How will the new CORE system interface with Colorado Payroll Personnel System (CPPS) for timesheet and labor distribution tracking?

Currently, an interface provides timesheet and labor distribution data to COFRS to support labor tracking for things such as grant reimbursement. New functionality is required to provide this same capability from Kronos to CPPS to CORE in addition to new timesheet functionality in CPPS. The CORE project team has identified an approach and is working on architecting the solution. When the solution is fully detailed and validated, the approach will be communicated to the CORE user community. This interface will be completed in conjunction with the CORE go live date of July, 2014.

What is the plan for replacing Agency level outbound interfaces from COFRS?

There are more than 200 current outbound interfaces from COFRS identified by agencies across the State. Many of these interfaces are generated to support reporting needs. The approach for replacing these outbound reporting requirements is to use the infoAdvantage reporting capability provided by CORE. Some standard reporting files will be provided from which departments can pull department specific reports. If a data extract is needed, it can be built using infoAdvantage. Each CORE department will be responsible for creating the outbound reports and interface data extracts required by their department. Monica Garlin (Monica.garlin@state.co.us) is the interface lead and should be contacted regarding questions related to the interface approach.

Are all of the policies and procedures that are currently used with COFRS going to be revised?

For the initial implementation of CORE, only those policies and procedures that have changed will be updated for “go live.” A post implementation effort will be undertaken to consolidate the changes into the existing policy and procedure documentation.
