any of these officers, as their duties and powers are set by state law. The city council must be elected on a ward system, and the terms of office are limited to two years.

The statutory provisions regarding salary are very specific and somewhat unrealistic; for example, the mayor's annual salary may not be less than $1,800, and the police chief's salary is limited to a maximum of $125 per month. Like all general law municipalities, the powers and limitations of first class cities are set forth by statute,[5] and these cities can exercise only such powers as are expressly conferred by statute.[6]

Rather than revise these archaic laws, the practice has been for the General Assembly to raise the qualifying population limits, so that no large city not adopting home rule would have to operate under them. Consequently, all non home rule cities operate under the more modern second class city statutes.

Second Class Cities

There are twenty-four municipalities which operate as second class cities; another twenty-seven fall in this category but have adopted home rule. Among these twenty-four second class cities are five that no longer have 2,000 population, but continue to operate in this category. There are also a few municipalities which continue to operate as towns, even though their population exceeded 2,000 in the 1960 census.

Second class cities may be organized under either of two basic statutory plans: weak mayor-council, or council-manager.

Mayor-Council Plan. Seventeen cities operate under this weak mayor-council plan. The mayor is elected and has only limited powers over official appointments, the budget, and administrative organization. He is the ceremonial chief of the city and is responsible for preserving law and order in the community. The mayor also presides at council meetings, although he votes only in case of ties and in certain other specific situations. The mayor in second class cities has veto power over municipal ordinances, but the council may override this veto by a two-thirds majority. The office of city clerk is an elective one and has a term of two years.[7] Figure I shows the organization of second class mayor-council cities.

It should be noted that a few cities operating under second class city laws have established by ordinance the position of chief administrative officer or the approximate equivalent to a full-time city manager. The legal authority for this position is questionable, and, in most cases, the responsibilities of the council and the administrator are not clearly defined.

FIGURE I
GOVERNMENT ORGANIZATION,
2ND CLASS MAYOR-COUNCIL CITY

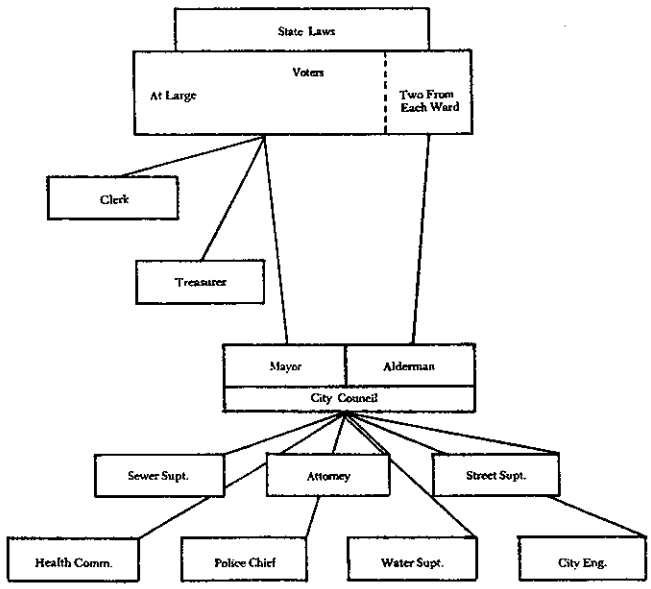

FIGURE J
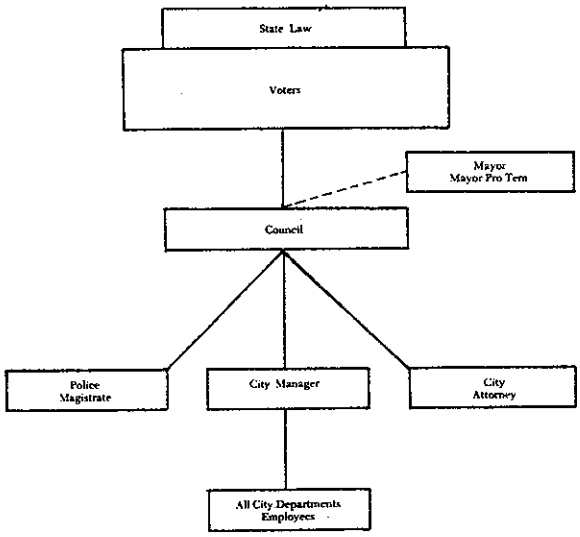
GOVERNMENT ORGANIZATION,
2ND CLASS COUNCIL-MANAGER CITY



Council-Manager Plan. Since the passage of the council-manager statute in 1945, a number of second class cities have elected to organize under this plan. At the present time, seven cities—Brighton, Florence, Glenwood Springs, Golden, La Junta, Thornton, and Trinidad—are so organized. Most second class cities which have adopted home rule provide for a professional manager or administrator in their charters.

The council-manager plan must be initiated by a petition signed by electors equal in number to fifteen percent of the votes cast for all candidates for mayor at the last preceding city election. The council must then order the question submitted to the voters at a special or regular election within sixty days after the passage of the ordinance. If approved by a majority of those voting, the city proceeds to reorganize at the next regular election in accordance with the form outlined by statute.

The corporate and policy authority of the city remains in the council, which consists of two persons elected from each ward in the city and one elected at large. A mayor and mayor pro tem are selected from the council. The mayor presides at council meetings and votes as a member of the council. The administration of the city government is vested in a manager, and the council is prohibited from interfering with the manager's appointment or removal of subordinate employees or in his administration of municipal programs. Salaries are set by ordinance. The manager sits with the council, but has no right to vote or participate in the discussion.[8] Figure J shows the organization of second class council-manager cities.

Both mayor-council and council-manager cities operate under the same general laws relating to second class cities.

Towns

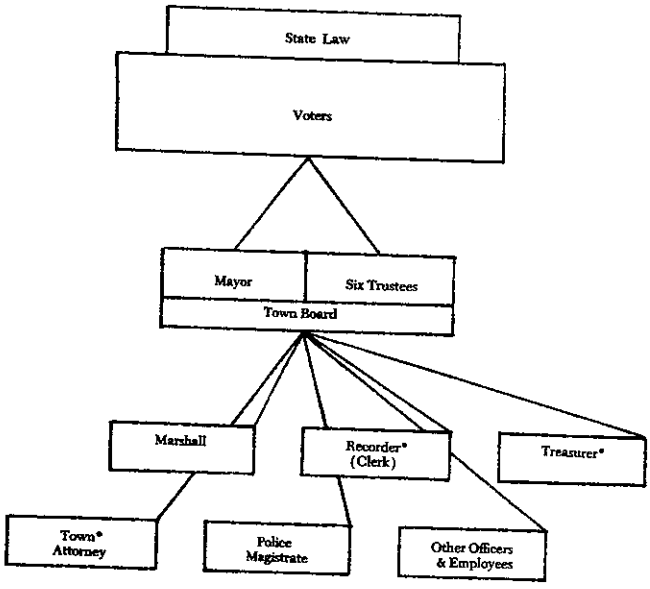
Excluding the three territorially-chartered municipalities, there are approximately 190 incorporated towns in Colorado, although a few of these are relatively inactive. Towns are obliged to accept the single controversial form permitted by state statute. They must have a board of trustees, consisting of a mayor and six trustees. The mayor serves as presiding officer and votes only in case of tie. The board serves in both legislative and executive capacities. The terms of office for trustees are constitutionally limited to two years.[9] Town organization is shown in Figure K.

Since the statutory provisions regarding towns are very general and somewhat ambiguous, the Attorney General held in 1942 that one individual can hold the offices of both clerk and treasurer. Some towns have combined these offices under one person to whom the town board has assigned duties corresponding to those of a town manager. Other town officers, such as the police magistrate, are appointed by the board. It has been noted that "the very ambiguity of the statutes has given towns a certain amount of discretion in organizational matters."[10]

Changes in Classification

A town may change its status to that of a second class city by following the procedure set forth by statute. The law provides that the governor, state auditor, and secretary of state, or any two of them, must certify the change after the filing of a census of enumeration showing that the town has more than 2,000 inhabitants, together with a resolution of the town board. After a statement of the change has been issued by the governor and published, the town proceeds to reorganize at its next regular election. The same procedure is available to second class cities which wish to become first class cities, although it has seldom, if ever, been used.

FIGURE K
GOVERNMENT ORGANIZATION OF TOWNS



**May be elected, if so provided by ordinance.*

Home Rule

Since the passage of Article XX of the state constitution in 1902, Colorado cities having populations in excess of 2,000 have been able to adopt a large measure of home rule authority. At the same time that this amendment created the City and County of Denver with home rule authority, it provided procedures for other cities to adopt local charters. A home rule charter provides for governmental organization and becomes the basic law for all matters of "local and municipal concern."[11] Typical home rule city organization is shown in Figure L.

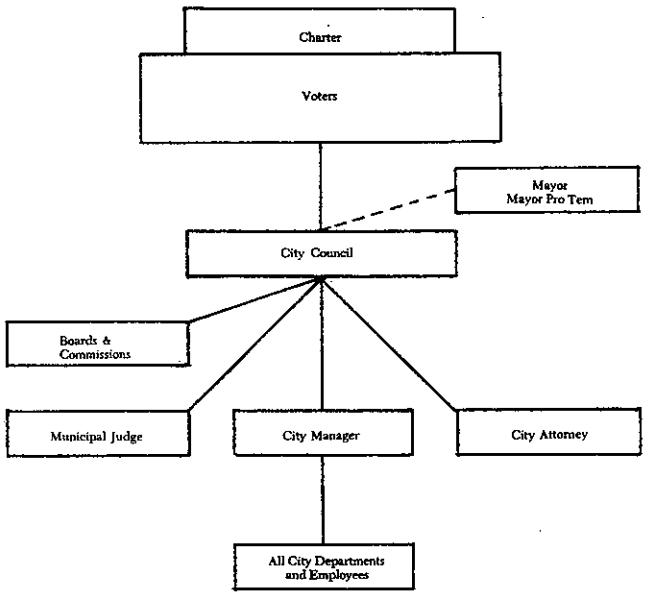
Home Rule Cities. Over the years, an increasing number of cities have adopted home rule charters pursuant to Article XX. There are now thirty municipalities which have become home rule, most of them having done so within the last ten years. Following is a current list of home rule cities in Colorado:

Alamosa	Cortez	Englewood	Lafayette	Montrose
Arvada	Craig	Ft. Collins	Lamar	Pueblo
Aurora	Delta	Fort Morgan	Littleton	Rifle
Boulder	Denver	Grand Jct.	Longmont	Sterling
Canon City	Durango	Greeley	Manitou Spgs.	Westminster
Colo. Spgs.	Edgewater	Gunnison	Monte Vista	Wray

Procedure for Adoption. The procedure for adopting home rule is specifically set forth in Section 6, Article XX. A city must have a population of more than 2,000, according to the last official census, in order to qualify. Formal action must be initiated by a petition signed by at least five percent of the total number of votes cast for governor at the preceding election. The petition is then filed with the municipal governing body, which must submit the question to a vote at the next general election, or at a special election if the petition is signed by ten percent of the votes cast in the preceding election for governor.

Three separate elections are required before a charter can be adopted. The elections are held in accordance with the Municipal Election Law. In the first election, voters determine whether a charter convention should be held. If approved, a second election is held to elect twenty-one charter convention members. To be eligible as a convention delegate, one must have been a taxpaying elector in the community for the last five years. After the convention is elected, it has sixty days to complete a charter. When the charter is completed, it must be published and submitted for ap-

FIGURE L
TYPICAL HOME RULE CITY GOVERNMENT ORGANIZATION



proval by the electorate at a third election. If the charter is rejected, a new charter convention must be elected and the procedure repeated until a charter is adopted. After a charter has been approved, it must be published and filed with the secretary of state.

Organization. Home rule cities may establish by charter an organization suitable to their individual needs. Twenty-two cities have provided for council-manager plans; others have elected to choose variations of the mayor-council or commission form of government. The number of councilmen, the method of election (by ward or at large), their terms of office, and the structure of city government are generally described in the charter.

Powers. The constitution provides that "the statutes of the state of Colorado, so far as applicable, shall continue to apply to such cities and towns, except insofar as superseded by the charters of such cities and towns or by ordinance passed pursuant to such charters."[12] The extent of authority granted to home rule cities is a subject of continuing litigation. Several decisions including the famous Merris case have made it clear that home rule cities have no power over matters of "exclusive statewide concern."[13]

Article XX enumerates the following specific areas over which home rule cities have the power to legislate upon, provide, regulate, conduct, and control:

1) creation and terms of municipal officers, agencies, and employment;
2) establishment of police courts, and the definition and regulation of their jurisdiction, powers, and duties;
3) creation of municipal courts, and the definition and regulation of their jurisdiction;
4) all matters pertaining to municipal elections;
5) issuance, refunding, and liquidation of all kinds of municipal obligations;
6) consolidation and management of park or water districts;
7) assessment of property for municipal taxation and the levy of special assessments; and
8) imposition, enforcement, and collection of fines and penalties.

Incorporation

General incorporation statutes provide for the following procedures:[14]

1) A petition by not less than seventy-five landowner electors is filed in the county court. If the territory to be incorporated is in a county of 25,000 inhabitants or less, forty electors may qualify for petition. The area to be incorporated may not be less than forty acres, except that legislation adopted in 1966 prohibits the incorporation of any municipality within one mile of an existing city or town unless it contains at least 320 acres.[15] This legislation also requires the court to determine that any proposed incorporation contains at least 100 registered voters per square mile before ordering an incorporation election.[16]
2) The court appoints five commissioners to call an election, appoint judges, and publicize the election.
3) The election returns are filed with the court.
4) The classification of the municipality is determined.
5) Officers are elected and papers certified to complete the incorporation.
6) Any public property dedicated to the municipality is described and platted.

An act adopted by the General Assembly in 1965 aids in the transition of an area from unincorporated to incorporated status by providing that the county must continue to perform all duties and carry out all responbilities and to apply all zoning, subdivision, and other regulations within the limits of a newly incorporated municipality for ninety days after the first election of municipal officers or until superseded by municipal ordinance, whichever is sooner.[17]

Consolidation

Consolidation of two or more municipalities is permitted under state law, provided that the municipalities are contiguous. The statutory procedure requires that the governing bodies of the municipalities appoint three commissioners to negotiate the terms of the consolidation. The final terms must be approved by the board of trustees or council of each of the municipalities and then submitted to a vote of the electorate in both municipalities, where the issue is "For Consolidation" or "Against Consolidation." If consolidation is approved by the voters of both municipalities, then a special election must be held to elect the officers of the new municipality. The legal status of the consolidated municipality automatically becomes the same as that of the largest of the unconsolidated municipalities. The consolidation law has not been amended since its pasage in 1885 and has not been used in recent years.[18]

Reorganization

Specially-chartered cities (this classification appears to apply only to territorially-chartered cities) may elect to abandon their charters and become subject to the general law. Action must be initiated by a petition signed by a number of petitioners equal to one-eighth of the whole number of votes cast at the last preceding election for city or town officers. The governing body must then call a special election, and a proclamation to this effect must be published. The question at the election is "for municipal organization under the general law" and "against municipal organization under the general law." If reorganization is approved, the council must call another special election to elect officers. The reorganized municipality becomes subject to the same liabilities, powers, and limitations as the class that such incorporation would have under the general law.[19]

Dissolution, Abandonment & Disconnection

Whenever one-fourth of the legal voters of any city or town in the state petition the county court for discontinuance of the incorporation, the court must order the petition published and declare an election. If approved by a majority of those voting, the municipality is dissolved, and provision is made to pay all outstanding indebtedness.[20]

Towns which have failed to hold municipal elections, levy taxes, or maintain municipal government for a period of twenty years may be abandoned upon a petition filed in county court, to which all property owners in the incorporated area must be made parties. After publication, notice, and a hearing, the court may decree the municipality abandoned and make disposition of municipal property.[21]

One law relating to dissolution of municipalities has not been altered in this century, and probably has never been used. Its application appears limited to general law cities that wish to dissolve and annex to an adjoining municipality existing under a special charter. This procedure is instituted by a petition signed by twenty percent of the taxpaying electors of the general law municipality and filed in the district court. An election is then held and if annexation is approved, the city is dissolved and its property transferred to the annexing city.[22]

In addition, the property owners of territory at the edge of a municipality may petition for disconnection from the city, if twenty or more acres of their property is contiguous to the border.[23]

Annexation

In 1965, the General Assembly enacted the first major overhaul of the municipal annexation laws in twenty years.[24] The new law, referred to as the "Municipal Annexation Act of 1965" liberalizes annexation procedures and gives municipalities unilateral annexation authority with respect to enclaves and peninsulas. An enclave is an unincorporated area entirely surrounded by a municipality, and a peninsula is unincorporated area whose boundaries are two-thirds contiguous with a municipality.

In brief the new annexation act:

1) sets forth certain criteria to determine whether an area is eligible for annexation;

2) sets forth certain limitations which must be observed in annexation proceedings;

3) permits municipalities to annex enclaves by ordinance one year after the effective date of the act when the area has been surrounded for at least three years;

4) permits municipalities, after certain procedures are followed, to annex by resolution, one year after the effective date of the act, unincorporated areas having two-thirds boundary contiguity fo rat least three years;

5) provides for two other annexation procedures:
   a) a petition to initiate annexation proceedings by owners of more than fifty percent of the territory to be annexed, and
   b) by a petition for an annexation election filed by ten percent of the resident landowners in the area to be annexed; (Even if a petition for annexation is filed, a counter petition for annexation election takes precedence under certain conditions.)

6) provides an election procedure to determine to which of two or more competing municipalities an area will be annexed;

7) gives annexation proceedings priority over proceedings for municipal incorporations and special district formations, except for municipal incorporation proceedings involving a population of 10,000 or more;

8) limits annexations which change school district boundaries (Denver), except for enclaves with 500 population or less and annexations for which the petition has been signed by 100 percent of the property owners; in all other annexations, no more than five percent of the assessed value of any school district may be annexed in any one year, and a certain ratio must be maintained between number of pupils and assessed value in each annexation; and

9) permits municipalities to require an agreement to annex when eligible as a condition of any contract to provide municipal services outside of corporate boundaries.

Fiscal Powers and Limitations

The legal authority to impose taxes and incur debt differs somewhat between statutory municipalities and home rule cities. The constitution provides that the General Assembly may not impose taxes for the purposes of any city or other local government unit, but may instead vest local governing bodies with the power to assess and collect taxes.[25] Pursuant to this authority, the General Assembly has authorized statutory cities and towns to levy property and other kinds of taxes. Statutory municipalities are also authorized by law to issue bonds and incur debt subject to certain constitutional limitations.

Article XX, Section 6 of the constitution gives home rule cities the specific authority to impose property taxes. In addition, this section grants wide general local powers and provides that state law applies to home rule cities, except where superseded by charter or ordinance. The fiscal powers of home rule cities have been subject to judicial interpretation from time to time, and these interpretations have helped define the scope of home rule cities' fiscal authority. For example, the Colorado Supreme Court, in a recent case, upheld the right of home rule cities to levy sales taxes and also declared that home rule cities are not subject to the limitations on municipal debt found elsewhere in the constitution (as are statutory cities).[26] In a 1959 case, the supreme court held that home rule cities may not levy an income tax.[27]

Sources of Revenue

Property Tax. The property tax continues to be a major source of revenue for Colorado cities and towns. The statutes not only give municipalities general property tax authority,[28] but also authorize certain property tax levies for specific purposes, such as maintenance and improvement of parks (1.5 mill maximum),[29] airports (no maximum),[30] construction of public buildings and additions thereto (two mills maximum unless approved by the electorate),[31] and waterworks (no maximum).[32]

Municipalities may also impose special assessments on a particular area or group of property owners for improvements, such as sidewalks, curbs, gutters, streets, and sewers.

Non Property Tax Revenues. Although only home rule cities may presently levy a sales tax,* and no municipality may levy an income tax,[34] there are a number of other non property tax revenue sources which may be used by both home rule cities and statutory municipalities. The most important of these revenue sources are:

Franchise Taxes	annual tax on private utilities awarded gas, electric, or water franchises[35]
Utility Charges	surpluses from charges for municipally-owned public utilities are often used to finance general municipal operations[36]
Fines and Fees	fines for municipal ordinance violations, building inspection, and other fees
Sales and Charges	trash collection, park facilities, airports, etc.
Occupational Taxes	either levied on all businesses or limited to certain types as a regulatory measure[37]
Cigarette Taxes	per pack tax on the sale of cigarettes.

Budget and Financial Procedures

All municipalities, except home rule and territorially-chartered cities, are subject to the provisions of the Local Government Budget Law in the same way as counties.** There are other statutes which concern

Legislation has been proposed to authorize statutory municipalities to levy a sales tax.

***See Chapter I for asummary of these provisions.*

municipal budget and fiscal procedures which augment the Local Government Budget Law, including the requirement that municipalities with less than 10,000 population must publish a financial statement within twenty days after a regular or special meeting of the governing body.[38] This statement must show all payments made and contracts awarded.

Indebtedness

There are two major limitations on a statutory municipality's ability to create a debt: a fixed debt limit and the required approval of the voters. Statutory cities and towns are authorized by law to issue bonds for several specific purposes: constructing public buildings, purchasing and improving parks, constructing sanitary and storm sewers, purchasing water rights and constructing water systems, purchasing or constructing gas or electric plants and distribution systems, constructing bridges, and supplying a temporary deficiency in the revenue for defraying current expenses.[39]

Statutory cities and towns are also authorized to issue bonds for funding any legal floating indebtedness,[40] for refunding any bonded indebtedness,[41] and for paying any special assessment bonds or obligations which has or may be issued.[42]

The total amount of debt in any one municipality is limited both by the state constitution and by statute to three percent of total assessed valuation.[43] Debts incurred in supplying water are specifically excluded. In addition the constitution limits the amount of annual levy for bond and interest payments to twelve mills and requires that such indebtedness be retired in no less than ten years and in no more than fifteen years.[44] The Colorado Supreme Court has held that the twelve mill limitation is only a limit on the amount of indebtedness that may be contracted and not upon the power of taxation.[45] All bond issue proposals, except those for supplying water, must be submitted to the voters for approval.[46]

Home rule cities are subject to the limitations imposed by their charters on the amount of debt that may be incurred, the purposes of such debt, and the time in which it must be retired.

Types of Bonds. Colorado municipalities may issue both general obligation bonds and revenue bonds. General obligation bonds are secured by a special tax levy established by an ordinance which can not be repealed until the bonds are paid. Bonds issued by statutory cities must be retired in no less than ten years and in no longer than fifteen years, except for bonds issued for supplying water, which must be paid in thirty years.[47]

Revenue bonds are not secured by general tax revenues, but by the earnings of the project they are used to finance, such as a water or sewer system, electric or gas utilities, and airports.

Revenues and Expenditures

Colorado municipalities over 1,000 population, excluding the City and County of Denver, collected $42.5 million in revenue in 1964 and spent $40.2 million. Denver's revenue collection totaled $71.2 million, and it spent almost $66.9 million. Denver's revenues increased almost forty-six percent between 1958 and 1964, and its expenditures rose forty-four percent. For all other municipalities* the rate of increase during the same period was 70.3 percent for revenues and 78.1 percent for expenditures, with the cities over 10,000 population experiencing the greatest rise. These are also the municipalities which have had the greatest rate of population growth.

As was true of counties, municipal expenditures and revenues have risen at a much lower rate on a per capita basis than in actual dollars, between thirty and thirty-three percent for municipalities other than Denver and slightly less than thirty percent in Denver.

**All figures for municipalities other than Denver do not include towns with populations of less than 1,000.*

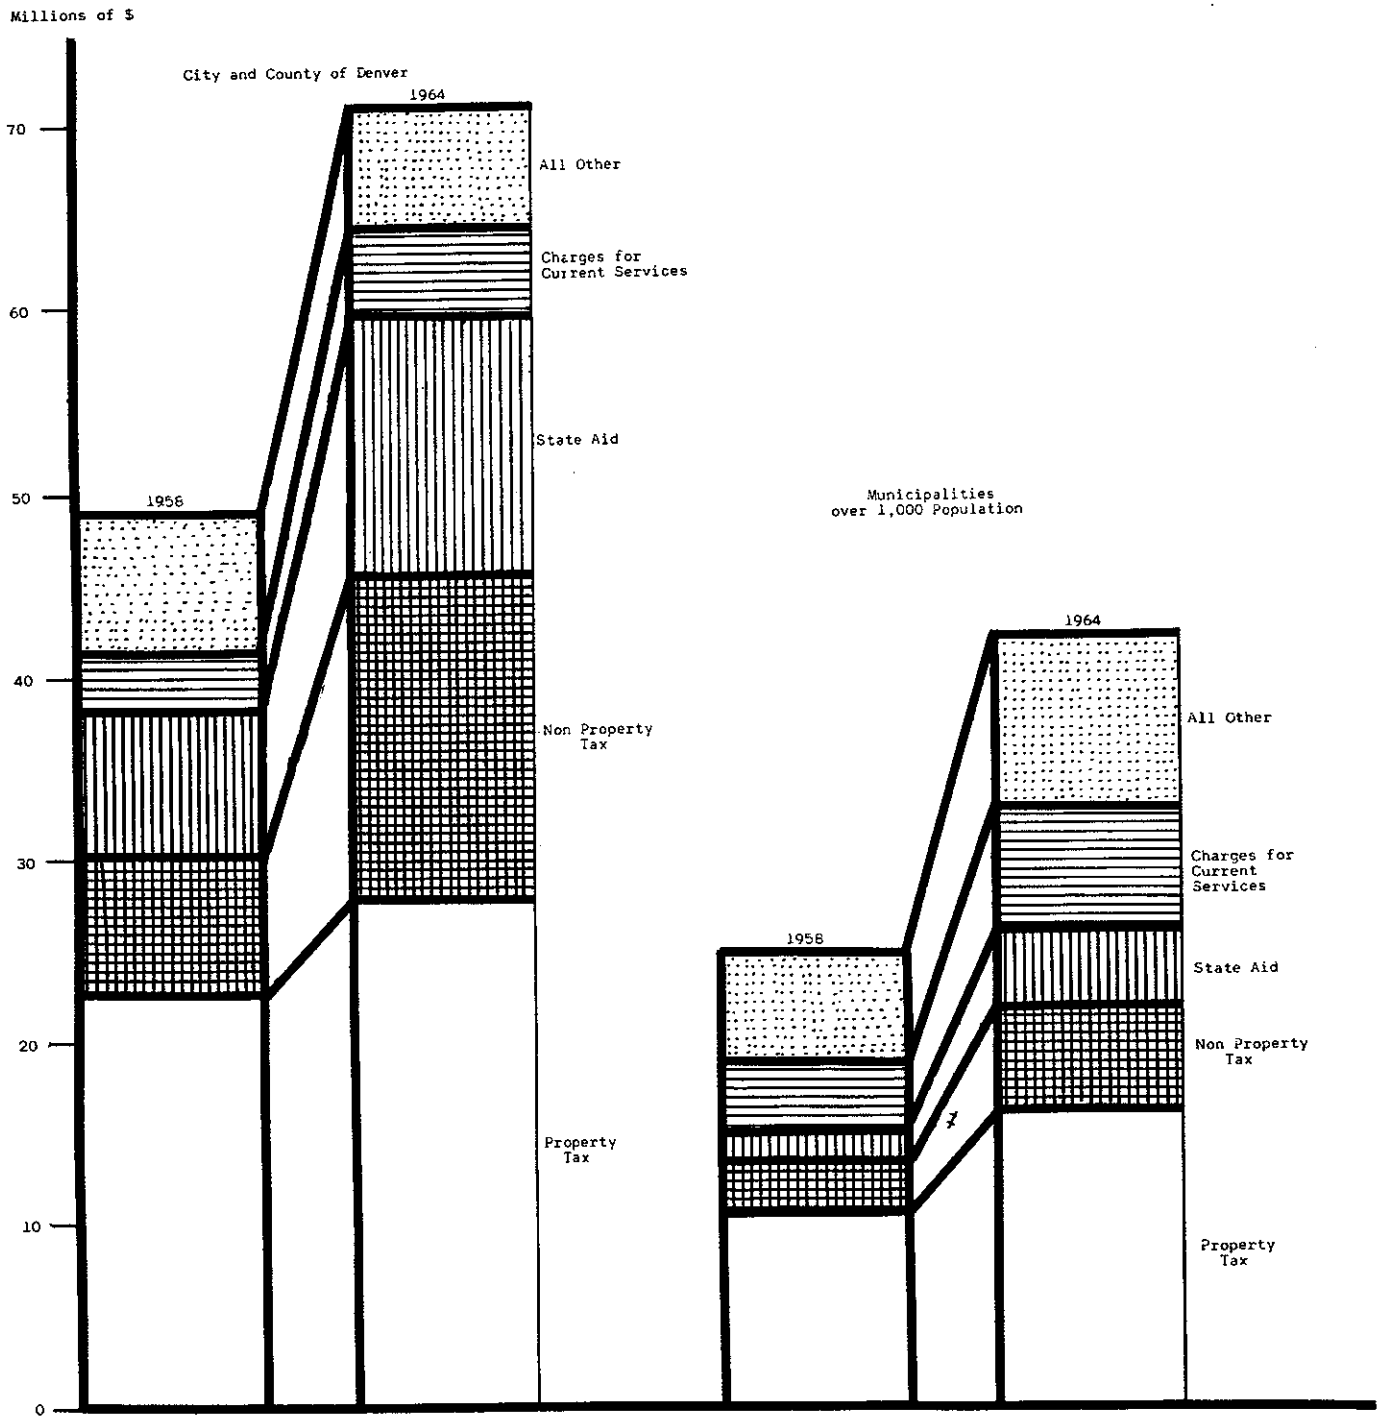
Following is a brief description of where municipalities get their funds, how much, and the purposes for which they are spent.

Revenue

The property tax provides a greater proportion of municipal revenues than any other source, but its relative importance declined between 1958, when it accounted for 45.6 percent of all municipal revenue (including Denver), and 1964, when it comprised 38.7 percent of the total. Other important sources of revenue include non property taxes (cigarette, franchise, sales), state aid, charges for services, and utility transfers. Figure M shows the amount of revenue collected by major courses in 1958 and 1964. Denver is shown separately from other municipalities over 1,000 population. Because it is both a city and a county, its revenue and expenditure pattern is not comparable to any other local government unit in Colorado.

FIGURE M

TOTAL REVENUE BY SOURCE FOR CITY AND COUNTY OF DENVER AND FOR ALL OTHER MUNICIPALITIES OVER 1,000 POPULATION COLORADO 1958-1964



Per Capita. The difference between Denver and other municipalities can be seen in Table 3 which shows per capita revenues by major source in 1964 for municipalities over 1,000 population; municipalities are grouped in this table by population size. Denver's total per capita revenue in 1964 was $135.12, as compared with $57.43 for Colorado's next largest cities, the four with populations between 50,000 and 100,000. Denver's much higher per capita revenue total is in part because of its size, but it also is a consequence of the additional functions for which Denver is responsible as a county.

Table 3 shows that total per capita revenue generally tends to decrease as municipal population decreases, which is just the opposite of the relationship of county per capita revenue and county population. The two exceptions to this general tendency are Group IV (5,000-10,000 population) and Group V (2,500-5,000 population). The total per capita revenue for each of these groups, however, is less than in the two largest groups.

Property Taxes. There appears to be no relationship between population size and either the proportion of municipal revenue derived from the property tax or the per capita amount received from this revenue source. The degree of reliance on the property tax, rather, appears to depend on such factors as 1) whether a sales tax is levied (available only to home rule cities); 2) the extent to which general operations are financed from utility transfers (an especially important source in cities and towns owning electric or gas utilities); 3) the extent to which services are financed on a charge basis, such as sewage collection and parks and recreation fees; and 4) the importance of occupational licenses, fines, and parking meter collections.

None of these factors is necessarily related to size; larger municipalities usually employ a greater variety of revenue sources, although many small cities and towns levy a cigarette tax or may own electric or gas utilities. Only two groups of municipalities relied on property taxes for more than forty percent of their total revenues in 1964; those in the smallest population group and those between 25,000 and 50,000 population.

State Aid. State aid has less impact on total revenues for municipalities than it has for counties. The primary source of state aid is the municipal share of highway users' funds; municipalities also receive state contributions to the firemen and police pension funds. Again, there appears to be little relationship between population size and either the per capita amount of state aid received or the proportion of total revenue received from this source.

Denver receives much more state aid than other municipalities because of welfare grants-in-aid, a function for which Denver, as a county, is responsible.

Non Property Tax Revenue. Denver receives slightly more than twenty-five percent of its revenue from franchise, cigarette, and sales taxes, with the latter being the most important source, yielding $11.17 per capita from a two percent tax, excluding food and drugs, in 1964.

In other municipalities, per capita revenue from these sources tend to decrease as population decreases, and large municipalities depend more on this source than smaller ones.

[d]surplus revenues from water, electric, or gas utilities
[e]license and permits, parking meter collection, fines, interest, rentals, etc.
[f]percent of total per capita revenue

Charges for Current Services. Denver received a much smaller proportion of revenue from charges than did other municipalities in 1964, primarily because: 1) it had no sewage disposal fee at that time, and its airport revenues are not included because of being earmarked to retire the bonded indebtedness for expansion of Stapleton International Airport; 2) greater reliance on sales taxes than most other municipalities; and 3) the greater proportion of total revenue received from state aid because of also being a county.

All other groups of municipalities, except the very largest and the very smallest, received more than seventeen percent of total revenue from charges in 1964, while those in Group VI received only 10.9 percent from this source. The average for all municipalities, except Denver, was 16.5 percent, making this the second most important source of revenue for municipalities over 1,000 population in 1964.

Utility Transfers. Denver received no revenue from untility transfers as it does not own either its gas or electric utilities, and water revenues in excess of operational costs are used to retire water sytem indebtedness. There was a wide variation in per capita revenues and degree of dependence on this source among the other population groups.

All Other. This category includes licenses, parking meter collections, fines, interest, rentals, sales of assets, and miscellaneous revenues not otherwise classified. Denver received less than ten percent of total revenue from these sources in 1964, as contrasted with 15.1 percent in all other municipalities, although its per capita revenue ($12.75) in this category was the highest. As indicated in Table 3, the amount of per capita revenues from, or the reliance on, these sources depends on factors other than population.

Expenditures

Denver expenditures totaled almost $66.9 million in 1964, and all other municipalities over 1,000 population expended slightly more than $40 million. While Denver's total expenditures increased forty-four percent between 1958 and 1964, those of other municipalities over 1,000 population rose slightly more than 78.1 percent. The municipalities experiencing the greatest increases were those in Group II (25,000-50,000 population), 97.3 percent; Group III (10,000-25,000 population), 83.1 percent; and Group I (over 50,000 population), 76.8 percent.

Public safety (27.2 percent), street maintenance and construction (18.3 percent), capital outlay (12.7 percent), and general administration (12.7 percent), accounted for the greatest proportion of total expenditures in municipalities other than Denver. In Denver, public safety (20.9 percent), health and hospitals (15.4 percent), and all other expenditures, including welfare (34.4 percent), accounted for the greatest proportion of the total.

Figure N shows the total amount of expenditures by major functions in 1958 and 1964, both for Denver and all other municipalities over 1,000 population.

Per Capita. Denver's per capita expenditures in 1964 were more than twice as great as municipalities in any other group, reflecting both Denver's larger size and its responsibilities as a county. Denver's per capita expenditures increased 29.8 percent between 1958 and

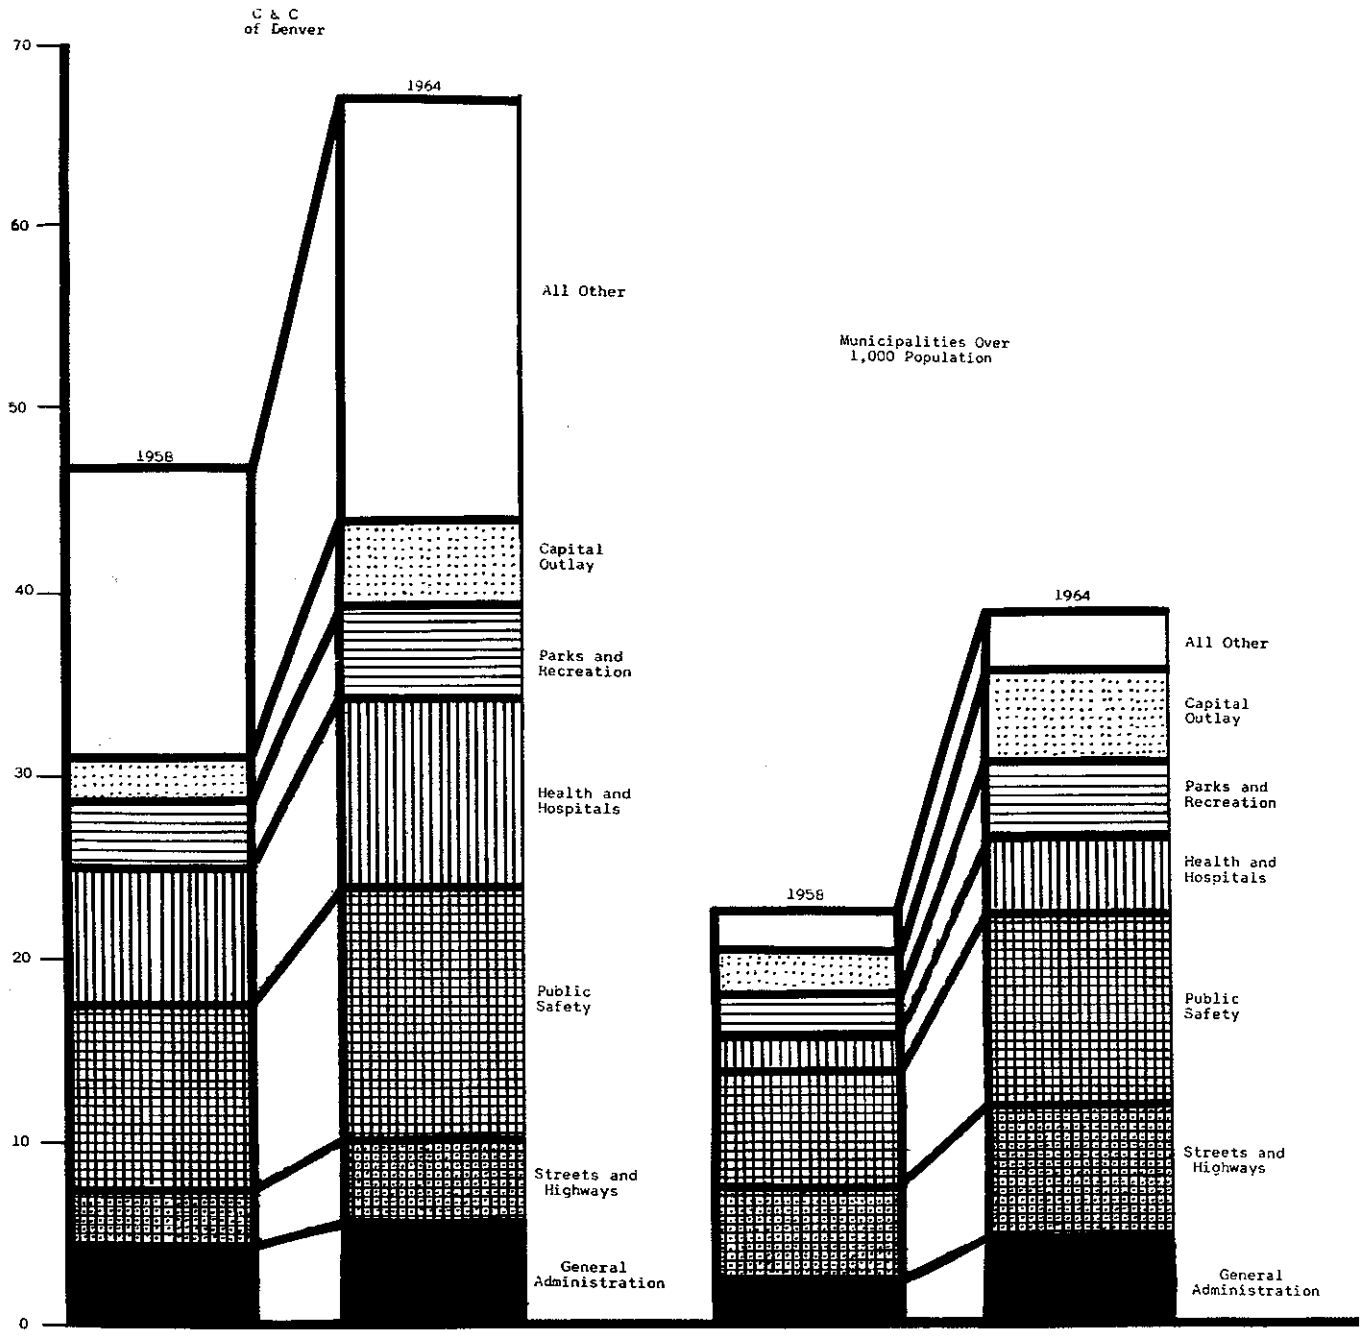
FIGURE N

TOTAL EXPENDITURES BY FUNCTION FOR THE CITY AND COUNTY OF DENVER AND FOR ALL OTHER MUNICIPALITIES OVER 1,000 POPULATION COLORADO 1958-1964



1964, while those of all other municipalities over 1,000 population increased 32.8 percent. Table 4 shows 1964 per capita expenditures by major function for Denver and for other municipalities grouped according to size.

General Administration. Aside from Denver, whose expenditures also include some county functions, per capita expenditures for general administration tend to increase as municipal population size decreases. The biggest difference in this respect in 1964 was between cities in Group I, where general administration per capita costs were only $4.12, constituting 7.7 percent of all expenditures, and municipalities in all other groups—ranging from $5.96 to $7.91 per capita and from 13.2 percent to 18.9 percent of total expenditures.

Streets. Street maintenance and construction, including traffic engineering and street lighting, accounted for the second largest proportion of expenditures in 1964 in all municipalities over 1,000 population, except Denver. In municipalities under 5,000 population, this function required a higher proportion of total expenditures than any other. Per capita expenditures for this purpose also tend to increase as municipal population decreases. This relationship generally applies as well to the proportion of total expenditures for this function.

Public Safety. Public safety (primarily police and fire protection), was by far the most expensive municipal function in 1964, except in Denver and in the smallest cities and towns. Per capita expenditures and the importance of this function in the total expenditure picture tend to decrease as population size decreases, illustrating the greater law enforcement and fire protection needs of larger communities.

Parks and Recreation. Parks and recreation per capita expenditures tend to be higher in the larger municipalities, including Denver. Municipalities under 5,000 population spent over one dollar per capita less for this function than those in the next population group. For all cities over 5,000 population, except Denver, parks and recreation expenditures accounted for at least ten percent of the total in 1964, but were only slightly more than seven percent in those with less than 5,000 population.

Health. Health expenditures include public health in Denver and those few cities participating in joint city-county health departments and street cleaning, trash and garbage collection and disposal, sewage treatment and disposal, and cemeteries. These functions accounted for 15.4 percent of total expenditures in Denver, and 10.2 percent of the total in all other municipalities. There appears to be little relationship between population size and per capita expenditures for these functions.

Capital Outlay and Other Expenditures. In 1964, per capita expenditures for capital outlay were highest in Denver and in municipalities over 50,000 population. As far as the municipalities in other population groups, however, there was no relationship between population and per capita expenditures.

All other expenditures covering a multitude of functions, as explained in Table 4, varied greatly among all groups of municipalities without relationship to size.

Municipal Government Problems

Urban Growth

Since World War II, many of Colorado's municipalities, particularly the larger ones and those located in areas experiencing the greatest population increase, have been greatly concerned with problems arising from urban growth and development. These problems have been two-fold, but are closely interrelated: 1) expansion, planning, and initiation of services and facilities and the broadening of the municipal tax base to meet the increased demand of growing population within corporate limits; and 2) large scale development of urban fringes outside corporate boundaries.

Table 5 shows the rate of population growth between 1950 and 1965 for twenty-eight cities and towns. While many of these are located either in the Denver metropolitan area or elsewhere along the Eastern Slope of the Rockies, others were selected so that each area of the state would be represented. Also shown is the rate of population growth for counties in which these municipalities are located.

It is interesting to note that a number of municipalities outside of the state's metropolitan areas grew in population at a much greater rate than the counties in which they are located. Three of these cities grew significantly in population, while the counties in which they are located suffered decreases. These examples illustrate the increasing urbanization taking place in Colorado, even in areas still considered predominantly rural and experiencing an over-all decline in population.

A county population increase rate greater than that of its municipalities is indicative of urban fringe area growth, but such growth and resultant problems have developed around most of the cities listed in Table 5.

Fringe Areas. Long-range planning for municipal services and facilities and how they are to be financed can be done most effectively in connection with the development of a logical and orderly municipal growth program, including the potential extension of municipal boundaries to include urban fringe areas. Prior to

1965, there were several impediments to the development of orderly growth programs by municipalities with highly developed and populated unincorporated fringes. Several of these impediments were lessened, although not eliminated, by legislation adopted in the 1965 and 1966 sessions of the General Assembly.

Demand for Urban Services. Municipal objectives of logical and orderly growth and development do not necessarily conflict with the needs and desires of urban fringe residents and commercial enterprises, but in many instances conflict has resulted. Residents in densely populated unincorporated fringe areas usually want urban services which have been traditionally provided by municipalities, such as water, sewer, parks and creation, and police and fire protection. County government has not been legally or structurally able to provide these services. Consequently, residents of fringe areas have four ways in which they may obtain urban services: 1) incorporation; 2) formation of special districts; 3) annexation to an adjacent municipality; and 4) purchase of services from an adjacent municipality.

Incorporation. Incorporation is seldom financially or politically feasible and can rarely guarantee adequate municipal services within a reasonable period of time. Moreover, the community spirit necessary for incorporation is seldom present in a new development, and the reluctance to form a city or town is often even greater when the development is adjacent to an existing municipality. In recent years municipal incorporation has seldom been used to meet the urban growth problem in Colorado, except in large housing developments somewhat remote from other municipalities, such as Broomfield.

One of the major reasons why incorporation has been unpopular is the prior existence of one or more special districts providing services, such as water or sewer, which ordinarily would be provided by a municipality. Unless a new municipality completely encompassed these districts, and the districts agreed to dissolve, the districts would continue to operate and be financed by the new municipal taxpayers in addition to financing the new city—adding appreciably to the tax burden of property owners.

Another problem has been the transition from unincorporated to municipal status. In the past, during the period while a municipality is being organized, the county withdrew its services, such as road maintenance and police protection, which the new city is not yet able to supply. Legislation adopted in 1965 helps correct this situation by requiring that counties continue to provide services during this period.

Even though recent efforts have not been very successful, incorporation is often tried as a defensive measure against annexation by an adjacent municipality. Often these proposed defensive incorporations would establish municipalities with little population, inadequate tax base, and illogical boundaries. The formation of such a municipality not only obstructs the growth of the adjacent city, but also does its residents a disservice because of inability to provide expected municipal services at a reasonable cost.

Until the current year, Colorado had no laws to control or prevent the formation of illogical or defensive municipal corporations, although such legislation had been adopted in other states. Municipal control legislation in other states has taken three forms:

1) State Reviewing Authority: In Minnesota, proposed new cities within a specified radius of existing ones must petition the state boundaries commission for approval. The commission holds a hearing to determine whether broad statutory criteria are met, before approving or disapproving holding an incorporation election.

2) Judicial Review: Some states require the courts to review and approve new incorporations; in some cases, there are statutory standards to be used by the courts. These standards may either set forth non discretionary requirements, such as minimum population, assessed valuation, and land area, or they may establish broad general criteria to assist the court in its determination.

3) Local Review: In Arizona, a buffer zone for existing municipalities has been established by statute consisting of three miles for those under 5,000 population and six miles for those over 5,000. New incorporations within these zones may not be formed without the approval of the existing municipality unless within 120 days it refuses to annex the area to be incorporated.

The first steps toward controlling new municipal incorporations in Colorado were taken in the Municipal Annexation Act of 1965. This measure gives annexation proceedings priority over municipal incorporation proceedings involving populations of less than 10,000. It also authorizes municipalities to require an agreement to annex when eligible as a condition of any contract to supply municipal services outside corporate boundaries. Such agreements are an effective future barrier against defensive incorporation attempts.

In 1966, legislation was adopted requiring that any new incorporation within one mile of an existing municipality must have an area of at least one-half square mile and at least 100 registered voters per square mile. This legislation was watered down considerably from original proposals, and while its passage appears to have blocked one proposed incorporation, some critics feels that more restrictive legislation will be necessary.

Special Districts. The formation of special districts to provide municipal services in unincorporated areas has been used extensively in Colorado, as evidenced by the fact that the number of districts has almost doubled in the past ten years. Until 1965, there was no control over the formation of special districts. Special districts were easy to form and are subject to very liberal taxing and indebtedness restrictions.

The obstructive effect of special districts on municipal incorporation attempts has already been commented upon. They have tended to have the same effect on proposed annexations principally for two reasons:

1) differences between municipal and special district facilities and services, such as engineering standards, type and size of pipe, etc. which make it difficult, if not impossible, to merge and integrate special district facilities and equipment with municipal systems; and

2) the usual continuance of district operation and taxpayer responsibility after an area is annexed.

A major step toward avoiding future difficulties arising from the illogical formation of special districts was taken with the passage of the Special Districts Control Act of 1965. In addition to giving county commissioners authority to approve new special district formations, subject to meeting certain criteria, this act provides that any municipality within three miles of a proposed district shall be an "interested party" and may be heard at the formation hearing.

If there is satisfactory evidence that the facility and service standards of a proposed district are incompatible with the facility and service standards of adjacent municipalities and special districts, the county com-

missioners may disapprove the service plan, which is tantamount to disapproving the district formation.

The provisions of water and sewer service to urban fringe areas by municipalities on condition of annexation when eligible should also reduce the future need for formation of districts for these purposes.

The problem of continued special district operation in annexed areas was dealt with in part by other legislation adopted in 1965.[48] This act provides procedures and conditions for the exclusion of territory from special districts, other than those providing water and sanitation, when such territory has been annexed to a municipality. The excluded territory, however, would continue to remain liable for its share of any outstanding district bonded indebtedness. The major municipal services affected by this legislation are fire protection and parks and recreation. Water and sanitation districts, however, are the ones most usually found operating in urban fringe areas. These districts are usually the ones with the greatest outstanding indebtedness and the highest operating and debt retirement property tax levies, so that the major portion of the problem is yet to be dealt with by legislative action.

Annexation. Although annexation is an effective method of meeting urban growth problems and providing municipal services to heavily populated fringe areas, its use was hampered during the twenty years prior to the passage of the Municipal Annexation Act of 1965 by restrictive annexation laws. These restrictions, as well as negative annexation policies by some municipalities, were partially responsible for the growth of special districts as a way to meet urban service needs in unincorporated areas.

The new act makes annexations easier, gives municipalities the authority to annex unilaterally totally surrounded areas and areas bounded two-thirds by a municipality, and requires municipalities to accept some annexations. This act did not become effective until January 1, 1966, so that there has been insufficient experience under its provisions as yet to determine its impact on urban growth problems and to ascertain what changes, if any, are needed.

Purchase of Service. As previously indicated, residents of some fringe areas can obtain certain services, particularly water and sewer, from adjacent municipalities. Charges for these services are usually higher than they are for municipal residents, and annexation when eligible may be required as a condition to their provision. These contractual services meet only a portion of the needs of fringe area residents, who must still use one of the three other alternatives (incorporation, special district formation, or annexation) to provide other services.

Summary. While it appears that some of the problems related to urban growth and development have been partially solved by legislation adopted in the past two years, they still remain matters of pressing concern, which are likely to become more complex as population growth increases, especially if a large share of this growth is concentrated in unincorporated areas in the future as it has in the past. Of special concern are regional problems resulting from population growth over an area too large to be met adequately by existing units without fragmentation, duplication of effort, or wide diversity of service standards and financing.*

Home Rule

Several significant procedural and substantive municipal home rule problems either have developed or have become more apparent in recent years. In part, these problems have arisen from judicial interpretations of Article XX of the Colorado Constitution, especially the provisions delineating matters of local concern and related powers. In part, they are a consequence of population growth and accompanying urbanization, technological development, and shifting economic and social patterns, all of which require continuing reexamination of powers and responsibilities of the state and its local governments and of intergovernmental relations.

Procedural Problems. There are four major procedural problems relating to the adoption of home rule charters under the present provisions of Article XX. The first is the minimum population requirement of 2,000, which denies home rule status to smaller municipalities interested in attaining a greater degree of self-government.

The second problem arises from the election procedures to be followed in adopting home rule. Article XX requires three separate elections, which makes the adoption of home rule cumbersome and expensive. Third, Article XX limits the home rule charter convention to only sixty days in which to complete the charter draft. This time limitation is too short to permit the necessary deliberation and legal thoroughness which should be given to a municipal charter. The fourth problem is caused by the requirement in Article XX that charter convention delegates must have been taxpayers for at least five years; this provision has been construed to mean that a municipality must be in existence at least five years before it can adopt home rule.

Other minor problems concern the cumbersome publication requirements in Article XX and the size of the charter convention (twenty-one members), which has been criticized as being too unwieldy a group. The constitutional provision of home rule adoption procedures constitute at least as much of a problem as the

*These problems are foremost in the state's metropolitan areas and are discussed in Chapter V.

procedures themselves, because it is impossible to modify them easily from time to time as experience and changing conditions warrant.

Substantive Problems. The language of Article XX attempts to delineate an area of "exclusive local and municipal concern" which is not subject to the control of or interference by the General Assembly. Yet, it also attempts to protect the sovereign power of the General Assembly in the area of "statewide concern." For the past sixty years the courts have engaged in a continuing struggle to define and protect the sovereign power of home rule municipalities without jeopardizing or restricting the power of the General Assembly to regulate matters of statewide import. A number of these decisions have tended to promote considerable confusion and uncertainty on the part of municipal authorities as to the meaning and extent of municipal home rule.*

Generally, the judicial interpretations of Article XX have tended to give superior status to the state's authority when it conflicts with local home rule regulations. Because such decisions interpret constitutional delineations of power, they may not, as a general rule, be modified by the General Assembly through additional grants of authority to home rule municipalities. In one instance, however, it can be concluded that the Colorado Supreme Court has upheld the supremacy of the General Assembly to decide, at least in some matters, when matters of statewide concern may be subject to concurrent local regulation.[49] Generally, the definition of "matters of local concern" encompass a changing grey area, still beyond the power of the General Assembly to regulate. Consequently, even though state-local relationships under Article XX are constantly undergoing change, the final allocation of jurisdiction is being made by the courts rather than the General Assembly.

The major difficulties with municipal home rule in Colorado stem from the attempt constitutionally to delineate matters of exclusive local and municipal concern. Such delineation, of necessity, is subject to judicial interpretation from time to time. These interpretations, because they involve constitutional questions, are not generally susceptible to legislative modification, even on those matters determined to be of statewide concern, so constitutional amendment is required. Because judicial decisions usually do not go beyond the scope of the matter in the case before the court, a series of constitutional amendments would appear to be required if modification of judicial interpretations is desired. Since constitutional amendment is a lengthy and costly process and therefore seldom attempted, judicial interpretation has tended to make the relationship rigid between the state and its home rule municipalities and, in some instances, to circumscribe the ability of home rule cities to join in formal arrangements with other governmental entities to solve area-wide or regional problems.[50] The lack of flexibility in state-municipal relationships and authority is a major handicap in meeting needs brought about by changing conditions in a rapidly urbanizing society.

Alternate Approaches to Home Rule. There are two basic approaches to municipal home rule, one of which is presently provided in Article XX. The other is the approach developed by the National League of Cities.** It vests broad powers in home rule municipalities, but provides for legislative supremacy in the area of state-local relationships. It protects the right of municipalities to adopt local home rule charters, and such home rule municipalities are given all governmental powers, except as may be expressly denied them by general class legislation enacted by the General Assembly, or otherwise denied or restricted by local charter. Charter provisions regarding internal administration and organization are made superior to statute.

There are several advantages to this form of municipal home rule:

1) It provides a balanced allocation of powers, reserving complete local authority over local governmental organization, with which the state has no justifiable interest, and preserving legislative supremacy with respect to other governmental powers exercised by the state and its local government creations.

2) Because home rule cities are granted all governmental powers, except those expressly prohibited them by the General Assembly, they may be vested with greater home rule authority than a constitutional grant of all powers of "local and municipal concern."

3) The system is flexible, because the General Assembly would be placed in the position of arbitrating between state and local concern rather than the courts, whose decisions usually cannot be modified by legislative action.

The possible disadvantages might be summarized as follows:

1) Subjecting municipal home rule powers to control by the General Assembly might result in legislative interference in local affairs and the gradual erosion of the home rule concept.

2) This concept represents a substantially different approach to municipal home rule from that which has been established and followed in Colorado for over sixty years.

*These are discussed in greater detail in Chapter VII.

**Formerly known as the American Municipal Association.

3) A substantial revision in the provisions of Article XX could result in increased uncertainty for home rule jurisdictions and might cause a new round of judicial interpretations.

While these are the two basic approaches to municipal home rule, several variations have been advanced by other authorities, including the imposition of significant limitations on the plenary power vested in home rule jurisdictions; these limitiations prevent home rule municipalities from enacting regulations on general private law and civil relationships and also preclude local definition and provision for the punishment of felonies.

Other constructive suggestions have been offered by various legal authors. For example, Professor Terrance Sandalow, University of Minnesota, suggests that there is a serious weakness in the National League of Cities and National Municipal League model provisions, in that no provision is made for annexation and extraterritorial powers to be exercised by home rule municipalities.[51] Professor Sandalow persuasively urges that home rule should not grant blanket authority for the local exercise of these powers, but rather, such power should be governed by the conditions and procedures established by statutory enactment.

Professor Richard B. Dyson, University of Kansas, also makes a case for the proposition that home rule cities should have no authority to dissolve, enlarge, or contract municipal boundaries without express statutory delegation by the state's legislative body.[52] In addition, he suggests constitutional phraseology which would provide that local regulation shall be deemed to conflict with state legislation only when, by every reasonable construction, to obey or carry out one would either be to disobey the other or tend to defeat the purpose of the other.

Statutory Municipalities

Two major problems affecting statutory municipalities relate to constitutional provisions limiting the terms of elected officials and the amount and terms of debt which may be assumed.

Two-Year Term Limitation. Under the provisions of Article XIV, Section 12 of the Colorado Constitution, elected officials of general law cities and towns are limited to two-year terms of office. This provision makes possible a complete turnover of elected officials at a single election, thereby constituting an unnecessary impediment to the continuity of local government operations by leaving local governing bodies without sufficient experience to conduct their affairs in a proper manner. The two-year election requirement tends to discourage qualified and experienced candidates from running for municipal office.

Debt Limits. Article XI, Section 8, of the constitution limits the outstanding general debt of any municipality* to three percent of assessed valuations, prohibits the imposition of a debt redemption levy in excess of twelve mills, and requires that bonds must be retired in no less than ten nor more than fifteen years.

Although debt incurred from the construction of water facilities and debt to be redeemed by revenue are not limited by this article, many municipalities have found it extremely difficult to provide capital facilities through general obligation bonds because of these constitutional limitations. Consequently, many cities and towns have created special districts to pay for improvements which could have been financed more reasonably by municipal general obligation bonds. Resultant higher financial and administrative costs have placed an undue burden on local taxpayers which might have been avoided. The twelve mill levy limit has the effect on towns under 1,000 population of virtually prohibiting the use of general debt to finance community improvements.

Sales Tax. Although the authority of home rule municipalities to levy a sales tax has been upheld by the Colorado Supreme Court, statutory cities and towns are unable to do so without express legislative authorization. Statutory municipalities have requested this authority, so that they may be able to broaden their tax base and reduce dependence on the property tax as a revenue source. Closely related to this grant of authority is consideration of whether local government sales taxation should be made more uniform through the imposition of a state-collected locally-distributed tax.

Statutory Revision and Recodification. The enumeration of municipal powers in Chapter 139, Colorado Revised Statutes 1963, need review and consolidation, particularly the classification of municipal corporations. Of particular importance is the revision or elimination of the statutes relating to first class cities. Many of the other provisions of Chapter 139 are ambiguous, duplicatory, antiquated, or all three.

*Construed by the Colorado Supreme Court to apply only to statutory cities and towns.

Commission Recommendations

Urban Growth

The Governor's Local Affairs Study Commission's recommendations to alleviate urban growth problems are based on the premise that logical urban growth (except for certain problems peculiar to metropolitan areas) can be achieved best by municipal annexation and extension of services to areas that are municipal in nature. Most of these recommendations have already been enacted into law: 1) Municipal Annexation Act of 1965, including authorization for municipalities to require annexation when eligible as a condition of providing services outside corporate limits; 2) Special District Control Act; and 3) requiring counties to continue to provide service to newly incorporated areas for a minimum time after incorporation to assist in orderly transition.

As previously indicated, there has not yet been sufficient experience under the new annexation act to evaluate its effect on urban growth problems or for unforeseen legal and procedural problems to develop. After enough time has elapsed for proper evaluation of the act, the Commission suggests that consideration be given to the need for stronger annexation legislation, vesting more extensive unilateral authority in municipalities; such authority may be needed as long as the state's population growth continues to concentrate in and around municipalities.

The Special District Control Act is a transitional step toward curbing and eventually eliminating this form of local government in Colorado and should be followed by legislation authorizing counties to establish service areas or special taxing districts to provide urban services in unincorporated areas which cannot be reasonably served by or annexed to a municipality.

The Commission also recommends much more comprehensive and restrictive legislation to control illogical and defensive incorporations than was adopted in the 1966 session. Under the Commission's recommended legislation:

1) No municipality with less than 10,000 population could be incorporated if more than fifty percent of the total area to be included within its corporate boundaries is within one mile of the boundaries of any existing municipality.

2) No incorporation election for any other proposed municipality could be held until the district court determined that the petition for incorporation was in substantial compliance with several incorporation criteria:

   a) that the proposed area to be incorporated is urban in character and has a community of interest (business, social, economic);

   b) that the territory is in need of municipal services and that the proposed municipality is capable of providing them;

   c) that the municipal services needed could not be provided better by annexation to an adjacent municipality or through service arrangements with existing local governmental units;

   d) that the area to be included is not excessive in size in relation to its population;

   e) that the tax base of the proposed municipality is sufficient to finance municipal services on a reasonable basis; and

   f) that the relative impact of an additional municipality shall not be adverse upon the overall governmental pattern in the area.

The legislation adopted in the 1966 session represents a step toward preventing illogical and defensive incorporations, but the Commission still recommends the stronger controls outlined above.

Local Government Home Rule Amendment

Several Commission recommendations relating to municipal government are contained in the Local Government Home Rule Amendment, including municipal home rule, two-year term limits for elected officials in statutory municipalities, municipal debt limits, intergovernmental cooperation, and state-collected, locally-distributed taxes.

Municipal Home Rule. This portion of the amendment would become Section 4 of Article XX of the constitution. Under the provisions of this section, the opportunity to adopt home rule would be extended to all municipalities. The detailed procedures for becoming a home rule municipality and adopting a home rule charter would be provided by statute subject to two constitutional requirements: 1) that at least five percent of the qualified electors of the municipality would have to initiate a home rule petition; and 2) that a home rule charter must be approved by a majority of qualified electors voting thereon. This section also makes it possible for new municipalities to adopt home rule at the time of incorporation.

These provisions are designed to solve the procedural problems previously discussed. Municipal home rule substantive problems are handled by changing the definition of municipal home rule to guarantee to home rule cities all powers of government and taxation except as expressly limited or denied by specific legislative enactment. Any limitation or denial of powers, however, would have to apply to no less than one class of municipalities consisting of at least three home rule cities.

This section provides further that annexation or extraterritorial authority shall not be exercised except as provided by law, and home rule cities would be prohibited from defining and punishing felonies or enacting charter provisions or ordinances governing or regulating relationships between private persons, associations, or corporations.

This new definition of municipal home rule is similar to the one proposed by the National League of Cities, but has been modified to clarify annexation and extraterritorial authority and to prohibit home rule cities from legislating on matters that are clearly of statewide concern, such as felonies and private law relationships. Protection is given to individual municipalities by the requirement that any limitation or denial of powers must apply to at least one municipal class consisting of at least three cities.

By using this method of granting home rule powers, the courts would be replaced by the General Assembly as the referee on matters of state and local concern. This change should provide the necessary flexibility to adjust state and local relationships as changing conditions warrant, and it would also eliminate legal barriers in coordinating state-local jurisdiction in a variety of matters, such as traffic violations.

Two-Year Term Limitation. The present two-year limitation on elected officials in statutory cities and towns would be removed by a simple amendment to Article XIV, Section 12, of the constitution. This amendment would make it possible to set the term of office by statute. In this connection, the Commission recommends that officials of statutory cities and towns be elected for four-year overlapping terms.

Municipal Debt Limits. Article XI, Section 8 of the constitution would be amended to eliminate the three percent of asssessed valuation limitation on bonded indebtedness, the twelve mill levy limit for debt retirement, and the ten to fifteen year time limitation on debt retirement. It would then be possible to impose more reasonable limitations by law and to change these from time to time as conditions may warrant.

Other Provisions Applicable to Municipalities. Other provisions of the Local Government Home Rule Amendment would eliminate several constitutional impediments to the proper functioning of local government and intergovernmental relations. These provisions would make it possible:

1) for state-levied and collected and locally-distributed taxes to be handled on a direct basis;
2) for home rule jurisdictions to cooperate and contract with each other, either directly or through the authorization by statute of a separate government entity as an instrument to be used through voluntary participation by cooperating or contracting political subdivisions; and
3) for home rule cities to levy an income tax, unless expressly denied by the General Assembly.

Statutory Revision and Recodification

As was the case with county government laws, the Commission recommends that the statutes pertaining to municipalities be revised and recodified, with special emphasis given to Chapter 139, Colorado Revised Statutes 1963. In completing its work, the Commission has prepared a detailed outline of what is required in the revision and recodification of municipal laws, including alternative methods of carrying out this important task.

III

SPECIAL DISTRICT GOVERNMENT

Origin and Development

Special districts are quasi municipal corporations which are organized for the purpose of performing one or more governmental functions or services. They are, like all other local governmental units, creatures of the state and derive their powers from state law. They may exercise only those powers expressly delegated to them by the General Assembly, or those which can be reasonably inferred from such laws.[1]

The legal status of special district government under the Colorado Constitution is somewhat unclear and difficult to define. It is possible, however, that special districts of all types and kinds could be considered to form the fourth class of municipal corporation, permitted by Article XIV, Section 14, of the state constitution. (The other three classes are cities of the first class, cities of the second class, and towns.)

It is important to distinguish between the two basic types of special districts—special service districts and local improvement districts. Special service districts are independent legal entities which may be organized in either incorporated or unincorporated areas and are governed by a board of directors. The term "local improvement districts" usually applies to districts within municipal limits, usually created and operated under the supervision of the municipal governing body. They are used to provide a special benefit type of service or facility (curbs, gutters, storm sewers, etc.) to a part of the community only.

Origin in Colorado

Special districts were first organized in this state for agricultural and resource purposes. The General Assembly authorized the creation of certain types of irrigation and drainage districts even before the turn of the century. Special districts for domestic water supply also were authorized early in the state's development. The vast majority of special district laws were enacted during the late 1940's and the 1950's, apparently to provide municipal-type services for urban development in unincorporated areas. Most of the increase in the number of special service districts during this period occurred in the Denver metropolitan area, although many special districts were created in other growing urban areas within the state.

Number of Special Districts

The exact number of special service districts in Colorado at the present time is not known. Estimates vary considerably according to source. The 1962 *Census of Governments** places the total number at 566, which may include some local improvement districts. The 1964 annual report of the Colorado Tax Commission shows 592, excluding districts listed more than once because of operation in more than one county. This total is also not accurate, because it includes a number of local improvement districts and excludes special districts not levying a property tax. It is likely that there are between 575 and 625 special districts in Colorado at the present time. The number of districts has almost doubled in the past ten years.

Special Service District Laws

There are a variety of laws under which special districts may be organized. Sixteen major acts permit the formation of special service districts. Each of these laws is described briefly below:

Domestic Waterworks Act of 1913. This is a somewhat obsolete and seldom used law authorizing the formation of waterworks districts, primarily for rural areas. These districts are created by the county commissioners and have taxing and borrowing authority to finance the construction of water facilities.[2]

Metropolitan Districts Act of 1947. This act authorizes the formation of different types and combinations of special service districts, including the following: 1) water, 2) sanitation,3) fire protection, 4) safety protection (traffic and safety control), 5) mosquito control, 6) street improvement, and 7) television relay. Many of the types of districts authorized by the act have never been organized. The act is frequently used to form water, sanitation, and fire protection districts in urbanized areas. Legal counsel who write opinions for leading bonding firms are reluctant to approve bonds for district combinations, other than water, sanitation, and fire protection.[3]**

*Published by Bureau of Census, United States Department of Commerce.

**The authority for metropolitan districts to provide police protection was repealed by the General Assembly in 1965.

1939-1949 Water and Sanitation Districts Act. Most of the water and sanitation districts now in existence were created under this law. Either water, sanitation, or consolidated water and sanitation districts may be organized under this act. The law has been well tested in the courts, and bonds that are issued are usually approved by the bonding attorneys. Districts are organized by petition of the taxpaying electors and by decree of the district court, after an election has been held.[4]

Fire Protection District Act of 1949. Most fire protection districts in the state are organized under this law. Districts are formed by the district court after petition by fifty taxpaying electors, a public hearing, and an election.[5]

1953 Disposal Districts Act. This is a seldom used law, and no bonds have been issued for this type of service district in recent years. A disposal district is created by the county commissioners and apparently has limited powers. The enabling act is a very brief one and is not clear in defining the powers of such districts.[6]

Metropolitan Recreation District Act. A number of recreation districts have been organized under this law, many of them in the Denver metropolitan area. Bonds have been approved and issued in some cases. These districts may be organized without an election, unless a counter petition is submitted to the district court.[7]

Metropolitan Water District Act of 1955. This is another act which apparently has seldom been used. It authorizes two or more municipalities to join together to form a district to provide water for domestic, industrial, and irrigation purposes. The governing board of the district is composed of representatives from the participating municipalities. Like most service districts, this district is empowered to levy taxes, fix rates, borrow money, and issue bonds.[8]

Hospital District Act of 1960. A few hospital districts have been organized under this law since its passage. The district is organized by decree of the district court, after petition by the taxpaying electors. A hospital district may levy up to two mills to retire bonds or finance operations.[9]

Metropolitan Sewage Disposal District Act of 1960. Essentially, this is an intergovernmental cooperative district. The only one formed is in the Denver metropolitan area, although similar districts could be created elsewhere. Participation of municipalities and other special districts is by approval of the governing bodies of these units. The district operates primarily through contracts with other local units, although it may levy three-quarters of a mill for a period of five years to pay costs.[10]

Recreation District Act of 1947. It does not appear that this act has been used. Under its provisions, counties may establish recreation districts after holding a hearing to determine "public sentiment." The county commissioners appoint five taxpaying residents of the district to serve as the district board. The county commissioners may also levy a maximum of one mill on the property in the district, unless the whole county is included, in which case the district is financed from the county general fund, and no special levy may be made.[11]

Regional Library District. A regional library district may be formed by two or more governmental units. The participating governing bodies appoint a committee of their members to select the district board of directors. A regional library board is required to serve, and be supported by, all unincorporated areas and municipalities not operating their own libraries within the district. Whenever the board of county commissioners decide that only a part of a county which is not already served by a public library shall join in establishing a district, the board may levy a tax on that part of the county so included in the district.[12]

The Moffat Tunnel District. This district is unique and was created by special legislative enactment in 1922. It comprises several counties in the western part of the state. The district is organized to provide a transportation and water tunnel through the Continental Divide. The board of directors is empowered to levy taxes and fix charges to retire indebtedness and to meet operating costs.[13]

Soil Conservation District Act. These districts are established by order of the State Soil Conservation Board on petition and after a referendum in the area concerned. The governing body is a five-member board of supervisors, three elected and two appointed by the State Soil Conservation Board. The districts are authorized to levy a tax based on benefits with the prior approval of the voters and may accept grants and borrow money from the federal or state governments. Few soil conservation districts have been formed in recent years.[14]

Cemetery District Act. On petition of property owners in each area concerned, these districts are established by the board of county commissioners, which also appoints a board of directors to govern the district. This board is empowered to determine the amount of taxes to be levied. A few cemetery districts exist in various parts of the state.[15]

Drainage District Act. Drainage districts are created by order of the board of county commissioners on petition and after an election in the proposed district; no election is necessary if the land concerned is unoccupied. The districts are governed by elected boards

of directors, who may levy benefit assessments and issue bonds after approval of the electors.[16]

Water Conservation District Act. Conservancy districts are established to prevent floods, regulate and divert stream channels, and build reservoirs and dams. They are formed by order of the district court on petition by the landowners or a governing body of a public corporation. The district board is empowered to levy taxes, make special assessments, and issue bonds. There are several conservancy districts in Colorado organized by special legislative enactment, including the Colorado River Conservancy District, Southwestern Water Conservation District, the Caddoa Reservoir, and the Arkansas Basin Conservancy District.[17]

Mine Drainage District Act. These seldom used districts are established by the district court on petition of mine owners and after a hearing; they are governed by a board of supervisors elected by the mine owners. The board may levy taxes upon all mining claims in the district, may fix levies, and incur bonded indebtedness.[18]

Metropolitan Stadium District. This unique district was created by special legislation in 1966. The district is organized to provide a sports stadium and related facilities in the Denver metropolitan area. The district directors must hold an election on a bond issue within a year of the effective date of the act. If the bond issue is defeated, the district is automatically dissolved.[19]

Other Districts. There are other district laws but the districts formed under them may be classified as local improvement-type districts. Some of these districts have characteristics of both special purpose and improvement districts. An example is the Domestic Waterworks District Act of 1905 for cities over 10,000 population.[20] This district may be organized only by the governing body of a city of more than 10,000 population, but the district operations are conducted by an independent board of directors appointed by the municipal governing body. Like many acts in this category, the Domestic Waterworks Law is infrequently employed, and little attention is paid to its content.

Analysis of Selected Service District Laws

The enabling acts of some of the more common and important service districts are analyzed in Tables 6 through 9. These tables describe the method of creation, organization, powers and fiscal authority of each of the special service districts enumerated in Chapter 89, Colorado Revised Statutes 1963, as amended. Each of these tables is summarized below.

Method of Creation

All of the special districts analyzed in Table 6 are formed by one of three authorities: 1) the district court, 2) the county commissioners, or 3) the municipal governing body. In most cases, organization is initiated by petition of the taxpaying electors. Elections must be held automatically in five districts and may be required upon counter petition in fire protection districts. Other laws make no provision for election. Where elections are held, "taxpaying electors" are eligible to vote. A 1965 act prohibits any new organizational election for at least twelve months after the defeat of a proposal to create a district.[21]

District Organization

As shown in Table 7, special district boards consist of either three or five members, or else are determined by the number of member units, as provided in the Metropolitan Sewage District Act. Terms of office vary from two to six years. Other district officers may be appointed by the board in all districts, except the treasurer of a water district organized under the Domestic Waterworks Act of 1913, must be the county treasurer. Compensation of board members vary greatly in the various laws—most of them range from a maximum of $60 to $300 per year. Legislation was passed in 1963 which increased the maximum salaries of water and sanitation board members to $600 per year or $25 each meeting.

District Powers

All special districts included in Table 8 have contract rights. All laws, except the 1953 Disposal District Act, authorize districts to borrow, issue bonds, acquire property, and tax. All districts have eminent domain power, except waterworks districts and hospital districts. Five district laws permit district boards to fix rates and to hold rights-of-way for construction purposes. Only the so-called "metropolitan districts" appear to have general police and zoning powers. Three types of districts may join other districts, and four other district laws permit joinder with a municipality.

District Financial Authority

The county is the assessing and collecting agency for all special districts, as shown in Table 9. Some laws provide a mill levy limit, ranging from .75 mills for the Metropolitan Sewage District to six mills for

fire protection districts organized under the 1949 act. All special districts organized under Chapter 89, Colorado Revised Statutes 1963, are now required to complete and file an audit with the State Auditor. Most special districts may issue bonds. An election vote on bond issues is required in most, but not all cases. Generally, the maximum limit on bonds is twenty years, with an interest limit of six percent.

Special District Control Act

In 1965, the General Assembly adopted the "Special District Control Act."[22] In general this legislation gives boards of county commisioners authority to review and approve a service plan for each new special district providing municipal-type services, thus placing some control over special district formation and operation, as well as over urban development in unincorporated areas.

The petitioners to form a new special district are required to file a service plan with the commissioners in the county or counties where the proposed district is to be located. The service plan must include such information as: how and what services are to be provided, a map of the district, operational and capital facility costs, and financing.

Before taking final action, the board of county commissioners must hold a hearing after due notice to all interested parties, including all municipalities within a radius of three miles of the proposed district boundaries and the residents and landowners in the proposed district. The bill sets forth the broad criteria to be followed in evaluating the service plan, all of which are related to logical growth and development. An approved service plan is a prerequisite for incorporation of a special district by the district court. Enforcement and appeal procedures are also set forth in the bill.

TABLE 6
PROCEDURES FOR CREATING SPECIAL PURPOSE DISTRICTS IN COLORADO

Type of District	Creating Agency	Initiative	Election	Voter Qualifications	Statement of Result	Inclusion and Exclu. of Territory	CRS
Domestic Waterworks District–1913	County Commissioners	Petition by 50% of landowners	Yes	Taxpaying elector or landowner	Publication, Judges, Votes Cast, Directors	Board Decision	89-1
Metrolopitan Districts–1947	District Court	Petition by 100 taxpaying electors	Yes	Taxpaying Elector or on Last Registry List	Decree from District Court	By Petition and Board Decision	89-3
Water & Sanitation District–1939-49	District Court	Petition by 10% of taxpaying electors	Yes	Taxpaying Electors or on Last Registry List	Decree from District Court	By Petition and Board Decision	89-5
Fire Protection District–1949	District Court	Petition by 50 taxpaying electors or 75% of taxpaying electors whichever is smaller	Upon Counter Petition by Fifty Electors	Taxpaying Electors	Decree from District Court	By Petition and Board Decision	89-6
Disposal District –1953	County Commissioners	County Resolution	No	.....	County Commissioners' Resolution	Business Choice and by Petition	89-11
Metropolitan Recreation District	District Court	Petition by 15% of taxpaying electors	Yes	Taxpaying Electors	Decree from District Court	Business and Farm Choice and Petition to Court	89-12
Metropolitan Water District	Councils of Member Municipalities	City Ordinance	No	.....	Declaration by Secretary of State	City Ordinance	89-13
Hospital District	District Court	Petition by 15% of registered voters	Yes	Taxpaying Electors	Decree from District Court	.....	89-14
Metropolitan Sewage Disposal District	City Councils of Member Municipalities	City Ordinance	No	.....	Declaration by Secretary of State	City Ordinance	89-15

Metropolitan Sewage Disposal	*	Appointment by Member Units	2 years	Discretion of Board	Appointed by Board	Appointed by Board	$60 per year	89-15

*Determined by the number of member units.

Other Recent Legislation

Exclusion of Special District Territory. Other legislation adopted in 1965 provides procedures and conditions for the exclusion of territory from special districts, other than those providing water and sanitation, when such territory has been annexed to any municipality.[23] This measure permits the governing body of the annexing municipality, the governing body of the special district, or fifty percent of the taxpaying electors of the territory so annexed to petition the court for such exclusion. Certain conditions must be met before the court may order the exclusion of territory, which becomes effective on the January 1 following the court's order. Excluded territory would continue to remain liable for its proportionate share of the district's outstanding bonded indebtedness.

List of Districts. The Colorado Tax Commission is required by a 1965 act to compile, maintain, and publish a list of all special districts organized under Chapter 89, CRS 1963.[24] Such list must include the date of each district's formation and a description of its boundaries. No organization or dissolution of any district shall be effective until notice of such action and a description of the boundaries affected are filed both with the Colorado Tax Commission and with the clerk of the county in which the action was taken.

Audits and Accounting. Special districts are also subject to the provisions of the Local Government Audit Law and the Local Government Uniform Accounting Law. Both of these laws were enacted in 1965. The audit law is much more comprehensive than the one it replaced and spells out in detail the requirements and procedures for local government audits, the duties of the state auditor, and penalties and violations.[25] The uniform accounting law is designed to strengthen local government reporting procedures and to provide uniform local government fiscal data for management and fiscal analysis and other uses.[26]

Special District Problems

Much has been written and said about the so-called "special district problem." It is actually composed of a series of interrelated problems which pose complex and difficult challenges to sound local government in Colorado. Authoritative observers of American government have long regarded special service districts as obstacles to logical governmental development. Their concern has increased correspondingly with the remarkable growth rate which single-purpose special districts have undergone in recent years, both in Colorado and throughout the nation. One noted writer has voiced his alarm at this phenomenon by referring to special districts as "the dark continent of American politics."[27]

Rate of Growth

Perhaps the most significant cause of the concern over special district governments has been the alarming growth rate of these units. Colorado is now reputed to be fourth among all the states in the rate of growth of special districts. For the most part, this rate of growth can be attributed to the formation of districts to provide such urban services as water, sanitation, fire protection, and parks and recreation. Irrigation districts, water conservancy districts, soil conservation districts, and other rural resource districts have increased little in number since World War II.

Ease of Formation

The increase in the number of special districts is attributable in part to the ease in which such units could be formed prior to the passage of the Special District Control Act in 1965. As indicated in preceding tables and comments, special districts may be created to perform at least sixteen different functions under a variety of existing laws. Some urban service districts, such as water and sanitation districts, may be organized under two or even three different statutory provisions. Some single-purpose districts may be organized by as few as three petitioners, who may even be members of the same family.[28] In one instance, a whole city was involuntarily included within the boundaries of a weed control district, notwithstanding the fact that city residents received little or no benefits and were forced to finance most of the costs.[29] Often landowners do not know that their land or homes are included within a district until receipt of their annual tax levies.

Lack of Public Responsiveness

Once formed, special service districts operate with very few operational restraints. Some districts have varying legal limitations on their authority to levy taxes or to issue bonds; many others have no such limits prescribed by statute. Generally, district directors appear to have considerable discretion and authority in levying taxes, making charges, and prescribing regulations related to the functions and services which the district is authorized to perform. The terms of office of district directors range from two to six years. There is evidence to indicate that only a small percent of the eligible voters actually exercise their voting franchise in many district elections. In some districts, elections may not be held at all.

Often people residing within a special district do not know who the district officials and employees are, so that it is very difficult to receive satisfaction on service complaints.

Responsibility of Other Local Units

Often, the formation of special districts is the only way in which urban services can be provided. Officials in some municipalities have discouraged annexation attempts or have refused to annex urban fringe areas. Some municipalities have also refused to provide municipal services outside their boundaries, thereby leaving fringe area residents no alternative but to form one or more special districts. Municipalities have occasionally been forced to form a special district to finance the construction of capital facilities which could not be built otherwise because of the constitutional limitations on bonded debt incurred by statutory municipalities. Other municipalities have become part of special districts providing water, sanitation, fire protection, or parks and recreation because of reluctance or fiscal inability to undertake such service or services solely as a municipal responsibility.

In some instances, counties have contributed to the growth of special districts by refusing or failing to adopt comprehensive county zoning and building codes which could help prevent or curb helter-skelter, leapfrog residential and commercial development. Such development, especially isolated subdivisions not located near any municipality, has led to the formation of special districts to obtain urban services.

Fragmentation of Local Government Pattern

Except for metropolitan districts organized under the 1947 law, which can combine to perform as many as eight different functions, special districts are generally authorized to perform only one or two functions and services. They are not designed nor equipped to provide a full complement of municipal services. Consequently, the creation of one special-purpose district in a densely populated area frequently encourages the creation of still another district to perform still another municipal function. This leads to what is commonly referred to as the "proliferation" of special districts, or the overlapping of one district on top of another. Such proliferation serves to discourage logical municipal annexations and municipal incorporations, which would otherwise tend to prevent the formation of additional single-purpose governmental units. The result is that special districts fragment and fractionalize the local government pattern and contribute to urban fringe area problems.

Commission Recommendations

The Governor's Local Affairs Study Commission has recommended a two-step approach to the solution of the problems related to special district governments:

First, controls should be placed on the formation of special districts to prevent the creation of illogical and unnecessary special districts. In this category are proposed districts: 1) which are located in areas that can be served adequately by adjacent municipalities or special districts either through annexation or by contract; 2) which do not have sufficient tax base or financial ability to operate the district and discharge indebtedness on a reasonable basis; and 3) which would not have adequate service standards and facilities, or whose standards and facilities would be incompatible with those of adjacent municipalities and special districts.

Second, the need for special districts to provide municipal-type services should be elminated by establishing service areas or special taxing districts directly under county government to provide these services in areas which cannot be served by municipal incorporation, annexation to an adjacent municipality, or by contracting with an adjacent municipality. After county service areas or special taxing districts are created, existing districts should be transferred to county control.

First Step

The first step was carried out when the Commission-recommended Special District Control Act was adopted in the 1965 legislative session. This law went into effect on August 1, 1965, and since that time very few special districts have been formed; those that have were required to meet the criteria set forth in the act.

Second Step

As explained in Chapter I, the second step would be easier to accomplish if the Local Government Home Rule Amendment were adopted. Further, special districts providing water, sanitation, and parks and recreation would automatically be eliminated in areas adopting the urban county form of government authorized in the amendment. Even without the constitutional changes contained in the proposed amendment, it is possible to provide for county service districts by law. It would appear necessary, however, to incorporate these service districts as separate entities, with the board of county commissioners serving as the board of directors for each one. The resulting centralized control should not only make operations more efficient but could assist in the orderly transition of these areas to municipal status when possible through annexation or incorporation.

In connection with county service area legislation, consideration should be given to broadening the special district territory exclusion law adopted in 1965. This legislation does not make it possible to sever territory from water and sanitation districts when it is annexed to a municipality. It also contains no provisions for excluding territory from special districts when it is incorporated as a municipality. Broadening the scope of this legislation would also make transition to municipal status easier to accomplish, thus promoting orderly growth and development, but care must be taken not to jeopardize the bondholders nor to leave residents in the remaining portion of the district with inadequate services or an undue financial burden.

Statutory Revision and Recodification

Some sixteen different laws in addition to the Special District Control Act, provide for the formation, powers, and functions of special districts. Most of these are contained in Chapter 89, Colorado Revised Statutes 1963, but others are scattered throughout the other volumes of the statutes. Many of the provisions of these acts are vague and contradictory and have led to much litigation. The Commission recommends that these laws be revised and recodified into a single special district law. This revision could take place in conjunction with the development of county service area legislation, so that existing districts, prior to transfer to county authority, and those districts (rural resource types) which may not be placed under county control would be covered by the revised general special district law. In completing its work, the Commission has also prepared a detailed outline of what is required in the revision and recodification of special district laws.

IV

METROPOLITAN PROBLEMS

Metropolitan Area Growth

During the first seventy years of Colorado's statehood, there was little need to be overly concerned with the problems resulting from large concentrations of population in urban areas. This was especially true since the local government needs and problems of the state's only metropolitan area had presumably been solved with the adoption of Article XX of the Colorado Constitution in 1902. This article established Denver as a home rule city and county with boundaries extensive enough to provide for anticipated future growth. Most of the larger cities also took advantage of the constitutional municipal home rule provisions, and the others usually were able to operate satisfactorily under general law. With the exception of Denver, county problems were generally rural in nature, as there were no large urbanized unincorporated areas. Consequently, there was little pressure for major changes in county government.

Since the Second World War, Colorado's population growth rate has been among the highest in the nation, and the state now has four metropolitan areas and several rapidly growing population centers. In absolute numbers, Colorado's metropolitan and urban population is small when compared with population concentrations in other parts of the country. Nevertheless, the problems are similar, even though they have not yet assumed the magnitude found in other places.

Defining Metropolitan Areas

Metropolitan areas may be defined in a number of different ways, depending on the purposes for which the definition is made and criteria used. For example, the Bureau of the Census defines a standard metropolitan statistical area as follows:

> County or group of contiguous counties which contains at least one city of 50,000 inhabitants or more or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA, [Standard Metropolitan Statistical Area] if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city.

Generally, the criteria used to define metropolitan areas fall in three major categories: 1) those dealing with economic and social relationships; 2) those dealing with physical and geographical characteristics, both natural and man-made; and 3) political subdivisions and public and semi-public organizations, the areas of which have pertinence in the delineation of a region.[1]

A partial listing of economic and social relationships would include communications (newspaper location and circulation, radio and television station coverage, telephone system), commuting area to central city, finance and trade, land use, manufacturing, population location and density, and retail areas. Geographical and physical characteristics include watersheds, topographical features such as rivers and other natural barriers, location of principal highways, and public transportation routes.[2] The boundaries of existing political subdivisions, no matter how artifically or irrationally contrived, have had a strong influence on metropolitan area definitions, and in most places, the final boundaries of a metropolitan area will run along those of some governmental unit.[3]

When a metropolitan area is being defined for the purpose of providing governmental services, additional criteria should be considered. These criteria were enumerated in a recent research report as follows:

1. The governmental jurisdiction responsible for providing any service should be large enough to enable the benefits from that service to be consumed within the jurisdiction.
2. The unit of government should be large enough to permit realization of the economics of scale.
3. The unit of government carrying on a function should have a geographic area of jurisdiction adequate for effective performance.
4. The unit of government carrying on a function should have the legal and administrative ability to perform the services assigned to it.
5. Every unit of government should be responsible for a sufficient number of functions so that it provides a forum for resolution of conflicting interests, with signifi-

cant responsibility for balancing governmental needs and resources.

6. The performance of functions by a unit of government should remain controllable by and accessible to its residents.
7. Functions should be assigned to that level of government which maximizes the conditions and opportunities for active citizen participation and still permits adequate performance.[4]

Colorado Metropolitan Areas

While the Bureau of the Census includes Boulder County within the Denver Standard Metropolitan Statistical Area for the purposes of data collection and compilation, it has been considered as a separate entity in this study and the resultant recommendations. When Boulder County is considered separately, the state has four metropolitan areas, of which the Denver metropolitan area has the largest population and the greatest number of local government units, including all or part of four counties. The other three metropolitan areas involve only a single county, except that the Colorado Springs metropolitan area includes a very small portion of Teller County west of Colorado Springs along U.S. 24. Table 10 shows the population, area, number of governmental units and other selected data for the state's four metropolitan areas.

Metropolitan Area Problems

Multiplicity of Local Governments

The Denver metropolitan area encompasses between 700 and 1,000 square miles, depending on how it is defined, and has a population of more than one million. The people living and working in this area are served by and are subject to a large number and variety of local governmental units. Included among these governmental units are: one city and county, three counties (and possibly parts of two others), twenty-one municipalities, approximately 150 special districts (providing such major municipal services as water, sanitation, recreation, and fire protection), all or part of four judicial districts, and some eighteen school districts. In addition, there are at least six private water companies supplying domestic water in portions of the Denver metropolitan area, and many private contractors provide trash and refuse collection and disposal. There are also several large and highly populated urbanized unincorporated areas.

This multiplicity of governments is the source of several of the major problems facing the Denver metropolitan area. Many areawide service and regulatory needs are beyond the ability of existing units to meet, acting individually, because they transcend local governmental boundaries.

Perhaps one of the most important consequences of the existence of a large number of local governmental units is the resulting fragmentation of attitudes toward and concern over areawide problems. This fragmentation coupled with undue emphasis on local identity has served as a barrier to areawide cooperation and coordination in meeting areawide needs.

Special Districts. Of special concern is the large number of single-purpose special districts. The large number of these districts in the Denver metropolitan area (and in other urban areas as well) is the result of: 1) urban growth in unincorporated areas, which became accelerated after the Second World War; and 2) formation of a number of small municipalities lacking the resources to provide a full range of municipal services. It is relatively easy to form a special district to provide municipal-type services, and often such districts have been incorporated by subdividers, contractors, or the first residents in an area.

The creation of these districts and the resultant outstanding indebtedness have acted as a barrier to municipal incorporation or annexation in some parts of the Denver metropolitan area, as has been true in other parts of the state. Another barrier to annexation has been the type of facilities constructed in some dis-

tricts, which are often incompatible with those in adjacent municipalities.

Because special districts are usually limited to the provision of one or two services, a suburban resident in an unincorporated area may find himself living in several of these districts and still not receive all of the municipal services he requires. It is possible for his property to be located within four separate districts, each supplying a single municipal-type service (water, sanitation, parks, and fire protection). He may also reside in a hospital district. His property may be taxed by each of these districts for operating expenses, debt retirement, or both. These tax levies are in addition to his county and school district property taxes. He may also be subject to water and sanitation service charges.

Many special districts have been formed to provide a means of obtaining services from other governmental entities. More than fifty districts purchase water from the Denver Water Board, four purchase water from Englewood, two from Littleton, one from Golden, and one from Arvada. Of the some fifty special districts presently providing sanitation services, twenty-one have contracts with Denver for sewage treatment, eight contract with metro sewer, eight contract with Englewood, seven contract with Littleton, four have interdistrict contracts, and one contracts with Thornton.

County Government. County government in its present form is not designed to deal adequately with urban problems, nor does it have sufficient powers to do so. Municipal residents and officials have opposed county efforts to provide municipal-type services to unincorporated areas on the grounds that it imposes an extra financial burden upon them. They object to supporting such functions as street maintenance and traffic control within their municipality and also having to contribute financially to their provision in urbanized unincorporated areas.

Intergovernmental Cooperation. There have been several approaches to intergovernmental cooperation in the Denver metropolitan area, but these have been only partially successful. The Inter-County Regional Planning Commission has undertaken and completed a number of regional studies and has also established a number of intergovernmental committees composed of local officials to deal with specific areawide problems. Its efforts have gone a long way in fostering regional cooperation, but the implementation of its recommendations depends on the voluntary cooperation of participating units—often a slow and unrewarding process. Other groups and organizations have also been concerned with areawide problems, such as the Urban Mayors' Association and District # 1 of the Colorado Municipal League.

Only a portion of the governmental units in the area presently participates in the metropolitan sewer district, although the number is steadily increasing. An effort was also made at meeting local government financial needs on an areawide basis through the creation of the Metropolitan Capital Improvements District, but this approach was declared unconstitutional by the Colorado Supreme Court.[5]

Core City-Suburban Relationships

There are a number of conflicts between the core city (Denver) and the surrounding suburban area, one of which in particular has had statewide ramifications.

Annexation. Because Denver is both a city and county, Denver annexations change county boundaries. In addition, Article XX, Section 7 of the Colorado Constitution requires that the City and County of Denver shall consist of only one school district. Consequently, Denver annexations reduce the land area and tax base, not only of the surrounding county affected, but of the school district or districts as well. School district officials have resisted Denver annexations for this reason and because it makes adequate planning for future educational needs difficult, if not impossible, in some instances. Residents of annexed areas often would prefer to remain in the same school districts, and some have opposed annexation for this reason. Denver school officials also have difficulty in planning and often have to provide for newly annexed areas by resorting to long distance bussing or split sessions until adequate facilities can be provided. Annexations may also result in a short-term financial burden to the city, depending on the degree of development and assessed value of the areas annexed. The city has the obligation of extending services to these areas, even if they are unable immediately to bear their fair share of the cost of providing them.

Annexation has been resisted in some areas by the defensive incorporation of municipalities; resulting in the formation of municipalities with inadequate tax base, population, or area to provide necessary municipal services.

The changes in county and school district boundaries resulting from Denver annexations caused resistance to the adoption of modern annexation legislation, considered necessary for orderly urban growth and development by municipal officials and city residents throughout the state. Two modern annexation statutes were subject to gubernatorial veto for this reason.*

**Annexation legislation was vetoed in 1961 and 1963. The Annexation Act adopted in 1965 tries to meet the Denver-suburb problem by limiting annexation which changes school boundaries, except for enclaves with 500 population or less and annexations for which the petition has been signed by 100 percent of the property owners; in all other annexations, no more than five percent of the assessed value of any school district may be annexed in any one year, and a certain ratio must be maintained between number of pupils and assessed value in each annexation.*

Core City Services. The city has continued its annexation policy because of its concern over orderly growth and development in the absence of any areawide authority and because of its facilities and services used by suburban dwellers without reimbursement, such as mountain parks, museums, and arterial streets. As the suburbs have grown and higher income groups have moved out of the city, Denver has assumed an increasingly larger proportion of the area's welfare burden, considered by many to be a metropolitan problem regardless of caseload location.*

Areawide Service and Regulatory Needs

There are several reasons why some governmental services, needs and problems, as well as certain kinds of governmental regulation and control, transcend local government boundaries in metropolitan and highly urbanized areas:

1) **Population Concentration and Location.** The changing patterns of population concentration and location in metropolitan areas tend to ignore existing local government boundaries, especially if such boundaries are fixed. Even municipal boundaries, which may be changed by annexation, generally do not expand rapidly or sufficiently enough to accommodate peripheral population shifts and growth. There is a tendency, found in virtually all metropolitan areas, for population growth continually to take place beyond the fringes of older concentrations and organized governmental units. Usually, this outward shift in population is confined to middle and high income groups, leaving the core city and other communities located near it with a high proportion of low income groups and a resulting disproportionate share of the area's social problems along with a declining or less rapidly growing tax base. Uncontrolled residential development and sprawl coupled with restrictions on the location of industrial and commercial enterprises outside of the core city have led to the creation of "bedroom" communities lacking adequate tax bases to provide needed services.
2) **Areawide Effect or Use.** There are several local government functions and responsibilities which have areawide effect or use or which cannot be carried out adequately by individual local units. Included among these are: air pollution, water pollution, other public health programs, storm drainage, transportation (primary thoroughfares and mass transit), water supply and distribution, large parks and recreational facilities, and libraries and other cultural facilities. Failure to deal with these functions and responsibilities on an areawide basis can result in ineffective control, badly planned and mislocated development, and overlapping and duplication, especially when viewed from the standpoint of overall metropolitan area needs.
3) **Equal Financial Effort and Broad Base of Support.** Areawide financial support for functions and responsibilities which transcend local government unit boundaries is necessary to assure a uniform level of service or performance throughout the area by: a) providing as broad and adequate revenue base as possible; and b) equalizing financial support throughout the area to the greatest extent possible, thereby avoiding the placement of an undue fiscal burden on any local government unit or units.
4) **"Economies of Scale" and Efficiency of Operation.** There are several functions which benefit from "economies of scale" and, therefore, should be provided areawide for economic efficiency, aside from other considerations. These include, but are not limited to, sewage collection, treatment, and disposal; water supply and distribution; refuse disposal; jail and detention facilities; and library facilities and services (larger general and specialized collections and services).
5) **Reduction in Unfair Competitive Advantages.** Tax burden differences between municipalities and unincorporated areas can result in industrial and commercial growth beyond municipal boundaries. The core city may levy a sales tax to cover increased costs resulting from the suburban migration of high and medium income groups. If other local units in the area do not levy a sales tax, or levy one in a lesser amount, commercial enterprise and growth in the core city may be hampered. These are examples of unfair competitive advantages between local government units and portions of a metropolitan area which can lead to the growth and development of some parts of the area to the detriment of others and to the area as a whole. These unfair advantages can be alleviated, at least in part, by providing and financing certain functions and services on an areawide basis.
6) **Adequate Planning for Future Growth and Development.** Each metropolitan area is in competition with every other metropolitan area in attracting industrial and commercial enterprises. The organization and provision of governmental services based on a sound and equitable tax base and comprehensive planning to make a desirable place to live and work play major roles in this competition.

**The welfare experience in the Denver area parallels that in many other metropolitan areas throughout the country, where the welfare burden and low income population have increased disproportionately in the core city.*

General Approaches to Metropolitan Problems

There are several ways to approach solutions to metropolitan area problems. One way is to attack specific problems individually, an approach which usually does not involve basic governmental reorganization and which, depending on constitutional limitations, may be accomplished through legislation. Examples of past and continuing efforts in attacking problems separately as they occur, include legislation concerning special district organization and functions, improvement in annexation laws, increased county powers, and areawide special authorities, such as metropolitan sewer districts.

The solution of metropolitan problems on an expedient, piecemeal basis is generally considered easier to accomplish than an over-all approach involving basic changes in government structure. Such expedient measures deal with immediate, more easily definable problems and generally do not infringe appreciably on authority and structure of existing local governmental units, leaving local loyalties and identification undisturbed. On the other hand, because of the interrelationship of metropolitan area problems, attempted solutions on a piecemeal, individual basis can easily result in additional and more complex problems. Such solutions are more often therapeutic than preventive, and the therapy may be directed at symptoms rather than basic causes. Further, the problems tend to outrun the acceptance or the application of the proposed solutions.

Comprehensive Approach

An alternative is to attempt a comprehensive solution of metropolitan area problems through the reorganization of local government structure and a shift in responsibility for at least some functions and services. This approach is not alien to Colorado. Article XX of the Colorado Constitution, adopted in 1902, and as later amended, created the City and County of Denver and provided for municipal home rule. This government reorganization in the state's only metropolitan area at that time provided a framework which met the area's needs until the population explosion and exodus to the suburbs which followed the Second World War. The city-county consolidation and municipal home rule concepts embodied in Article XX received national acclaim as progressive forward steps in local government, and they have served as models for other jurisdictions.

Metropolitan Plans

Over-all metropolitan reorganization can be approached in several ways. It can be limited to one area or made applicable to any area which meets certain criteria. It can be made mandatory (for example, the mandatory creation of the City and County of Denver in Article XX) for one metropolitan area and permissive in others, mandatory for all, or permissive for all. Whether mandatory or permissive, it can require a complete reorganization upon adoption, or it may be gradual in its application, while providing sufficient flexibility to become more comprehensive in the future as needs require and the area's residents determine. Reorganization may involve the shift of existing functions and services among existing units, the consolidation or elimination of units, or any combination thereof.

The different metropolitan plans considered in the Commission study cover a broad spectrum, ranging from those which would result in varying degrees of substantial local government consolidation and reorganization to others which would effect little, if any, change in local government structure. Some of these were designed for the Denver metropolitan area, others have been proposed or put into effect in other jurisdictions. These plans may be placed in six general categories according to the degree of change involved: complete consolidation, partial consolidation, metropolitan counties, metropolitan service districts, local government councils, and voluntary cooperation.

Complete Consolidation. Under complete consolidation plans, all local governments in a metropolitan area would be merged into one unit which would perform all local government functions, including those traditionally provided by county governments. (Judicial districts and school districts may retain separate identities and administration, but usually their boundaries would be coterminus with the areawide consolidated government.) Two proposals were examined which provide for complete consolidation.

Simpson Plan. The Simpson Plan, originally known as the Colorado Plan, was first proposed in 1957. Under this proposal and its later modifications, the boundaries of the City and County of Denver would be extended to encompass the major portion of the Denver metropolitan area, and the governmental units within these enlarged boundaries would be merged with the city and county. Consolidated cities and counties would also be established for the Colorado Springs and Pueblo metropolitan areas. Other areas would be permitted to adopt the consolidated city-county government form if they have a population of 30,000 or more and contain at least one municipality. The boundaries of the proposed consolidated cities and counties would include urbanized areas around the core cities which depend on the core city for their existence and to which the core city could logically extend services.

The form of government would be the same as that of the present City and County of Denver. Each city and county would constitute a separate judicial district, but school district boundaries (even in the City and County of Denver) would not be changed by the creation of a city and county, nor would they be changed by subsequent city and county annexations. Under this proposal, municipal home rule powers would be clarified, especially with respect to taxation, and home rule would be made available to all municipalities with more than 1,000 population. Home rule cities and city-county units would have unilaterial annexation powers, except that home rule cities having a population of more than 5,000 could not be annexed by a city-county unit.

Nashville - Davidson County.[6] The city of Nashville and Davidson County have been replaced by a single "Metropolitan Government for Nashville and Davidson County." The new combined government has a forty-one member council, thirty-five elected from single-member districts and six elected at large.

A metropolitan court was created to embrace the former city and county courts. City and county fiscal functions were consolidated into an integrated department of metropolitan finance. The metropolitan police department exercises all law enforcement responsibility, the county sheriff and constables retaining custody of the metropolitan workhouse and jail.

Two service districts have been established. One, a general service district is countywide and provides numerous services, including: assessment, health, welfare, hospitals, streets and roads, schools, libraries, parks and recreation, refuse disposal, urban redevelopment, planning, and building regulation. All taxpayers in the county finance these services. In addition, an urban service district was also created to provide additional services for the more urbanized areas. This district may be expanded as needed. This two-district device was designed to establish two taxation levels—one for urban areas and one for rural areas.

Executive authority is vested in a metropolitan county mayor elected at large for a four-year term, but limited to three successive terms in office. He has the authority to appoint department heads and most of the members of boards and commissions. Board and commission appointments are subject to council confirmation, in several instances by a two-thirds majority.

Partial Consolidation. This classification covers plans which would provide for the consolidation of some local government units in a metropolitan area, with the possible elimination of others. The remaining local governments might be changed in structure, functions, and responsibilities. Partial consolidation may also include a federated metropolitan area government, with the remaining local government units represented on the governing body. Two proposals for partial consolidation of local governments in the Denver metropolitan area were presented for study. Another approach, used in two Canadian metropolitan areas also may be included in this category.

Borough Plan. Under this proposal developed by Senator Joe Shoemaker, the urban areas of Adams, Arapahoe, and Jefferson counties would be joined with Denver to form one large city. This city would include the present suburban county seats of Golden, Brighton, and Littleton. Broomfield in Boulder County would be excluded, as would the northern portion (north of Parker) of Douglas County, although originally it was included.

The county of Denver would be abolished, and the new city of Denver would be divided into three boroughs (counties) which would continue to be known as Adams, Arapahoe, and Jefferson. The new three-borough metropolitan city government would be run by a mayor elected at large and a city council (or commission) of fifteen members, six elected at large and three elected from each of the boroughs. The three from each borough would have dual roles, city councilmen and borough or county commsissioners.

The boroughs would be responsible for welfare, health, public hospitals, licensing, public dumps, gravel roads, and tax collection. All other services and functions would be performed by the new metropolitan area government, such as water, sanitation, air pollution control, streets, engineering, police and fire protection, parks and recreation, planning, and property assessment.

There would be only one judicial district, whose boundaries would be coterminus with that of the metropolitan city, but school district boundaries would be unaffected.

Municipalities and special districts within the boundaries of the proposed new city of Denver would be phased out gradually and their assets and liabilities assumed by the city. Branch offices of the new government would be operated in several present municipalities: Brighton, Westminster, Commerce City, Aurora, Littleton, Englewood, Arvada, and Golden.

Sandquist Plan. This proposal was advanced in 1957 as an alternative to the Simpson Plan by Earl Sandquist, then city manager of Aurora. Under this plan, the suburban counties would be eliminated, and the boundaries of the City and County of Denver would be extended to cover the metropolitan area. Municipalities would continue to exist within the city and county and would perform local services and functions. All unincorporated territory would be required to annex to an existing municipality or to incorporate in order to receive local services. All services and functions, except those strictly local in nature (not defined) would be provided by the city and county, which would also be responsible for all traditional county

functions. A distinction would be made between the urban and rural portions of the city and county as to level of services and tax rates.

The proposed city and county would be governed by a metropolitan mayor elected at large and a council of twelve to fifteen members, nine of whom would be elected by district. Municipalities within the city and county could contract with it to provide services.

Metro Toronto and Metro Winnipeg. The metropolitan federation plans in effect in the Toronto and Winnipeg areas are somewhat related to the partial consolidation proposals. In both instances, a federated areawide government has been established and given the responsibility for several areawide functions. Local units in the area (municipalities and townships) are prohibited from performing these functions, and their assets and liabilities related to these functions were transferred to the new metropolitan government.

Metro Toronto was created in 1954, and is composed of Toronto and twleve suburban municipalities. Initially, it had areawide responsibility for water supply, sewage treatment and disposal, public housing, education, arterial highways, mass transit, metropolitan parks, certain welfare services, and areawide planning. Property assessment and police protection have been transferred to the metropolitan council, and it is now proposed that waste disposal, public welfare, and libraries become metro responsibilities.[8] A twenty-five member metropolitan council is the governing body, consisting of twelve Toronto councilmen and officials, the council chairman from each of the twelve suburban municipalities, and a chairman appointed annually by the metropolitan council. Metro Winnipeg is similar in organization and responsibilities.[9]

Metropolitan Counties. One county with a modern municipal-type government structure would be created in the metropolitan area with broad powers to perform areawide urban services and functions. The plans proposed for the Denver metropolitan area provide for the consolidation of all or the urban portions of suburban counties, and Denver would become a city rather than a city and county.

Johnson Plan. Under this proposal developed by former governor, Ed Johnson, a new county of Metro would be formed out of the City and County of Denver and urban portions of Adams, Arapahoe, and Jefferson counties. The new county would be square in shape and encompass 576 square miles. The county's governing authority would be placed in a board of county commissioners to be composed of at least seven members to be elected by districts. County employees would be placed under a merit system, and a county manager would be employed.

Metro County would have broad powers with respect to highways and streets, water, sanitation, drainage, zoning and planning, air and water pollution, recreation, health, welfare, and other functions and services.

Municipalities and special districts in existence at the time the county is created would operate as before and continue to perform all urban services and functions, except those relinquished to Metro County. In other words, the county would perform only those services relinquished to it by the municipalities, and each municipality could decide for itself what functions it wished to perform and which ones it wished to relinquish to the county. Municipalities would also be authorized to contract with the county for the performance of services and functions. This plan would establish a metropolitan county government and local government organization similar to that in effect in Los Angeles County.

Byrne Plan. Judge Edward Byrne proposed the creation of a home rule metropolitan county which would include all of Jefferson County, except the southwest portion; all of Adams and Arapahoe counties, except territory east of a line formed by extending the west boundary of Douglas County north to the Adams County-Weld County line; and the northern portion of Douglas County down to, and including Castle Rock.

The proposed Metro County would be governed by a "strong" mayor and a fifteen-member council. The mayor, five councilmen, and a controller would be elected at large. Ten council members would be elected by district. The mayor would appoint a cabinet, which would include the heads of such departments as public works, parks and recreation, budget, welfare, health and hospitals, jails and detention, and revenue. Under the public works department would be such functions as highways and bridges, traffic engineering, street lighting, and sewer and sanitation. General services and purchasing would be under the budget director, and air pollution would be a function of the department of health and hospitals. The revenue department would be charged with the responsibility of tax assessment and would collect taxes for other governmental units. The proposed county would have the authority to levy income taxes.

Municipalities within the proposed county would continue in existence with very limited functions. Special districts would ultimately be absorbed by the county government.

Miami - Dade County. [10] The Miami - Dade County Metro Board is composed of eight members, selected by district and elected at large for non-staggered four-year terms. The board selects its own chairman and vice chairman and serves as a policy-making and legislative body, with ordinance-making power. It appoints the county manager, county attorney, judges, and the clerk of the metro court. It also serves as the port authority and appoints the port

authority director. The county manager has the power to appoint and remove all administrative officers and employees of the county, subject to charter provisions and civil service rules.

This metropolitan county government has jurisdiction over all countywide functions, except state courts and schools. These include: planning, roads and traffic control, public transportation, sewer and utilities, zoning, fire and police (training, records, and communications), hospitals, health and welfare, ports (sea and air), parks, libraries and museums, building codes, and urban renewal.

The metro board is authorized by charter to take over a function from a municipality if it fails to meet minimum service standards set by the county. The municipalities retain self-determination in local matters not ceded to the county under the charter. Any municipality may request the county to take over a function upon approval of two-thirds of its governing body. The county also has some limited powers in the establishment of new municipalities and changes in boundaries of existing ones.

Metropolitan Multiservice District or Corporation. Although there are a number of variations to this approach, generally, they provide for the creation of an areawide multiservice district or corporation which would have broad powers to perform urban services and functions. Such areawide districts would take over functions performed by local government units. Under some proposals, the areawide district would be required to perform some functions, and others could be added by a vote of the electorate. Under most plans, single-purpose special districts providing services to be assumed by the areawide district would be eliminated. Two multiservice district proposals for the Denver metropolitan area were examined, as were three other plans proposed or in effect elsewhere.

Metropolitan Services District. A metropolitan services district for the Denver metropolitan area was proposed by Dr. Franklyn Newmark. The area to be encompassed would include Denver and the contiguous urban portions of Adams, Arapahoe, and Jefferson counties. Boulder and Douglas counties would be excluded. Territory might be added to the district by voluntary merger of adjacent districts, condemnation of adjacent districts, or by extending service to areas not included in any district.

The areawide services to be provided by the proposed metropolitan services district include: air pollution control, insect control, fire protection, master planning, libraries, parks, sanitation, storm drainage, trash and garbage disposal, traffic engineering, and water. Counties and municipalities would continue to provide public health, police protection, recreation, roads and streets, street lights, welfare, and zoning.

The metropolitan service district would be financed through service charges and property and sales taxes. In this connection, the establishment of uniform assessment practices and the adoption of necessary enabling provisions to make the imposition of a sales tax possible were recommended.

All special districts within the area encompassed by the metropolitan service district would surrender their functions to the areawide district, which would be given the power of condemnation, and no new district could be formed. New areawide services could be provided only upon approval of the district's taxpaying electors. The district would be governed by an elected board of directors consisting of one representative from, and elected by, each municipality. Persons in unincorporated areas would be represented by a director elected from each county. Each director would cast a vote proportional to the number of people he represented and would serve full time. The directors would employ professional, technical, and other personnel.

Metropolitan Municipal Service Corporation. A single metropolitan service corporation composed of Denver and the urban portions of Adams, Arapahoe, and Jefferson counties was recommended by Congressman Roy McVicker. Under this proposal, the metropolitan service corporation would be assigned one or two areawide functions initially, with others to be added as determined by the residents within the boundaries of the corporation's service area. The municipal service corporation would also be authorized to provide services on less than an areawide basis and to control municipal annexations. Existing local government units would be retained, but special districts would be phased out. The functions to be provided by the corporation would be financed by service charges.

Seattle - King County. The municipality of Metropolitan Seattle was established in 1958 under a 1957 statute enabling municipalities to act jointly to meet problems and perform services not provided adequately by existing local governments. It presently provides sewage disposal and water pollution control in an area entirely within King County. The statute also permits local communities to add several functions to the metro district, including planning, transportation, water, parks, and garbage disposal.

The district is governed by a council of sixteen members, consisting of fourteen elected officials from participating municipalities, one King County commissioner, and an additional person (not an elected official) chosen by the other fifteen to act as chairman. The district has no direct taxing powers. It may accept federal grants, borrow from other local governments, and issue revenue bonds for capital improvements. Revenue to finance operations, maintenance, and debt service comes from service charges imposed on a per household basis. The district may also obtain supple-

mental income from participating municipalities and King County. Such income payments are based on the participating unit's proportionate share of the total assessed value of the district within its boundaries.

St. Louis - St. Louis County The "Greater St. Louis City-County District" proposal was voted upon and defeated in 1959. It was designed to serve St. Louis and St. Louis County, which are non overlapping jurisdictions. It provided for direct election of the fifteen-member board of supervisors. The district was to assume areawide responsibility for seven functions: 1) establishment and control of a metropolitan road system; 2) regulation of mass transit facilities; 3) promotion of economic development; 4) preparation of an areawide comprehensive master plan; 5) central control of police training and communication functions; 6) civil defense; and 7) sanitation and land drainage. In assuming the responsibility for sanitation and drainage, the proposed district was to absorb the Metropolitan St. Louis Sewer District, which had been created by a special election in 1954.

Purely local aspects of these functions were to continue to be a responsibility of the existing municipalities and St. Louis County, and new functions could not be added either by vote of local governing bodies or by the electorate.

California Proposal In 1960, the Governor's Commission on Metropolitan Area Problems (California) recommended enabling legislation which would permit the establishment of a multipurpose district by the majority vote of the electorate within a metropolitan area. The district would be governed by a council selected by (and from the membership of) the governing bodies of the participating counties and municipalities. Such districts would be required to provide metropolitan planning and one or more other functions. After establishment of a district, additional functions could be undertaken by a majority vote of the electorate, and separate metro districts in the area would be forbidden. Legislation was considered in 1961, but was not adopted.

Local Government Councils. Local government councils usually are voluntary associations of elected public officials from most or all of the governments of a metropolitan area, formed to seek a better understanding among the governments and officials in the area, to develop a consensus regarding metropolitan needs, and to promote coordinated action in solving problems. Intergovernmental agreements for joint conduct of activities in research and planning and deliberations on issues of areawide concern are fostered by such councils.

Although the councils vary as to method of establishment and membership, they usually have these characteristics: 1) They cut across or embrace several local jurisdictions, and sometimes do not stop at state lines. 2) They are composed of the chief elected officials of the local governments in a metropolitan area and sometimes have representation from the state government. 3) They have no operating functions. Rather, they are forums for discussion, research, and recommendation only. Recommendations are made to the constituent governments, or to state legislatures. 4) They are multipurpose, concerning themselves with many areawide problems. 5) They may employ full-time staffs.

The eight oldest and most active councils now in existence are: Supervisors Inter-County Committee (Detroit area); Metropolitan Regional Council (New York, New Jersey, Connicticut); Association of Bay Area Government's (ABAG) (San Francisco area); Mid-Willamette Valley Intergovernmental Cooperation Council (Salem, Oregon area); Regional Conference of Elected Officials (Philadelphia area); the Puget Sound Governmental Conference (Seattle-Tacoma area); and the Baltimore Metropolitan Area Council. Councils were recently formed in the Ithaca, New York, and Des Moines, Iowa, areas.

Informal Cooperation. Existing intergovernment organziations and ad hoc arrangements would be utilized to foster cooperation on an areawide or more localized basis when it is in the interest of the participants to do so. This approach can be effective when dealing with problems concerning only a portion of a metropolitan area, such as street numbering systems in adjacent municipalities or the sharing of facilities between municipal and county courts. It has limited application to areawide problems other than to provide a forum for discussion.

Choosing The Basic Approach

General Criteria

In selecting the basic approach to be followed in meeting local government needs and problems in the Denver metropolitan area, the following criteria were used:

1) relationships and balance between the core city and suburban areas;
2) need for areawide services and functions;
3) proper balance between consolidation or merger and preservation of local identity;
4) financial resources and equality of tax burden;
5) simplification of local government structure, including reduction in number of existing units and limitation on new units; and
6) future growth and development, not only in the Denver metropolitan area, but throughout the entire region from Fort Collins-Greeley to Pueblo, and in other parts of the state as well.

The general concepts of partial consolidation, a metropolitan multiservice district, a metropolitan or urban county, and various combinations of these general concepts were considered in light of these criteria.*

Partial Consolidation

There are several advantages to partial consolidation: The number of local government units in the Denver metropolitan area would be drastically reduced, local government structure would be substantially simplified, and a mechanism would be created for the areawide provision of services and functions and the areawide application of revenue sources. The application of this concept, however, appears limited to the Denver metropolitan area and, therefore, would not provide a general means of meeting emerging metropolitan needs in other parts of the state. Further, the drastic elimination of local government units and the substantial alteration in the functions of those units make it likely that partial consolidation would be as acceptable as proposals for the complete consolidation of all metropolitan area governmental units.

Metropolitan Multiservice District

The creation of an areawide multiservice district to meet metropolitan needs has considerable merit. The major advantages of this approach are:

1) It would cause the least disruption to the existing local government pattern.
2) The enabling constitutional provision possibly could be relatively simple and short, with detailed implementation left to the General Assembly.
3) Boundaries would not have to be determined precisely either by the constitution or the statutes. Service areas could be quite flexible and easily changed.
4) The multiservice district concept could be applied in other areas.
5) It could provide a gradual means of developing areawide cooperation and identification of interest.

On the other hand, there are a number of major difficulties and problems related to the multipurpose service district approach, such as the following:

1) **Quid Pro Quo Between Core City and Suburbs.** This problem does not appear susceptible of solution if the district initially were to provide only one or two services (such as water and sewer). To create a proper balance between Denver and the suburbs in this respect, it would be necessary to include services and functions on an areawide basis which are not usually provided by metropolitan districts (at least those in operation elsewhere), such as welfare and arterial roads and streets.

2) **Addition of Services and Functions at a Later Date.** The point of view has been expressed that a multiservice district should start with only one or two services, with others to be added from time to time upon vote of the electorate. It does not appear too likely that suburban voters would approve adding a service or a function which would benefit the core city primarily while increasing suburban costs. This is an important consideration in determining the services and functions to be provided initially, because the suburban population is growing at a much more rapid rate than the core city's and, in the aggregate, will be larger than the core city's in the not too distant future.

3) **Ordinance Making and Enforcement Authority.** Special districts in Colorado have not had ordinance-making or enforcement authority (although there is some hint of these powers under certain circumstances in the Metropolitan Districts Act of 1947). This could be a serious problem, depending on the services to be provided by a multipurpose district. If these were lim-

*Complete consolidation was not considered, because of suburban opposition to the expansion of the City and County of Denver to encompass the entire metropolitan area. Creation of local government councils was not considered sufficient to meet the problems of Denver and other metropolitan areas, and the Inter-County Regional Planning Commission's functions in many respects are similar to those of a local government council.

ited to services for which charges are usually made and for which the district would normally be expected to set standards, such as water and sewer, there might be no problem. If other functions were included, such as air and water pollution control, then legislative and enforcement authority become matters of serious concern. The alternative to giving the district such authority would be to leave it with participating units. The latter approach would have the virtue of not complicating and compounding present jurisdictional problems, but would leave several questions unanswered: How could the district require compliance from local units, and should it be able to do so? How effective would such an arrangement be? How could local units be penalized if they did not comply?

4) **Equality of Tax Base and Areawide Taxing or Revenue Authority.** Counties are authorized to assess property and collect property taxes for other jurisdictions as well as the county itself. Even if the district is given the power to levy a property tax, it is unlikely that the assessing function would be transferred. Consequently, even if the district has an areawide levy, it would be applied to property which might be assessed at different levels. The revenue and tax levying relationship between a multipurpose district and other local units also raises several questions. Should the district have taxing authority presently denied to other local units or a significant portion of them (such as income and sales taxes)? If given such authority, should it be exclusive among local units in the area served by the district (allow no other local unit to levy sales tax, for example), or should it be in addition to that of local units? Should the district levy taxes or make charges directly against individuals, or should such assessments be made against participating units?

5) **Planning and Coordination.** It would be difficult for a multiservice district to provide areawide planning and coordination, except for those functions and services to be performed by it, even if it replaced the Inter-County Regional Planning Commission in the Denver metropolitan area (or regional planning commissions in other areas). It is unlikely that existing local units would be willing to give a multiservice district the implementing authority which the Inter-County Regional Planning Commission and other regional planning commissions presently lack.

6) **Annexation.** Unless the district were given specific authority to control annexations, this approach would not provide any solution to this problem in the Denver area,* in and of itself. It is unlikely that Denver would accept a multiservice district having control over annexations, especially if the functions to be provided by the district require Denver facilities, personnel, and equipment to be successful. It could be accompanied, however, by a proposal to amend Article XX. In this connection, three alternatives are possible:

a) elimination of the requirement that territory annexed to Denver shall become part of the Denver school district;

b) provide that Denver annexations must be approved by the governing body of the county affected; or

c) provide that territory annexed to Denver shall not alter either school district or county boundaries.

The first alternative is generally acceptable to suburban school districts, but has been objected to by county officials because suburban counties would still be subject to tax base loss. The second alternative has been strongly opposed by the City and County of Denver, because the effect would be to freeze Denver's boundaries while residential, industrial, and commercial growth continues in the surrounding areas. The third alternative would result in an administrative nightmare in that Denver would be both a city and county and a city, and its county and municipal jurisdiction would no longer be coterminus.

7) **Multiplicity of Local Governments.** The creation of a multiservice district would add another local government layer to an already confusing and complicated pattern. Depending on the functions to be performed by the district, other areawide entities could be expected to multiply on a formal or informal basis to deal with particular problems (e.g., metropolitan stadium), nor would the special district problem be solved, particularly in unincorporated newly urbanized areas which would require services not provided by the areawide district. It would appear that the continued formation of special service districts under such circumstances would be a necessity, unless these areas were forced to annex or incorporate.

Because of these problems, a multiservice district limited to one or two functions or services would not meet the area's needs. If functions, services, and authority were added to the extent necessary, the re-

This problem may have been alleviated, at least in part, by the Municipal Annexation Act of 1965.

sult would no longer be a multiservice district as it is generally known, but an areawide formal governmental unit. Such a formal areawide government should not be superimposed upon the existing pattern of counties, municipalities, and districts, but rather, the existing pattern should be altered to meet areawide needs.

Urban or Metropolitan County

The metropolitan or urban county offers an approach to areawide problems and needs which would result in less drastic local government alteration and merger than would occur under partial consolidation. This approach also has the advantage of using a traditional formal structure to serve as a basis for adaptation to urban conditions and needs, which is not true of a metropolitan multiservice district. Such adaptation is necessary, because the traditional form of county government is not able to cope with urban problems. In addition, a reduction in the number of counties with urban functions in the Denver metropolitan area, is desirable to develop an adequate areawide governmental framework. Metropolitan problems would be further complicated if Denver and the tri-counties all had home rule authority with the structure and powers to perform urban functions.

The following table shows present traditional county services and functions and how they might serve as a basis for areawide urban services and functions:

Present County Functions	Possible Urban Adaptation
1) Welfare	Consolidate services and equalize burden.
2) Property Assessment and Property Tax Collection	Basis for areawide property assessment and tax, could continue to collect for other local units; basis for other possible taxes.
3) County Roads and Bridges	All roads, streets, and bridges (or primary thoroughfares); construction, maintenance, traffic engineering, possible sweeping, lighting, and snow removal.
4) County Airports	Air terminal facilities and existing county airports, possible future feeder airports.
5) Erection of Public Buildings	County buildings, including sub-offices, convention and cultural facilities.
6) Law Enforcement (Sheriff)	Enforcement of county ordinances, law enforcement in unincorporated areas, basis for later provision of areawide police protection services, if desirable.
7) Jail and Detention Facilities	Jail and detention facilities could be consolidated on areawide basis, municipalities could use areawide facilities.
8) Public Health (Also hospitals in counties with countywide hospital districts)	Areawide provision of all public health services, including air and water pollution, inspections, etc., could also include public hospitals.
9) Planning and zoning (unincorporated areas)	Continue in unincorporated areas, eventual countywide planning, if desired, municipal zoning could remain under local control in accord with overall plan.
10) Building Code (unincorporated areas)	Continue in unincorporated areas, possible minimum standards which could be augmented by municipalities.
11) Libraries	Basis for integration of areawide library services and facilities.

In addition, an urban or metropolitan county provides the structure for the areawide performance of other functions which traditionally have been provided locally by municipalities and special service districts. Among these are water supply and distribution, sanitation collection, treatment, and disposal; parks and recreation, storm drainage, and trash and refuse disposal.

Municipalities could be barred from performing services for which an urban county would have areawide responsibility, and special districts providing these services could be eliminated with the urban county acquiring the districts' assets and liabilities. Municipalities would continue to exist within urban counties, and new ones could still be formed. Under this arrangement, municipalities would still have the responsibility for local functions and services, such as business licensing and regulation, franchises, police and fire protection, trash collection, local parks, playgrounds, and recreation programs.

Application of the urban county concept would result in a basic two-level government structure in metropolitan areas, with each level having specific responsibilities to avoid overlapping and costly duplication.

New Concept. The urban county approach as outlined above represents a new local government concept in Colorado. It combines several features of all three general metropolitan reorganization concepts considered. Some governmental units (special districts) would be consolidated with the county, and the functions of others (municipalties) would be altered. These changes changes are similar to provisions of the proposals for partial consolidation. The provision of certain municipal-type functions by one unit on an areawide basis incorporates the major feature of the multiservice district proposals. The basic governmental framework is drawn from the several metropolitan and urban county plans.

Commission Recommendations

Reasons for Adoption

The Governor's Local Affairs Study Commission adopted the urban county concept because a more limited approach will not solves the problems of a multiplicity of governments, fragmentation of tax base and interest, and core city annexations in the Denver area, nor will it provide a broad range of areawide services and functions. Neither will a more limited approach meet needs resulting from anticipated future regional growth in the area from Fort Collins and Greeley on the north to Pueblo on the south, and possible urban growth elsewhere in the state. An approach involving even greater consolidation would not be easily applicable elsewhere and would go too far in destroying local identity.

Specifically, the urban county appears to be the best approach of those considered to meet the criteria used in selecting the basic approach.

1) **Relationships and Balance Between Core City and Suburbs.** While core city services and facilities would serve as a basis for several areawide functions needed by the suburbs, the core city would also receive financial relief for some functions and facilities which now have areawide application or use but which are presently supported by the core city. In addition, the present annexation barrier and related problems in the Denver area would be removed.

2) **Need for Areawide Services and Functions.** The urban county provides an adequate organizational framework to provide and finance areawide services and functions.

3) **Balance Between Consolidation and Local Identity.** While counties would be merged and special districts generally consolidated with the county, municipalities would remain and would still perform necessary functions and exercise police powers, although not as extensively as at present.

4) **Financial Resources and Equality of Tax Burden.** The urban county provides an entity for the assessment of property and the levying of taxes and service charges throughout the area.

5) **Simplification of Local Government Structure.** The number of governmental units would be reduced and special districts would be virtually eliminated. Areawide functions would be centered in one government unit, eliminating the need for independent and quasi-independent boards and commissions for specific areawide functions.

6) **Future Growth and Development.** Urban needs could be met on an areawide basis throughout the populous eastern slope region by a series of approximately five urban counties, ultimately stretching from Fort Collins on the north to Pueblo on the south. The urban county concept could also be applied in other areas of the state as needed. It would also be easier for a smaller number of units to cooperate on the solutions to problems that transcend even urban county boundaries, such as water pollution, which affects a whole drainage basin.

Application of Urban County Concept

Permissive Adoption. Much study and consideration was given to the application of the urban county concept both in the Denver metropolitan area and in other parts of the state. The decision was made that the urban county form of government should be made available on a permissive basis throughout the state to those areas which meet certain minimum criteria. This would leave the decision to adopt this new local government concept to the residents of each area affected, rather than having it imposed by constitutional mandate.

Other Local Government Units. Existing school districts and judicial district boundaries would not be affected or altered by the formation of an urban county. These governmental subdivisions could still be altered or consolidated under applicable statutory and constitutional provisions in the same way as if an urban county had not been formed. Special districts providing services other than those to be assumed by an urban county would continue to exist and new ones could be formed subject to the appropriate statutory provisions.

Form of Government and Officials. The urban county form of government should be similar to that of large municipalities because of the similarity in services and functions. The urban county board of supervisors or council should be the county legislative body and should be the same size as or slightly larger than the typical city council. An urban county could have an elected or appointed chief executive. Each urban county should also determine for itself the number, duties, and compensation of other officials, boards, and commisions as well as the election or appointment of such officials, boards, and commissions.

Urban County Services. An urban county should perform all traditional county functions such as property assessment, public welfare, public health, tax collection, etc. In addition, an urban county should per-

form municipal-type services which have areawide application, such as water, sanitation, and parks and recreation. Initially, these services should be limited to five or six of the most important, but it should also be possible to add services if the residents of an urban county so desire.

Local Government Home Rule Amendment

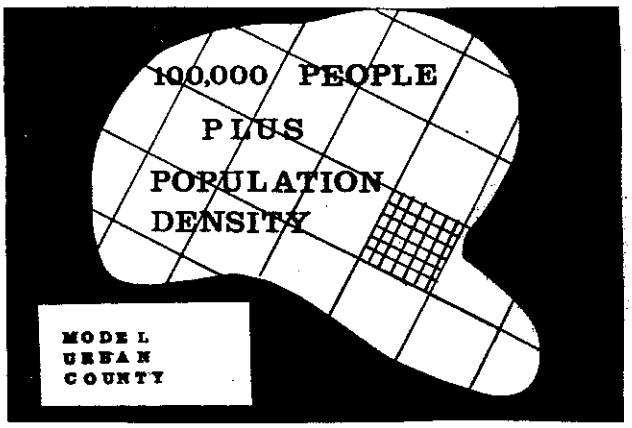
Three sections of the Local Government Home Rule Amendment provide for the creation, organization, and authority of urban counties. These sections would become Sections 5, 6, and 7 of Article XX. The urban county represents an adaptation of a traditional form of local government—the county—to meet the needs for areawide services in heavily populated areas, while at the same time retaining local (municipal) control over other services and local identity.

In other words, the urban county approach would provide two levels of local government in metropolitan areas, the county and municipalities, each level with clearly defined powers and responsibilities. Most special districts would be eliminated, as explained below, and school districts and judicial districts would not be affected.

Formation Standards. It should be clearly understood that adoption of the urban county form of government is permissive and not mandatory. It must be initiated by residents of an area in much the same way that a municipal home rule petition is initiated. The following standards must be met, however, in the formation of an urban county:

1) The area to be included within an urban county must have a population of at least 100,000 and an aggregate population density of at least 100 persons per square mile. (See Figure O.)
2) No municipality may be divided by an urban county's boundaries. A municipality must be entirely within or outside of an urban county.

FIGURE O
URBAN COUNTY FORMATION STANDARDS



3) Urban counties may be formed out of all or parts of one or more counties, provided that all the area included must be adjoining compact territory, containing no enclaves.
4) An urban county may include all or part of one or more judicial districts, and the creation of any urban county would not affect or alter the boundaries of existing school or judicial districts.
5) Any urban county formed in the Denver metropolitan area would have to include the City and County of Denver and territory containing at least 100,000 people from each of the three surrounding counties.

Each county or portion thereof, included within an urban county, would be represented on the urban county charter convention in relation to its proportion of the urban county population. Failure to approve a charter within two years of an urban county's formation would cause it to be dissolved.

Legislative Districts. An urban county would be subject to the same legislative subdistricting provisions as all other counties, but if there were no such constitutional provisions, an urban county would still have to be divided into representative and senatorial districts by the General Assembly.

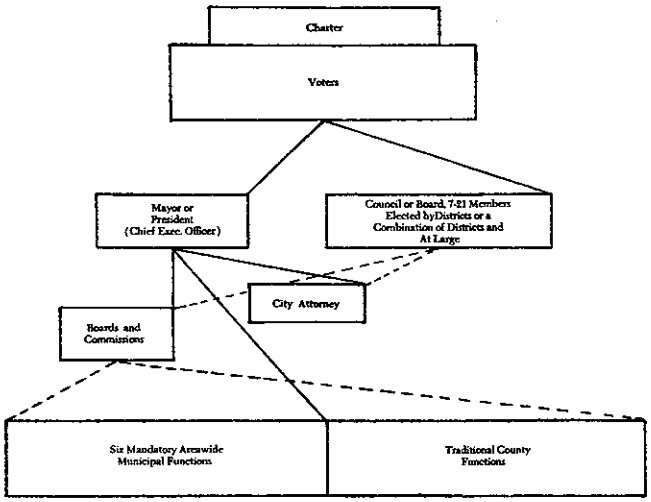
Form of Government. Urban counties would be required to have a municipal-type government, with a council or board of supervisors of at least seven and no more than twenty-one members as provided by charter. Urban counties would also be required to have an appointed or an elected chief executive. All other officials, boards, etc., and their salaries would be provided by charter and ordinance. An example of urban county government organization is shown in Figure P.

Urban County Functions. In addition to all traditional county functions, an urban county would be vested with the sole and exclusive authority for performing the following municipal-type functions throughout the county in both incorporated and unincorporated areas:

1) domestic water supply and distribution;
2) sanitary and storm sewer collection, treatment, and disposal;
3) airports and air transport facilities;
4) trash and refuse disposal (but not collection);
5) library facilities; and
6) park and recreation facilities and services (except that municipalities could own, maintain, and operate local parks and recreation programs).

In addition, an urban county would have the sole and exclusive responsibility to provide such additional functions and services throughout the county as may

FIGURE P
POSSIBLE URBAN COUNTY GOVERNMENT ORGANIZATION UNDER PROPOSED LOCAL GOVERNMENT HOME RULE AMENDMENT



be authorized for all urban counties by the General Assembly and expressly provided in the urban county charter. In other words, before an urban county could perform an additional areawide function, it would have to be authorized by the General Assembly and approved, either as an amendment to an urban county charter, or by inclusion in the charter initially.

This provision provides flexibility to meet changing conditions and needs without further constitutional amendment, while at the same time providing safeguards by assuring that decisions on additional areawide services are made by the residents of an urban county.

All other municipal functions would continue to be performed by the cities and towns within an urban county.

An urban county would assume all of the assets, rights, and liabilities connected with the services it is required to perform. The procedures for transfer, adjustment, and orderly transition between an urban county and the municipalities within its boundaries would be provided in the urban county charter.

Home Rule Powers. It is important to note the major difference in home rule powers given urban counties and municipalities. Urban county home rule powers of government and taxation would be confined to those functions of a municipal nature which it is required to perform throughout the county. These powers would also be subject to express denial or limitation by the General Assembly. As indicated previously, home rule municipalities would have all powers of government and taxation not expressly limited or denied by the General Assembly. Limitation was placed on urban county powers to preserve the existence of municipalities within urban counties, while at the same time providing for the home rule authority of each.

In a further attempt to avoid jurisdictional conflicts between an urban county and the municipalities within its boundaries, the amendment expressly provides that a home rule municipality within an urban county shall not perform any function or service for which the urban county has the sole and exclusive authority (except local parks and recreation programs).

Implementing Legislation

The outline below lists the basic legislation necessary to implement the Local Government Home Rule Amendment. This outline covers other portions of the amendment as well as the provisions relating to urban counties. Considerable preliminary work on this legislation has been completed by the Commission.

Urban Counties.

1) Procedures for urban county formation, charter delegate election, charter convention, charter election, subsequent elections, and conventions, etc.
2) Provision for the transfer and transition of territory not to be included within urban county boundaries
3) Provision for the transfer or adjustment of assets, rights, and liabilities between urban counties and other counties to or from which territory has been transferred
4) Provision for financial adjustment and service arrangements between urban counties and special districts divided by urban county boundaries
5) Urban county annexations; standards, limitations, procedures, relationship to municipal annexation statutes
6) Urban county extraterritorial powers
7) Restrictions on urban county powers
8) Modifications in traditional county functions as they might apply in urban counties, such as planning, zoning, building codes, jail facilities, and roads and bridges
9) Authorization for additional urban county areawide services and functions, if any
10) Definition of municipal (local) park and recreation programs
11) Charter amendment and revision procedures

Home Rule Municipalities.

1) Procedures for becoming a home rule municipality, charter delegate election, charter conventions, charter election, subsequent elections, and conventions, etc.

2) Restrictions on the powers of home rule municipalities
3) Municipal extraterritorial authority
4) Charter amendment and revision procedures

Non Urban Home Rules Counties.

1) Procedures for becoming a non urban home rule county, charter delegate election, charter convention, charter election, subsequent elections, and conventions, etc.

Elected Officials in Statutory Municipalities.

1) Provision for length of terms
2) Provision for overlapping terms

Municipal Debt Limits.

1) Debt limit as proportion of assessed valuation
2) Annual levy limit, if any, to retire indebtedness
3) Time limits, if any, on terms of indebtedness.

V

INTERGOVERNMENTAL RELATIONS

Introduction

The term "intergovernmental relations" has many meanings and encompasses a broad range of governmental activities. It cover relationships between different levels of government, such as federal-state, state-local, and federal-local. It also applies to relationships among comparable governmental units, such as interstate compacts or cooperative or contractual arrangements in which several local governmental units may participate. Grants-in-aid and other financial assistance programs constitute a very important aspect of intergovernmental relations. These have been the subject of much study since World War II, because of the fiscal and administrative impact of federal aid programs on state and local governments and of state aid programs on counties, municipalities, and school districts.

This chapter and the next are concerned primarily with intergovernmental fiscal relations, including the financial impact of federal aid programs in Colorado and the fiscal and administrative implications of state-local relationships in three important functions: public welfare, judicial administration, and highway and street construction and maintenance. Two other important facets of intergovernmental relations are also covered in this chapter: the state's over-all role and responsibilities (non fiscal) to local governments and contractual and cooperative arrangements among local governments.

Federal Grants-In-Aid in Colorado

Historical Development of Federal Grants

During the first 125 years of the nation's existence, almost all federal grants to the states were for educational purposes, most of them in the form of land grants. The reservation of land for educational purposes was a common practice in the thirteen colonies, and the Northwest Ordinance of 1785 set aside one section of every township for the "maintenance of public schools within the said townships."

Beginning with Indiana's statehood in 1819, large areas of the public domain were reserved by the United States Congress for public education. In the last territories to achieve statehood, four of every thirty-six sections of public land in each township were set aside for elementary and secondary education. Nor was higher education ignored. In 1787, the continental congress gave each state two townships for university purposes. The Morrill Act of 1862 established land grants for colleges of agriculture and the mechanic arts, with the proviso that these colleges must also offer instruction in military science.

Federal grants to states prior to 1900 also included: 1) distribution to the states in 1836 of the federal treasury surplus; 2) aid for state and territorial homes for disabled soldiers and sailors, introduced in 1888; 3) distribution of funds and earmarking of land grants to states for specific canal and road projects, such as the Cumberland Road, which helped to open Ohio, Indiana, and Illinois; 4) land grants to railroads which aided states, territories, and municipalities indirectly by requiring the connection of certain cities and regions; 5) annual grants of books and apparatus for the education of the blind, beginning in 1879; and 6) annual recurring money grants to states starting in 1887 for agricultural experiment stations.

Start of the Modern Federal Grant Era. Generally, these early forms of federal assistance did not impose conditions or standards for performance. With the passage of the Weeks Act in 1911 providing grants for forest fire prevention, and the Federal Aid Road Act of 1916 for the construction of rural post roads, uncontrolled federal assistance was discontinued. Federal grants since that time have generally required conformance to the standards established by the supervisory agency and submission to federal inspections and program controls. In addition, state financial participation has usually been required.

Other federal aid programs inaugurated or expanded prior to the depression included: maternal and child health aid, vocational rehabilitation, vocational education, venereal disease control, marine schools aid, and agricultural extension work.

Depression Impact. The depression had a tremendous impact on federal grants and assistance. From $2.8 million in 1900, grants increased to more than $2 billion in 1935, when emergency federal aid for highways,

relief, and public works programs reached its peak. Though the amount declined in the following years, it still totaled $758 million in 1945.

More significantly, it was during the depression that many of the programs were conceived which have become a permanent part of federal grants-in-aid. Included among these are: the several categorical public welfare programs, public health, maternal and child health, assistance for public works, school lunch program, and grants for state employment service operation. These programs generally were inaugurated in the latter part of the 1930's and were the outgrowth of the emergency programs designed to assist states and local governments in meeting relief and unemployment needs from 1933 to 1935.

Postwar Period. Immediate postwar developments in federal grants were largely an extension of prewar trends, although many new programs were inaugurated and others extended. Highway, airport, hospital, and public health center construction were all the subject of legislation and increased appropriations immediately after World War II. Public health, mental health, and public welfare grants were also expanded, and new programs were incorporated. All of these programs and the ones which followed during the next few years set the basis for the wide variety of present federal grants-in-aid and assistance programs.

Legal Authority for Federal Grants-in-Aid

Constitutional Basis. The legal justification for federal grants-in-aid rests on Article 1, Section 8 (1) of the United States Constitution, which states:

> (1) To levy and collect taxes, duties, imposts and excises; to pay the debts and provide for the common defense and *general welfare of the United States;* but all duties, imposts and excises shall be uniform throughout the United States. (emphasis supplied)

Under the "general welfare" clause, the national government has entered a number of fields, despite the fact that most programs receiving grants-in-aid are not specifically enumerated among national government powers.

Challenges and Disagreement The legal basis for federal grants-in-aid has been subject to a number of challenges throughout the years. As early as 1854, President Franklin Pierce vetoed a grant of ten million acres of public land to the states for the care and treatment of the indigent insane. His veto message to the Senate specified four reasons for his disapproval of the measure:

1) If the national government accepted responsibility for the indigent insane, the way would be clear for national assumption of responsibility for every other citizen suffering from some infirmity, an area long within the traditional and legal responsibility of local units of government.
2) The United States Constitution permits the federal government to exercise only enumerated powers, reserving to the states all other governmental powers not expressly denied to them (Amendment X, United States Constitution). Care of the indigent insane is not such an enumerated power.
3) The "general welfare" clause of the United States Constitution is not a substantive grant of authority, but is a limitation on the power to tax. If it were otherwise, the careful delineation of federal powers would be meaningless.
4) There is no substantial difference between a direct appropriation of money and a grant of land for specific purposes, such as the care of the indigent insane. Congress lacks authority to appropriate monies for the support of general state government.

In recent years, opponents of federal grants-in-aid have contended that not only does Congress lack authority to provide for the many programs undertaken, but that the basic federalism established by the United States Constitution is threatened by national interference with state government though grants-in-aid.

The major arguments against the legality of federal grants-in-aid were submitted in one of the landmark supreme court cases on this subject. In 1936, the United States Supreme Court upheld the constitutionality of unemployment compensation grants-in-aid provided for by the Social Security Act of 1935.[1]

In this case, the supreme court also disposed of arguments concerning the right of congress to tax a privilege created by state law, the uniformity of the employment tax, and the legitimacy of such a tax. Turning to national-state relations and the application of the general welfare clause, the supreme court, in summary, stated:

The employment tax does not constitute coercion of states, nor does it destroy or impair the autonomy of states in violation of the Tenth Amendment or in contravention of the restrictions implicit in the federal form of national-state government. In a crisis so extreme (unemployment), the use of national funds to relieve the needs of the unemployed and their dependents has as its purpose the promotion of the general welfare. Failure of the states to enact unemployment legislation through fear of economic disadvantage laid a disproportionate burden at the doorstep of the national government.

Intervention of the national government, was conditioned on the need to protect the resources of the national government on one hand, and on the other, to place all the states on an equal footing from an eco-

nomic standpoint. The federal legislation constitutes an attempt to provide a framework within which all public agencies responsible for relief might work.

The administrative conditions established by the unemployment compensation provisions are so far-reaching as to require the surrender of some state powers which are a part of their traditional quasi-sovereign existence. Equity would demand that the unemployed seeking relief under state law should receive similar kinds of treatment in all states. Each state may provide for unemployment compensation plans which differ considerably from those of other states. A state adopting an unemployment compensation plan is seeking and obtaining a credit of millions of dollars in favor of her citizens from the national treasury. There is no prohibition under our federal system against a state assenting to conditions which will assure a fair and just requital for benefits received.

Several similar test cases were filed, and the United States Supreme Court handed down decisions similar to that rendered in the Steward Machine Case and for the same reasons.[2] Since that time there has been no serious challenge of the legal validity of federal grants and assistance programs.

Federal Aid and Colorado Law

Colorado statutes governing state and local government acceptance of federal aid vary considerably in content and detail. Many of these statutes are extremely flexible, so that revision is not required by the frequent amendment of federal law and the continuous revision of regulations by federal supervisory agencies. Many of these statutes contain very general provisions, for example, the State Board of Health shall exercise the following powers:

> (8) To accept and, through the division of administration, to use, disburse and administer all federal aid or other property, services, and moneys allotted to the state department of public health for state and local public works or public health functions, . . .[3]

Such general provisions make it possible in many instances for the state to accept and participate in new or expanded federal programs without requiring additional statutory authorization.

The laws relating to federal aid programs administered under state control are, of necessity, more detailed than those in which the state merely acts as a disbursing agent or which provide direct authorization to local units to participate in federal grants. In this category are those applying to various welfare programs and those requiring the state to establish specific boards or other administrative mechanisms in order to be eligible for federal grants, such as the creation of the state advisory hospital council in connection with the distribution of Hill-Burton funds for hospital and health center construction.

Statutory provisions for state participation in federal aid programs cover the following broad fields: agriculture, welfare (including hospital construction and air and water pollution), mental health, highways, mental retardation, academic education, vocational education, rehabilitation, planning, and airports.

In addition, there are a number of statutes authorizing local governments to participate directly in federal grants. Counties are authorized to accept grants for airports, planning, and housing for agricultural workers. Municipalities are authorized to participate in the following federal aid programs: urban renewal, water pollution control, sewer system construction, planning, public housing, and airports. In some instances the statutes provide for joint city-county participation, for example, planning and airport construction. There are also a number of statutes authorizing special districts to participate in federal aid programs. Included are metropolitan districts, water and sanitation districts, fire protection districts, recreation districts, hospital districts, water districts, metropolitan sewage disposal districts, conservancy districts, soil conservation districts, irrigation districts, and the Moffat Tunnel District.

Federal Aid Received in Colorado

Total Federal Aid. Federal aid received by Colorado for all purposes (not including grants to local governments) increased from $38.9 million in fiscal year 1950 to $139.2 million in fiscal year 1965, an increase of 258 percent. In 1965, federal aid accounted for 31.6 percent of all state revenues. For the eleven year period, 1955 through 1965, the proportion of total state revenue received from federal funds varied from a low of 22.6 percent in 1956 to a high of 33.5 percent in 1958 and averaged almost thirty percent throughout the period.

The greatest increase in federal aid occurred between 1956 and 1958; Colorado received $49.6 million in fiscal year 1956, $63 million in 1957, and $91.7 million in 1958. Since that time, there has been a gradual increase, except in 1960, when Colorado received $1.1 million less than in 1959. Table 11 shows the amount of federal aid received by Colorado and total state revenues for the years 1950 and 1955 through 1965. These amounts are shown both in actual dollars and in constant dollars (based on the Consumer Price Index).

Four major functions (involving a large number of smaller programs) account for eighty-five percent of the federal funds received by the state. These major functions, the amount of federal funds received for each in fiscal year 1965, and the proportion each is of the total federal funds received are shown below:

Function or Purpose	Amount Received	% of Total
Highways	$59.8 million	43.0%
Old Age Assistance	23.5 "	16.9
All Other Welfare	20.3 "	14.6
Employment Security (including unemployment compensation)	18.5 "	13.3

Other federal programs from which Colorado received more than a million dollars in 1965 include: mineral leasing, $3.4 million; Hill-Burton (hospital and health center construction), $1.2 million; school lunch program, $1.9 million; National Defense Education programs, $1.7 million; vocational rehabilitation, $1.7 million; Manpower Training and Development programs, $1.0 million; and programs under the Vocational Education Act of 1963, $1.1 million.*

Per Capita Federal Aid. The relationship between per capita federal aid received in Colorado and per capita total state revenues is shown in Figure Q. Per capita federal aid received by the state increased 128.1 percent from 1955 to 1965 (from $30.98 to $70.67). During the same period, per capita total state revenue increased only 79.5 percent, from $124.24 to $222.97. Per capita federal aid was less than $40 through 1957, but increased to almost $55 in 1958 and remained between $55 and $57 through 1962. In 1963, per capita federal aid exceeded $60 for the first time ($61.79) and increased to more than $70 in 1965.

TABLE 11

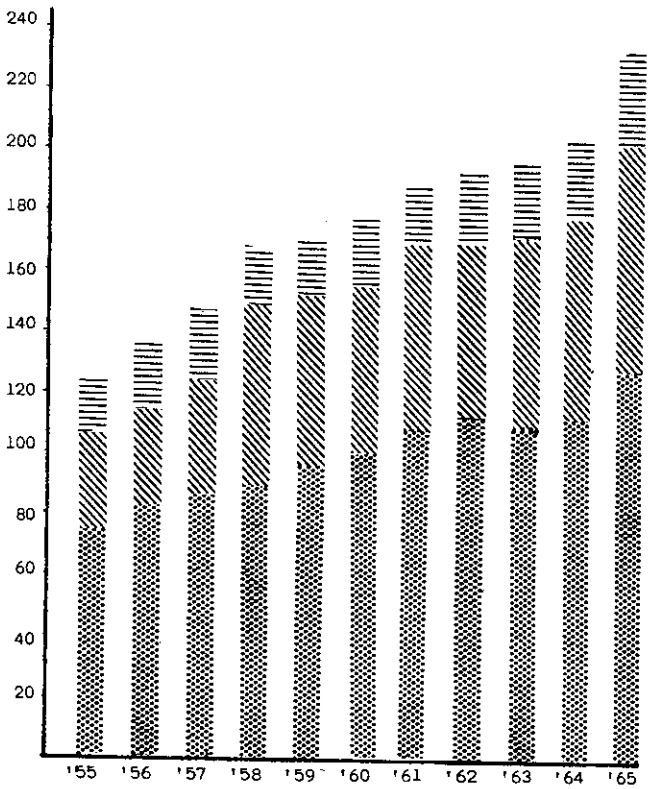
FEDERAL GRANTS-IN-AID AND TOTAL STATE REVENUE IN ACTUAL AND CONSTANT DOLLARS FEDERAL AID AS A PROPORTION OF TOTAL STATE REVENUE, PERCENT OF ANNUAL CHANGE IN FEDERAL AID
Colorado, 1950 and 1955-65

Year	Federal Aid In Millions of $	Total State Revenue Millions of $	% Federal Aid of Total Revenues	Consumer Price Index (1957-59 = 100)	Federal Aid In Constant $ (Millions)	Total State Revenue Constant $ (Millions)	Annual % of Change In Fed. Aid (Constant $)
1965	$139.2	$439.1	31.5%	109.0	$127.7	$402.8	+8.7
1964	127.0	402.4	31.6	108.1	117.5	372.2	+3.8
1963	120.8	378.6	31.9	106.7	113.2	354.8	+12.2
1962	106.3	364.7	29.1	105.4	100.9	346.0	+1.2
1961	103.9	344.3	30.2	104.2	99.7	330.4	+6.3
1960	96.7	309.8	31.2	103.1	93.8	300.5	−2.7
1959	97.8	302.3	32.4	101.5	96.4	297.8	+5.8
1958	91.7	274.1	33.5	100.7	91.1	272.2	+41.7
1957	63.0	236.2	26.7	98.0	64.3	241.0	+22.7
1956	49.6	219.6	22.6	94.7	52.4	231.9	+2.3
1955	47.8	191.3	25.0	93.3	51.2	205.0	.....
1950	38.9	137.4	28.3	83.8	46.4	164.0	.....

**A list of all federal aid programs in which the state and its local units are participating or may participate is presented in Appendix B. These programs are classified and identified in three ways: 1) according to major purpose; 2) according to degree of state control or coordination; and 3) type of financial assistance provided. Appendix C shows the annual amount of federal aid received in Colorado by federal programs for fiscal year 1955 through fiscal year 1965.*

FIGURE Q

ANNUAL PER CAPITA STATE REVENUE BY SOURCE, COLORADO, 1955-1965



LEGEND:

State Taxes (Property, Sales and Use, Motor Fuel and Excise, Income, Inheritance, Franchises, and Others)

Federal Aid

All Other (use of Money and Property, Service Charges and Sales, Licenses and Permits)

To show federal aid receipts more meaningfully, Figure R presents per capita federal grant-in-aid revenues in constant dollars. This figure makes more clear the areas in which actual changes have occurred, especially highways and employment security. The almost unchanging band showing per capita receipts for welfare purposes is particularly interesting. There was a gradual increase in payments for all welfare programs through 1964, but from 1964 to 1965 there was a decrease in the amount received for Aid to Dependent Children and Old Age Assistance. More of the elderly are now qualified to receive greater payments from Social Security and other pension programs which either disqualify them for Old Age Assistance or reduce their Old Age Assistance payments. The absolute, as well as constant, dollar increase in Aid to Dependent Children and employment security receipts since 1963 indicates a decrease in need for such benefit payments. This phenomenon reflects not only the improved employment situation in Colorado, but also an increase in some other federal aid programs, e.g., Manpower Training and Development and Economic Opportunity programs.

Over-All State Responsibilities to Local Government

State Concern

In recent years, Colorado and other states experiencing rapid growth and urbanization have focused ever-increasing attention on local government, its needs and problems. In some of these states, Colorado included, this attention has been concentrated primarily on legislation and constitutional changes, revenue needs affected by state policy, and on problems of statewide concern (such as water pollution and assessment levels and practices) which also involve local governments.

In other states, however, attention has also been directed to the provision of technical assistance and consultation for local units in meeting particular problems and in improving their government organization and services. As a consequence, a number of states have created state-level local government agencies or have given new responsibilities to an existing agency. These agencies have a variety of titles and perform a variety of functions, foremost among which is usually the provision of professional help on request to local government units. Table 12 shows selected examples of local government agencies and their functions in other states.

Present State-Local Relationships in Colorado

At present, several Colorado agencies and institutions are either directly involved to some degree with local governments or else have programs which affect local units. A few state agencies perform or are responsible for the same functions as local units and may exercise some degree of supervision over local units as far as these functions are concerned. In this group are the state departments of health, education, welfare and highways. Examples of the relationship between local units and state agencies, other than these four, are shown in Table 13.

TABLE 12
LOCAL GOVERNMENT AGENCIES AND FUNCTIONS IN SELECTED STATES

States and Agency	Functions
MINNESOTA	
Minnesota Municipal Commission	Holds hearings and makes determinations on petitions for municipal incorporations, annexations, and consolidations; governed by statutory guides in making decisions, including investigation of the following: population trends, assessed values, land development, and need for governmental services
NEW JERSEY	
Division of Local Government, Department of the Treasury	Examination of local government budgets and audits, with compliance enforcement powers; control over local government debt, including refunding and approval of debt beyond legal limits; publication of reports, guides, and statistical data for local governments; makes local government studies, and provides consultation and assistance to local units on request
NEW YORK	
Office for Local Government	Assists governor in coordinating the activities and services of all state departments and agencies having relationships with local units; provides advice and assistance to local units upon request; makes both specific and general studies of all aspects of local affairs; serves as a clearing house for local government information; encourages and assists cooperative local efforts directed toward the solution of common problems, particularly in metropolitan and rapidly growing areas (The State Board of Equalization and Assessment, the Municipal Training Council, and the Division of Fire Safety have recently been placed under the Office for Local Government.)
PENNSYLVANIA	
Bureau of Municipal Affairs	Makes local government studies, including taxation, local government organization, intergovernmental cooperation, and legislation affecting local units; prepares manuals and handbooks for local government officials; answers inquiries from and provides advice and consultation for local officials; edits and files budget and financial reports and uses them to compile and publish fiscal data reports; provides planning assistance to local units, primarily on the layout and design of parks, playgrounds, and recreation areas; determines if proposed local government bond issues and proceedings comply with legal requirements
TENNESSEE	
Municipal Technical Advisory Service, Division of University Extension, University of Tennessee	Provides assistance and consultation to local units in the following general areas: management and administration, finance and accounting, engineering and public works, fringe area problems, municipal law, public relations, and ordinance codification; publishes directories, handbooks, statistical compilations, and analyses of state laws and constitutional amendments

TABLE 13
A SUMMARY OF STATE-LOCAL RELATIONSHIPS
SELECTED STATE AGENCIES, COLORADO, 1966

Agency	Relationship to Local Government
Attorney General	May provide legal advice and opinions upon request of political subdivision attorneys (Such opinions and advice are not official, and all requests may not be answered.)
Division of Commerce and Development	1) State economic research and information center for the use of local government agencies, among others 2) Coordination and assistance to local planning agencies 3) Acceptance and administration of federal grants-in-aid for planning in municipalities of less than 50,000 population (701 funds)
Colorado Tax Commission	1) Maintains file of county, municipal (non home rule), and special district budgets 2) Maintains file of special district incorporation dates, maps of boundary descriptions, and any annual boundary changes 3) Determines assessed value of public utilities and allocates same among counties 4) Reviews assessment methods in each county and methods used by county boards of equalization 5) Prepares and publishes assessment guides and manuals 6) Holds annual school for county assessors 7) Reviews and certifies county abstracts of assessment and makes recommendations on same to state board of equalization 8) Reviews and approves certain local government mill levy increases 9) Reviews and approves tax abatements and refunds 10) Reviews and grants tax exemption applications
State Auditor	1) Formulates, prescribes, and publishes uniform classifications of accounts for the several levels of local government 2) Publishes annual compendium of local government fiscal information 3) Maintains file of local government audits and examines same to determine compliance with statutory requirements and violations thereof
Secretary of State	Issuance of liquor and malt beverage licenses
University of Colorado	1) Institutes and conferences for local government officials, may be held in conjunction with state associations of local government units or officials, may involve bureau of government research and service, bureau of continuing education, law school, and other departments 2) Research and technical assistance from bureau of government research and service
Colorado Highway Patrol	Operation of State Law Enforcement Training Academy, which provides training programs for local law enforcement personnel
Department of Institutions	Coordination and planning for community mental health and retardation programs and allocation of state and federal funds for these programs (Community non profit corporations primarily involved, but municipalities, counties, and school districts may participate on fiscal or service basis.)
Highway Safety Council	Works with local government officials in developing highway safety programs and in holding conferences related to the same
Department of Revenue	1) Sales tax collection for municipalities 2) Motor Vehicle License program 3) Driver licensing program

State Local Government Agency

A number of reasons have been cited for the creation of a permanent state agency for local government in Colorado. Among the most important are:

1) There should be an agency at the state level from which local governments can request professional and technical assistance and consultation not otherwise available. This agency should also serve as a clearinghouse on local government information and federal and state programs affecting local government and provide liaison among the several state agencies concerned with local government.

2) Continuing increased emphasis on local government at the state level makes it desirable to have a specialized agency which can be a source of information and advise the Governor and the General Assembly on local government and urban needs and problems.

3) The research program initiated by the Governor's Local Affairs Study Commission should be continued and expanded to cover other matters, and this research should be performed on an on-going basis.

4) There should be an agency at the state level which can serve as a counterpart to the new federal cabinet-level urban affairs department. This is especially important if the state is to carry out its responsibilities to local government and not abdicate them to the federal level.

Opposition to a state local government agency has been voiced by some local officials who feel it might infringe on local authority and become another vehicle for the exercise of control over local units at the state level. Concern has also been expressed that such an agency might interfere with private engineers, planners, and other consultants who provide services for local units on a fee basis. Another argument against creating a state agency for local government is that it would be a needless expense, because it would duplicate services and functions already performed.

Possible Functions and Responsibilities. The variety of functions which a state local government agency might perform may be classified under four headings: research, services, supervision, and policy-making. These functions may be summarized as follows:

Research. Research activities fall into two broad categories: 1) research originated at the state level which may have any or all of the following purposes: a) examination of local government structure and intergovernmental relationships; b) research on specific problems which involve local government, wholly or in part; and c) research to inform the General Assembly and the Governor and to assist them in making policy decisions, allocate funds, or propose legislation; and 2) research at the request of specific local government units, officials, or a group of citizens to solve a specific problem. Such research is usually less comprehensive in scope than that described above.

Services. There is a wide range of services which could be provided for local governments. Of prime importance are technical assistance and consultation, some examples of which are:

Fiscal Matters	— budgeting, accounting, financial reporting, revenue forecasting, debt management, capital improvement programs
Personnel	— job classifications, recruitment, salary schedules, qualification standards, fringe benefits (health insurance, retirement, paid vacation and sick leave policies)
Administration	— purchasing, data processing, record management, administrative organization, program analysis, insurance needs
Legal	— charter drafting, ordinance recodification, statutory analysis
Planning	— technical consultation on planning and public works projects
Training Programs	— sponsoring and participation in institutes and training programs for local government officials and employees
Other	— intergovernmental cooperation and contractual arrangements

Supervision. In this category are local governmental activities over which the state exercises some control, as well as state-imposed requirements concerning such matters as fiscal reporting, budget procedures, and annual audits. Not included are direct functional relationships, such as public health, public welfare, and education.

Policy-Making. Only one jurisdiction (Minnesota) has a state-local government agency which excises policy-making authority. In that state (as indicated in Table 12), the Minnesota Municipal Commission is authorized to approve or disapprove proposed municipal incorporations, consolidations, and annexations.

Organization and Structure. There are several ways in which a state local government agency might be organized, including:

1) a staff agency closely related with or located in the office of the governor;
2) a separate department; or

3) a bureau or division of an existing department or a state university.

Some of the advantages and disadvantages to each of these alternatives have been summarized in a recent study:

> In many respects the staff agency arrangement providing close association with the office of governor would appear to be the most desirable plan. Since the agency would presumably have no control functions, it does not need to be in the line structure of the executive branch. Close association with the governor's office would emphasize the agency's potential advantages as a source of information, research and policy advice in local affairs.
>
> If the new agency were established as a separate department unto itself it would be given a status commensurate with the importance of its service and a position where it would also have a close relationship with the chief executive. But such an arrangement might incur more political resistance than the gubernatorial staff agency concept. Also it would be something of an organizational misfit among the other functionally oriented departments of the state government.
>
> Establishment of the new agency as a bureau or division within an existing department has the advantage of probably being more easily accomplished, and in this position the agency might be able to perform useful services that are not now being performed in most states. However, location within an existing department, presumably a department of finance, might tend to bury the agency in the state organizational structure and make it too remote from the governor to provide effective policy guidance with respect to urban problems.[4]

New Division of Local Government

The Division of Local Government was created by the General Assembly in 1966.[5] This new agency goes into effect on July 1, 1966 and has an appropriation of $50,000 for its first year of operation. The legislation creating the Division of Local Government follows closely the recommendations made by the State-Wide Committee of the Governor's Local Affairs Study Commission, concerning the functions which the new agency is to perform.

Under this legislation, the new agency shall:

1) assist the Governor in coordinating the activities and services of those state departments and agencies having relationships with local units;
2) advise the Governor and the General Assembly on local government problems;
3) serve as a clearinghouse on information relating to local government problems and on state and federal services and other assistance to local governments;
4) refer local governments to appropriate state and federal agencies for advice, assistance, and available services in connection with specific problems;
5) perform research on intergovernmental relations and local government structure, powers, finance, services, management, and functions;
6) encourage and assist on request cooperative efforts among local government officials toward the solution of common problems;
7) encourage and cooperate in training institutions, conferences, and programs for local government officials, and employees; and
8) publish an annual compendium of local government fiscal data and other statistical and research reports of interest to local government, the General Assembly, and the general public.

Local Government Cooperation

Colorado law provides a number of ways for local governments to contract or cooperate with each other in providing services or solving common problems.

General Contracting Authority

Under a comprehensive law enacted in 1949, every local governmental unit has authority to enter into an agreement with any other local unit for the performance of any function or service it is authorized by law to provide.[6] This law provides for general contracting authority and does not specify procedures for the execution of contracts or for contract continuity after election of a new governing body.

In 1963, the General Assembly passed additional legislation on cooperative agreements between local units of government.[7] Although this act does not provide specifically for intergovernmental contracts, it authorizes certain types of emergency assistance from one local unit to another when time is not sufficient to enter into a more formal arrangement. It authorizes emergency fire and police assistance from one local unit to another when requested by the fire chief or police chief of the unit needing assistance. It provides that men and equipment from an assigning unit may

be sent in answer to a call for help from a requesting unit of local government and that the men and equipment sent shall be under the supervision and direction of the fire or police chief of the requesting unit. Legal liabilities are also delineated in the statute; the assigning unit assumes responsibility for all workmen's compensation and retirement obligations, while the requesting unit is responsible for any tort liabilities.

Specific Cooperation Authority

Sanitation Facilities. Municipal corporations are authorized by general law to cooperate or contract with state and federal agencies and other local public bodies for the joint construction and financing of sewage facilities and the maintenance and operation thereof. This law provides broad authority for municipal governing bodies to contract with other local governments and industrial enterprises for the construction, operation, and maintenance of sewer facilities, either inside or outside municipal limits.[8] Municipalities and special districts may form a metropolitan sewer district to provide sewage collection, treatment, and disposal on an areawide basis.[9]

Recreation. Cities, towns, special districts, and school districts are authorized to cooperate with one another in the acquisition, construction, and maintenance of park and recreation facilities.[10] Under another section of the statutes, any two or more incorporated towns which are contiguous or adjacent may unite in acquiring, establishing, and maintaining parks, boulevards, avenues, and roads for their common benefit, if it is mutually agreed upon by ordinance.[11]

Health and Hospitals. Two or more adjacent counties may form a district health department. Of particular interest is the fact that municipalities over 25,000 population are authorized by this act to maintain their own health departments, but are not required to do so. A municipality over 25,000 population may, however, merge its health department with the county, with the composition of the health board to be determined by agreement between the two parties.[12]

Libraries. A regional library district may be established by the legislative bodies of two or more local governmental units. The district is supported by and serves all unincorporated areas and municipal corporations within the territorial limits of the governmental units involved. Trustees of the district are appointed by members of the governing bodies of the units participating, and special tax levies are authorized by the law. This act also permits a municipality which already has its own library to participate in the library district and still retain title to its library property, continue its board of trustees, and levy its own taxes. Further cooperation is permitted by the provision that local governments not wishing to form a regional library district may contract with an existing public library for services.[13]

Planning. Planning cooperation between local units is made possible by a number of statutory provisions relating to county planning. Local units, consisting of at least one county and one or more municipalities, may establish a regional planning commission. The governing bodies of the participating units may by agreement determine the composition and selection of the planning commission and also the proportion of expenses to be borne by each participating unit. The primary responsibility of such a planning commission is the formation of a master plan for the county or counties involved; however, the portion of the plan relating to municipalities is not deemed to be official unless adopted by the municipality. The commission is authorized to draw up a zoning code and review such development and land use matters as are subsequently referred to it by the participating units.[14]

Airports. Two or more municipalities may form an airport authority for the purpose of acquiring and improving airports and related facilities.[15]

Water. Two or more municipalities may join together to form a metropolitan water district to provide water for domestic, industrial, and irrigation purposes.[16]

Roads and Streets. Boards of county commissioners by mutual agreement may form road districts consisting of more than one county.[17] Cities and towns may contract with the board of county commissioners for the construction and maintenance of city streets,[18] and counties may contract with each other for highway construction and maintenance, even though a multicounty road district is not formed.

Other. Counties may form a joint public welfare district upon approval of the state department of welfare.[19] They may also establish joint juvenile detention facilities and establish multicounty probation services.[20] Under a law enacted in 1966, counties may join to establish an employee retirement program.[21]

Extent of Cooperation

Contracts and other cooperative arrangements among local governments have not been as extensive as might be assumed from the amount of legal authority available, although there are many examples of such cooperation.

Only one metropolitan sewer district has been formed (Denver metropolitan area), and a number of eligible local units are not participating. A number of special districts in the Denver metropolitan area and elsewhere do contract with municipalities and with other districts for water and for sewage treatment.

No metropolitan water district has been formed, however.

Some use has been made of the authority for cooperative park and recreation programs, and two intergovernment library districts have been established, the most recent being in Arapahoe County. Fort Collins and Loveland are in the process of forming an airport authority, but these are the only municipalities known to have taken advantage of this 1965 act.

There are at least three city-county health departments (in addition to Denver), and three multicounty public health districts (northeast Colorado, San Juan Basin, and Adams-Arapahoe counties). A few regional planning commissions have been established, primarily in highly urbanized or metropolitan areas; the most prominent is the Inter-County Regional Planning Commission comprising Denver, Adams, Arapahoe, Jefferson, and Douglas counties.

No multicounty road districts are known to exist, but municipalities in several counties have worked out agreements with the board of county commisioners on street construction and maintenance, including Adams, Arapahoe, Mesa, and Rio Blanco counties.

A few welfare districts are in the process of being formed under impetus provided by the State Department of Welfare, but there has also been considerable opposition to merging counties for this function. There are a few multicounty probation departments, but no joint juvenile detention facilities have been established, although there has been considerable discussion about doing so among Adams, Arapahoe, and Jefferson counties.

Reasons for Lack of Cooperative Arrangements. There are several reasons why intergovernmental cooperation has not been as extensive as it might be. First, there is reluctance on the part of some local government officials to participate in joint programs, although this reluctance is diminishing as problems increase beyond the ability of single units to solve adequately. Second, many local government officials are unaware of the statutory authorization for intergovernmental cooperation and contracts, at least as far as some functions are concerned.

Third, some of the statutes authorizing contracts and other forms of cooperative arrangements are not clear and specific, causing some reluctance to make use of these provisions. These statutes should be carefully checked, revised, and added to as needed in any general revision and recodification of local government laws. Fourth, there still remains a question as to the extent to which home rule cities may enter into intergovernmental contracts in light of the Colorado Supreme Court's decision in the Metropolitan Capital Improvements District case.[22]

Despite present legal problems, intergovernmental cooperation and contracts appear to be devices which will be used more and more to solve local government problems as the state's population growth and urbanization continues and problems and needs expand beyond the ability and jurisdiction of local units.

VI

SELECTED INTERGOVERNMENTAL PROGRAMS

Introduction

Three governmental functions—public welfare, judicial administration, and roads and streets—involve both the state and local governments and require large annual expenditures. How these programs might best be operated and financed is a matter of major concern for state and local officials, although the problems connected with each are slightly different.

The major question concerning public welfare is whether this program should become an exclusive state responsibility. Ninety percent of welfare costs are financed by federal and state funds, and federal and state laws and regulations leave little authority at the county level.

The same question applies to judicial administration, but in a slightly different way. Approximately fifty-five percent of state court system costs are borne at the county level, but counties can exercise budgetary control only if they can prove that the courts have been arbitrary and capricious in their requests for funds. Otherwise, such budgetary control has been judicially construed to be an interference with the separation of powers doctrine and the coordinate and equal status of the executive, legislative, and judicial branches of government.

The problems connected with road and street construction and maintenance center on the amount of state aid which should be allocated to county and municipal governments, the basis for and objectives of this aid, and the extent to which local effort should be required.

Public Welfare

More than $100 million is spent annually in Colorado for public welfare, exceeded only by education and highways. Three levels of government have fiscal and administrative responsibility for public welfare—federal, state, and county; however, counties pay only a very small portion of the costs and exercise limited administrative authority.

Welfare Department Organization

State Public Welfare Department. The state welfare department is established under the provisions of Article 1, Chapter 119, CRS 1963. This article provides that the state department shall be responsible for the administration or supervision of all public welfare activities in the state.

Since welfare programs at present, generally, are state supervised and county administered, the major responsibilities of the state department are:

1) to supervise all forms of public assistance and medical care;
2) to act as an agent of the federal government for all federally-aided programs; and
3) to administer state and federal funds for the various programs.

State Board of Welfare—Executive Director. The state board of public welfare consists of nine members appointed by the governor to serve for three-year overlapping terms. The members serve without compensation, except for necessary travel expenses. The board adopts all policies, rules, and regulations for the government of the state department. The executive director (who is under civil service, as are all department employees) is responsible for the operation and administration of the department, subject to the authority of the state board, which also must approve the department's proposed budget.

Administrative Structure. The state department is composed of several divisions: administrative management, personnel, children and youth, adult aids and services, and medical services. In addition, the executive assistant to the director is responsible for several administrative functions, and legal counsel and advice is provided by the legal services section.

The state department of welfare has a staff of 155 during the current fiscal year, which will be increased to 169 in fiscal year 1967.

County Departments of Public Welfare

Each county is required to have a department of public welfare by 119-1-9 CRS 1963. Any two or more counties, however, may form a district department of welfare upon the approval of the state welfare department. The county departments are responsible for administration of the various welfare programs under statutory requirements and the rules and regulations of the state welfare department. In particular, county departments determine the eligibility of recipients and their need for assistance, both as to kind and amount.

The county welfare board consists of the board of county commissioners, except that if a district department is created, one or more of the county commissioners from each of the counties involved may serve on the board. The board selects the county director of welfare, but must do so in accordance with the merit system established for county welfare employees by the state department as required by 119-1-12, CRS 1963. While the board determines the salaries and salary ranges to be paid the director and other county welfare employees, these are selected from schedules established by the state department under the merit system.

The county departments are employing an average of 1,283 persons during the current fiscal year, almost 100 more than during the previous year. The seventeen largest counties, which have 82.5 percent of the total welfare caseload, employ 82.4 percent of the total county welfare personnel. The number of county welfare employees will increase in fiscal year 1967 and following years, both because of increased caseloads and because of certain federal requirements concerning worker-caseload ratios.

Welfare Programs and Method of Finance

The several public welfare programs may be divided into four categories according to how they are financed:

1) programs financed exclusively from federal and state funds;
2) programs financed from a combination of federal, state, and county funds;
3) programs financed only from state and county funds; and
4) programs financed entirely from county funds.

Three programs are in the first category: old age pensions (OAP), old age pension medical care (OAP Med), and medical aid to the aged (MAA). The second group comprises aid to the blind (AB), aid to dependent children (ADC), and aid to the needy disabled (AND). Two programs are financed only from state and county funds: child welfare services and tuberculosis assistance, and one program (general assistance) is financed entirely at the county level.

The basis for financial participation by the federal, state, and county governments in the various welfare programs and in state and county welfare administration is shown in Table 14. This table also shows the changes in federal participation which took place as of January 1, 1966, as a result of the amendments to the social security act adopted in 1965.

Recent Trends in Welfare Expenditures and Finance

Total Welfare Expenditures. In fiscal year (FY) 1963, $97 million was expended for welfare purposes in Colorado. Total expenditures increased to $100.6 million in FY 1965 and are expected to reach almost $111 million in FY 1967, fourteen percent more than in FY 1963.

During the same period, the increase in federal funds expended for welfare purposes is estimated at 23.8 percent; state funds, 3.2 percent; and county funds, 18 percent. In FY 1963, federal funds financed 46.4 percent of the total welfare program; state funds, 43.0 percent; and county funds, 10.6 percent. In FY 1967, federal funds are expected to finance slightly more than fifty percent of total welfare costs; state funds, almost thirty-nine percent; and county funds, almost eleven percent. Table 15 shows the proportion of expenditures for welfare purposes by program from federal, state, and county funds for fiscal years 1965 through 1967.

Caseloads and Per Case Costs. There are several reasons for recent and anticipated welfare expenditure increases. Increased caseloads have been an important factor, especially in the ADC and child welfare programs. The average monthly ADC caseload in FY 1963 was 9,314 and is expected to be 13,488 in FY 1967, an increase of almost 45 percent; a similar increase is expected in the number of children receiving benefits (an average of 28,561 per month in FY 1963 and an estimated average of 41,390 per month in FY 1967).

The child welfare caseload is expected to be almost fifty-five percent higher in FY 1967 than in FY 1963, with an average monthly caseload estimated at 7,170 as compared with 5,191 in FY 1963. An even higher rate of increase is expected in child welfare cases requiring foster and institutional care payments. An average of 1,762 children per month required such payments in FY 1963, with a monthly average of 2,728 expected in FY 1967.

AND caseload will be eleven percent, and the case-

TABLE 14
BASIS OF PARTICIPATION IN WELFARE EXPENDITURES BY THE FEDERAL, STATE AND COUNTY GOVERNMENTS, COLORADO, 1966

PROGRAMS	FEDERAL* before January 1, 1966	FEDERAL* after January 1, 1966	COUNTY	STATE
OLD AGE PENSION Money Payments	$29 of first $35 plus 50% of balance up to $70 for Class A Pension only Burials are excluded	$31 of first $37 plus 50% of balance up to $75 for Class A Pension only Burials are excluded	NO Participation	Balance of expenditures & cost of burials in full
OLD AGE PENSION Medical Care	50% of first $15 of medical vendor payments for Class A Pension only	Same as before	NO Participation	Balance of expenditures
MEDICAL ASSISTANCE FOR THE AGED	50% of all expenditures except Personal Needs for nursing home recipient and burials	Same as before	NO Participation	Balance of expenditures
AID TO THE NEEDY DISABLED	$29 of first $35 plus 50% of balance up to $70 of both money and medical vendor payments together Burials are excluded	$31 of first $37 plus 50% of balance up to $75 of both money and medical vendor payments together Burials are excluded	20% of total expenditures excluding Personal Needs for nursing home patients	Balance of expenditures
AID TO THE BLIND	Same as for AND except Federal Government does not participate in treatment expenditures Burials are excluded	Same for AND except Federal Government does not participate in treatment expenditures Burials are excluded	20% of total expenditures and treatment costs	Balance of expenditures
AID TO DEPENDENT CHILDREN	$14 of the first $17 plus 50% of balance up to $30 per person of both money and medical vendor payments together	$15 of the first $18 plus 50% of balance up to $32 per person of both money and medical vendor payments together	20% of total expenditures	Balance of expenditures
TUBERCULOSIS ASSISTANCE	NO Federal Participation in any part of the program	Same as before	50% of reimbursable expenditures plus 100% of non-reimbursable expenditures[1]	Balance of reimbursable expenditures only
CHILD WELFARE	NO Federal Participation (except Children's Bureau monies received for administration)	Same as before	Same as for Tuberculosis Assistance[1]	Balance of reimbursable expenditures
GENERAL ASSISTANCE	NO Federal Participation in any part of the program	Same as before	Paid entirely from County funds	NO State Participation
COUNTY ADMINISTRATION	Approximately 41% of total expenditures	Same as before	19% of total Approximately	Balance of expenditures
STATE ADMINISTRATION	Approximately 44% of total expenditures	Same as before	NO Participation	Balance of expenditures

**Federal participation is based on the monthly average payment for the entire State in each categorical program where applicable.*
[1]20 percent of reimbursable expenditures as of January 1, 1967. Source: Colorado State Department of Public Welfare.

During the same period, the estimated increase in loads in other programs are either relatively stable or declining.

A major factor in the rise in welfare expenditures has been the continuing increase in medical and hospitalization costs. This increase, as might be expected, is felt mostly in those programs in which the major emphasis is on medical care, but it is reflected throughout all of the programs where medical care is a component. Increased benefits and cost of living adjustments have also had a bearing on welfare expenditure increases.

Administrative costs have increased on both the state and county levels, as more employees have been needed to keep pace with increased caseloads and new and expanded programs. Salaries have risen because of merit and longevity increases (normal increments) and reclassification of some positions.

Expenditures of County Funds for Welfare

Per Capita Expenditures. Per capita expenditures of county funds for welfare increased 19.58 percent (from $4.80 to $5.74) between 1960 and 1965. During this period, forty-seven counties had increased per capita expenditures, and sixteen experienced a reduction. The largest increases occurred in ADC (41.86 percent), child welfare (88.57 percent), and administration (15.25 percent). AND and general assistance per capita expenditures remained stable.

Two programs account for more than sixty-five percent of all county expenditures for welfare: general assistance and ADC. General assistance per capita expenditures amounted to $1.91, accounting for almost forty percent of the total in 1960. In 1965, general assistance per capita expenditures amounted to $1.92, or slightly more than one-third of the total. In 1960,

ADC per capita expenditures of $1.29 were almost twenty-seven percent of the total. In 1965, ADC per capita expenditures had increased to $1.83 and were almost thirty-two percent of the total.

Even though there was a large rise in per capita expenditures for child welfare purposes from 1960 to 1965, child welfare continues to require a relatively minor proportion of county funds spent for welfare purposes (7.3 percent in 1960 and 11.5 percent in 1965).

Huerfano County had the largest per capita expenditure of county funds for welfare purposes in 1965, $12.20. Two other counties had per capita expenditure of county funds for welfare purposes in Animas, $10.07. The following counties were between $7 and $10 per capita: Conejo, $9.43; Weld $9.41; Saguache, $9.01; Clear Creek, $8.84; Pueblo, $8.65; Routt, $8.05; Costilla, $7.87; and Denver, $7.68. An additional eight counties had per capita expenditures between $6 and $8.

This is a marked contrast to 1960, when only one county, Gilpin ($10.90) had per capita welfare expenditures from county funds in excess of $10. In that year only eleven counties (including Gilpin) had per capita expenditures in excess of $6. Other counties with large per capita expenditures in 1960, included Saguache, $9.42; Las Animas, $9.37; Weld, $8.04; Huerfano, $7.75; and Clear Creek, $7.36.

Per capita expenditures by county for selected welfare programs and functions for 1960, 1963, and 1965 are shown in Table 16.

Administration Costs. Administrative per capita expenditures accounted for virtually the same proportion of total per capita expenditures in 1960 and 1965 (twelve percent and 12.3 percent respectively). Administrative per capita costs are substantially higher in the smaller counties, ranging from $.56 per capita in 1965 in counties over 50,000 population to $1.61 per capita in those with less than 2,500 population. Administrative costs also account for a much larger proportion of total welfare expenditures from county funds in the smaller counties (slightly more than ten percent in counties over 50,000 population, but almost thirty-one percent in those with less than 2,500 population). Table 17 shows the relationship between county population and per capita administrative expenditures and between county population and the proportion administrative costs are of total welfare per capita expenditures.

General Assistance. As indicated above, general assistance expenditures account for a greater portion of welfare expenditures from county funds than any other program. In FY 1965, counties spent $3.8 million for this purpose. The largest amount of general assistance funds are spent for medical care and hos-

TABLE 17

PER CAPITA EXPENDITURES FOR WELFARE ADMINISTRATION, COUNTY FUNDS ONLY, COUNTIES GROUPED BY POPULATION CLASS 1965

Size of Counties	Administration Average Per Capita	Prop. Admin. of Total Per Capita Costs
Over 50,000 pop.	$ .56	10.1%
10,000 - 50,000	.79	12.5
5,000 - 10,000	.76	15.4
2,500 - 5,000	.85	18.4
Under 2,500	1.61	30.8

pitalization, more than sixty-eight percent in FY 1965 as follows: hospitalization, 26.3 percent; medical drugs, 25.8 percent; and county hospitals, 16.1 percent. In kind assistance (groceries, rents, clothing, etc.) accounted for 16.7 percent; cash, 12.1 percent, and county home operation and maintenance, burials, and commodity distribution, 3.1 percent.

County Mill Levies

County funds for welfare purposes come from the property tax, which is also the primary source of financial support for all other county functions. The amount of tax that can be levied by a county for welfare purposes is determined by its per capita assessed value as provided in 119-3-6, CRS 1963, as follows:

Per Capita Assessed Value	Mill Levy Limit
$ 800 or less	6.0 mills
800 - 1,000	5.5
1,000 - 1,200	5.0
1,200 - 1,400	4.5
1,400 - 1,600	4.0
1,600 - 2,000	3.5
2,000 - 2,600	3.0
2,600 or more	2.5

Per capita assessed value is determined each year by dividing a county's current assessed value by the State Planning Division's most recent population estimate for that county. Welfare levy limits may be exceeded for good cause upon approval of the Colorado Tax Commission. Levy limits and 1965 and 1966 welfare levies are shown for each county in Table 18.

Currently fourteen counties are levying in excess of their statutory limits, and an additional five counties are at their limit. Thirty counties had an increase in welfare levies from 1965 to 1966, and only eleven had a mill levy reduction. Generally, those counties with the largest welfare levies (including those above their statutory levy limit) are the ones with the highest per capita expenditures for welfare from county funds.

a. Welfare levy limits are determined according to per capita assessed value as provided in 119-3-6, C.R.S. 1963. 1965 assessed value and county population estimates as of January 1, 1965 by the State Planning Division were used in determining per capita assessed value for each county.

Implications of New Federal Legislation

Several 1965 amendments to the Social Security Act have major implications for welfare administration and finance in Colorado. Also having an important bearing on welfare administration and finance are federal regulations concerning caseworker-caseload ratios and caseload-supervisor ratios which were promulgated pursuant to the 1962 Social Security Act amendments.

1965 Social Security Act Amendments. The 1965 amendments increased the amount of federal aid to adult recipients of Aid to Needy Disabled, Aid to Blind, and Old Age Pension (Class A) programs. Effective January 1, 1966, federal aid was increased from $46.50 to $50.00 per month for each adult recipient in these three programs receiving a grant of at least $75 per month. Federal aid also is increased proportionately for those receiving grants of less than $75 per month. An increase in federal aid of $1.50 per month for each ADC recipient was also effective January 1, 1966.

Maintenance and Expenditure Level. In order for a state to receive this increased reimbursement, state and local governments must maintain at least the level of expenditures in effect prior to the changes in the federal aid formulae. Each state has a choice in determining the benchmark to be used to govern the level of state and local expenditures which must be maintained to be eligible for increased aid.

A state may chose the quarterly average expenditures from state and local funds for either FY 1964 or FY 1965. If it makes this choice, then future quarterly expenditures from state and local funds can not be less than the quarterly average selected. Instead of the quarterly average, a state may chose the actual expenditures in each quarter in either FY 1964 or FY 1965 as a benchmark. If this method is chosen, then future quarterly expenditures from state and local funds can not be less than the actual expenditures from the comparable quarter in the fiscal year selected as a benchmark. No official decision has yet been made as to which fiscal year and which basis (quarterly average or actual expenditures) Colorado will use.

Title XIX, Social Security Act. Any savings of state and local funds resulting from the new medical care program will have to be used for other welfare purposes, because of the requirement concerning the level of state and local expenditures to be maintained. It is contemplated that the savings on the state level will be used to provide improved and uniform medical benefits for all of the federally-aided programs: AB, ADC, AND. In fact, Title XIX of the Social Security Act, as amended in 1965 encourages that this be done and provides federal matching funds for this purpose.

The intent of Title XIX has been stated as follows:

> The underlying objective of the State financing provision in Title XIX is to assist States, where necessary, in securing a broader base of financial support of the new medical assistance program, facilitate maintenance of standards for both administration and program services throughout the State, and avoid placing excessive reliance for program improvement on the varying, and sometimes limited, tax resources of local governments.[1]

To assure that improved medical services will apply uniformly in all areas of a state, as well as in all programs, Title XIX provides further that as of July 1, 1970, there must be only state funds used to meet all of the non federal share of the costs, unless the state plan provides for distribution of federal or state funds on an equalization or some other basis which will assure that lack of funds from local sources will not result in lowering the amount, duration, scope, or quality of care and services under the plan.[2]

In other words, either a state must provide all of the funds for the enlarged medical assistance program, or it must allocate federal and state funds to the counties in such a way that the program will be uniform, regardless of the amount of county funds available.

1962 Social Security Act Amendments

In order to obtain increased federal participation under the 1962 Social Security Act amendments, federal regulations require welfare departments to decrease caseworker workloads to a maximum of sixty cases or an equivalent proportion of time. These regulations also require a caseworker-supervisor ratio of no more than five to one. These ratios must be achieved by July 1, 1967, or the increased federal welfare administration aid of seventy-five percent for the proportion of service cases in the federal-aid categories will be reduced to fifty percent.

During the current fiscal year, it would require a county welfare department staff of 1,424 to meet these standards as contrasted with the average of 1,283 that can be employed under the present appropriation. The required total in FY 1966 is estimated at 1,477 because of increased caseloads.

The increased staff needed to meet federal standards will require additional expenditures of state and local funds, because currently forty percent of the cost of county administration is financed by the state and nineteen percent by the counties. Staffing pattern and caseload ratio requirements also raise several questions concerning welfare organization and administration which will be discussed in connection with the counties' role in welfare administration and finance.

The Counties' Role in Welfare Administration and Finance: Major Problems and Policy Questions

County governments in Colorado provide only ten to eleven percent of the total cost of welfare programs and administration. While counties are responsible for welfare administration on the local level, this responsibility is limited and must be exercised in conformity with federal and state regulations and procedures. Even though the boards of county commissioners (in their capacity as public welfare boards) hire welfare personnel, personnel qualifications, service, and salary

schedules are governed by the state welfare merit system.

Property Tax Burden. Local county financial support is provided entirely from the property tax. The welfare levy is separate from the county general fund levy, so that its increase does not affect general fund levy limits or the level of county services financed from this fund. Nevertheless, the welfare levy adds to the property tax burden which is already excessive, or considered so, in many portions of the state.

In this connection, it should be noted that those counties with the highest welfare levies (most of which are in excess of their statutory limits) are generally those with declining or depressed economic conditions, and it is these economic conditions which cause increased welfare needs. Increasing the property tax levy to meet a need resulting from declining economic conditions tends to impede or postpone economic improvement by aggravating an already bad situation. High property tax levies discourage industrial and commercial growth, which would reduce the need for welfare assistance and also broaden the property tax base.

While the state provides some additional assistance to economically distressed counties, the annual appropriation is only $150,000, which provides only a small amount of relief when applied on a statewide basis.

New Federal and State Aid Changes. New federal and state aid formulae and programs will shift the welfare financial burden even more to these two sources. In addition to increased federal aid, the state (as previously indicated) will finance eighty percent of both the child welfare and the tuberculosis assistance programs instead of the current fifty percent, beginning January 1, 1967. The requirement concerning non federal support for medical assistance programs to take effect July 1, 1970, will either eliminate the county financial burden for these programs or reduce the need for increased county expenditures for this purpose in depressed areas.

Administration and Personnel. Even though the counties will be relieved of a portion of their financial obligations for welfare by these changes, greater county administration expenditures can be expected, unless the state assumes a larger share of the increased cost required to meet federal caseworker and supervisor standards.

The per capita cost of welfare administration paid from county funds is already high in counties with less than 50,000 population and is extremely high in counties with less than 2,500 population. While welfare administration expenditures are only ten percent of the total in counties over 50,000 population, it ranges from 12.5 percent to almost thirty-one percent in the other fifty-three.

The problem is not just limited to administrative costs, it also involves the employment and effective use of professional staff. Caseloads in many small counties do not justify a full-time welfare director, even without additional professional staff. It would seem that these cases might be supervised and serviced more efficiently on a multicounty basis where the caseload would be sufficient to have several professional specialists (such as a trained child welfare worker) serving under one supervisor or director, with centralized clerical functions. Such a change would appear to be a minimum requirement, if the new federal standards are to be met in the most efficient and least costly way.

Welfare Districts. The state welfare department has embarked upon a program to encourage county welfare departments to combine on a district basis as permitted by 119-19 CRS 1963. As presently projected, these districts would follow judicial district boundaries except in the northeast corner of the state where two welfare districts would comprise the six counties in the 13th judicial district.

This program carried to its completion would result in the creation of twenty-three welfare districts. Six of the ten largest counties would operate as single county districts: Adams, Boulder, Denver, Mesa, Pueblo, and Weld.

The other four counties over 50,000 population would have smaller counties attached for welfare purposes as follows:

Arapahoe:	Douglas and Elbert
El Paso:	Cheyenne, Kit Carson, and Lincoln
Jefferson:	Clear Creek and Gilpin
Larimer:	Jackson

The division of the state into welfare districts would not save any money, nor would it necessarily reduce the welfare property tax burden, although there might be some slight shifts in mill levies among counties in some districts. It is designed to provide more efficient administration and utilization of professional personnel, and it would reduce the number of local administrative entities from sixty-three to twenty-three.

This proposal has already met with opposition in some parts of the state, particularly in the northeast and southeast, where the county commissioners want to maintain their welfare program authority on a county basis. Opposition has also been generated by those who feel that the state should take over complete responsibility for welfare and relieve counties of this obligation.

Major Policy Questions

The major policy questions concerning the counties' role in welfare administration and finance revolve around whether this function should be assumed entirely by the state, either immediately or on a gradual basis to be completed in 1970 to coincide with the Title XIX provisions on local support for medical assistance programs.

Pro. Arguments in support of the state assuming complete responsibility for welfare may be summarized as follows:

Counties in reality have little control over the welfare program and contribute only a small proportion of welfare expenditures. The extent of control and financial contribution will diminish in the future, even if the state doesn't assume complete responsibility. As this happens, there is even less justification than at present for counties to be involved in welfare administration and finance.

State assumption of complete responsibility would reduce the property tax burden, which would be of special benefit to economically distressed counties. It would also simplify welfare administration and eliminate county-state friction over salary levels, personnel requirements etc. By assuming greater financial support on a gradual basis, the state could take over the program without a large amount of additional funds required in any one fiscal year. Increased federal aid will also help offset the state's fiscal burden.

Con. The arguments against eliminating the counties' welfare role may be summarized as follows:

It is important to have at least some degree of local control in the welfare program, especially in determining recipient eligibility. County welfare boards are closer to the scene, understand local situations, and are better able to make these decisions than a state agency. In particular, general assistance should not be administered on a uniform basis throughout the state, because of vast differences in local conditions and needs. Consolidation of county welfare departments on a district basis would provide more efficient administration and service, while retaining some degree of local control. Increased state aid could be made available to assist economically distressed counties to a greater extent than at present, without turning this function entirely over to the state.

If the decision is made to retain at least some degree of county control and participation in the program, the following questions should be considered:

1) Should county welfare departments be consolidated on a district basis? If so, should 119-1-9 CRS 1963 be amended to make such consolidation mandatory rather than permissive? How should district welfare boards be constituted and what authority and responsibility should they have?
2) Should there be an increase in state aid to relieve local welfare financial burden? If so, to what extent and on what basis (e.g. to all counties or just to economically distressed counties, for all programs and administration or certain programs)?

Judicial Administration

Cost and Method of Finance

The major portion of the operational cost of Colorado's court system is financed by the property tax at the county level.* Total gross judicial system costs for calendar year 1965 were approximately $9.6 million. Almost eighteen percent of this amount, or $1.7 million was financed from the state's general fund. State general fund appropriations cover the following: 1) the entire cost of the supreme court and the judicial administrator's office; 2) all of the salaries and travel expenses of the state's sixty-nine district judges and the state's share of retirement coverage; 3) $1,200 per year of the salary of each of the state's twenty-two district attorneys; and 4) up to $2,400 per year of the salary of each full-time juvenile probation officer who meets certain statutory qualifications.

Approximately $2.5 million of the total cost, or twenty-six percent is derived from fines and fees. The balance, or fifty-five percent of the total, was financed from the general fund in each county. The property tax is the only tax source of county general fund revenue, and the legal general fund levy limit varies among counties from five to 11.5 mills, depending on county assessed valuation.

Most states finance their court systems in the same manner as does Colorado, although the state share of the cost and the method of allocation varies considerably. Preliminary study indicates that the court system is financed entirely at the state level only in Alaska and Hawaii.

Reasons for Concern

There are two major reasons for the present concern over judicial system costs and the ways in which these costs are met: 1) a 1963 Colorado Supreme Court opinion concerning judicial expenses and the salaries of judicial employees; and 2) the reorganization of the Colorado court system resulting from the approval of a new judicial article in the Colorado Constitution by voters in the 1962 general election and im-

*This total includes district attorneys' offices, probation departments, and jury commissions, in addition to the supreme court, district and county courts, and the Denver probate, juvenile, and superior courts. It is difficult to arrive at a more exact total because counties operate on a calendar-year basis and the state on a July to June fiscal year.

plementing legislation thereto adopted by the General Assembly in 1964.

Smith v. Miller.[9] In this case, the supreme court held that necessary and reasonable judicial expenses must be paid by the county commissioners unless the amount of these expenses is so unreasonable as to indicate affirmatively artibrary and capricious action on the part of the court. The supreme court also held that the district court has the power to set employees' salaries, which salaries must be approved by the county commissioners, again unless there is a clear indication of arbitrary and capricious action on the part of the court and that salaries are unreasonable and unjustified. The supreme court stated further that the county commissioners have the burden of establishing proof of arbitrary and capricious action in the incurring of judicial expense and in setting judicial salaries. As an underlying basis for its decision the supreme court said that courts have inherent power to carry on their functions, so that they may operate independently in accord with the doctrine of separation of powers and the coordinate and equal status of the executive, legislative, and judicial branches of government.

Court Reorganization. The court system reorganization which took effect in January, 1965 included an increase in the number of district judges (from forty-one to sixty-nine) and an accompanying increase in the number of judicial employees, office equipment, supplies, etc. These increases were necessary primarily because of the transfer to the district court of jurisdiction formerly exercised by the county court, such as probate and juvenile. In part, the expansion of the district court was required because of the increase in the amount of judicial business in the state's rapidly-growing population centers. A new county court was established to replace the justice of the peace system. This new minor court is a court of record and requires adequate facilities and staff to carry out its functions properly. Because of caseload and geographic problems, a number of counties have one or more additional full-time or part-time county judges.

Court Budget Increases

The combination of the Smith v. Miller decision and the inauguration of the new court system led to substantially higher court budgets being requested for the 1965 calendar year, resulting in increases of from ten to twenty percent in the amount of county general fund property tax revenue which was required for judicial purposes.

Because of the increase in court budgets, the county commissioners in a number of counties had to exercise tight budget control over the other functions financed from the general fund to avoid exceeding the statutory general fund mill levy limit. As a result, commissioners and other officials in these counties, especially the rapidly-growing ones, state that other necessary county functions have had to be curtailed because they no longer have any control over court budgets.

County General Fund Mill Levy Limits. Twenty-three counties are presently at the maximum general fund mill levy limit, and fifteen are levying in excess of this limit. The remaining twenty-five counties have a general fund mill levy below the maximum. Three types of counties appear to be having the most difficulty with general fund levy limits: 1) the largest counties, which are experiencing the greatest population growth (seven of the ten largest, including Denver, are at or above the levy limit); 2) the smallest counties in population, such as Gilpin, Park, Ouray, Teller, and Dolores; 3) counties suffering from economic decline, such as Las Animas, Huerfano, and Costilla.

Alternate Financing Methods

Several alternatives to the present method of financing courts have been suggested:

1) increase county general fund levy limits;
2) establish a separate county judicial levy;
3) establish separate levies for other county general functions, such as public health;
4) additional state support; and
5) assumption by the state of the entire cost of court system operation.

An increase in county general fund levy limits would make it possible for counties at or above the levy limit to increase appropriations for other general fund functions. The county commissioners favor the creation of a separate judicial fund levy rather than an increase in the county general fund levy limit. Since they have no control over judicial budgets, they would prefer to have a separate levy, so that taxpayers will be aware of judicial costs and not blame the commissioners for general fund increases caused by judicial expenditures. A bill was introduced in the 1965 legislative session to create a separate judicial fund; this measure passed the House in the closing days of the session, but was not considered by the Senate.

In a number of states, the state pays a greater share of court system costs than in Colorado. Salaries for judges of lower courts and of other judicial employees may be paid wholly or in part by the state. Such a proposal was considered, but rejected, by the Legislative Council's Administration of Justice Committee.

Assumption of all judicial system costs by the state has been advocated for several reasons. It is argued that the state should have the entire financial respon-

sibility for the support of the state court system, especially since the county commissioners no longer have any control over judicial budgets. Concern over the property tax burden has also led to the recommendation that the state assume financial responsibility for the court system. Two bills (S.B. 313 and H.B. 1490) providing for state support of the court system were introduced in the 1965 session. Neither of these measures (similar in content) were adopted. The many unanswered questions raised by these bills led to a legislative request that a study be made of the factors involved in state assumption of the entire fiscal responsibility for the court system.*

A State-Financed Judicial System

If the state were to finance all judicial system operating costs under present staffing patterns, salary levels, and administrative practices, it could require a maximum net annual appropriation of $6.2 million.** This total is based on the assumption that all fines and fees presently retained by counties would go to the state and that the additional motor vehicle fines received under this transfer would go to the state highway fund. If the additional motor vehicle fines were to go to the general fund, the approximate net cost increase to the state would be $5.7 million for a full twelve months.
