When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005). A Workers' Compensation case is decided on its merits. Section 8-43-201(1). The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions.

COMPENSABILITY OF ALLEGED OCCUPATIONAL DISEASE

The test for distinguishing between an accidental injury and occupational disease is whether the injury can be traced to a particular time, place, and cause. *Campbell v. IBM Corporation,* 867 P.2d 77 (Colo. App. 1993). An "occupational disease" is defined by § 8-40-201(14), C.R.S., as:

> [A] disease which results directly from the employment or the conditions under which work was performed, which can be seen to have followed as a natural incident of the work and as a result of the exposure occasioned by the nature of the employment, and which can be fairly traced to the

> employment as a proximate cause and which does not come from a hazard to which the worker would have been equally exposed outside of the employment.

This section imposes additional proof requirements beyond those required for an accidental injury by adding the "peculiar risk" test; that test requires that the hazards associated with the vocation must be more prevalent in the work place than in everyday life or in other occupations. *Anderson v. Brinkhoff*, 859 P.2d 819 (Colo. 1993). However, the existence of a preexisting condition does not defeat a claim for an occupational disease. *Id.* A claimant is entitled to recovery if the hazards of employment cause, intensify, or, to a reasonable degree, aggravate the disability for which compensation is sought. *Id.* Where there is no evidence that occupational exposure to a hazard is a necessary precondition to development of the disease, the claimant suffers from an occupational disease only to the extent that the occupational exposure contributed to the disability. *Id.*

The claimant bears the burden to prove by a preponderance of the evidence that the hazards of the employment caused, intensified or aggravated the disease for which compensation is sought. *Faulkner v. Industrial Claim Appeals Office,* 12 P.3d 844 (Colo. App. 2000); *Wal-Mart Stores, Inc. v. Industrial Claim Appeals Office,* 989 P.2d 251 (Colo. App. 1999). The question of whether the claimant has proven causation is one of fact for the ALJ. *Faulkner v. Industrial Claim Appeals Office, supra*. In this regard the mere occurrence of symptoms in the workplace does not require the conclusion that the conditions of the employment were the cause of the symptoms, or that such symptoms represent an aggravation of a preexisting condition. *See F.R. Orr Construction v. Rinta,* 717 P.2d 965 (Colo. App. 1985); *Cotts v. Exempla, Inc.,* W.C. No. 4-606-563 (I.C.A.O. August 18, 2005).

Expert medical opinion “is neither necessary nor conclusive in determining causation.” However, when expert medical opinions are presented it is for the ALJ to determine the weight to be accorded such opinions. *Rockwell International v. Turnbull,* 802 P.2d 1182, 1183 (Colo. App. 1990).

When evaluating this issue of causation the ALJ may consider the provisions of the MTG because they represent the accepted standards of practice in workers’ compensation cases and were adopted pursuant to an express grant of statutory authority. However, the MTG are not dispositive of the issue of causation and the ALJ need not give them any more weight than he determines they are entitled to in light of the totality of the evidence. *See Cahill v. Patty Jewett Golf Course,* WC 4-729-518 (ICAO February 23, 2009); *Siminoe v. Worldwide Flight Services,* WC 4-535-290 (ICAO November 21, 2006).

As determined in Findings of Fact 23 through 31 the claimant failed to prove it is more probably true than not that he sustained an occupational disease proximately caused, intensified or aggravated by the conditions under which he performed his employment. As found, Dr. Wunder credibly and persuasively opined that the claimant’s only diagnosis is left ulnar neuropathy. Dr. Wunder credibly and persuasively

applied the causation algorithm contained in the Cumulative Trauma MTG and opined that the diagnosis of left ulnar neuropathy is not causally related to the duties of the claimant's employment as evidenced by his own testimony and the Genex job analysis.

The claimant cites *City of Brighton v. Rodriguez*, 318 P.2d 496 (Colo. 2014) for the proposition that the claimant's left ulnar neuropathy arose out of his employment because it was the result of a "neutral" or unexplained cause. However, as determined in Finding of Fact 29, the ALJ has found the most probable cause of the left ulnar neuropathy is the idiopathic development of the disease without any contribution from risk factors encountered in the claimant's employment. Therefore, the credible and persuasive evidence establishes that the disease of left ulnar neuropathy resulted from a "personal" or idiopathic cause and did not arise out of the claimant's employment. Therefore, the holding in *City of Brighton* is inapplicable to the facts of this case.

ORDER

Based upon the foregoing findings of fact and conclusions of law, the ALJ enters the following order:

1. The claim for workers' compensation benefits in WC 4-952-008 is denied and dismissed.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

1. Whether Claimant has established by a preponderance of the evidence that he sustained a compensable occupational disease during the course and scope of his employment with Employer.

2. Whether Claimant has demonstrated by a preponderance of the evidence that he is entitled to receive authorized medical treatment that is reasonable and necessary to cure or relieve the effects of his occupational disease.

3. Whether Claimant has proven by a preponderance of the evidence that he is entitled to receive temporary disability benefits for the period October 29, 2013 until terminated by statute.

FINDINGS OF FACT

1. On January 12, 2012 Claimant began working for Employer as a Janitor. He was promoted to Production Lead in April 2012. Claimant's job duties involved supervising the organization of goods for sale and performing the duties of absent employees.

2. The warehouse positions of Belt Loader and Forklift Operator were responsible for moving furniture and boxes weighing up to 500 pounds from the production area to the storage area. The employees working in the positions of Belt Loader and Forklift Operator quit on the same day in September 2012. The positions were not filled until March 2013. Claimant testified that, as the Production Lead, he was responsible for performing the duties of Belt Loader and Forklift Operator during most of his shifts between September 2012 and May 2013.

3. Claimant asserts that he suffered an occupational disease with a date of onset of January 1, 2013. He specifically described his occupational disease as micro traumas caused by his work duties that acted upon his "genetically weak neck and back" to create various symptoms.

4. Claimant clarified the medical benefits that he seeks. Specifically, Claimant stated that he desires reimbursement for three visits at the University of Colorado Hospital with Matthew Leiszler, M.D. in the amount of $35 each. He also seeks reimbursement in the amount of $535 for a May 2, 2013 MRI. Claimant finally wants payment for services of chiropractor Dan Carluccio, D.C. in the amount of $5,850.

5. In March of 2013 Claimant began treatment at the University of Colorado Hospital with Dr. Leiszler. His first visit occurred on March 11, 2013. The History section of the treatment notes provide, "[Claimant] states he thinks that he might have

MS. Symptoms going on for 7+ years. Blackouts, loss of balance, chest pains, tingling in fingers…" Claimant also reported chest pressure, blacking out once or twice per day for the past 3-4 years, twitching in his arms, tingling in his hands at times, short-term memory impairment, slurred speech and body shakes. Dr. Leiszler recommended diagnostic testing. Claimant thus underwent a brain MRI on May 2, 2013, labs on May 6, 2013 and an X-ray of his cervical spine on September 17, 2014. The preceding testing did not identify any basis for Claimant's symptoms.

6. Chiropractor Dr. Carluccio has treated Claimant for his symptoms. He testified that he lives in Claimant's neighborhood, ran into him a number of times, considered Claimant's symptoms and discussed tests that were performed at University of Colorado Hospital. The symptoms Claimant mentioned included dizziness, balance issues, spontaneous collapses of a synoptic nature (without loss of consciousness), mentation issues, speech issues, intermittent tremors of the upper extremities, leg weakness, pain and numbness in the upper and lower extremities, intermittent nausea, extreme need to sleep, extreme intolerance to cold, migraines and constant tension in the right temple. Dr. Carluccio testified that he was with Claimant more than once when Claimant would start to fall and had to be caught. He remarked that Claimant told him he could just be walking and collapse both during and outside of work. Dr. Carluccio commented that one day while discussing matters with Claimant on a street in their neighborhood, he realized that Claimant's symptoms were similar to those of his other patients. After gently pressing an area of Claimant's skull, Dr. Carluccio suspected that Claimant's symptoms were related to his neck. Dr. Carluccio thus began to treat Claimant in May of 2013.

7. Dr. Carluccio testified that Claimant's pre-existing condition was upper cervical instability causing neurological deficits that he considered related to Atlanto-Occipital Syndrome. He explained that "classic" Atlanto-Occipital Syndrome is very often correlated with Downs Syndrome children and involves a laxity of the ligaments. However, Dr. Carluccio remarked that he was using the term in the chiropractic sense. He thus meant "a chiropractic disrelationship or malfunction between the functional dynamics of the skull and [Claimant's] first neck bone, as opposed to a syndrome." Dr. Carluccio acknowledged that he did not have copies of Claimant's medical records, has done no diagnostic testing and has not taken any specific measurements of the spine or any gaps in the spine. Dr. Carluccio explained that he believed Claimant was initially injured when he was 11 years old and kicked three times behind his head during a black belt karate test. He commented that there was no treatment for neck issues following the incident. Although Claimant told him that his symptoms began while working for Employer, Dr. Carluccio determined the kicks at age 11 were the source of Claimant's "disastrous" cervical function.

8. Dr. Carluccio testified that Claimant's work related diagnosis was repetitive over-demanding actions that exploited his Occipital Atlanto and C2 weakness. He detailed that when Claimant was asked to do more physical work he would have to grab behind him, pull a dolly and "torque his whole system to pull it." The motion involved tilting his head to one side at an angle with rotation of the neck. Dr. Carluccio commented that the movement was compressing Claimant's head and exploiting the

pre-existing weakness. He explained that Claimant's symptoms could occur both at work and outside of work. Dr. Carluccio noted that Claimant's activity at work caused his neck to become "stuck" and produced the symptoms outside of work.

9. Dr. Carluccio acknowledged that he was not familiar with the Division of Workers' Compensation Rule 17, Exhibit 5 "Guidelines for Cumulative Trauma Conditions" (Guidelines). Dr. Carluccio testified that he did not follow the method outlined in the Guidelines to arrive at his diagnosis. He also acknowledged that he was unaware of any evidence-based studies that correlated his diagnosis to Claimant's work activities.

10. Dr. Carluccio testified that after six months of chiropractic treatment Claimant's condition significantly improved. Although Claimant still has some balance issues when he gets up, he has improved 98% from the effects of his work exposure. Dr. Carluccio remarked that Claimant has not suffered any permanent physical impairment related to the work duties.

11. Claimant testified that on approximately January 1, 2013 he began experiencing symptoms that affected his work performance and quality of life. His symptoms included a persistent headache, collapsing during and after work, vertigo, momentary loss of consciousness, numbness of the extremities, twitching hands, cold sensitivity, requiring sleep of 12 hours per day and diminished cognitive function. He reported his symptoms to Employer and was directed to medical treatment. Notably, Claimant testified that all of the University of Colorado testing as well as Dr. Carluccio's chiropractic treatment preceded his report of a Workers' Compensation injury to Employer.

12. On February 14, 2014 Claimant visited Authorized Treating Physician (ATP) Elizabeth W. Bisgard, M.D. for an examination. Dr. Bisgard reviewed Claimant's diagnostic testing and the medical records of Dr. Carluccio. She summarized that "[a]fter review of these records, we have no clear diagnosis. Without a diagnosis, we cannot even begin the process of a causality assessment. He is having pain. There is no etiology, therefore there is no causal relationship to work."

13. On November 10, 2014 Douglas C. Scott, M.D. conducted an independent medical examination of Claimant. He also testified at the hearing in this matter. Claimant reported that he developed neck pain, back pain, headaches, dizziness and momentary loss of consciousness as a result of his work activities by January 1, 2013. Dr. Scott performed a physical examination of Claimant. Claimant did not report pain when he moved his neck. Dr. Scott noted that Claimant's neck motion was excellent and within normal ranges. Claimant did not exhibit any evidence of nerve root compromise causing pain or symptoms into his extremities. He also did not demonstrate any balance problems.

14. Dr. Scott reviewed Claimant's MRI and medical records. He remarked that there was no confirmation of any medical diagnosis of Claimant's symptoms and therefore could not assess whether Claimant's work activities caused an occupational

disease. Although Dr. Carluccio noted that Claimant suffered from the chiropractic diagnosis of Atlanto-Occipital Syndrome, Dr. Scott remarked that there was no objective medical documentation or radiographic studies to support Dr. Carluccio's determination. Specific measurements must be taken radiographically to establish that there is a qualifying increased interval between the atlas, the axis and the occipital to support the diagnosis of Atlanto-Occipital Syndrome. The requisite measurements were not performed on Claimant.

15. Dr. Scott stated that there was no cervical neck problem confirmed by the MRI scan. He explained that it was not probable that Claimant has Atlanto-Occipital Syndrome caused by a traumatic event when he was 11 years old. There is simply no evidence that there was movement of the spine at the time of the incident. If the black belt testing caused subluxation or movement in the cervical spine, Claimant would have suffered a very serious medical condition. However, Claimant did not receive any medical treatment after he was kicked in the head when he was 11 years old. Dr. Scott testified that if the kicks had caused movement of the spine Claimant would probably have required hospitalization and immobilization. He also explained that a dislocation at the relevant area of the spine would cause death. Finally, the MRI did not show current subluxation in the relevant area of the spine.

16. Claimant has failed to establish that it is more probably true than not that he sustained a compensable occupational disease during the course and scope of his employment with Employer. Claimant asserts that he suffered an occupational disease with a date of onset of January 1, 2013. Claimant specifically described his occupational disease as micro traumas caused by his work duties that acted upon his "genetically weak neck and back" to create various symptoms. Chiropractor Dr. Carluccio testified that Claimant's pre-existing condition was upper cervical instability causing neurological deficits that he considered related to Atlanto-Occipital Syndrome. He explained that Claimant was initially injured when he was kicked three times behind his head during a black belt karate test at 11 years old. Dr. Carluccio detailed that when Claimant was asked to do more physical work for Employer he would have to grab behind him, pull a dolly and "torque his whole system to pull it." The motion involved tilting his head to one side at an angle with rotation of the neck. Dr. Carluccio commented that the movement compressed Claimant's head and exploited the pre-existing weakness.

17. In contrast, Drs. Bisgard and Scott persuasively determined that there was no confirmation of any medical diagnosis of Claimant's symptoms and therefore they could not assess whether Claimant's work activities caused an occupational disease. Dr. Scott explained that there was no cervical neck problem confirmed by the MRI scan. He also noted that it was not probable that Claimant has Atlanto-occipital Syndrome caused by a traumatic event when he was 11 years old. There is simply no evidence that there was movement of the spine at the time of the incident. Moreover, although Dr. Carluccio noted that Claimant suffered from the chiropractic diagnosis of Atlanto-Occipital Syndrome, Dr. Scott remarked that there was no objective medical documentation or radiographic studies to support Dr. Carluccio's determination. Finally, Dr. Carluccio agreed that he was not familiar with the Guidelines and did not follow the

method outlined in the Guidelines to arrive at his diagnosis. Moreover, he acknowledged that he was not aware of any evidence-based studies that correlate his diagnosis to Claimant's work activities. Accordingly, Claimant has not demonstrated that the hazards of his employment caused, intensified, or, to a reasonable degree, aggravated a pre-existing condition.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" (Act) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. §8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. §8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979); *People v. M.A.*, 104 P.3d 273, 275 (Colo. App. 2004). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. §8-43-201, C.R.S. A Workers' Compensation case is decided on its merits. §8-43-201, C.R.S.

2. The Judge's factual findings concern only evidence that is dispositive of the issues involved; the Judge has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *See Magnetic Engineering, Inc. v. ICAO,* 5 P.3d 385, 389 (Colo. App. 2000).

3. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2007).

4. For a claim to be compensable under the Act, a claimant has the burden of proving that he suffered a disability that was proximately caused by an injury arising out of and within the course and scope of employment. §8-41-301(1)(c) C.R.S.; *In re Swanson,* W.C. No. 4-589-645 (ICAP, Sept. 13, 2006). Proof of causation is a threshold requirement that an injured employee must establish by a preponderance of the evidence before any compensation is awarded. *Faulkner v. Industrial Claim Appeals Office,* 12 P.3d 844, 846 (Colo. App. 2000); *Singleton v. Kenya Corp.,* 961 P.2d 571, 574 (Colo. App. 1998). The question of causation is generally one of fact for determination by the Judge. *Faulkner,* 12 P.3d at 846.

5. The test for distinguishing between an accidental injury and an occupational disease is whether the injury can be traced to a particular time, place and cause. *Campbell v. IBM Corp.*, 867 P.2d 77, 81 (Colo. App. 1993). "Occupational disease" is defined by §8-40-201(14), C.R.S. as:

> [A] disease which results directly from the employment or the conditions under which work was performed, which can be seen to have followed as a natural incident of the work and as a result of the exposure occasioned by the nature of the employment, and which can be fairly traced to the employment as a proximate cause and which does not come from a hazard to which the worker would have been equally exposed outside of the employment.

6. A claimant is required to prove by a preponderance of the evidence that the alleged occupational disease was directly or proximately caused by the employment or working conditions. *Wal-Mart Stores, Inc. v. Industrial Claim Appeals Office,* 989 P.2d 251, 252 (Colo. App. 1999). Moreover, §8-40-201(14), C.R.S. imposes proof requirements in addition to those required for an accidental injury by adding the "peculiar risk" test; that test requires that the hazards associated with the vocation must be more prevalent in the work place than in everyday life or in other occupations. *Anderson v. Brinkhoff*, 859 P.2d 819, 824 (Colo. 1993). A claimant is entitled to recovery only if the hazards of employment cause, intensify, or, to a reasonable degree, aggravate the disability for which compensation is sought. *Id.* Where there is no evidence that occupational exposure to a hazard is a necessary precondition to development of the disease, the claimant suffers from an occupational disease only to the extent that the occupational exposure contributed to the disability. *Id.*

8. As found, Claimant has failed to establish by a preponderance of the evidence that he sustained a compensable occupational disease during the course and scope of his employment with Employer. Claimant asserts that he suffered an occupational disease with a date of onset of January 1, 2013. Claimant specifically described his occupational disease as micro traumas caused by his work duties that acted upon his “genetically weak neck and back” to create various symptoms. Chiropractor Dr. Carluccio testified that Claimant’s pre-existing condition was upper cervical instability causing neurological deficits that he considered related to Atlanto-Occipital Syndrome. He explained that Claimant was initially injured when he was kicked three times behind his head during a black belt karate test at 11 years old. Dr. Carluccio detailed that when Claimant was asked to do more physical work for Employer he would have to grab behind him, pull a dolly and “torque his whole system to pull it.” The motion involved tilting his head to one side at an angle with rotation of the neck. Dr. Carluccio commented that the movement compressed Claimant’s head and exploited the pre-existing weakness.

9. As found, in contrast, Drs. Bisgard and Scott persuasively determined that there was no confirmation of any medical diagnosis of Claimant’s symptoms and therefore they could not assess whether Claimant’s work activities caused an occupational disease. Dr. Scott explained that there was no cervical neck problem confirmed by the MRI scan. He also noted that it was not probable that Claimant has Atlanto-occipital Syndrome caused by a traumatic event when he was 11 years old. There is simply no evidence that there was movement of the spine at the time of the incident. Moreover, although Dr. Carluccio noted that Claimant suffered from the chiropractic diagnosis of Atlanto-Occipital Syndrome, Dr. Scott remarked that there was

no objective medical documentation or radiographic studies to support Dr. Carluccio's determination. Finally, Dr. Carluccio agreed that he was not familiar with the Guidelines and did not follow the method outlined in the Guidelines to arrive at his diagnosis. Moreover, he acknowledged that he was not aware of any evidence-based studies that correlate his diagnosis to Claimant's work activities. Accordingly, Claimant has not demonstrated that the hazards of his employment caused, intensified, or, to a reasonable degree, aggravated a pre-existing condition.

ORDER

Based upon the preceding findings of fact and conclusions of law, the Judge enters the following order:

Claimant's request for Workers' Compensation benefits is denied and dismissed.

If you are a party dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. *For statutory reference, see section 8-43-301(2), C.R.S. (as amended, SB09-070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a form for a petition to review at http://www.colorado.gov/dpa/oac/forms-WC.htm.*

DATED: January 23, 2015.

ISSUES

I. Did Claimant prove by a preponderance of the evidence that she sustained a compensable injury arising out of and in the course and scope of her employment?

II. Did Claimant prove by a preponderance of the evidence that she is entitled to an award of temporary total disability (TTD) benefits?

III. Did Claimant prove by a preponderance of the evidence that she is entitled to an award of medical benefits for her treatment with Concentra, Absolute Health Centers, Dr. Jeffrey Jenks, Penrose-St. Francis emergency room and Southwest Diagnostic Centers?

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. Claimant worked for Employer as a cashier for approximately six (6) months prior to the date of injury. Although she was originally hired as a part time employee, her hours increased to the point that she was working full time on the date of her injury.

2. Claimant testified that customers would normally approach the checkout counter from her left side and she would then scan the items which were being purchased. She would then have to twist to her right to access the cash register and complete the transaction. On average she would check out approximately 200 people every shift. She would perform the aforementioned twisting motion for every transaction, whether it was cash or a credit transaction.

3. While checking out a customer on June 21, 2014, Claimant scanned a customer's merchandise, turned to the right, and felt an immediate stabbing pain in her lower back. She explained that she felt like she had been "cut in half" by the sharp burning pain as if someone had stabbed her in her lower back. Claimant immediately felt numbness going down the outside of her left thigh. This numbness has persisted through the present time.

4. At the time the incident occurred, Claimant testified it felt like her back "went out" and that she blurted out "Oh My God" when the injury occurred. Tiffany Salazar, a co-employee of Home Depot, was working as a cashier at the register next to Claimant when this occurred. She heard Claimant's outburst and asked her what was wrong and if she was okay. When Claimant told her that she didn't think she was okay, Ms. Salazar called the head cashier, Amber, to report what had happened. Amber

brought Claimant a chair to sit on and requested that she finish her shift because they were shorthanded that day. Claimant was able to complete her shift.

5. No written report was filed by Employer or Claimant on the date of injury. Claimant identified Claimant's Exhibit No. 2 as the statement she wrote on 6/23/14 outlining the circumstances surrounding the injury. She completed this statement at the request of Employer. Claimant was injured on a Saturday and the next two days were her regular days off. She did not contact her employer again until 6/24/14 when she was regularly scheduled to work because she thought her condition might improve during the time she was off. On 6/24/14, Claimant called her employer and spoke with her assistant manager, Eric, who told her to come into the store to get a list of treating providers. She did so on 6/24/14 and chose Penrose Hospital where she was seen in the emergency room on 6/27/14. Claimant testified that she was unable to get to the doctor on 6/2514 and 6/26/14 because her car had broken down and she had no transportation. During that time frame, she stayed at home and either iced or placed heat on her lower back to try to control the pain.

6. Dr. Langstaff, the emergency room physician from Penrose-St. Francis noted in her 6/27/14 report that Claimant "accidentally twisted into an awkward position while working as a cashier at Home Depot". Examination of the Claimant revealed moderate paraspinal tenderness in both the lumbar and thoracic spine. Dr. Langstaff suspected that Claimant had sustained a myofascial strain of her lumbar spine and provided a diagnosis of "acute back pain". Claimant testified that the emergency room physician took her off work for three days. Claimant notified her supervisor, Connie, of the results of the emergency room visit and was directed by Connie to get in touch with the Human Resources Department. The Claimant did so and was referred to Concentra where she began treatment with Dr. Randall Jones on 6/27/14.

7. Dr. Jones examined the Claimant and referred her to physical therapy (PT) three times a week for a period of two weeks. When PT did not help and in the face of worsening pain, Dr. Jones referred Claimant for an MRI at Southwest Diagnostics; to Dr. Jeffrey Jenks, a physiatrist; and for chiropractic care with Absolute Health Center. On 6/27/14, Dr. Jones imposed physical restrictions of no lifting more than 10 pounds and no pushing or pulling more than 20 pounds, no squatting, no climbing of ladders or stairs or climbing of any kind. Dr. Jones noted in his initial assessment that Claimant was standing behind a cash register and twisted to the right to put money in the register and felt left lower lumbar pain. The Physician's Report of Worker's Compensation Injury authored by Dr. Jones on 6/27/14 (Claimant's Exhibit 4, p. 6) notes the objective findings he observed to be consistent with the history and/or work related mechanism of injury.

8. Claimant provided Dr. Jones' restrictions to her employer at which time she was informed that her restrictions could not be accommodated. Claimant has not worked for Employer or at any other job since 6/21/14.

9. The ALJ finds that the Claimant is entitled to temporary total disability (TTD) benefits commencing on 6/21/04.

10. Dr. Jones saw Claimant again on July 12, 2014. He again noted that the objective findings he observed were consistent with the history and/or work related mechanism of injury. He continued Claimant's physical restrictions and added that she be provided a chair with a back adjustable to the proper height to complete her cashiering duties.

11. Claimant began physical therapy on July 16, 2014 at Concentra with Katherine Nikolaus, P.T. Ms. Nikolaus noted mild increased muscle tone in both the right and left paraspinal muscles. She also noted severe tenderness of the paraspinal muscles on the left and moderate tenderness on the right. Her record also reflects that the Claimant was unable to lie on her back. On July 17, 2014, Ms. Nickolaus noted that the Claimant should also be sitting 75% of the time while cashiering. The July 18, 2014 physical therapy notes indicate that Claimant reported increased low back pain up to 9 out of 10. The July 25, 2014 therapy note indicates that the Claimant reported worsening of symptoms and was progressing slower than expected.

12. On August 4, 2014, Dr. Randall Jones saw Claimant and noted that if Claimant did not show significant improvement by the next visit, she would need to be referred for an x-ray, an MRI and to Dr. Zimmerman and Dr. Polvi for chiropractic treatment and acupuncture. He continued her physical restrictions. On August 7, 2014, Dr. Jones discontinued physical therapy and referred the Claimant to Dr. Jeffrey Jenks, Absolute Health Center and Southwest Diagnostics.

13. Claimant underwent an MRI on 8/21/14 which revealed a broad-based right foraminal bulge and facet arthrosis at L4-5 and mild right foraminal stenosis. It also revealed a broad based foraminal bulge and left paramedian protrusion L5-1 with mild canal and foraminal stenosis.

14. Claimant saw Dr. Jeffrey Jenks on August 21, 2014. Dr. Jenks recommended a left sacroiliac joint injection.

15. The ALJ finds that the treatment rendered by Dr. Jones and his referrals in this case reasonably necessary to cure and relieve Claimant of the effects of the June 21, 2014 injury.

16. At the time Claimant was hired at Home Depot, she informed Employer that she had restrictions with respect to her knees due to a preexisting degenerative knee condition. She also reported pre-existing multiple sclerosis. Claimant's physical restrictions due to these conditions required her to have use of a chair with a back so that she could sit when needed while performing her cashier duties. At the time Claimant was injured, she was standing and only had a stationary stool (without a back) to sit on. The seat of the stool did not rotate. The Claimant testified that she had previously spoken to an assistant manager, Andy, in the Spring of 2014 regarding her need for a chair with a back on it. She understood the chair to be on back order. She testified she also talked to Andy about the status of the chair in June of 2014 but still had not received it at the time of her industrial injury.

17. Claimant had no preexisting lumbar spine conditions nor had she received treatment for her lumbar spine in the year prior to this claim. Claimant had been seen at Memorial Hospital in the emergency room on April 13, 2014 for burning pain in her shin after receiving a steroid injection to her knee. She explained that this was not the same kind of pain and numbness that she currently has going down the outside of her left thigh since her June 21, 2014 injury. Claimant had also been treated in the emergency room of Penrose St. Francis on April 3, 2014 and April 5, 2014 for knee pain. Finally, Claimant sought treatment through the emergency room of Memorial Hospital on January 25, 2014 for tooth pain. Claimant explained that even though the emergency room report from this visit noted back and neck pain as well as chronic pain, she had no prior back and neck pain and had not been treated for those conditions prior to this industrial injury.

18. Claimant was diagnosed with relapsing and remitting multiple sclerosis (MS) in 2004 after experiencing persistent severe headaches. She did not have any symptoms in her lower back or down her legs at that time. She had a relapse of her MS in 2012 when she lost sight in one of her eyes which eventually returned. Claimant receives social security disability benefits and veteran's administration benefits for her preexisting bilateral knee and ankle issues as well as the multiple sclerosis. At the time of her June 21, 2014 injury, Claimant was taking Oxycodone and Fentanyl for her knee and ankle conditions/pain. She continues to take those pain medications since the injury in this case. She has been given no additional pain medications by Dr. Jones or Dr. Jenks. She also testified that none of her prior medical providers had ever diagnosed her with fibromyalgia.

19. Dr. Allison Fall testified on behalf of the Respondents. Dr. Fall is a Level II accredited physiatrist in the State of Colorado. Dr. Fall opined that the Claimant could not have injured her lower back by the mechanism of injury described by the Claimant. Dr. Fall testified that in her causative analysis, it would not matter how far an individual twisted her trunk nor how many times an individual twists her trunk in a day–twisting at the waist would never cause lower back problems since the human body was "meant" to twist at the waist. Absent any additional weight or bending while twisting, an individual could not injure her low back from merely twisting according to Dr. Fall. Dr. Fall opined that there was no correlation between Claimant's symptoms and the findings on the MRI scan of 8/20/14. She also testified that she did not find any objective findings in her examination of Claimant to substantiate Claimant's pain complaints although she did admit that Claimant could have had muscle spasms which she would not have been able to see or feel at the time she examined the Claimant due to Claimant's obesity.

20. Dr. Fall testified that it is possible that asymptomatic degenerative conditions can become symptomatic in the face of a traumatic event. She also conceded that bulging disks can be sources of pain in the lower back and that individuals with foraminal stenosis can develop pain in their lower back. She admittedly did not review any, nor is she aware of any, records prior to 6/27/14 relating to treatment of Claimant's low back. Dr. Fall also admitted that she was not aware of any other records, prior to 6/27/14, where the Claimant was complaining of radiating leg pain or numbness with the exception of the emergency room report of Penrose Hospital

from 4/3/14 involving pain down the shin after Claimant received a steroid injection to the knee.

21. Dr. Fall further opined that Claimant had preexisting chronic pain associated with fibromyalgia which was probably the source of her ongoing myofascial back pain. However, on cross-examination, Dr. Fall admitted that the basis for this opinion was information that she gleaned from two previous emergency room records which mentioned fibromyalgia in the past medical history section. One of those records was from 2/26/13 (Respondent's Exhibit E, Bates Stamp 156) and one was from 3/3/14 (Respondent's Exhibit D, Bates Stamp 126). Dr. Fall admitted that she had no idea where the diagnosis of fibromyalgia had originated from, nor did she know what doctor or specialist, if any, made the original diagnosis. Additionally, she was not aware of what symptoms (how many tender points and where they were located), if any, the Claimant presented with which resulted in the diagnosis of fibromyalgia. Based upon the totality of the evidence presented, the ALJ is not convinced that Claimant was formally diagnosed with fibromyalgia. Consequently, the ALJ finds Dr. Falls' testimony regarding fibromyalgia as the likely cause of Claimant's low back pain unconvincing. Dr. Fall also opined that she felt the Claimant had some functional overlay in her symptoms due to the Employer failing to accommodate the Claimant's prior work restrictions due to her knee condition (prior to this industrial injury).

22. The Claimant has proven by a preponderance of the evidence that she sustained a compensable injury arising out of the course and scope of her employment with Home Depot.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

Generally

A. The purpose of the Workers' Compensation Act of Colorado (Act), §§ 8-40-101, *et seq*., C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. *Section 8-40-102(1), C.R.S*. The claimant shoulders the burden of proving by a preponderance of the evidence that he is a covered employee who suffered an "injury" arising out of and in the course of employment. *Section 8-43-301(1), C.R.S.; Faulker v. Industrial Claim Appeals Office, 12 P.3d 844 (Colo.App. 2000); City of Boulder v. Streeb, 706 P.2d 786 (Colo. 1985); Pacesetter Corp. v. Collett, 33 P.3d 1230 (Colo.App. 2001).* A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark, 197 Colo. 306, 592 P.2d 792 (1979)*. The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights

of the claimant nor in favor of the rights of respondents. *Section 8-43-201, C.R.S*. A workers' compensation claim is decided on its merits. Section 8-43-201, supra.

B. In accordance with § 8-43-215, C.R.S., this decision contains specific Findings of Fact, Conclusions of Law and an Order. In rendering this decision, the ALJ has made credibility determinations, drawn plausible inferences from the record, and resolved essential conflicts in the evidence. *See Davison v. Industrial Claim Appeals Office*, *84 P.3d 1023 (Colo. 2004).* This decision does not specifically address every item contained in the record; instead, incredible or implausible testimony or unpersuasive arguable inferences have been implicitly rejected. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office, 5 P.3d 385 (Colo. App. 2000).*

C. In determining credibility, the ALJ should consider the witness' manner and demeanor on the stand, means of knowledge, strength of memory, opportunity for observation, consistency or inconsistency of testimony and actions, reasonableness or unreasonableness of testimony and actions, the probability or improbability of testimony and actions, the motives of the witness, whether the testimony has been contradicted by other witnesses or evidence, and any bias, prejudice or interest in the outcome of the case. *Colorado Jury Instructions, Civil*, 3:16.

Compensability & Temporary Partial Disability

D. As noted, for an injury to be compensable under the Act, it must "arise out of" and "occur within the course and scope" of employment. *Price v. Industrial Claim Appeals Office*, 919 P.2d 207, 210 (Colo. 1996). The "arising out of" test is one of causation. It requires that the injury have its origins in an employee's work related functions, and be sufficiently related thereto so as to be considered part of the employee's service to the employer. In this regard, there is no presumption that an injury which occurs in the course of a worker's employment arises out of the employment. *Finn v. Industrial Commission,* 165 Colo. 106, 437 P.2d 542 (1968); *see also, Industrial Commission v. London & Lancashire Indemnity Co.,* 135 Colo. 372, 311 P.2d 705 (1957) (*mere fact that the decedent fell to his death on the employer's premises did not give rise to presumption that the fall arose out of and in course of employment*). Rather, it is the Claimant's burden to prove by a preponderance of the evidence that there is a direct causal relationship between the employment and the injuries. § 8-43-201, C.R.S. 2006; *Ramsdell v, Horn,* 781 P.2d 150 (Colo. App. 1989).

E. The determination of whether there is a sufficient "nexus" or causal relationship between the claimant's employment and the injury is one of fact which the ALJ must determine based on the totality of the circumstances. *In Re Question Submitted by the United States Court of Appeals,* 759 P.2d 17 (Colo. 1988); *Moorhead Machinery & Boiler Co. v. Del Valle,* 934 P.2d 861 (Colo. App. 1996). In this case, the evidence demonstrates that Claimant engaged in frequent "twisting" (rotation) of her lumbar spine to complete the duties required of her position as a cashier during her shift. While the ALJ is persuaded that the degenerative findings demonstrated on MRI

were not caused by her twisting, the ALJ finds Dr. Fall's testimony–that Claimant could not have injured her low back twisting at the waist because the human body is designed to twist at the waist–unpersuasive. Similarly, the ALJ is not convinced that Claimant did not injure her low back because Dr. Fall was unable to appreciate any objective findings on physical examination which substantiated Claimant's complaints of low back pain or that Claimant's low back pain is chronic and related to preexisting fibromyalgia. The ALJ notes that Dr. Fall's IME was performed on October 8, 2014, in excess of three months after the date of injury. The medical records closer in time to Claimant's date of injury and thereafter during treatment reflect objective findings consistent with lumbar strain and associated left sacroiliac (SI) joint dysfunction. Moreover, Dr. Fall admitted on cross examination that she based her reliance on "fibromyalgia" as a cause of Claimant's low back pain on information gleaned from two ER reports which mention the diagnosis in the past medical history section of the reports. The ALJ credits Claimant's testimony that she has never been diagnosed with "fibromyalgia". Based upon the totality of the evidence presented, the ALJ concludes that, more probably than not, Claimant suffered a myofascial strain of her lumbar spine and left SI joint while having to twist to complete her work duties. Consequently, the ALJ concludes that a logical causal connection exists between the Claimant's complaints and her work-related duties. Thus, the injury is compensable.

Medical Benefits

F. Respondents are liable for medical treatment reasonably necessary to cure or relieve the employee from the effects of the injury. Section 8-42-101(1)(a), C.R.S.; *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988). As found, the treatment rendered by Dr. Jones and his referrals in this case was reasonably necessary to cure and relieve Claimant of the effects of the June 21, 2014 injury. Nonetheless, Respondents are only liable for authorized treatment or emergency medical treatment, which may be obtained without prior authorization. See § 8-42-101(1), C.R.S.; *Pickett v. Colorado State Hospital*, 32 Colo. App. 282, 513 P.2d 228 (1973); *Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990).

G. Authorization refers to a physician's legal status to treat the industrial injury at respondents' expense. *Bunch v. Industrial Claim Appeals Office*, 148 P.3d 381 (Colo. App. 2006); *Popke v. Industrial Claim Appeals Office*, 944 p.2d 677 (Colo. App. 1997). Once an ATP has been designated, a claimant may not ordinarily change physicians or employ additional physicians without obtaining permission from the insurer or an ALJ. If the claimant does so, the respondents are not liable for the unauthorized treatment. *Yeck v. Industrial Claim Appeals Office*, 996 p.2d 228 (Colo. App. 1999).

H. Authorized providers include those medical providers to whom the claimant is directly referred by the employer, as well as providers to whom an ATP refers the claimant in the normal progression of authorized treatment. *Town of Ignacio*

v. Industrial Claim Appeals Office, 70 P.3d 513 (Colo. App. 2002); *City of Durango v. Dunagan*, 939 P.2d 496 (Colo. App. 1997). Whether an ATP has made a referral in the normal progression of authorized treatment is a question of fact for the ALJ. *Suetrack USA v. Industrial Claim Appeals Office*, 902 P.2d 854 (Colo. App. 1995). Here, the persuasive record evidence supports that Claimant was given a list of providers from her employer which included Penrose Hospital ER as a choice. After providing the emergency room record to her employer, Claimant was referred to Concentra Medical Centers where she was seen by Dr. Jones who subsequently made referrals to physical therapy, Southwest Diagnostics, Absolute Health Center (Dr. Polvi and Dr. Hill) and Dr. Jeffrey Jenks. Based upon the evidence presented, the ALJ concludes that Dr. Jones is the designated provider for this claim. Consequently, his treatment and the treatment obtained through his referrals, including the physical therapy obtained through Concentra, the imaging performed at Southwest Diagnostics, the chiropractic care obtained at Absolute Health Centers and the treatment with Dr. Jenks is authorized.

Disability Benefits

I. Pursuant to §§8-42-103, 8-42-105, C.R.S., a claimant is entitled to an award of Temporary Total Disability (TTD) Benefits, if: (1) the injury or occupational disease causes disability; (2) the injured employee leaves work as a result of the injury; and (3) the temporary disability is total and lasts more than three regular working days. *See Lymburn v. Symbios Logic*, 952 P.2d 831 (Colo. App. 1997). A claimant must establish a causal connection between the industrial injury and the subsequent wage loss in order to be entitled to TTD benefits. Section 8-42-103, C.R.S.; *Liberty Heights at Northgate v. Industrial Claim Appeals Office*, 30 P.3d 872 (Colo. App. 2001).

K. The term "disability" as used in workers' compensation cases, connotes two elements. The first is "medical incapacity" evidenced by loss or impairment of bodily function. The second is temporary loss of wage earning capacity, which is evidenced by the Claimant's inability to perform his/her prior regular employment. *Culver v. Ace Electric*, 971 P.2d 641 (Colo. 1999). The second element of "disability" may be evidenced by showing a complete inability to work, or by physical restrictions which impair a claimant's ability to effectively perform the duties of his regular job. *See Ortiz v. Charles J. Murphy & Co.*, 964 P.2d 595 (Colo. App. 1998). In this case, the persuasive evidence establishes that Dr Jones has continually imposed physical restrictions which have precluded the Claimant from performing the duties of her usual work since July 8, 2014. The evidence also establishes that the Employer chose not to accommodate those restrictions by offering Claimant a modified duty position. Thus, Claimant has been out of work due to her industrial injury and has suffered a wage loss as a direct consequence. Accordingly, Claimant is "disabled" within the meaning of section 8-42-105, C.R.S. and entitled to TTD benefits. *Culver v. Ace Electric, supra; Hendricks v. Keebler Company*, W.C. No. 4-373-392 (Industrial Claim Appeals Office. June 11, 1999). Because Claimant's disability has lasted longer than two weeks from the day she left work as a result of her industrial injury, TTD benefits are recoverable from the day she left work, specifically June 21, 2014. C.R.S. §8-42-103(1)(b).

Respondents shall pay TTD in accordance with C.R.S. §8-42-103(1)(b), i.e. beginning June 21, 2014 at a rate of sixty-six and two-thirds percent of her average weekly wage (AWW), but not to exceed a maximum of ninety-one percent of the state average weekly wage per week so long as Claimant's disability is total. C.R.S. §8-42-105(1). Such TTD benefits shall continue until the first occurrence of any one of the events enumerated in C.R.S. §8-42-105(3) after which Respondents may terminate such TTD payments.

ORDER

It is therefore ordered that:

1. Claimant's industrial injury to her lumbar spine which occurred on June 21, 2014 is deemed compensable.

2. Respondents shall pay all reasonable and necessary medical bills from Concentra, Absolute Health Centers, Dr. Jeffrey Jenks, the Penrose-St. Francis emergency room and Southwest Diagnostic Center related to this injury.

3. Respondents shall pay Temporary Total Disability benefits in accordance with C.R.S. §8-42-103 from June 21, 2014 to the present and ongoing until such time as TTD benefits may be terminated pursuant to any one of the events enumerated in C.R.S. §8-42-105(3).

4. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

5. All matters not determined herein are reserved for future determination.

DATED: January 15, 2015

/s/ Richard M. Lamphere
Richard M. Lamphere
Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Drive, Suite 230
Colorado Springs, CO 80906

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That

you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

The issues in this expedited hearing are compensability, medical benefits, and affirmative defenses to those issues raised by the respondent.

FINDINGS OF FACT

1. The claimant was employed with the respondent-employer as a lead engineer technician II. His job duties primarily consisted of inspection of hospital facilities and maintenance operations throughout the hospital The claimant spent, on average, six or more hours per day engaged in inspection and maintenance.

2. In the summer of 2014, the hospital set out to refurbish a decorative planter at the entrance of their facility. During the construction of this planter, the claimant's job duties remained those of inspection and repair of the hospital. However, the claimant did have some tangential involvement with the planter, occasionally chipping in to help the employees primarily responsible for the refurbishment.

3. The claimant believes that, at some point during the refurbishment of the planter, in July 2014, he either suffered a work related injury to his right shoulder or incurred an occupational disease in his right shoulder.

4. The claimant testified that he spent a significant amount of time over June and July of 2014 installing the landscaping project in front of the hospital. The claimant testified that he alone cut down a large tree in the previous landscaping installation and that he manually dug out the stump of this tree using a pick and shovel. The claimant testified that he attempted to manually remove boulders weighing 200 to 300 pounds and that he leveled the surface of the landscaping installation using a pick and shovel; this testimony included statements that he dug down at least four inches into the ground throughout the landscaping project. To accomplish these tasks, along with any number of additional landscaping labors, the claimant testified he spent over six hours a day working on refurbishing the planter.

5. The claimant also testified that he moved a number of file cabinets and desks throughout the hospital and that to accomplish this task he was only provided a

small dolly for assistance. The claimant did not relate these duties to his shoulder injury, but emphasized the size and weight of these objects.

6. With respect to the onset of his right shoulder symptoms, at hearing the claimant testified his shoulder became symptomatic in January of 2014. He testified that his symptoms increased over June and July of 2014 due to the use of his right upper extremity, although he could not point to an incident or task which led to the increase in symptoms. The claimant further testified that while he did receive an injection for nausea in March of 2014, this did not lead to shoulder pain. The claimant stated that during June and July of 2014, he was in significant pain and was completely unable to use his right arm.

7. The medical records reflect that on or about March 10, 2014, the claimant reported to nurse Porterfield that he was experiencing pain in his right arm as a result of an injection in his right shoulder. On July 2, 2014, the claimant returned to nurse Porterfield complaining of ongoing pain in his right shoulder radiating down to his elbow as a result of the earlier injection.

8. On July 9, 2014, the claimant underwent an x-ray of his right shoulder "for shoulder pain/recent parental injection."

9. The claimant was next seen by Dr. Robert Thomas on July 14, 2014. In his report, Dr. Thomas states, "the patient is a 44-year-old gentleman coming in complaining of about 5 months of right shoulder pain. He does not remember any one specific injury. He reports having had some type of an injection for nausea, and after that, his shoulder started getting painful." An MRI of the claimant's right shoulder revealed a rotator cuff tear. On July 31, 2014 Dr. Thomas performed an arthroscopic repair of the claimant's right shoulder. Since Dr. Thomas' operation, the claimant has been undergoing conservative postoperative recovery and physical therapy.

10. Billy Strickland, head of facilities and maintenance for the hospital, testified credibly regarding the claimant's job duties through June and July 2014. Mr. Strickland explained that the claimant's primary responsibility was the inspection and repair of the hospital facilities and that this job took at least six hours a day. Mr. Strickland testified that the claimant was in a managerial capacity and was to spend time designating tasks to other employees. Mr. Strickland also testified that refurbishing the planter was not the claimant's primary job duty, and that that task was left to a father and son team, Bill and Charlie Antista. Mr. Strickland explained, given the community environment fostered by the hospital, the claimant would occasionally check on the work being done in the planter and on occasions provided some light assistance.

11. Billy Strickland testified regarding the refurbishment of the planter which he designed and implemented. With respect to removing a tree from the old planter, this was done by an independent contractor. Mr. Strickland testified that the ground was leveled using a Bobcat and that the claimant did not have to dig four to six inches into the ground with a pick and shovel. Mr. Strickland explained that the claimant's job duties had him spending at least six hours a day inspecting and maintaining the hospital. Mr. Strickland testified that this was claimant's primary responsibility and would have precluded the claimant from spending the alleged six hours a day on the landscaping project.

12. Mr. Strickland also provided testimony on the issue of moving furniture in the hospital. He testified that any number of dollies or assistive devices were provided for the transportation of furniture.

13. Both Billy Strickland and Tammy Rogers testified regarding the chain of events leading to claimant's resignation. Mr. Strickland and Tammy Rogers both testified credibly that they had no knowledge of claimant's intent to resign until July 22, 2014. On that day, the claimant advised the hospital that he wished to resign, voluntarily executed a letter of resignation, which was accepted by the respondent-employer, and ended his employment.

14. Billy Strickland, Tammy Rogers, and David Rollins (CFO) all provided testimony regarding statements by the claimant that he was not injured on the job. By the time the claimant had resigned from his employment, he had had the opportunity to be examined by several physicians and had undergone an MRI of his shoulder. Nonetheless, during his resignation, the claimant stated to Billy Strickland and Tammy Rogers that he did not injure his shoulder on the job. Additionally, the claimant voluntarily went to the office of David Rollins and, as part of saying farewell, stated that he did not hurt his shoulder on the job.

15. A deposition of the orthopedic surgeon who treated the claimant's shoulder, Dr. Robert Thomas, was conducted on December 1, 2014. The deposition focused directly on the issue of causation. Dr. Thomas testified, "In my opinion, based on his description of the labor work that he was doing, that would be consistent with a rotator cuff tear." Dr. Thomas further testified that he only had a vague description of the claimant's job duties without information on the specifics or durations of the tasks performed by the claimant. It was his understanding the claimant did "a lot of shoveling of heavy gravel or materials prior to a sudden onset of increased pain."

16. At the request of the respondents, the claimant underwent an independent medical examination with Dr. Eric Ridings on October 8, 2014. In this evaluation, the claimant stated to Dr. Ridings that he injured his shoulder in a December 19, 2012 slip-and-fall on ice at work. In his report, Dr. Ridings noted a number of discrepancies between the claimant's reported injury and the medical records. Further, Dr. Ridings concluded, "overall, then, the patient has a history of unexplained pain and paresthesia in the right upper extremity (and later unexplained pain at the left shoulder), with the right upper extremity symptoms beginning after a non-work-related injection on March 5, 2014. His workup for those complaints revealed a rotator cuff tear, although the patient's history to that point was not suggestive of that diagnosis . . . In my judgment within a reasonable degree of medical probability there is no connection between the patient's current symptoms and any incident at work, either in September [*sic*] 2012 or the shoveling of the 3" trench (which is not an activity that would be expected to cause a rotator cuff tear in any case)."

17. The deposition of Dr. Eric Ridings was conducted on December 10, 2014. This deposition focused on the issue of causation. Dr. Ridings testified that he had the opportunity to question the claimant as to his job duties over the summer of 2014, including several specific activities. Dr. Ridings had the opportunity to review numerous medical records relating to claimant's condition going back to 2012.

18. Dr. Ridings testified that when he interviewed the claimant, he stated that he injured his shoulder when he fell at work on December 19, 2012 and that his shoulder pain had continued from that time. Dr. Ridings testified that in his review the medical records he found it was unlikely the claimant sustained a shoulder injury at that time. Dr. Ridings opined that, in reviewing the medical records there were no records connecting the claimant's work activities and the development of the tears of his tendons or his labrum. Dr. Ridings also opined that the numerous inconsistencies in the claimant's statements in the medical records indicated it is unlikely injury occurred while on the job.

19. Finally, Dr. Ridings testified that he could not say, within a reasonable degree of medical probability, that any of the claimant's job activities caused him to have a rotator cuff tear. This testimony was based on his review of the claimant's job duties, in which he noted nothing would have been expected to have caused a rotator cuff tear. Dr. Ridings opined that it is equally probable that outside activities off the job could have caused the condition in the claimant's right shoulder.

20. The ALJ finds that the claimant is a poor historian of his medical conditions.

21. The ALJ finds that the opinions of Dr. Ridings are credible and more persuasive than medical evidence to the contrary.

22. The ALJ finds that the claimant has failed to establish that it is more likely than not that he suffered an injury or occupational disease arising out of and in the course of his employment with the respondent-employer.

CONCLUSIONS OF LAW

1. The purpose of the Workers' Compensation Act of Colorado (Act), §§8-40-101, et seq., C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201(1), C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of respondents. Section 8-43-201(1).

2. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005). A Workers' Compensation case is decided on its merits. Section 8-43-201.

3. The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000).

4. To the extent the claimant is asserting an injury as opposed to an occupational disease, the claimant must prove by a preponderance of the evidence that at the time of the alleged injury he was performing a service arising out of and in the course of the employment, and that the alleged injury was proximately caused by the performance of such service. Section 8-41-301(1)(b) & (c), C.R.S. The question of

whether the claimant met the burden of proof is one of fact for determination by the ALJ. *City of Boulder v. Streeb*, 706 P.2d 786 (Colo. 1985); *Faulkner v. Industrial Claim Appeals Office*, 12 P.3d 844 (Colo. App. 2000).

5. An injury occurs "in the course of" employment where the claimant demonstrates that the injury occurred within the time and place limits of his employment and during an activity that had some connection with his work-related functions. *See Triad Painting Co. v. Blair*, 812 P.2d 638 (Colo. 1991). The "arising out of" element is narrower and requires claimant to show a causal connection between the employment and the injury such that the injury has its origins in the employee's work-related functions and is sufficiently related to those functions to be considered part of the employment contract. *See Triad Painting Co. v. Blair, supra.*

6. The claimant failed to prove it is more probably true than not that in July 2014 he sustained any work-related injury. The claimant's testimony indicates that he did not suffer a specific injury in July 2014. Instead, the claimant has provided numerous alternate dates of injury. On none of these dates of injury does the claimant point to a specific mechanism of injury.

7. The claimant also testified to any number of arduous tasks conducted in June and July 2014, but the claimant links no specific task or incident to the condition of his right shoulder. The claimant has been thoroughly examined by several physicians, none of whom trace the condition of his right shoulder to a specific action or incident. This includes the claimant's own expert, Dr. Thomas. There is no persuasive evidence to show claimant suffered a compensable work injury in July 2014.

8. The test for distinguishing between an accidental injury and occupational disease is whether the injury can be traced to a particular time, place, and cause. *Campbell v. IBM Corporation*, 867 P.2d 77 (Colo. App. 1993). "Occupational disease" is defined by C.R.S. § 8-40-201(14) as:

> [A] disease which results directly from the employment or the conditions under which work was performed, which can be seen to have followed as a natural incident of the work and as a result of the exposure occasioned by the nature of the employment, and which can be fairly traced to the employment as a proximate cause and which does not come from a hazard to which the worker would have been equally exposed outside of the employment.

9. This section imposes additional proof requirements beyond those required for an accidental injury by adding the "peculiar risk" test; that test requires that the hazards associated with the vocation must be more prevalent in the work place than in

everyday life or in other occupations. *Anderson v. Brinkhoff*, 859 P.2d 819 (Colo. 1993). However, the existence of a preexisting condition does not defeat a claim for an occupational disease. A claimant is entitled to recovery if the hazards of employment cause, intensify, or, to a reasonable degree, aggravate the disability for which compensation is sought.

10. Where there is no evidence that occupational exposure to a hazard is a necessary precondition to development of the disease, the claimant suffers from an occupational disease only to the extent that the occupational exposure contributed to the disability. *Id*.

11. The claimant bears the burden to prove by a preponderance of the evidence that the hazards of the employment caused, intensified or aggravated the disease for which compensation is sought. *Faulkner v. Industrial Claim Appeals Office*, 12 P.3d 844 (Colo. App. 2000). The question of whether the claimant has proven causation is one of fact for the ALJ. *Faulkner v. Industrial Claim Appeals Office, supra*. In this regard the mere occurrence of symptoms in the workplace does not require the conclusion that the conditions of the employment were the cause of the symptoms, or that such symptoms represent an aggravation of a preexisting condition. *See F.R. Orr Construction v. Rinta*, 717 P.2d 965 (Colo. App. 1985); *Cotts v. Exempla, Inc*., W.C. No. 4-606-563 (I.C.A.O. August 18, 2005).

12. In this case, the claimant failed to prove that he sustained an occupational disease caused, intensified or aggravated by the performance of his duties for the respondent-employer.

13. Dr. Ridings had the opportunity to speak with the claimant regarding his job duties, which he testified would not lead to an occupational disease. Dr. Ridings reviewed the available medical records and testified there was no connection in the records between claimant's work activities and the development of a shoulder injury.

14. The claimant has failed to present sufficient persuasive evidence that he sustained an occupational disease caused, intensified or aggravated by the performance of his duties.

15. The ALJ concludes that the claimant is a poor historian of his medical conditions.

16. The ALJ concludes that the opinions of Dr. Ridings are credible and more persuasive than medical evidence to the contrary.

17. The ALJ concludes that the claimant has failed to establish by a preponderance of the evidence that he suffered an injury or occupational disease arising out of and in the course of his employment with the respondent-employer.

ORDER

It is therefore ordered that:

The claimant's claim for benefits under the Workers' Compensation Act of Colorado is denied and dismissed.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATE: January 13, 2015

Colorado Springs, CO 80906

ISSUES

- Whether claimant has proven by a preponderance of the evidence that he sustained an injury to his right shoulder arising out of and in the course and scope of his employment with employer on August 1, 2014?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that the medical treatment he received from Dr. McLaughlin and Dr. Copeland was reasonable and necessary to cure and relieve claimant from the effects of the work injury?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that the medical treatment provided by Dr. McLaughlin and Dr. Copeland was authorized medical treatment?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that he is entitled to an award of temporary total disability ("TTD") benefits?

- If claimant has proven a compensable injury, what is claimant's average weekly wage?

- If claimant has proven a compensable injury, whether respondents have proven by a preponderance of the evidence that claimant committed a volitional act that led to his termination of employment?

FINDINGS OF FACT

1. Claimant was employed with employer as a CDL driver. Claimant began working for employer on July 21, 2014. Claimant's job duties included distributing oil products to customers of employer, including 55 gallon drums containing oil.

2. Claimant testified he first received his CDL license in 2011. In 2014, prior to claimant being hired, claimant underwent a fitness test to renew his CDL license. Claimant testified the fitness test included pushups, sit ups, planking, a hearing test and an eye test. Claimant testified that following the fitness test, claimant's CDL license was renewed.

3. One week after claimant was hired, on July 28, 2014 claimant missed work. Claimant testified at hearing that he was stranded in Denver and he called

employer to let them know of his situation. Claimant's absence was recorded as a no call/no show incident.

4. Claimant testified that on August 1, 2014, he was assigned to drive a truck and deliver 55 gallon drums of oil to the Sommerset Mine near Paonia. Claimant testified that he was assured before he left that the mine would have a fork lift to assist with the unloading of the drums when he arrived.

5. Claimant testified that he loaded 8 barrels of oil, wrapped the barrels in plastic wrap so the barrels would not shift on the drive and began driving to the mine with Mr. Hoyt, the head of sales for employer. Claimant testified he left at approximately noon. Upon arriving at the mine, claimant and Mr. Hoyt checked in with the security guards, were given a short training session on safety at the mine, and were allowed to proceed up to the area of the mine where the oil was to be delivered.

6. Claimant testified that the road to the mine is steep and slow and he and Mr. Hoyt eventually arrived at the gate. Once they arrived at the gate, claimant got out of the truck to check his route and had Mr. Hoyt be his land guide as he maneuvered the truck to unload the oil. Claimant testified that there were two mine employees standing outside the building that housed the generators where the oil was to be delivered.

7. Claimant testified that after getting the truck situated for unloading, claimant noted that there was not a fork lift to help unload the barrels. Claimant testified that Mr. Hoyt was adamant that the oil barrels be delivered or they may lose the account. Claimant testified he informed Mr. Hoyt that he would try to unload the oil barrels, but if anything happened, he was going to return to Grand Junction without unloading the barrels.

8. Claimant testified he began taking the plastic wrap off the oil barrels and was trying to get the barrels off the pallet to unload the barrels. Claimant testified that while doing this, his shoulder popped out and then back into place right away. Claimant testified that Mr. Hoyt then went about trying to find a fork lift, which was eventually located and brought to the truck.

9. Claimant testified that on the drive back to Grand Junction, he reported to Mr. Hoyt that he had hurt his shoulder while trying to unload the barrels. Claimant testified that when he returned to the shop, he reported to Ms. Veatch, the warehouse manager, that he had injured his shoulder. Claimant testified that Ms. Veatch handed claimant an Axiom card and informed him that if his shoulder got any worse, contact Axiom and they would tell him what to do.

10. Claimant testified that he returned to work on Monday and reported to Ms. Veatch that he needed to see someone for his shoulder. Ms. Veatch and claimant called a nurse with Axiom regarding the injury. Claimant testified that approximately an

hour and a half later, a nurse with Axiom called him back and instructed claimant to go to a physician. Claimant testified he was referred to Dr. McLaughlin by employer.

11. Mr. Hoyt testified at hearing regarding the incident on August 1, 2014. Mr. Hoyt testified that he went with claimant to the mine because the mine is difficult to find, and the delivery of the oil was important. Mr. Hoyt testified that sometimes as a courtesy the mine will provide a forklift to help unload a product, but it is not required to do so.

12. Mr. Hoyt testified that after arriving at the mine, claimant expressed concern with regard to the steepness of the hill and the difficulty of getting the truck situated to make the delivery. Mr. Hoyt testified that claimant was becoming loud and was using foul language in the presence of the mine employees. Mr. Hoyt testified that claimant was using obscenities as he believed he was going to have to unload the barrels across the gravel without the use of a fork lift. Mr. Hoyt testified that claimant threatened to take the truck back to Grand Junction without unloading the barrels. Mr. Hoyt testified he felt claimant's behavior at the mine and use of obscenities was inappropriate.

13. Mr. Hoyt testified he witnessed claimant remove the plastic wrap and then Mr. Hoyt went to see if he could find a fork lift. Mr. Hoyt testified he did not see claimant attempt to walk to the barrels.

14. Mr. Hoyt testified that on the drive back to Grand Junction, claimant was highly upset because he had a 4:00 appointment that he was going to be late for. Mr. Hoyt testified that claimant reported to him on the drive back to Grand Junction that he had tweaked his shoulder, but said he wasn't going to do anything about it.

15. When Mr. Hoyt and claimant arrived back at the shop, Mr. Hoyt testified he informed Ms. Veatch that they needed to speak later regarding claimant's behavior. Mr. Hoyt testified that he later spoke to the owner and Ms. Veatch and informed them of claimant's use of obscene language in front of clients and recommended that claimant be let go.

16. Ms. Veatch testified at hearing in this matter. Ms. Veatch testified that she has hiring and firing responsibilities in association with her position as warehouse manager. Ms. Veatch testified that claimant returned to the shop on August 1, 2014 and reported that he had hurt his shoulder earlier in the day.

17. Ms. Veatch testified that later that day, Mr. Hoyt explained to her claimant's behavior in front of the client. Ms. Veatch testified that she had issues with claimant as an employee, including issues with his attendance and the fact that claimant did not want to learn about the product or how to handle the invoices. Ms. Veatch testified that she determined at lunch on August 1, 2014 that claimant was going to be terminated from his position with employer. Ms. Veatch testified that she communicated

her intent to terminate claimant to the parent office in Albuquerque, New Mexico on the morning of August 4, 2014, and advised claimant of his termination when he returned from the physician's office.

18. Ms. Veatch testified on cross examination that the basis for claimant's termination was his lack of interest in the job, the fact that he was antsy, that he would leave work early and missed work without permission. The ALJ notes that claimant was not warned by employer of the fact that his job with employer was in jeopardy based on his lack of interest in the job and his issues with reliability.

19. Claimant sought medical treatment with Dr. McLaughlin on August 4, 2014. Claimant reported to Dr. McLaughlin that he injured his right shoulder while moving 55 gallon drums of oil for employer on August 1, 2014. Claimant was diagnosed with a right shoulder strain and referred for a magnetic resonance image ("MRI") of the right shoulder. The MRI showed an anterior labral tear and tendonopathy and partial bursal surface tear of the supraspinatus.

20. Claimant returned to Dr. McLaughlin on August 13, 2014. Dr. McLaughlin reviewed the findings of the MRI and referred claimant to Dr. Copland for a surgical consultation.

21. Claimant was examined by Dr. Copeland on August 19, 2014. Claimant reported a consistent accident history of injuring his shoulder while moving a barrel of oil off a pallet. Dr. Copeland performed a physical examination and reviewed the MRI findings. Dr. Copeland recommended claimant consider conservative treatment including physical therapy and provided claimant with lifting restrictions of 10 pounds.

22. Claimant returned to Dr. McLaughlin on August 25, 2014. Dr. McLaughlin noted claimant's ongoing complaints and prescribed physical therapy. Claimant was re-examined by Dr. McLaughlin on September 11, 2014. Dr. McLaughlin noted claimant's continued complaints of pain in his shoulder and recommended six more visits of physical therapy.

23. Claimant returned to Dr. Copeland on September 19, 2014 and was examined by physician's assistant Rexroth. Mr. Rexroth noted claimant presented with continued complaints of pain. Claimant had undergone a course of physical therapy, but reported that he felt he was no longer improving. Dr. Copeland and Mr. Rexroth noted that claimant was a surgical candidate and recommended right shoulder arthroscopy with labral repair, subacromial decompression and rotator cuff debridement.

24. Claimant returned to Dr. McLaughlin on September 23, 2014. Dr. McLaughlin noted the surgical recommendation from Dr. Copeland. Dr. McLaughlin opined that the surgical recommendation was reasonable and took claimant off of work completely until after the recommended surgery.

25. The ALJ finds that claimant's report of an injury occurring at work on August 1, 2014 is consistent with the medical records entered into evidence. Claimant reported the injury to Mr. Hoyt and Ms. Veatch on the date the injury occurred. Claimant sought medical treatment from a physician designated by employer on the next working day following his injury. The ALJ finds that claimant has proven that it is more likely than not that he injured his right shoulder in the course and scope of his employment with employer on August 1, 2014 while moving oil drums.

26. The ALJ finds the medical records from Dr. McLaughlin and Dr. Copeland to be credible and persuasive regarding the issue of the reasonableness and necessity of the medical treatment provided to claimant. The ALJ credits the reports as establishing that the medical treatment was related to a mechanism of injury consistent with claimant's testimony at hearing and finds the treatment to be reasonable and necessary. The ALJ further credits the testimony of claimant and Ms. Veatch and finds that claimant was referred by employer to Dr. McLaughlin for medical treatment. The ALJ credits the medical records from Dr. McLaughlin and determines that Dr. Copeland was a referral from Dr. McLaughlin and is likewise within the proper chain of referrals. Therefore, the ALJ determines that the medical treatment from Dr. McLaughlin and Dr. Copeland is authorized under the Colorado Workers' Compensation Act.

27. The ALJ credits the work restrictions set forth by Dr. McLaughlin and Dr. Copeland and claimant's testimony at hearing and determines that claimant has established that he is not capable of performing his regular job duties with the work restrictions set forth by Dr. McLaughlin on August 4, 2014

28. Respondents argue that claimant was responsible for his termination of employment and is therefore, not entitled to TTD benefits. The ALJ credits the testimony of Ms. Veatch and finds that claimant had issues with regard to his employment including a failure to show up for work, and a lack of interest in the job. The ALJ further credits the testimony of Ms. Veatch and determines that the decision to terminate claimant was made at approximately lunch time on August 1, 2014, prior to claimant's injury.

29. However, claimant was not given any written confirmation regarding his poor work performance. Ms. Veatch testified that when claimant did not appear for work, he was not terminated. According to Ms. Veatch, claimant was terminated for a lack of interest and a lack of reliability.

30. Claimant's testimony regarding his work performance and his behavior at the mine on August 1, 2014 is found to be not credible and is not relied on by the ALJ. However, the decision to terminate claimant was made prior to claimant's actions at the mine, and therefore, the ALJ does not take into consideration claimant's unprofessional behavior at the mine when determining if claimant was responsible for his termination of employment. Because the decision to terminate claimant was made at lunchtime on

August 1, 2014, volitional acts by the claimant made after that time did not lead to his termination of employment.

31. Taking into consideration the evidence presented at the hearing that claimant was terminated for a lack of reliability and a lack of interest in the job, the ALJ finds that respondents have failed to establish that it is more probable than not that claimant committed a volitional act that led to his termination of employment.

32. While the testimony does establish that claimant was not reliable, claimant was not terminated for his failure to appear for work on July 28, 2014. Furthermore, while employer presented evidence that claimant was leaving work on the morning of August 1, 2014 to go to the bank for a personal errand, Ms. Veatch testified that she provided claimant with permission to run this errand. Moreover, the credible evidence presented at hearing established that claimant was terminated for a lack of interest in performing the work required by employer, and not because of a volitional act.

33. Claimant was employed with employer from July 21, 2014 through August 4, 2014. Claimant earned $1,072.50 for this period of 15 days (2 1/7 weeks). This equates to an AWW of $500.50. Claimant argues in his position statement that he worked 9 full days prior to being terminated. Claimant argues that the AWW should be calculated based on claimant's daily wage during the 9 full days of employment. The ALJ is not persuaded.

34. The ALJ notes that claimant did not work for employer for an extended period of time (just over two weeks). The ALJ further notes that during those two weeks claimant missed a day of work due to personal reasons. However, the ALJ concludes that the most fair way to calculate the AWW is to consider the full amount of money claimant was paid during the 2 1/7 weeks he was employed with employer. The ALJ recognizes that this includes claimant's final day when he only worked 4.5 hours, but based on the fact that the ALJ has determined that the decision to terminate claimant had occurred prior to his injury the previous Friday, claimant's AWW should include the final day of employment.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. Section 8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the

employer. Section 8-43-201, C.R.S., 2006. A Workers' Compensation case is decided on its merits. Section 8-43-201, *supra*.

2. The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and action; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2006).

3. A compensable industrial accident is one that results in an injury requiring medical treatment or causing disability. The existence of a preexisting medical condition does not preclude the employee from suffering a compensable injury where the industrial aggravation is the proximate cause of the disability or need for treatment. *See H & H Warehouse v. Vicory*, 805 P.2d 1167 (Colo. App. 1990); *see also Subsequent Injury Fund v. Thompson*, 793 P.2d 576 (Colo. App. 1990). A work related injury is compensable if it "aggravates accelerates or combines with "a preexisting disease or infirmity to produce disability or need for treatment. *See H & H Warehouse v. Vicory, supra.*

4. As found, claimant has proven by a preponderance that he suffered compensable injury arising out of and in the course of his employment with employer when he injured his shoulder on August 1, 2014 while moving the oil barrel.

2. Respondents are liable for authorized medical treatment reasonably necessary to cure and relieve an employee from the effects of a work related injury. Section 8-42-101, C.R.S.; *see Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990). Pursuant to Section 8-43-404(5), C.R.S., Respondents are afforded the right, in the first instance, to select a physician to treat the industrial injury. Once respondents have exercised their right to select the treating physician, claimant may not change physicians without first obtaining permission from the insurer or an ALJ. *See Gianetto Oil Co. v. Industrial Claim Appeals Office*, 931 P.2d 570 (Colo. App. 1996).

5. "Authorization" refers to the physician's legal authority to treat, and is distinct from whether treatment is "reasonable and necessary" within the meaning of Section 8-42-101(1)(a), C.R.S. 2008. *Leibold v. A-1 Relocation, Inc.*, W.C. No. 4-304-437 (January 3, 2008). Section 8-43-404(5)(a) specifically states: "In all cases of injury, the employer or insurer has the right in the first instance to select the physician who attends said injured employee. If the services of a physician are not tendered at the time of the injury, the employee shall have the right to select a physician or chiropractor." "[A]n employee may engage medical services if the employer has

expressly or impliedly conveyed to the employee the impression that the employee has authorization to proceed in this fashion…." *Greager v. Industrial Commission*, 701 P.2d 168 (Colo. App. 1985), *citing*, 2 A. Larson, *Workers' Compensation Law* § 61.12(g)(1983).

6. As found, the treatment provided by Dr. McLaughlin and Dr. Copeland was reasonable and necessary to cure and relieve claimant from the effects of her industrial injury. As found, claimant was referred to Dr. McLaughlin by employer after reporting his injury to employer. As found, Dr. McLaughlin subsequently referred claimant to Dr. Copeland for consultation. As found, Dr. McLaughlin and Dr. Copeland are authorized to treat claimant for his injuries arising out of his August 1, 2014 injury.

7. To prove entitlement to temporary total disability (TTD) benefits, claimant must prove that the industrial injury caused a disability lasting more than three work shifts, that he left work as a result of the disability, and that the disability resulted in an actual wage loss. *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). Section 8-42-103(1)(a), *supra*, requires claimant to establish a causal connection between a work-related injury and a subsequent wage loss in order to obtain TTD benefits. *PDM Molding, Inc. v. Stanberg, supra*. The term disability, connotes two elements: (1) Medical incapacity evidenced by loss or restriction of bodily function; and (2) Impairment of wage earning capacity as demonstrated by claimant's inability to resume his prior work. *Culver v. Ace Electric*, 971 P.2d 641 (Colo. 1999). There is no statutory requirement that claimant establish physical disability through a medical opinion of an attending physician; claimant's testimony alone may be sufficient to establish a temporary disability. *Lymburn v. Symbios Logic*, 952 P.2d 831 (Colo. App. 1997). The impairment of earning capacity element of disability may be evidenced by a complete inability to work, or by restrictions which impair the claimant's ability effectively and properly to perform his regular employment. *Ortiz v. Charles J. Murphy & Co.*, 964 P.2d 595 (Colo.App. 1998).

8. As found, claimant has proven by a preponderance of the evidence that his injury resulted in work restrictions set forth by Dr. McLaughlin that limited claimant's ability to earn wages. As found, claimant has established that he is entitled to TTD benefits commencing August 5, 2014 and continuing until terminated by law or statute.

9. Sections 8-42-105(4) and 8-42-103(1)(g), C.R.S., contain identical language stating that in cases "where it is determined that a temporarily disabled employee is responsible for termination of employment the resulting wage loss shall not be attributable to the on-the-job injury." In *Colorado Springs Disposal v. Industrial Claim Appeals Office*, 58 P3d 1061 (Colo. App. 2002), the court held that the term "responsible" reintroduced into the Workers' Compensation Act the concept of "fault" applicable prior to the decision in *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). Hence, the concept of "fault" as it is used in the unemployment insurance context is instructive for purposes of the termination statutes. *Kaufman v. Noffsinger Manufacturing*, W.C. No. 4-608-836 (Industrial Claim Appeals Office, April 18, 2005). In

that context, “fault” requires that the claimant must have performed some volitional act or exercised a degree of control over the circumstances resulting in the termination. *See Padilla v. Digital Equipment Corp.*, 902 P.2d 414 (Colo. App. 1995) *opinion after remand* 908 P.2d 1185 (Colo. App. 1995).

10. In this case, Ms. Veatch testified credibly that she had determined that claimant was to be terminated on August 1, 2014 prior to claimant’s injury. Claimant subsequently made the delivery to the mine on behalf of employer and behaved in a manner which was entirely unacceptable in the presence of employees of the client. However, these actions didn’t directly lead to the decision to terminate claimant as that decision had already been made. Instead, claimant was terminated, according to Ms. Veatch, because he was not reliable and had a lack of interest in the position and the product. Respondents have failed to prove that claimant’s reliability issues and lack of interest in the product and position were volitional acts. Therefore, respondents argument that claimant’s right to TTD benefits be denied based on the fact that claimant was responsible for his termination of employment is dismissed.

11. The ALJ must determine an employee’s AWW by calculating the money rate at which services are paid the employee under the contract of hire in force at the time of the injury, which must include any advantage or fringe benefit provided to the Claimant in lieu of wages. Section 8-42-102(2), C.R.S.; *Celebrity Custom Builders v. Industrial Claim Appeals Office*, 916 P.2d 539 (Colo. App. 1995).

12. As found, claimant’s AWW for his August 1, 2014 injury is properly calculated at $425.61

ORDER

It is therefore ordered that:

1. Respondents shall pay claimant TTD benefits beginning August 5, 2014 and continuing until terminated by law based on an AWW of $425.61.

2. Respondents shall pay for the reasonable medical treatment necessary to cure and relieve claimant from the effects of the August 1, 2014 industrial injury provided by Dr. McLaughlin and Dr. Copeland.

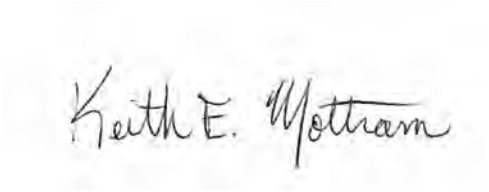
3. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

4. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or

service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: January 15, 2015



Keith E. Mottram
Administrative Law Judge
Office of Administrative Courts
222 S. 6th Street, Suite 414
Grand Junction, Colorado 81501

ISSUES

- Whether claimant has proven by a preponderance of the evidence that she sustained a compensable injury arising out of and in the course of her employment with employer?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that the medical treatment she received was reasonable and necessary to cure and relieve claimant from the effects of the work injury?

- If claimant has proven a compensable work injury, what is claimant's average weekly wage ("AWW")?

FINDINGS OF FACT

1. Claimant was employed by employer as an early childhood teacher who works with behaviorally challenged students. Claimant testified at hearing that she began working for employer in 1991. Claimant testified at hearing that the students she works with pre-Kindergarten can, at times, need to be physically restrained in order to keep the child, and other children safe.

2. Over the course of claimant's employment with employer, claimant testified that she has filed many workers' compensation claims with her Employer. She testified that she has sustained numerous minor injuries while working for Employer because of the nature of her work with behavior-challenged children.

3. Claimant testified that her prior claims have included several prior right knee work injuries. Claimant testified that she had a brief period of physical therapy following a 2009 injury when she hit her knee on an electrical box at work. Claimant testified that she did not receive a permanent impairment rating for that injury and did not have any follow-up care. Claimant testified that she had a work injury involving her right knee in 2010 when she slipped on black ice and fell. She testified that she did not have any medical care for that injury.

4. Claimant testified that she has also had prior issues with her neck resulting from work-related injuries. Claimant testified that she never received any permanent impairment ratings to her neck for any of these work injuries.

5. Claimant testified that she also had some non-work-related falls that led to neck symptoms. Claimant testified that she had chiropractic treatment following a fall while at a miniature golf course in 2010 that was non-work related.

6. Claimant's prior medical history includes a course of physical therapy treatment at Mountain View Therapy beginning July 2013 and ending November 2013. Claimant testified that she sought care because her neck was feeling weak and tired, and that she was having neck symptoms when she was flexed forward working with children at work. Claimant testified that she did not have a specific injury, and did not recall a specific onset of neck symptoms. Claimant testified that her symptoms were located at the base of her neck and across her shoulder blades.

7. Claimant testified that following her last visit with the physical therapists on November 27, 2013, she continued performed exercises at home and her neck symptoms improved. Claimant testified that she did not return for physical therapy after November 2013 because her neck felt better. Claimant testified that between November 2013 and February 2014, she did not have any other care involving her neck. claimant testified that just after stopping physical therapy treatment in November 2013, she was doing neck exercises at home three or four times per week and leading up to February 26, 2014, she had reduced her home exercises to twice per week.

8. Claimant testified at hearing that she was no experiencing any symptoms in her left ankle, right knee, or neck on the morning of February 26, 2014. Claimant testified that she arrived at work at approximately 7:30 or 8:00 a.m., met with a co-worker, and then left for Olathe, Colorado where they were going to purchase items from another preschool that was closing its doors. Claimant testified that she and her co-workers arrived at the Olathe preschool and walked around to browse items at the school. Claimant testified she had chosen some items for purchase and was carrying them while walking from a kitchen area and was speaking with Ms. Archuleta, her co-worker. Claimant testified she turned to respond to Ms. Archuleta, and did not see the two to three steps leading downward from the kitchen area. Claimant testified that she fell down the several stairs and landed on her left side on the floor. Claimant testified that she dropped the items she was holding when she fell.

9. Claimant testified that she felt pain in her left ankle and right knee as she stood up. Claimant denied at hearing that she experienced neck symptoms at that time. Claimant testified that she discussed her injury with several coworkers, and reported the injury to employer. Claimant testified that she reported her knee and ankle symptoms but did not mention pain in her neck. Claimant testified she iced her ankle in the truck and filled out an accident report when she got back to the classroom. Claimant testified she mentioned her left ankle and right knee in the accident report, but did not mention her neck.

10. The February 26, 2014 accident report stated that claimant "was carrying items from area to another and missed the steps going down into the other room, landing on my left ankle and falling down." Claimant circled her left ankle and right knee

on the diagram, but did not circle her neck. Claimant testified that she did not have neck symptoms at that time.

11. Claimant testified that in the evening of February 26, 2014, while at home, she began noticing neck symptoms as she watched television. Claimant testified that she had pain at the base of her skull that radiated down the right side of her neck to her shoulder area.

12. Claimant testified that when she woke up the following morning, February 27, 2014, she had a headache and her neck was sore and painful. Claimant sought treatment with Dr. Krebs the morning of February 27, 2014. Claimant testified that Ms. Hunt, the risk manager for employer, had made the appointment with Dr. Krebs for her the day before. Dr. Krebs's report noted that claimant slipped on some steps and fell, landing on her left foot. Dr. Krebs noted that claimant's left ankle, right knee, neck, and upper back were painful. Dr. Krebs also noted that claimant denied any prior right knee trouble, but claimant testified that she had seen Dr. Krebs for work-related right knee issues previously.

13. Dr. Krebs noted that claimant's neck was sore into her shoulder and upper back. Dr. Krebs also noted that claimant had prior neck and shoulder trouble. Dr. Krebs diagnosed claimant with thigh contusion or sprain/strain; left ankle sprain/strain; neck sprain; and thoracic region sprain. Dr. Krebs referred claimant for chiropractic care and released her to return to work full duty.

14. Claimant began a course of chiropractic treatment at Dunnagan Chiropractic on March 4, 2014. Dr. Dunnagain noted that claimant fell at work on February 26, 2014 when she missed steps and fell forward. Dr. Dunnagan noted claimant had neck, left ankle, and right knee symptoms.

15. Dr. Krebs noted on March 17, 2014 that claimant's left ankle and right knee had improved, but her neck remained bothersome. Dr. Krebs recommended additional chiropractic care and again released claimant to full duty.

16. Claimant returned to Dr. Krebs on April 8, 2014. Dr. Krebs noted that claimant continued to have neck symptoms and recommended claimant change from chiropractic care to massage treatment. Dr. Krebs also recommended a neck x-ray. Claimant testified that she and Dr. Krebs discussed the x-ray because her neck symptoms persisted following the injury.

17. Claimant underwent an x-ray on April 18, 2014. The radiologist, Dr. Welsh, noted endplate irregularity and mild disc space narrowing at C6-C7, small anterior osteophytes at C5-C6 and C6-C7, and facet arthropathy at C7-T1. Dr. Welsh's impression was mild degenerative spondylosis.

18. Dr. Krebs reviewed the x-ray results on April 21, 2014. Dr. Krebs again recommended massage therapy and released claimant to full duty. Claimant testified that she continued to work full duty for employer during this time.

19. On May 7, 2014, Dr. Krebs noted that claimant had increased radiating neck pain on the right side of her lower cervical spine. Dr. Krebs indicated that work activity and pulling weight increases her symptoms. Dr. Krebs noted that claimant's school year was nearing the end, and she would have a break in activities that seemed to aggravate her symptoms. Dr. Krebs recommended claimant continue taking ibuprofen and Flexeril.

20. Dr. Krebs noted on May 29, 2014 that claimant had recurring neck discomfort. Dr. Krebs noted that since claimant was now off work, she is more likely to heal since she was no longer caring for children. Dr. Krebs prescribed meidcations and urged claimant to finish massage therapy. Dr. Krebs also recommended a magnetic resonance image ("MRI") of claimant's cervical spine. Claimant testified that she and Dr. Krebs discussed an MRI at that time because her neck symptoms were becoming worse.

21. Claimant underwent an MRI scan on June 16, 2014. Dr. Welsh noted that the reason for the exam was claimant's recent fall and the resulting headaches, neck pain, and bilateral extremity numbness and tingling in her hands. Dr. Welsh noted that claimant had mild degenerative spondylosis most severe at C6-C7, where there was moderately severe left neural foraminal stenosis.

22. Claimant returned to Dr. Krebs on June 3, 2014. Dr. Krebs noted that he discussed claimant's case with Ms. Lindell with insurer and reported in his notes that: "Apparently, [Claimant] has had 12 work comp claims at [Employer]….We discussed the indications of the MR of the neck and it was mainly [] to clear the neck."

23. Claimant again returned to Dr. Krebs on June 18, 2014. Dr. Krebs noted that he had received a lengthy letter from insurer which noted that on February 26, claimant sustained an injury but did not initially complain of neck discomfort. Dr. Krebs noted that claimant had a prior history of neck pain and that while insurer did not dispute that the fall occurred, there was a question as to whether or not the fall caused any new injury or aggravation. Dr. Krebs noted that claimant had neck pain at her initial visit, and had also noted her prior neck pain and treatment. Dr. Krebs noted that claimant made complaints of left ankle, right knee, and neck symptoms when he initially saw her on February 27, 2014 and that claimant's neck symptoms had not resolved.

24. Dr. Krebs noted that he, at that point, did not believe that claimant sustained a new injury or permanent aggravation due to her February 26, 2014 fall based on his review of the MRI scan that did not show any terrible findings. Dr. Krebs opined that claimant was at maximum medical improvement ("MMI") with no permanent impairment that is ratable. Dr. Krebs recommended against maintenance care. At the same time, Dr. Krebs reported that he thought claimant's issues were degenerative, but

with some exacerbation. Dr. Krebs recommended additional physical therapy visits, and noted that claimant could be at MMI within six weeks. Insofar as Dr. Krebs report is ambiguous, the ALJ interprets Dr. Krebs report as indicating that claimant had a pre-existing condition that was exacerbated by the work injury and claimant was not at MMI. This is supported by the hand written physician's report that indicated claimant was not at MMI, but was anticipated to be at MMI in six weeks.

25. Claimant returned to Dr. Krebs on July 1, 2014. Dr. Krebs noted that claimant had not improved much, and was now complaining of numbness in both of her hands, right worse than left. Dr. Krebs noted that her neck remained uncomfortable and further noted that: "I did feel that medically probable new injury happened with [claimant] over her neck in February 2014." Dr. Krebs further noted that he felt claimant had a degenerative issue in her neck which was not unusual for a woman her age and felt it would be beneficial to start physical therapy with home stretching and exercise. Dr. Krebs noted that physical therapy records showed decreased range of motion in claimant's neck and that the goal of physical therapy was to reduce her pain and improve her range of motion. Dr. Krebs reported that he hoped to place claimant at MMI by the end of July.

26. Claimant returned to Dr. Krebs on July 22, 2014. Dr. Krebs noted that claimant was continuing to "move slowly along." Dr. Krebs noted that claimant had a degenerative neck condition that pre-existed her work injury. Dr. Krebs prescribed Flexeril. On August 1, 2014, Dr. Krebs noted that he spoke with claimant over the phone, and that he was recommending additional physical therapy treatment.

27. Claimant testified she had not seen Dr. Krebs since July 22, 2014 for this claim because her claim was denied and additional appointments had been cancelled.

28. Claimant testified at hearing that she sustained a separate work-related shoulder injury on September 2, 2014 unrelated to the present claim. Claimant testified that her neck symptoms were already present from the February 26, 2014 injury, and her right shoulder injury aggravated those symptoms, but that no new injury occurred involving her neck. Following the September 2, 2014 injury, claimant testified she was diagnosed with a right rotator cuff tear and was scheduled for shoulder surgery. Claimant remains under treatment for this separate claim.

29. Claimant testified at hearing that her left ankle symptoms resolved within a few weeks of the February 26, 2014 injury. Claimant testified that she still had right knee symptoms, including swelling and pain. Claimant testified that her right knee symptoms had made it difficult to kneel and squat.

30. Claimant testified that she still has neck symptoms from the February 26, 2014 injury including neck pain, stiffness, and tingling and numbness in her right arm. Claimant testified that her neck symptoms now are different then they were when she had treatment previously, because they have not improved with treatment and exercise. Claimant testified that in the past, she could control and improve her neck symptoms

with physical therapy and exercise, but she has not been able to improve her neck symptoms since the February 26, 2014 injury. Claimant also testified that her current neck symptoms are in a different location than the neck symptoms that caused her to seek physical therapy treatment in 2013: her prior pain was at the base of her neck and along her shoulder blades and her current neck pain begins at the base of her skull and goes down the right side of her neck to her shoulder area. Claimant testified that she has been able to tolerate working for employer by managing her symptoms with ice, a TENS unit at home, medications, and rest. The ALJ finds claimant's testimony regarding her symptoms to be credible and persuasive.

31. Respondents referred claimant to Dr. Sharma for an independent medical evaluation ("IME") on August 14, 2014. Dr. Sharma reviewed claimant's medical records, obtained a medical history and performed a physical examination in connection with his IME. Dr. Sharma noted that claimant's neck was not really a part of claimant's claim as it was initially reported as a right knee and left ankle claim. Dr. Sharma noted that claimant's MRI confirmed chronic degenerative changes that were not related to her fall on February 26, 2014. Dr. Sharma opined that claimant was at MMI as of April 1, 2014 and provided claimant with a diagnosis of a left ankle sprain, right knee sprain and a final impairment rating of 0% whole person. Dr. Sharma opined claimant did not need maintenance medical treatment related to her claim.

32. Dr. Sharma testified at hearing in this matter. Dr. Sharma's testimony was consistent with his August 14, 2014 IME report. Dr. Sharma testified that claimant's February 26, 2014 injury involved her right knee and left ankle, and that both of those conditions had resolved. Dr. Sharma testified that there were no objective findings in claimant's neck to explain her symptoms, but testified that claimant had undergone a neck MRI with several findings, including foraminal stenosis. Dr. Sharma testified that claimant sustained an accident on February 26, 2014, but not an injury because there was no disability associated with the event.

33. Dr. Sharma acknowledged on cross-examination that claimant's injury resulted in medical treatment for her knee and ankle, but opined that the treatment for claimant's neck was not related to the claimant's work injury. Instead, Dr. Sharma opined that claimant's neck symptoms that had manifested themselves sporadically prior to claimant's injury developed again after her injury and unrelated to her fall.

34. Dr. Sharma testified about claimant discontinuing her physical therapy care in November 2013. He testified that the therapist's January 22, 2014 note stated that "intervention goals and functional outcomes not achieved," and therefore claimant's neck symptoms must have still been present on February 26, 2014. The ALJ credits claimant's testimony that her neck symptoms had resolved prior to February 26, 2014 over Dr. Sharma's testimony that hypothesized that claimant's neck conditions continued to persist based on his review of the physical therapy records.

35. Dr. Sharma testified that although claimant fell and landed on the floor on February 26, 2014, developed neck pain later in the evening, and reported neck pain to

her doctor the following day, it is more likely that claimant's neck symptoms developed "spontaneously." The ALJ finds Dr. Sharma's testimony in this regard to be not credible.

36. The ALJ finds that claimant has proven that it is more likely than not that she sustained a compensable injury to her left ankle, right knee and neck on February 26, 2014. The ALJ notes that even respondents expert appears to agree that claimant injured her left ankle and right knee on February 26, 2014. Respondents argue that the claim as a whole is not compensable because claimant's injury did not result in a disability. However, on the issue of compensability, claimant needs only to establish that the accident resulted in disability or the need for medical treatment.

37. In this regard, the ALJ credits the medical opinions expressed by Dr. Krebs in his records over the contrary opinions expressed by Dr. Sharma in his report and testimony and finds that claimant has proven that it is more likely than not that she suffered a compensable injury arising out of and in the course of her employment with employer. The ALJ finds claimant's testimony regarding her symptoms to be consistent with the medical records in evidence. The ALJ credits claimant's testimony that she injured her left ankle and right knee just when she fell while working on February 26, 2014. The ALJ further credits claimant's testimony that she did not have neck symptoms in the days prior to February 26, 2014 and did not have neck symptoms on the morning of February 26, 2014 before the injury occurred. The ALJ credits claimant's testimony that she developed neck symptoms after returning home the evening of February 26, 2014 and finds that claimant has proven that it is more likely than not that her neck became symptomatic when she tripped and fell while working on February 26, 2014.

38. The ALJ notes that claimant reported the existence of the neck symptoms to Dr. Krebs less than 24 hours after the accident and finds that claimant has established that it is more likely than not that the fall on February 26, 2014 caused, aggravated, accelerated or combined with her pre-existing condition to result in the need for medical treatment.

39. The ALJ credits the medical opinions expressed by Dr. Krebs in his records and claimant's testimony over the contrary opinions expressed by Dr. Sharma in his report and testimony and finds that claimant has proven that it is more likely than not that the medical treatment she received from Dr. Krebs, Dunnagan Chiropractic, Montrose Massage Therapy, and from the physical therapists on referral from Dr. Krebs was reasonable and necessary to cure and relieve the claimant from the effects of her industrial injury. Specifically, the ALJ finds that the office visits with Dr. Krebs after the February 26, 2014 injury were reasonable and necessary to cure and relieve the claimant from the effects of the industrial injury. Respondents are liable for the medical treatment provided by Dr. Krebs and his referrals pursuant to the Colorado Medical Fee Schedule set forth by the Division of Workers' Compensation.

40. Claimant testified that her monthly pay at the time of the injury was $2,843.75. Claimant testified that she received a pay raise at the beginning of the 2014-2015 school year to $2,913.83 per month. Claimant argues that her AWW should be based on the amount she was paid after her raise at the beginning of the 2014-2015 school year. The ALJ is not persuaded.

41. Claimant's AWW is to be established by the rate at which claimant was paid at the time of the injury. Claimant was earning a monthly salary of $2,843.75 at the time of her injury. This results in an AWW of $656.25 ($2,843.75 x 12 divided by 52).

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. Section 8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. Section 8-43-201, C.R.S., 2006. A Workers' Compensation case is decided on its merits. Section 8-43-201, *supra*.

2. The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and action; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2006).

3. A compensable industrial accident is one that results in an injury requiring medical treatment or causing disability. The existence of a preexisting medical condition does not preclude the employee from suffering a compensable injury where the industrial aggravation is the proximate cause of the disability or need for treatment. *See H & H Warehouse v. Vicory*, 805 P.2d 1167 (Colo. App. 1990); *see also Subsequent Injury Fund v. Thompson*, 793 P.2d 576 (Colo. App. 1990). A work related injury is compensable if it "aggravates accelerates or combines with" a preexisting disease or infirmity to produce disability or need for treatment. *See H & H Warehouse v. Vicory, supra.*

4. As found, claimant has proven by a preponderance that she suffered compensable injury arising out of and in the course of his employment with employer when she fell at work on February 26, 2014.

5. Respondents argue at hearing that claimant's claim is not compensable because it did not produce disability. However, case law does not require that an injured worker establish that the injury result in disability where the injury aggravates, accelerates or combines with a pre-existing disease to produce the need for treatment. In fact, the vast majority of work related injuries result in the need for treatment, but not necessarily disability. This does not make these injuries "non-compensable" accidents and holding that there needs to be a finding of "disability" before the claim is determined to be compensable could result in significant issues in which medical treatment is necessary, but the injury doesn't result in a disability. In fact, ijured workers could end up facing the possibility of having to pay out of pocket for medical treatment that is reasonable and necessary if their injury does not result in a "disability". This is not the intent of the Act.

6. Respondents are liable for authorized medical treatment reasonably necessary to cure and relieve an employee from the effects of a work related injury. Section 8-42-101, C.R.S.; *see Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990).

7. As found, claimant has established that the medical treatment provided by Dr. Krebs for her ankle, knee and neck symptoms was reasonable and necessary to cure and relieve claimant from the effects of her work related injury. Therefore, respondents are liable for the cost of the medical treatment provided by Dr. Krebs and his referrals pursuant to the Colorado Medical Fee Schedule established by Division of Workers' Compensation.

8. The ALJ must determine an employee's AWW by calculating the money rate at which services are paid the employee under the contract of hire in force at the time of the injury, which must include any advantage or fringe benefit provided to the Claimant in lieu of wages. Section 8-42-102(2), C.R.S.; *Celebrity Custom Builders v. Industrial Claim Appeals Office*, 916 P.2d 539 (Colo. App. 1995). The general assembly has established that the phrase "at the time of injury" as used in subsection (2) of Section 8-42-102 refers to the date of the employee's accident. When subsection (2) of Section 8-42-102(2) is used to determine a worker's AWW, the wage on the date of the accident shall be used. Section 8-42-102(5)(a), C.R.S.

9. While the ALJ may still have discretion to use an alternative method for calculating an injured worker's AWW under the statute, the ALJ in this case determines that such discretion is not necessary under the facts of this case.

10. Therefore, the ALJ determines that Claimant's AWW is properly established at the time of her accident as $656.25.

ORDER

It is therefore ordered that:

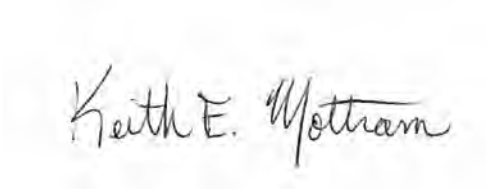
1. Respondents shall pay for the reasonable medical treatment necessary to cure and relieve the claimant from the effects of her industrial injury provided by Dr. Krebs and his referrals to claimant's left ankle, right knee and neck pursuant to the Colorado Medical Fee Schedule.

2. Claimant's AWW is established to be $656.25.

3. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: January 26, 2015



Keith E. Mottram
Administrative Law Judge
Office of Administrative Courts
222 S. 6th Street, Suite 414
Grand Junction, Colorado 81501

#J8FTK1YL0D17BBv 2

ISSUES

The issues for determination are:

1. Compensability;

2. Medical benefits;

3. Temporary partial disability benefits;

4. Temporary total disability benefits; and,

5. Whether the right of selection of the authorized treating physician has passed to the claimant.

STIPULATION

The parties stipulated that if the claim were found to be compensable that the claimant's average weekly wage is $556.10.

FINDINGS OF FACT

1. The claimant is a 52-year old cleaner who at the time of the claimed injury on June 10, 2014 worked for the respondent-employer. The claimant was hired by the respondent-employer on September 5, 2011.

2. The claimant's duties consisted of cleaning houses at Schriever Air Force Base for military personnel. Her duties included cleaning kitchens, bathrooms, windows, walls, floor, fixtures, and carpets. She was responsible for carrying all cleaning supplies to and from the houses she cleaned. Her cleaning supplies included a ladder, which she described as heavy. The claimant needed to use the ladder on a daily basis to reach things that needed to be cleaned.

3. The claimant began experiencing pain in her low back in May, 2014 as a result of carrying and working with the ladder.

4. The claimant was off work the week of May 26, 2014. Her low back pain eased during this time.

5. The claimant returned to work on June 2, 2014. Her low back pain increased due to lifting and carrying a ladder.

6. The respondent-employer's maintenance technician, Ed Romero, testified that the claimant told him she was having low back pain as a result of working with the ladder. He was familiar with the type of ladder the claimant used, and considered it to be heavy. The ALJ finds Mr. Romero's testimony to be credible and persuasive.

7. The claimant worked 10 hours on Monday, June 9, 2014. On June 10, 2014, she participated in a "stretch and flex" session at the respondent-employer's direction prior to beginning her work duties. Her low back pain was severe. She reported her low back pain to Steve Oser, the respondent-employer's Safety Manager. She told him her back pain was caused by working with the heavy ladder. The claimant was assigned to count inventory in a warehouse the rest of that day. She worked only 2.5 hours, then left to see a chiropractor.

8. The respondent-employer did not give the claimant a list of physicians to choose from to treat her injury. The respondent-employer did not post notices that a work related injury must be reported in writing.

9. The claimant saw chiropractor Travis Mauzy, D.C., on June 10, 2014. He noted, "…[the claimant] was in my office due to severe acute pain. It is my recommendation that she not work until I can re-evaluate her on Thursday."

10. The claimant was off work as a result of the effects of her injury on Wednesday, June 11 and Thursday, June 12, 2014. She returned to work on Friday, June 13, 2014 and was assigned to return to her regular job as a cleaner.

11. The claimant saw Sonia Seufer, M.D., at Colorado Springs Health Partners on July 31, 2014. Dr. Seufer issued work restrictions. The claimant presented Dr. Seufer's note to the respondent-employer.

12. On August 1, 2014, Dr. Seufer wrote a note indicating, "[The claimant] is under treatment for a back injury and sciatica which I feel is a work related injury." The claimant presented Dr. Seufer's note to the respondent-employer.

13. The respondent-employer provided modified duty work to the claimant beginning August 1, 2014.

14. The claimant presented to Dr. Walter Larimore at Concentra Medical Center on August 4, 2014. Dr. Larimore noted she was "…sent here for a one-time evaluation." He reported, "…51 y/o WWF with no history of back pain or injury who had a lumbar strain WC injury treated here from 10/28/13 until MMI on 11/18/13. Was asymptomatic until Monday, June 2. For the two weeks prior to that was having to carry a very heavy ladder. Was off from 5/29 through 6/1 to see her son graduate. Returned to work on Monday, June 2 and began to have bilateral low back pain that she believes was aggravated by a combination of carrying the heavy ladder and having to work 10 hours or more a day doing house cleaning on the Army post. Initial pain was noted on Monday night, 6/2/14 and worsened over that week. As the pain worsened, it also began to radiated [sic] down the left buttock…" Dr. Larimore diagnosed "lumbar pain with radiation down left leg," and "depression."

15. On August 5, 2014, Dr. Larimore reported, "…In my opinion, based upon her history and physical, there is a [greater than] 50% chance that these problems are due to a NEW work-related injury and NOT to her previous injury." [Emphasis in original]. Dr. Larimore's recommendations included medications, psychological therapy, physical therapy, and work restrictions.

16. Dr. Larimore continued the claimant's work restrictions on September 24, 2014.

17. On October 1, 2014, Kenneth Ginsburg, P.A., at Concentra reported, "…It was and is my opinion that this is a new injury and not related to her low back injury that was cared for under WC from 10/28/13 until 11/18/13. Has finally been approved for care here." PA Ginsburg noted , "...Her symptoms are about the same, she still has left low back pain radiating down her left leg…" PA Ginsburg diagnosed lumbar strain and sacroiliitis.

18. On October 2, 2014, Dr. Randall Jones of Concentra reported, "…This has finally been deemed a new injury. She is working light duty. She has not had MRI or pain specialist yet…" Dr. Jones referred the claimant for pain management with Dr. Jenks; for psychological treatment; and for MRI testing of both the lumbar spine and SI joints to rule out disc pathology.

19. MRI of the lumbar spine on October 21, 2014 revealed a L3-4 disc herniation/protrusion and annular tear displacing the descending nerve roots on the left side.

20. On October 23, 2014, Dr. Jones at Concentra referred the claimant to Dr. Polvi for chiropractic and/or acupuncture treatment. He also referred the claimant to Dr. Jenks "…for consideration of ESI." The referrals were not authorized.

21. The respondent-employer sent a letter to the claimant on October 28, 2014, advising that it "…has run out of meaningful work for you to do as a cleaner that will meet the restrictions presented on the [sic] October 23, 2014. As a result of this, the expectation is that you will file for a leave of absence and not return to work until you can perform the duties of your job." The claimant has been unable to work since then as a result of the effects of her injury.

22. The respondent-insurer arranged for A.C. Lotman, M.D., to perform a medical records review. Dr. Lotman issued a report dated November 5, 2014. Dr. Lotman opined that the medical treatment the claimant has received "…has been reasonable and necessary, and related to the June 10, 2014, DOL." Dr. Lotman opined that the claimant's "…current symptoms are causally related to the DOL of June 10, 2014." The ALJ finds those opinions of Dr. Lotman to be credible and persuasive.

23. Jack Rook, M.D., examined the claimant on November 12, 2014 and issued a report of the same date. Dr. Rook testified consistently with his report. He testified regarding the claimant's symptoms, his findings on physical examination, and his diagnosis. Dr. Rook opined the claimant sustained an injury in the form of an occupational disease, resulting from her working with and carrying the heavy ladder that the claimant described. Dr. Rook opined the claimant's symptoms and objective physical findings are consistent with the pathology demonstrated on her lumbar MRI. Dr. Rook opined the claimant has not reached MMI, and needs additional testing and treatment. The ALJ finds Dr. Rook's opinions to be credible and persuasive.

24. The claimant has selected Dr. Rook to treat her for the effects of her occupational disease.

25. The ALJ finds that the claimant has established that it is more likely than not that she suffered an occupational disease arising out of and in the course of her employment with the respondent-employer. The date of onset of the claimant's disability was June 10, 2014.

CONCLUSIONS OF LAW

1. The purpose of the Workers' Compensation Act of Colorado (Act), Sections 8-40-101, C.R.S. (2007), *et seq.*, is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. In general, the claimant has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of the respondents. Section 8-43-201, C.R.S.

2. A workers' compensation case is decided on its merits. Section 8-43-201, C.R.S. The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved. The ALJ need not address every piece of evidence or every inference that might lead to conflicting conclusions. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P. 3d 385 (Colo. App. 2000).

3. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of a witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005).

4. For a claim to be compensable under the Act, a claimant has the burden of proving that he or she suffered a disability that was proximately caused by an injury or disease arising out of and within the course and scope of employment. Section 8-41-301(1) (c), C.R.S.; *In re Swanson,* W.C. No. 4-589-645 (ICAP, Sept. 13, 2006). Proof of causation is a threshold requirement that an injured employee must establish by a preponderance of the evidence before any compensation is awarded. *Faulkner v. Industrial Claim Appeals Office*, 12 P.3d 844, 846 (Colo. App. 2000); *Singleton v. Kenya Corp*., 961 P.2d 571, 574 (Colo. App. 1998). The question of causation is generally one of fact for the determination of the Judge. *Faulkner*, 12 P.3d. at 846.

5. The ALJ finds the claimant to be credible.

COMPENSABILITY OF THE OCCUPATIONAL DISEASE CLAIM

5. An "occupational disease" is defined by §8-40-201(14), C.R.S., as:

> [A] disease which results directly from the employment or the conditions under which work was performed, which can be seen to have followed as a natural incident of the work and as a result of the exposure occasioned by the nature of the employment, and which can be fairly traced to the employment as a proximate cause and which does not come from a hazard to which the worker would have been equally exposed outside of the employment.

6. Under this statute the claimant bears the burden to prove that the disease was "directly and proximately caused" by the employment or working conditions. *Wal-Mart Stores, Inc. v. Industrial Claims Office*, 989 P.2d 251 (Colo. App. 1999). A claimant is entitled to recovery if the hazards of employment cause, intensify, or, to a reasonable degree, aggravate the disability for which compensation is sought. *Anderson v. Brinkhoff*, 859 P.2d 819 (Colo. 1993).

7. Expert opinion is neither necessary nor conclusive on the issue of causation. However, where expert opinions are presented it is for the ALJ to assess their weight and credibility. *Rockwell International v. Turnbull*, 802 P.2d 1182 (Colo. App. 1990). The question of whether the claimant has proven causation is one of fact for resolution by the ALJ. *Faulkner v. Industrial Claim Appeals Office*, 12 P.3d 844 (Colo. App. 1999).

8. As found, the claimant proved by a preponderance of the evidence that the disease affecting her lumbar spine was proximately caused, intensified or aggravated by her use, over time, of the heavy ladder in her workplace. The ALJ is persuaded by the opinions of Dr. Lotman and Dr. Rook, as well as they opinions of the Concentra medical personnel, that the cause of the claimant's lumbar spine problems was her work activities for the respondent-employer.

MEDICAL BENEFITS

9. Because this matter is compensable, the respondent-insurer is liable for medical treatment which is reasonably necessary to cure or relieve the the claimant from the effects of her industrial injury. § 8-42-101(1) (a), C.R.S; *Snyder v. Indus. Claim Appeals Office,* 942 P.2d 1337 (Colo. App. 1997). All of the medical treatment the claimant received for her industrial injury, from June 10, 2014 and onward, was reasonable and necessary. The respondent-insurer is liable for payment of that treatment, as well as all additional treatment necessary to cure and relieve the claimant from the effects of the injury.

RIGHT OF SELECTION OF THE TREATING PHYSICIAN

10. Pursuant to § 8-43-404 (5) (a) (I) (A), C.R.S., the employer is required to furnish an injured worker a list of at least two physicians or two corporate medical providers, in the first instance. An employer's right of first selection of a medical provider is triggered when the employer has knowledge of the accompanying facts connecting the injury to the employment. *Jones v. Adolph Coors Co.,* 689 P. 2d 681 (Colo. App. 1984). An employer must tender medical treatment forthwith on notice of an injury or its right of first selection passes to the injured worker. *Rogers v. Indus. Claim Appeals Office,* 746 P.2d 565 (Colo. App. 1987). As found, the respondent-employer failed to furnish the claimant with a list of authorized physicians. Accordingly, the right of selection passed to the claimant and she selected Jack Rook, M.D., to treat her. Dr. Rook is an authorized treating physician.

TEMPORARY PARTIAL DISABILITY BENEFITS

12. To prove entitlement to TPD benefits, the claimant must prove that the industrial injury contributed to some degree to a temporary wage loss. Section 8-42-106, C.R.S. *See also, PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). Here, as a result of the injury the claimant experienced an unspecified partial wage loss beginning June 10, 2014 and continuing through and including October 27, 2014.

TEMPORARY TOTAL DISABILITY BENEFITS

13. To prove entitlement to TTD benefits, the claimant must prove that the industrial injury caused a disability lasting more than three work shifts, that she left work as a result of the disability, and that the disability resulted in an actual wage loss. *PDM Molding, Inc. v. Stanberg*, supra. Section 8-42-103(1)(a), requires claimant to establish a causal connection between a work-related injury and a subsequent wage loss in order to obtain TTD benefits. *PDM Molding, Inc. v. Stanberg, supra*. The term "disability" connotes two elements: (1) medical incapacity evidenced by loss or restriction of bodily function; and (2) impairment of wage earning capacity as demonstrated by claimant's inability to resume her prior work. *Culver v. Ace Electric*, 971 P.2d 641 (Colo. 1999). There is no statutory requirement that the claimant establish physical disability through a medical opinion of an attending physician; claimant's testimony alone may be sufficient to establish a temporary disability. *Lymburn v. Symbios Logic*, 952 P.2d 831 (Colo. App. 1997). The impairment of earning capacity element of disability may be evidenced by a complete inability to work, or by restrictions which impair the claimant's ability effectively and properly to perform her regular employment. *Ortiz v. Charles J. Murphy & Co.*, 964 P.2d 595 (Colo.App. 1998).

14. Here, the claimant was working modified duty effective August 1, 2014 until the respondent-employer advised her on October 28, 2014 that it no longer had such work available for her. The claimant has been unable to return to work since that time due to the effects of her occupational disease. The disease caused a disability lasting more than three shifts, claimant left work as a result of the disability, and the disability resulted in actual wage loss. The claimant has established by a preponderance of the evidence that she is entitled to TTD benefits effective October 28, 2014, and continuing until such benefits can be terminated pursuant to law.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The claimant's claim for benefits under the Workers' Compensation Act of Colorado is compensable.

2. The date of onset of Claimant's disability is June 10, 2014.

3. The respondent-insurer is liable for payment of all of the treatment received since June 10, 2014 as well as all additional treatment necessary to cure and relieve the claimant from the effects of the injury.

4. Dr. Rook is the claimant's primary authorized treating physician.

5. The respondent-insurer shall pay TPD benefits to the claimant beginning June 10, 2014 and continuing through and including October 27, 2014 to be determined by the parties.

6. The respondent-insurer shall pay TTD benefits to the claimant beginning October 28, 2014, and continuing until such benefits can be terminated pursuant to law.

7. The respondent-insurer shall pay interest to the claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

8. All matters not determined herein, and not closed by operation of law, are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATE: January 2, 2015

Colorado Springs, CO 80906

ISSUES

1. Whether Claimant has established by a preponderance of the evidence that he sustained a compensable right hip injury on June 23-24, 2014 during the course and scope of his employment with Employer.

2. Whether Claimant has demonstrated by a preponderance of the evidence that he is entitled to receive authorized medical treatment that is reasonable and necessary to cure or relieve the effects of his industrial injury.

FINDINGS OF FACT

1. Claimant worked for Employer as a Garden Associate. His job duties involved unloading bundles of tools from wooden crates, stocking merchandise, assisting customers and cleaning. Claimant was required to squat, bend, kneel, lift, twist and pivot on a daily basis for extended periods of time.

2. Claimant also worked as a free-lance mechanic on an occasional basis prior to and during his employment with Employer. He fixed brakes, timing belts and motor mounts. Claimant performed most of this work in a seated position on the floor or leaning over the engines.

3. Claimant testified that on June 23, 2014 he was removing shovels from crates and stocking them on shelves. He noticed a sharp pain and warmth in his right hip. Claimant reported that the pain quickly subsided and he finished his shift without any further problems.

4. On June 24, 2014 Claimant was unpacking, lifting and stocking lawnmowers for approximately two hours when he noticed a popping sensation in his right hip. Subsequently, a customer requested assistance with loading a lawnmower into his vehicle. Claimant loaded the lawnmower onto a flat cart then into the customer's car. The popping and pain increased as Claimant began walking to the vehicle. As Claimant was returning to the store, he saw a supervisor walking toward him and asked her to feel the popping in his right hip area. The supervisor noticed that the popping was not right and advised him to seek medical attention.

5. On June 24, 2014 Claimant visited Katherine Drapeau, D.O. at OccMed Colorado for an examination. Claimant reported that in the early afternoon of June 23, 2014, after loading and unloading merchandise throughout the day, he noticed warmth and pain in his right hip greater trochanteric area. Dr. Drapeau noted, "[t]his morning when he went to work his hip started making popping sounds every time he stepped." She remarked that Claimant had no prior history of a right hip injury. Dr. Drapeau

summarized that Claimant had tenderness over the right greater trochanter and right hip popping when walking. She diagnosed Claimant with right greater trochanteric bursitis.

6. On July 1, 2014 Jim Keller, PA-C stated that his objective findings were consistent with a work-related mechanism of injury. He diagnosed Claimant with right greater trochanteric bursitis. PA-C Keller referred Claimant to physical therapy, wrote a prescription for Tramadol and recommended continued Ibuprofen.

7. On July 8 and July 22, 2014 Dr. Drapeau's objective findings remained consistent with her initial diagnosis of right greater trochanteric bursitis and a right hip sprain from a work-related mechanism of injury. Dr. Drapeau stated, "[b]ecause of the increase in pain and the palpable popping, I would like to make sure there is nothing wrong with the labrum of the hip joint, and MRI/arthrogram has been ordered."

8. A July 31, 2014 MRI/arthrogram of Claimant's right hip revealed a full thickness 8 to 12 mm anterior labral tear very near the midequatorial line. There were underlying features of femoroacetabular impingement. On August 1, 2014 PA-C Keller referred Claimant to Brian White, M.D. for orthopedic treatment of his hip.

9. On August 19, 2014 Brian White, M.D. evaluated Claimant and recommended right hip arthroscopic surgery to repair Claimant's labral tear. However, he noted that Claimant would need to lose about 40 pounds prior to the surgery.

10. On September 4, 2014 Claimant visited Greg Smith, M.D. for an examination. Dr. Smith noted that on June 23, 2014 Claimant had been unloading, lifting and stocking merchandise weighing up to 100 pounds when he developed pain and popping in his right hip. After conducting a physical examination, Dr. Smith diagnosed Claimant with a right hip sprain/strain, right hip greater trochanteric bursitis and an acute labral tear. He agreed with Dr. White that Claimant required surgery to repair his right hip condition. Dr. Smith remarked that Claimant did not exhibit any signs of prior right hip degeneration or injury. He summarized that "[a]fter going through his review of history and the MRI, I am uncertain how anyone could come to the conclusion that this was not a work-related injury, unless there is something that the insurance company knows previously that is not in the records. This injury did occur on the stated date and is work comp. related, at this point in time."

11. On September 8, 2014 Respondents filed a Notice of Contest challenging Claimant's claim for Workers' Compensation benefits.

12. On October 22, 2014 Claimant underwent an independent medical examination with Edward M. Healey, M.D. He issued a report and testified at the hearing in this matter. He reported that Claimant first experienced a burning sensation in his right hip on June 23, 2014 after stocking tools for Employer for two hours. Dr. Healey remarked that Claimant's pain returned on the following day after moving lawnmowers for one hour. He concluded that Claimant had pre-existing right hip abnormalities including a femoral acetabular impingement with increased alpha angle, pistol grip appearance of the femoral head and neck junction and mild dysplasia. He

noted that the pre-existing condition predisposed Claimant to having a labral tear. Dr. Healey explained that Claimant's repetitive job activities for Employer caused his pre-existing condition to become symptomatic and resulted in a labral tear. He noted that the Impingement/Labral Tear section of the Medical Treatment Guidelines states that impingement abnormalities are usually congenital. However, the condition may be aggravated by repetitive rotational forces such as twisting, squatting and kneeling.

13. Dr. Healey concurred with doctors Smith and White that Claimant had a work-related injury to his right hip that requires surgical correction. Dr. Healey stated that if Claimant does not receive the surgical procedure, he will have increasing, ongoing degenerative changes in the right hip and eventually require a right hip replacement. He noted that Claimant also needs to be referred to a dietician to help him with weight loss so he can reach 240-pounds as recommended by Dr. White. Dr. Healey also maintained that Claimant requires a health club membership with a pool so he can perform pool exercises to help him lose weight. Finally, in regard to right lateral femoral cutaneous nerve neuropathy, Claimant needs further evaluation with an ultrasound and possible cortisone injections. Dr. Healey also commented that it would be beneficial to obtain a lumbar MRI to make sure there is no evidence of an L2-3 disc herniation contributing to Claimant's right hip pain and right thigh numbness.

14. On October 10, 2014 Allison M. Fall conducted an independent medical examination of Claimant and issued a report. On December 3, 2014 the parties conducted the post-hearing evidentiary deposition of Dr. Fall. Dr. Fall explained that Claimant's MRI was not consistent with an overuse-type of injury. The MRI revealed an acute labral tear with no signs of past degeneration. Dr. Fall determined that the MRI showed a configuration of the hip that leads to impingement and tends to wear and tear the labrum. She noted that the type of tear had nothing to do with lifting, walking or other work activities.

15. Dr. Fall determined that Claimant's work duties would not be considered repetitive activities. She noted that his job description included many different types of duties including moving merchandise, helping customers, cleaning and walking down aisles. Dr. Fall testified that Claimant's work involved many different movements and activities throughout the day. She explained that the Medical Treatment Guidelines do not have a chapter for cumulative trauma disorders to the hip because the injury would be unusual.

16. Dr. Fall also noted that there was no evidence to support that Claimant sustained a traumatic, acute labral tear on the morning of June 23, 2014 or the afternoon of June 24, 2014. She commented that Claimant's reports of feeling warmth and momentary pain on June 23, 2014 and popping on June 24, 2014 were instead consistent with the symptoms of a pre-existing labral tear. Dr. Fall testified that Claimant had a pre-existing configuration of the hip that predisposed him to impingement of the hip and led to the labral tear. Therefore, she concluded that Claimant's right hip condition was not caused by his employment for Employer.

17. Claimant has established that it is more probably true than not that he sustained a compensable right hip injury on June 23-24, 2014 during the course and scope of his employment with Employer. On June 23, 2014 Claimant was removing shovels from crates and stocking them on shelves. He noticed a sharp pain and warmth in his right hip. Claimant reported that the pain quickly subsided and he finished his shift without any further problems. On the following day Claimant was unpacking, lifting and stocking lawnmowers for approximately two hours when he noticed a popping sensation in his right hip. Claimant's right hip popping subsequently increased as he walked to a customer's car to load a lawnmower. The medical records reflect that Claimant consistently reported his mechanism of injury and suffered an aggravation of his pre-existing right hip condition.

18. Dr. Drapeau initially diagnosed Claimant with right greater trochanteric bursitis and a right hip sprain from a work-related mechanism of injury. Moreover, PA-C Keller also noted that his objective findings were consistent with a work-related mechanism of injury. A July 31, 2014 MRI/arthrogram of Claimant's right hip revealed a full thickness 8 to 12 mm anterior labral tear very near the midequatorial line. There were underlying features of femoroacetabular impingement. Dr. Smith subsequently diagnosed Claimant with a right hip sprain/strain, right hip greater trochanteric bursitis and an acute labral tear. He agreed with Dr. White that Claimant required surgery to repair his right hip condition. Dr. Smith remarked that Claimant did not exhibit any signs of prior hip degeneration or injury. Finally, Dr. Healey concluded that Claimant had pre-existing right hip abnormalities including a femoral acetabular impingement. He noted that the pre-existing condition predisposed Claimant to suffering a labral tear. Dr. Fall also determined that Claimant had a pre-existing configuration of the hip that predisposed him to impingement of the hip and led to the labral tear. However, she concluded that Claimant's right hip condition is not related to his employment for Employer because his job duties were not repetitive and his symptoms were consistent with a pre-existing labral tear. Nevertheless, Dr. Fall's analysis failed to adequately consider the aggravation of a pre-existing right hip condition. Although Claimant suffered from a pre-existing condition, the temporal proximity of his symptoms and medical records reflect that his work activities on June 23-24, 2014 combined with his pre-existing right hip condition to produce a need for medical treatment.

19. Claimant has demonstrated that it is more probably true than not that he is entitled to receive authorized medical treatment that is reasonable and necessary to cure or relieve the effects of his industrial injury. Dr. White recommended right hip surgery and doctors Smith and Healey concurred with the surgical procedure. Accordingly, Claimant is entitled to reasonable and necessary medical treatment in the form of right hip arthroscopic surgery to repair a labral tear as recommended by Dr. White.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" (Act) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. §8-

40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. §8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979); *People v. M.A.*, 104 P.3d 273, 275 (Colo. App. 2004). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. §8-43-201, C.R.S. A Workers' Compensation case is decided on its merits. §8-43-201, C.R.S.

2. The Judge's factual findings concern only evidence that is dispositive of the issues involved; the Judge has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *See Magnetic Engineering, Inc. v. ICAO,* 5 P.3d 385, 389 (Colo. App. 2000).

3. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2007).

Compensability

4. For a claim to be compensable under the Act, a claimant has the burden of proving that he suffered a disability that was proximately caused by an injury arising out of and within the course and scope of employment. §8-41-301(1)(c) C.R.S.; *In re Swanson,* W.C. No. 4-589-645 (ICAP, Sept. 13, 2006). Proof of causation is a threshold requirement that an injured employee must establish by a preponderance of the evidence before any compensation is awarded. *Faulkner v. Industrial Claim Appeals Office,* 12 P.3d 844, 846 (Colo. App. 2000); *Singleton v. Kenya Corp.,* 961 P.2d 571, 574 (Colo. App. 1998). The question of causation is generally one of fact for determination by the Judge. *Faulkner,* 12 P.3d at 846.

5. A pre-existing condition or susceptibility to injury does not disqualify a claim if the employment aggravates, accelerates, or combines with the pre-existing condition to produce a need for medical treatment. *Duncan v. Industrial Claim Appeals Office,* 107 P.3d 999, 1001 (Colo. App. 2004). However, when a claimant experiences symptoms while at work, it is for the ALJ to determine whether a subsequent need for medical treatment was caused by an industrial aggravation of the pre-existing condition or by the natural progression of the pre-existing condition. *In re Cotts,* W.C. No. 4-606-563 (ICAP, Aug. 18, 2005).

6. As found, Claimant has established by a preponderance of the evidence that he sustained a compensable right hip injury on June 23-24, 2014 during the course and scope of his employment with Employer. On June 23, 2014 Claimant was removing shovels from crates and stocking them on shelves. He noticed a sharp pain

and warmth in his right hip. Claimant reported that the pain quickly subsided and he finished his shift without any further problems. On the following day Claimant was unpacking, lifting and stocking lawnmowers for approximately two hours when he noticed a popping sensation in his right hip. Claimant's right hip popping subsequently increased as he walked to a customer's car to load a lawnmower. The medical records reflect that Claimant consistently reported his mechanism of injury and suffered an aggravation of his pre-existing right hip condition.

7. As found, Dr. Drapeau initially diagnosed Claimant with right greater trochanteric bursitis and a right hip sprain from a work-related mechanism of injury. Moreover, PA-C Keller also noted that his objective findings were consistent with a work-related mechanism of injury. A July 31, 2014 MRI/arthrogram of Claimant's right hip revealed a full thickness 8 to 12 mm anterior labral tear very near the midequatorial line. There were underlying features of femoroacetabular impingement. Dr. Smith subsequently diagnosed Claimant with a right hip sprain/strain, right hip greater trochanteric bursitis and an acute labral tear. He agreed with Dr. White that Claimant required surgery to repair his right hip condition. Dr. Smith remarked that Claimant did not exhibit any sign of prior hip degeneration or injury. Finally, Dr. Healey concluded that Claimant had pre-existing right hip abnormalities including a femoral acetabular impingement. He noted that the pre-existing condition predisposed Claimant to suffering a labral tear. Dr. Fall also determined that Claimant had a pre-existing configuration of the hip that predisposed him to impingement of the hip and led to the labral tear. However, she concluded that Claimant's right hip condition is not related to his employment for Employer because his job duties were not repetitive and his symptoms were consistent with a pre-existing labral tear. Nevertheless, Dr. Fall's analysis failed to adequately consider the aggravation of a pre-existing right hip condition. Although Claimant suffered from a pre-existing condition, the temporal proximity of his symptoms and medical records reflect that his work activities on June 23-24, 2014 combined with his pre-existing right hip condition to produce a need for medical treatment.

Medical Benefits

8. Respondents are liable for authorized medical treatment that is reasonable and necessary to cure or relieve the effects of an industrial injury. §8-42-101(1)(a), C.R.S.; *Colorado Comp. Ins. Auth. v. Nofio*, 886 P.2d 714, 716 (Colo. 1994). A preexisting condition or susceptibility to injury does not disqualify a claim if the employment aggravates, accelerates, or combines with the preexisting condition to produce a need for medical treatment. *Duncan v. Industrial Claim Appeals Office,* 107 P.3d 999, 1001 (Colo. App. 2004). The determination of whether a particular treatment modality is reasonable and necessary to treat an industrial injury is a factual determination for the ALJ. *In re of Parker*, W.C. No. 4-517-537 (ICAP, May 31, 2006); *In re Frazier,* W.C. No. 3-920-202 (ICAP, Nov. 13, 2000).

9. As found, Claimant has demonstrated by a preponderance of the evidence that he is entitled to receive authorized medical treatment that is reasonable and necessary to cure or relieve the effects of his industrial injury. Dr. White recommended

right hip surgery and doctors Smith and Healey concurred with the surgical procedure. Accordingly, Claimant is entitled to reasonable and necessary medical treatment in the form of right hip arthroscopic surgery to repair a labral tear as recommended by Dr. White.

ORDER

Based upon the preceding findings of fact and conclusions of law, the Judge enters the following order:

1. Claimant suffered a compensable right hip injury on June 23-24, 2014 during the course and scope of his employment with Employer.

2. Claimant is entitled to reasonable and necessary medical treatment in the form of right hip arthroscopic surgery to repair a labral tear as recommended by Dr. White.

3. Any issues not resolved in this order are reserved for future determination.

If you are a party dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. *For statutory reference, see section 8-43-301(2), C.R.S. (as amended, SB09-070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a form for a petition to review at http://www.colorado.gov/dpa/oac/forms-WC.htm.*

ISSUE

- Did Claimant prove by a preponderance of the evidence that physical therapy treatments provided in the spring of 2014 constituted reasonable and necessary maintenance medical treatment?

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. Claimant's Exhibits 1 through 8 were received into evidence. Respondents' Exhibits A through C were received into evidence.

2. Claimant seeks an order requiring the Insurer to pay for 8 physical therapy (PT) visits that occurred from April to June 2014. These bills that were incurred at Performax Physical Therapy (Performax) and were for treatment of Claimant's left knee. The total amount billed for these services was $1043.

3. Claimant sustained admitted injuries on October 26, 2006 when she fell on both knees and also injured her back.

4. Claimant's treatment for her injuries included a left total knee arthroplasty (TKA) performed by Philip Stull, M.D. This surgery occurred on April 21, 2008.

5. On May 27, 2010 Insurer filed a Final Admission of Liability (FAL). The FAL admitted Claimant reached maximum medical improvement (MMI) on February 12, 2010. The FAL further admitted for permanent partial disability (PPD) benefits based on 26 percent whole person impairment, 28% of the right lower right lower extremity and 29% of the left lower extremity. The FAL also admitted for post-MMI "maintenance medical benefits" if "reasonable, necessary and related to the compensable injury."

6. Claimant credibly testified that Dr. Stull and Sharon Walker, M.D., were authorized treating physicians (ATP) with respect to her post-MMI medical care.

7. Claimant credibly testified that in March 2014 Dr. Walker referred her to Dr. Stull for examination of the left knee. At that time Claimant's left knee would hyperextend and "give out."

8. On March 21, 2014 Dr. Stull diagnosed "PCL deficiency (L) TKA." He prescribed PT "3 times per week for 8 weeks."

9. On April 11, 2014 Dr. Walker diagnosed "(L) TKA with loosening of joint; PCL deficiency." Dr. Walker referred Claimant to Performax for pool therapy and for "land PT quad strength."

10. On May 12, 2014 John Obermiller, M.D., issued a medical report assessing the reasonableness and necessity of the PT. Dr. Obermiller reviewed Dr. Stull's office note from March 21, 2014. Dr. Stull had written that 6 months previously he prescribed anti-inflammatories and "therapy" but Claimant was still "having some difficulties with left knee" including increased pain and "instability symptoms." Dr. Stull's impression was posterior cruciate (PCL) instability. Dr. Stull considered a surgical referral but stated he felt that "bracing and PT [were] warranted." Dr. Obermiller referred to the Medical Treatment Guidelines (MTG) and opined that the MTG would support PT "five times a week, for four to eight weeks, for an acute injury." However, Dr. Obermiller opined the available medical documentation did not provide "clear objective documentation of treatment rendered recent [sic]." Specifically Dr. Obermiller stated that there was "no clear documentation" of a need for PT for an injury that occurred in 2006. He further opined Claimant should be "well versed in a self-directed home-based exercise program." Based on the MTG and his review of the documentation Dr. Obermiller opined that the request for PT should not be "certified."

11. Claimant credibly testified she underwent 8 sessions of PT at Performax before she learned that further PT was denied. Claimant credibly testified that although the PT at Performax provided some relief of her symptoms it did not make a "major difference." As a result, she sought "advice" from Dr. Arthur. Dr. Arthur told the claimant she had a "loose ligament." She then saw Dr. Miner who recommended she undergo a left knee replacement surgery.

12. On September 30, 2014 Dr. Miner performed surgery described as a "single component (tibial component revision) left total knee arthroplasty." The pre-operative diagnosis included "failed left total knee arthroplasty due to: flexion extension instability, failure of the polyethylene insert with delamination and accelerated wear of the posterior aspect of the polyethylene insert." (Respondents' Exhibit A p. 5).

13. After the September 2014 revision surgery Claimant was again prescribed PT. Claimant attended PT. On January 5, 2015 Claimant advised Dr. Walker that she was improving and no longer experienced the "left knee giving way or locking or clicking." Claimant told Dr. Walker that she did not believe she needed formal PT any longer and wanted to "start using the gym for her therapy."

14. Claimant credibly testified she has experienced a good result from the September 2014 revision surgery.

15. On March 24, 2015 Lawrence Lesnak, D.O., performed an independent medical examination (IME) of Claimant. This IME was performed at the request of Respondents' counsel. Dr. Lesnak is board certified in physical medicine and rehabilitation and is level II accredited.

16. On March 24, 2015 Dr. Lesnak issued a written report concerning the IME. Dr. Lesnak took a history from Claimant, performed a physical examination and reviewed pertinent medical records. Dr. Lesnak wrote that he agreed with Dr. Obermiller that "there was no specific evidence which required formal physical therapy" prior to the September 30, 2014 surgery. Dr. Lesnak explained that "it appeared the patient was having some degree of hardware failure of her left knee prosthesis which ultimately led to surgical intervention." In these circumstances Dr. Lesnak opined that the PT performed in the spring of 2014 before surgery was not "reasonable or necessary, or related to the 10/26/2006 occupational injury."

17. Dr. Lesnak testified at the hearing. Dr. Lesnak stated that in the spring of 2014 Dr. Walker noted it was "likely" Claimant's left knee prosthesis had "loosened." He further noted that Dr. Arthur and Dr. Miner subsequently diagnosed Claimant with a loosening of the "polyethylene component" of her left knee prosthesis. Dr. Lesnak stated the polyethylene component of a prosthetic knee is a "plastic part" that serves as artificial menisci. Dr. Lesnak explained the polyethylene component wears out over time and when it does the patient can experience symptoms of instability in the knee. Dr. Lesnak opined that in light of the failure of the polyethylene component of the prosthesis the PT prescribed to Claimant in the spring of 2014 would not have been beneficial. Dr. Lesnak explained that PT would not help a patient with laxity of the prosthesis and he did not understand Dr. Stull's and Dr. Walker's reasons for prescribing PT. Dr. Lesnak expressed his opinions to a reasonable degree of medical probability.

18. On cross-examination Dr. Lesnak testified that he agreed with Dr. Obermiller that the PT performed in the spring of 2014 was not reasonable and necessary. However, Dr. Lesnak stated that he did not necessarily agree with Dr. Obermiller's reasoning. Dr. Lesnak explained that the MTG for lower extremity pain do not apply to post-MMI maintenance treatment. Therefore, Dr. Lesnak, unlike Dr. Obermiller, did not use the MTG in arriving at his conclusion that the PT was not reasonable and necessary.

19. Claimant failed to prove it is more probably true than not the PT she received at Performax from April through June 2014 was reasonable and necessary to relieve the effects of the industrial injury or prevent deterioration of her condition.

20. Dr. Lesnak credibly and persuasively opined that in the spring of 2014 Claimant's left knee symptoms of pain and instability were related to failure of the polyethylene component of the prosthetic knee. He also credibly opined that PT would be of no benefit for this condition and that bracing and surgery were the indicated treatments.

21. Dr. Lesnak's opinion that Claimant was suffering from laxity caused by failure of the polyethylene component is corroborated by the fact that in the spring of 2014 both Dr. Walker and Dr. Stull diagnosed Claimant with PCL instability. Dr. Arthur and Dr. Miner agreed Claimant should undergo surgery. In September 2014 Dr. Miner performed a revision surgery because of a "failed left total knee arthroplasty due to:

flexion extension instability, failure of the polyethylene insert with delamination and accelerated wear of the posterior aspect of the polyethylene insert."

22. Dr. Lesnak's opinion that PT was not a reasonable and necessary treatment in the spring of 2014 is underscored by Claimant's own actions. Claimant admitted the PT was not alleviating her condition and consequently she sought consultations with Dr. Arthur and Dr. Miner. Indeed, Claimant elected to undergo revision surgery by Dr. Miner in September 2014. Claimant also admitted that the surgery produced a good result.

23. Neither Dr. Stull nor Dr. Walker offered any credible and persuasive explanation of why PT was a reasonable and necessary treatment for Claimant's knee condition in the spring of 2014. Neither did either of them offer a credible and persuasive refutation of Dr. Lesnak's argument that PT was not an effective treatment for instability caused by failure of the polyethylene component of the knee prosthesis.

24. Evidence and inferences inconsistent with these findings are not credible and persuasive.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

The purpose of the Workers' Compensation Act of Colorado (Act), §§8-40-101, *et seq.*, C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. Claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201(1), C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of Claimant nor in favor of the rights of the Respondents. Section 8-43-201(1).

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005). A Workers' Compensation case is decided on its merits. Section 8-43-201(1). The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions.

REASONABLENESS AND NECESSITY OF PHYSICAL THERAPY

Claimant contends a preponderance of the evidence establishes that the PT she received from Performax in the spring of 2014 constituted reasonable and necessary treatment for her left knee condition. Respondents, relying on the opinions of Dr. Lesnak and Dr. Obermiller argue the PT was not reasonable and necessary considering that Claimant's diagnosis was PCL laxity and failure of the prosthesis.

The respondents are liable to provide such medical treatment "as may reasonably be needed at the time of the injury or occupational disease and thereafter during the disability to cure and relieve the employee of the effects of the injury." Section 8-42-101(1)(a), C.R.S. Colorado courts have ruled that the need for medical treatment may extend beyond the date of MMI where the claimant presents substantial evidence that future medical treatment will be reasonably necessary to relieve the effects of the injury or prevent further deterioration of her condition. *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988); *Stollmeyer v. Industrial Claim Appeals Office,* 916 P.2d 609 (Colo. App. 1995).

In cases where the Respondents file a final admission of liability admitting for ongoing medical benefits after MMI they retain the right to challenge the compensability, reasonableness, and necessity of specific treatments. *Hanna v. Print Expediters Inc.,* 77 P.3d 863 (Colo. App. 2003); *Teegardin v. J.C. Penney Co.,* WC 4-748-106-02 (ICAO January 17, 2014). When the Respondents challenge Claimant's request for specific medical treatment Claimant bears the burden of proof to establish entitlement to the benefits. *Ford v. Regional Transportation District,* W.C. No. 4-309-217 (ICAO February 12, 2009). The question of whether Claimant proved that specific treatment was reasonable and necessary to relieve or maintain her condition after MMI is one of fact for the ALJ. *See Kroupa v. Industrial Claim Appeals Office,* 53 P.3d 1192 (Colo. App. 2002).

As determined in Findings of Fact 19 through 23, Claimant failed to prove it is more probably true than not that the PT provided by Performax in the spring of 2014 constituted reasonable and necessary maintenance treatment. Rather, the ALJ credits the opinions of Dr. Lesnak that Claimant was suffering from instability caused by failure of the left knee prosthesis and that PT was not a reasonable and necessary treatment for that condition. The ineffectiveness of PT was emphasized by Claimant's decision to seek consultations with Dr. Arthur and Dr. Miner because the PT was not providing sufficient relief from her ongoing symptoms. Moreover, Claimant ultimately underwent surgery and admitted that she experienced a good result. Dr. Stull and Dr. Walker did not credibly and persuasively refute Dr. Lesnak's opinion that PT was notan appropriate treatment for Claimant's condition.

ORDER

Based upon the foregoing findings of fact and conclusions of law, the ALJ enters the following order:

1. The claim for payment of physical therapy expenses in the amount of $1043 is denied.

2. Issues not resolved by this order are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

- Did Claimant prove by a preponderance of the evidence that a topical cream containing the drug ketamine constitutes reasonable and necessary post-maximum medical improvement medical treatment designed to relieve ongoing symptoms associated with complex regional pain syndrome?

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. At the hearing Claimant's Exhibits 1 through 7 were admitted into evidence. Respondents' Exhibits A through D were admitted into evidence.

2. Claimant sustained a compensable injury to her right ankle in 2007. Subsequently she underwent at least 7 surgical procedures designed to alleviate ongoing ankle and right lower extremity pain.

3. On April 9, 2011 the Insurer filed a Final Admission of Liability including an admission for ongoing medical benefits after maximum medical improvement (MMI).

4. On March 24, 2014 J. Tashof Bernton, M.D., an authorized treating physician, examined Claimant. He assessed "chronic pain in the right foot and ankle following multiple surgeries." Dr. Bernton expressed concern for potential complex regional pain syndrome (CRPS) given the "appearance of the foot."

5. On May 12, 2014 Claimant underwent an Autonomic Testing Battery that demonstrated a "positive diagnostic assessment" for CRPS.

6. On August 25, 2014 Dr. Bernton noted Claimant had a positive diagnostic response to an initial sympathetic nerve block. Dr. Bernton stated that in conjunction with the results of the Autonomic Testing Battery Claimant met the Colorado Medical Treatment Guidelines (MTG) criteria for CRPS.

7. On September 22, 2014 Dr. Bernton stated Claimant had undergone a second sympathetic block. Dr. Bernton noted Claimant experienced transient improvement of her pain but experienced marked coldness of the entire leg with swelling and dramatic color change. Dr. Bernton stated that he did not want to move

forward with further blocks because Claimant "had a paradoxical response to blocks with some overall worsening of her condition, both subjectively and objectively."

8. On September 30, 2014 Dr. Bernton documented discoloration of Claimant's right leg from foot to mid thigh with evident swelling and "some hyperalgesia to light touch."

9. On December 23, 2014 Dr. Bernton noted that Claimant had CRPS of the right leg with evidence of ipsilateral spread to the right upper extremity. He stated Claimant had done poorly with blocks and suggested she return for a trial of topical analgesia. Dr. Bernton observed Claimant had "really shown the most benefit from this approach."

10. On January 8, 2015 Dr. Bernton documented "significant hypersensitivity and allodynia to the plantar aspect of the foot, more in the heel as well as the lateral aspect of the right foot and the medial aspect of the foot."

11. On January 12, 2015 Claimant reported to Dr. Bernton that she had not received the topical analgesic because the "the insurance company won't pay for it."

12. On January 12, 2015 Dr. Bernton wrote a letter to the Insurer stating that CRPS was "clearly a work-related condition" and that he prescribed topical analgesics in accordance with the MTG for CRPS page 79. Dr. Bernton stated that Claimant's condition was "likely to worsen, potentially irreversibly" as a result of the Insurer's failure to meet its obligation to provide care.

13. On January 29, 2015 Claimant reported to Dr. Bernton that she was in horrible pain with increased pain in the right foot and leg as well as in the right arm. She still had not received medications. Dr. Bernton noted Claimant's right foot and leg were discolored and swollen. Dr. Bernton recorded the presence of "mild hyperalgesia." He also observed mild swelling of the right hand. Dr. Bernton emphasized the importance of getting authorization for the medication and prescribed Gralise (long-acting gabapentin) and Vicodin.

14. On February 2, 2015 Dr. Bernton noted discoloration and in the distal right leg and into the foot. He also noted the dorsum of the right hand exhibited swelling and "some hyperalgesia." Similar findings were noted on February 10, 2015.

15. Claimant credibly testified as follows. In June or July, 2014 Dr. Bernton first prescribed a topical cream containing ketamine. She received the cream in the mail and applied it to painful areas of her right ankle and leg. The cream reduced her pain from 8 on a scale of 10 (8/10) to 4/10. She used the cream until the prescription ran out at the end of September or October 2014. The pharmacy then told her that further prescriptions for this compound had been denied by the Insurer. In January or February, 2015 she requested a prescription for Vicodin because she was in severe pain and had nothing to treat it. She did not need Vicodin when she was using the cream. She prefers the cream to Vicodin because the effects of Vicodin last only 3

hours and she wakes up in pain. Also, Vicodin causes Claimant to feel "groggy" and she fears becoming addicted to it.

16. WCRP 17, Exhibit 7, (G) (7) (j) (v.) (b) pp. 79-80, of the MTG for treatment of CRPS, provides that use of ketamine topical cream is a permissible non-operative treatment for CRPS under certain circumstances. This section of the MTG states that although there is good evidence that low dose ketamine cream (1%) does not relieve neuropathic pain, it is "physiologically possible" that higher doses of topical ketamine could have some effect on neuropathic pain. However, "use of … ketamine should be limited to patients with neuritic and/or sympathetically mediated pain with documented supporting objective findings such as allodynia and/or hyperalgesia." Further use of ketamine topical cream "beyond the initial prescription requires documentation of effectiveness, including functional improvement, and/or decreased use of other medications, particularly decreased use of opiates or other habituating medications."

17. Claimant proved it is more probably true than not that topical ketamine cream is a reasonable and necessary treatment for her CRPS.

18. Dr. Bernton credibly and persuasively opined that the use of ketamine based topical cream is a permissible treatment for CRPS under the MTG. Dr. Bernton credibly and persuasively opined that use of ketamine cream is appropriate under the MTG. In this regard Dr. Bernton has documented the presence of both allodynia and hyperalgesia. He has noted that application of topical medication has been the most effective treatment of Claimant's CRPS. Considering the totality of the evidence, the ALJ gives great weight to Dr. Bernton's testimony that use of ketamine cream is appropriate under the MTG.

19. Claimant credibly testified use of topical ketamine cream significantly reduced her pain before the Insurer stopped payment for the drug. She also credibly testified that after ketamine was stopped she had no effective relief from pain and was forced to request a prescription for Vicodin. The medical records corroborate Claimant's testimony. On December 23, 2014 Dr. Bernton noted Claimant had "shown the most benefit" from topical analgesia and suggested another trial. On January 29, 2015 Claimant reported "horrible" pain and Dr. Bernton prescribed Vicodin. The ALJ infers from this evidence that if Claimant is allowed to use topical ketamine cream there is a reasonable chance that she can reduce consumption of other medication, especially Vicodin.

20. The evidence produced by the Respondents, particularly the January 6, 2015 letter authored by Nicole Peck, R.N., is not persuasive insofar as it argues that ketamine topical cream is not a reasonable and appropriate treatment for Claimant's CRPS. First, this letter/report incorrectly states that the Colorado MTG do not address the "issue" of the use of ketamine cream for treatment of CRPS. As found above, and as mentioned by Dr. Bernton, the Colorado MTG for treatment of CRPS do in fact address this issue and indicate that use of ketamine topical cream may be appropriate under the specified conditions. Second, the January 6 report admits that use of

ketamine is “under study” and has shown “encouraging results” in “non-controlled studies for CRPS 1 and post-herpetic neuralgia.”

21. Evidence and inferences contrary to these findings are not credible and persuasive.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

The purpose of the Workers’ Compensation Act of Colorado (Act), §§8-40-101, *et seq.*, C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201(1), C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of respondents. Section 8-43-201(1).

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005). A Workers' Compensation case is decided on its merits. Section 8-43-201(1). The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions.

REASONABLENESS AND NECESSITY OF KETAMINE TOPICAL CREAM

Claimant argues she proved by a preponderance of the evidence that the ketamine topical cream prescribed by Dr. Bernton constitutes reasonable and necessary post-MMI treatment designed to cure and relieve the effects of CRPS. The ALJ agrees with this argument.

Respondents are liable to provide such medical treatment “as may reasonably be needed at the time of the injury or occupational disease and thereafter during the disability to cure and relieve the employee of the effects of the injury.” Section 8-42-101(1)(a), C.R.S. Colorado courts have ruled that the need for medical treatment may extend beyond the point of MMI where the claimant presents substantial evidence that future medical treatment will be reasonably necessary to relieve the effects of the injury or prevent further deterioration of her condition. *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988); *Stollmeyer v. Industrial Claim Appeals Office,* 916 P.2d 609 (Colo. App. 1995).

In cases where the respondents file a final admission of liability admitting for ongoing medical benefits after MMI they retain the right to challenge the compensability, reasonableness, and necessity of specific treatments. *Hanna v. Print Expediters Inc.,* 77 P.3d 863 (Colo. App. 2003). When the respondents challenge a claimant's request for specific medical treatment the claimant bears the burden of proof to establish entitlement to the benefits. *Ford v. Regional Transportation District,* W.C. No. 4-309-217 (ICAO February 12, 2009). The question of whether a claimant proved that specific treatment is reasonable and necessary to maintain her condition after MMI or relieve ongoing symptoms is one of fact for the ALJ. *See Kroupa v. Industrial Claim Appeals Office,* 53 P.3d 1192 (Colo. App. 2002).

When determining the issue of whether proposed medical treatment is reasonable and necessary the ALJ may consider the provisions and treatment protocols of the MTG because they represent the accepted standards of practice in workers' compensation cases and were adopted pursuant to an express grant of statutory authority. However, evidence of compliance or non-compliance with the treatment criteria of the MTG is not dispositive of the question of whether medical treatment is reasonable and necessary. Rather the ALJ considering the totality of the evidence may determine the weight to be given evidence of compliance or non-compliance with the MTG. *See Adame v. SSC Berthoud Operating Co., LLC.*, WC 4-784-709 (ICAO January 25, 2012); *Thomas v. Four Corners Health Care*, WC 4-484-220 (ICAO April 27, 2009); *Stamey v. C2 Utility Contractors, Inc.*, WC 4-503-974 (ICAO August 21, 2008). *See also*, § 8-43-201(3), C.R.S.

As determined in Findings of Fact 17 through 20, Claimant proved it is more probably true than not that ketamine topical cream constitutes reasonable and necessary medical treatment to relieve the ongoing effects of injury-related CRPS. As found, Dr. Bernton credibly opined that ketamine topical cream has been the most effective treatment for relieving Claimant's CRPS symptoms. Dr. Bernton also credibly and persuasively opined that the MTG for treatment of CRPS authorize the use of topical ketamine cream under the conditions and circumstances present in this case. As determined in Finding of Fact 18, Claimant credibly testified that use of topical ketamine cream significantly reduced the symptoms of her CRPS. She also credibly testified that when ketamine cream was no longer available her symptoms increased and she was forced to request a prescription for Vicodin. As determined in Finding of Fact 18, the ALJ infers that if Claimant is permitted to use topical ketamine cream there is a reasonable prospect that she can reduce the consumption of other medication including Vicodin. Although respondents presented some evidence to the contrary, the ALJ finds this evidence is not credible and persuasive.

ORDER

Based upon the foregoing findings of fact and conclusions of law, the ALJ enters the following order:

1. Insurer shall provide ketamine topical cream as a form of reasonable and necessary post-MMI medical treatment. Insurer shall continue to provide this treatment as long as it remains reasonable and necessary and causally-related to the injury.

2. Issues not resolved by this order are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

STATE OF COLORADO

W.C. No. 4-832-903-03 and 4-891-828

FULL FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

IN THE MATTER OF THE WORKERS' COMPENSATION CLAIM OF:

Claimant,

v.

Employer,

and

SELF-INSURED,

Self-Insured Respondent.

Hearing in the above-captioned matter was held before Edwin L. Felter, Jr., Administrative Law Judge (ALJ), on June 10, 2015, in Denver, Colorado. The hearing was digitally recorded (reference: 6/10/15, Courtroom 1, beginning at 1:30 PM, and ending at 4:30 PM).

W.C. No. 4-832-902-03 concerns a closed case involving an admitted back/neck injury of August 2, 2010. The Claimant filed a Petition to re-Open this case. W.C. No. 4-891-828 concerns a fully contested alleged compensable back/shoulder injury of July 2, 2012.

Claimant's Exhibits 1 through 5 were admitted into evidence, without objection. Respondent's Exhibits A through S were admitted into evidence, without objection.

At the conclusion of the hearing, the ALJ ruled from the bench and referred preparation of a proposed decision to counsel for the Claimant. The proposed decision was filed, electronically, on June 16, 2015. On June 18, 2015, the Respondent filed objections which, to some extent advocated the Respondent's position by adding in more suggested findings into the proposed decision, consistent with the Respondent's overall theory of the case. This is helpful, however, an ALJ is not held to a crystalline

standard in articulating and dealing with each piece of evidence in his findings. *See Magnetic Engineering, Inc. v. Indus. Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000). Although certain minute pieces of evidence may not be mentioned in a decision, there is a presumption that the minutae in the evidence was considered unless there is a showing that it was not considered. After a consideration of the proposed decision and the objections thereto, the ALJ has modified the proposal and hereby issues the following decision.

ISSUES

The issues to be determined herein concern the Claimant's Petition to Re-Open W.C. No. 4-32-902-03, based on an alleged worsening of condition. The issues in W.C. No. 4-891-828 concern compensability; if compensable, medical benefits, including change of physician and whether the Respondent received reasonable notice of this issue; and, temporary total disability (TTD) benefits from July 2, 2012 and continuing. The Respondent designated the issue of overpayment in W.C. No. 4-832-902-03. The Claimant's theory is there was either a worsening of the closed, admitted claim in W.C. No. 4-832-903-03; or, in the alternative, the Claimant sustained a new compensable injury on July 2, 2012. Claimant also requested a change of authorized physician to Kristin Mason, M.D., as an alternative to Dr. Mason being in the authorized chain of referrals after a refusal to treat for non-medical reasons by Dr. Fall, who was treating in the earlier case, W.C. No. 4-832-902-03, wherein the Petition to Re-Open is denied and dismissed.

The Claimant bears the burden of proof, by a preponderance of the evidence on all designated issues with the exception of overpayment, in which case the Respondent bears the burden, by preponderant evidence.

FINDINGS OF FACT

Based on the evidence presented at hearing, the ALJ makes the following Findings of Fact:

Preliminary Findings

1. The Claimant worked for the Employer in the Public Library, specifically as a clerk and driver of the bookmobile. According to the Claimant, there are two bookmobiles, and they depart from the Public Library on a scheduled route each week. The Claimant had served as both a driver and a passenger, though on July 2, 2012, she was the passenger riding in the back seat because she had taken a pain pill that morning for her back pain and determined that she should not drive under the influence of a pain pill.

2. According to the Claimant, each vehicle had a driver and one other person that rode in the back of the bookmobile along the back wall, behind the rear wheels. The bookmobile was a unique vehicle to drive and ride in because of the stiffness of the ride. According to the Claimant, the bookmobile required very stiff springs because of the weight of the books, so the ride from stop to stop was very rough. If the bookmobile went over a bump or a dip in the road the person in the back would bounce up and down even if seat-belted.

3. The Claimant had an admitted injury to her lumbar spine in the course and scope of her employment on August 2, 2010 (W.C. No. 4-832-902-03). She was treated for this injury by Allison Fall, M.D., who placed the Claimant at maximum medical improvement (MMI) on December 10, 2010, with a zero percent impairment rating. The Claimant disagreed with Dr. Fall's rating and sought a Division Independent Medical Examination (DIME). Eramus Morfe, D.O., was selected to perform the DIME. Dr. Morfe agreed with Dr. Fall's date of MMI, however, he disagreed with her zero percent rating. Dr. Morfe rated the Claimant at 11% whole person for her lumbar spine. He did not rate her thoracic spine or cervical spine. Dr. Morfe indicated that maintenance treatment (lumbar steroid injections) was appropriate for the Claimant's lumbar spine.

4. Dr. Fall testified at the hearing that she has seen the Claimant for the maintenance treatment under W.C. No. 4-832-902-03, with the most recent visit in May of 2015. Dr. Fall provided the Claimant with medication and referred her to Osteopathic Dr. Krembs. Dr. Fall's current diagnosis is fibromyalgia, and Dr. Fall stated that she did not have any treatment to offer the Claimant at this time. The Claimant did not agree that Dr. Fall was appropriately treating her for her injury.

5. In addition to Dr. Fall, the Claimant had seen her personal physician at Kaiser several times after her date of MMI for the 2010 injury. The Claimant visited Kaiser-Permanente on December 28, 2011 and complained of headache and right-sided neck pain, thoracic spine pain, tenderness in the thoracic spine, constant right hip pain, stiffness, low back pain, bilateral leg weakness, dull ache in the lower back, and bilateral buttocks pain. According to the medical record, she complained that she felt tension with flexion of the neck, she had discomfort sitting, and that her "butt hurts all the time". Leslie Pearson, M.D., diagnosed cervical radiculopathy, thoracic spine pain, and low back pain, chronic. Dr. Pearson planned to refer the Claimant for physical therapy (PT) and ordered x-rays of the right hip, pelvis, and a lumbar MRI (magnetic resonance imaging) without contrast.

6. The Claimant returned to Kaiser Permanente on January 3, 2012 for a physical therapy evaluation. She repeated many of the complaints stated in the December 28, 2011 Kaiser report. The Claimant returned to Kaiser on June 27, 2012 and again saw Dr. Pearson. She complained of worsening back pain. Dr. Pearson's note stated that the lower back is worst and that there was bilateral buttocks and lower

back mid. Dr. Pearson found tenderness over the lumbar and lower thoracic spines, tender over the paraspinal muscles, right and left lumbar, and bilateral SI joints. Dr. Pearson's diagnosis was again chronic low back pain and again recommended a lumbar MRI without contrast. The Claimant stated on cross examination that she went to Kaiser on June 27, 2012 for the reasons described in Dr. Pearson's note. She also stated that she asked Dr. Pearson about long-term disability because she felt it was becoming difficult to do her job. According to the Claimant, in late June 2012, she was trying to make an appointment to see Dr. Fall because she felt her condition was getting worse.

7. The Claimant continued working, full time, during the course of her Kaiser visits and none of the Kaiser physicians took the Claimant off work during this time.

W.C. No. 4-891-828—The Incident of July 2, 2012

8. According to the Claimant, on July 2, 2012, while working for the Employer on the bookmobile, she significantly aggravated her underlying back condition and sustained new injuries. She stated that, on that day, she was working with Melanie Pierce who was the driver of the bookmobile. The Claimant was sitting in the back seat when the driver hit a pothole that shook the vehicle violently. According to the Claimant, the force of the impact caused her to be jolted up even though she was wearing a seat and lap belt. The books that were on the shelves flew off, and the bookshelf directly across from where she was sitting was cracked by the force of the impact. The Claimant had immediate pain in her cervical area, and her tailbone and lower back. According to the Claimant, this pain was much worse than it had been prior to this incident. The ALJ finds the Claimant's testimony regarding this incident credible and, essentially, undisputed. The Respondent presented **no** witnesses to dispute the veracity of the Claimant's description of the incident or concerning its occurrence.

9. The Claimant reported the incident and alleged injury to her supervisor, Jennifer Hoffman, after the vehicle arrived at its next stop. Jennifer came to get the Claimant in Jennifer's private vehicle so that the Claimant would not have to finish the day.

10. The Claimant was seen at the occupational clinic that is part of Denver Health Medical Center on July 3, 2012. She advised the clinic of her prior injury and reported that she had substantially increased back pain, and "different pain between her shoulder blades." She reported difficulty sitting, in addition to the pain in her upper and lower back. She was taken off work by the physician at the clinic, Lori Szczukowski M.D.

11. The Claimant was off work until she again saw Dr. Szczukowski at the clinic on July 10, 2012. The Claimant reported back and neck pain being the same, however, Dr. Szczukowski indicated in the notes that she told the Claimant that the

claim was not being accepted so she was unable to offer her treatment. Dr. Szczukowski stated that the Claimant could return to full-duty work. Dr. Szczukowski suggested that the Claimant return to see Dr. Fall (who she was scheduled to see for a maintenance visit under W.C. No. 4-832-902-03). There is no indication that the Claimant voluntarily chose Dr. Fall to be her authorized treating physician (ATP) for W.C. No. 4-891-828, rather the records make it clear that the Claimant was sent to Dr. Fall because the Respondent denied care for the alleged new injury and treated the referral to Dr. Fall as a maintenance-care-referral under W.C. No. 4-832-902-03.

12. Between July of 2012 and the time of the hearing in this matter, Dr. Fall continued to see the Claimant for maintenance treatment related to her 2010 injury. Dr. Fall continued to provide the Claimant with small doses of Vicodin and she made a referral to Jordanna Quinn D.O. On cross examination, Dr. Fall stated that she made no referrals for diagnostic testing, an MRI (magnetic resonance imaging), or referrals to any specialists for the Claimant's continued complaints of pain in her hips, back and "sit bones."

13. The Claimant saw Dr. Fall on July 31, 2012 complaining of bilateral pain in the neck between her shoulders, mid back pain, lower back, hip and buttock pain, stabbing pain in the buttocks on the left and painful to sit, with weakness in the legs. She rated her pain 8 out of 10. Previous records of visits with Dr. Fall provided by the Respondent indicated a consistent pain rating of 4 out of 10. (Resp. Ex I**) Dr. Fall recommended that she pursue treatment outside of workers compensation. She did not believe that there was a mechanism of injury to account for her (then) current symptomatology.** Based on this recommendation, the ALJ infers and finds that Dr. Fall declined to treat the Claimant for the 2012 injury, based on her non-medical determination that it was not a compensable injury. Dr. Fall did not provide treatment recommendations. Indeed, the ALJ infers and finds that Dr. Fall offered no meaningful treatment as of the last visit to alleviate the Claimant's condition. The ALJ infers and finds that this fact amounts to a *de facto* refusal to further treat the Claimant to improve her condition.

Independent Medical Examination (IME) by Gretchen Brunworth, M.D.

14. Dr. Brunworth performed an IME at the request of the Respondent. She outlined her review of the records provided to her in her report. It was her opinion that the Claimant remained at MMI for the 2010 injury, that she did not suffer a new injury in 2012, and that she was not in need of further treatment. She categorically agreed with the testimony of Dr. Fall that no further treatment was needed, though she did not dispute that the Claimant was "in pain." The ALJ finds that Dr. Brunworth's opinions are contrary to the weight of the evidence, contrary to the credible opinion of Kristin Mason, M.D. who had been treating the Claimant under the Claimant's health insurance and, therefore, has "no dog in the work-related fight."

Declining of Treatment by Dr. Fall for Non-Medical Reasons and Thereafter

15. When Dr. Fall advised the Claimant to seek treatment from her personal physician for the 2012 incident, the ALJ infers and finds that there was a refusal to treat for non-medical reasons. The Claimant thereupon sought treatment with her personal physician Amber Wobbekind, M.D. Dr. Wobbekind subsequently referred the Claimant to Dr. Kathyrn A Witzeman, M.D. Dr. Witzeman is a specialist in pelvic issues, working at the women's integrative pelvic health clinic. Dr. Witzeman's records indicate that she saw the Claimant on November 19, 2014 and on January 15, 2015. In her report dated January 15, 2015, Dr. Witzeman states that the Claimant has a 2 year history of worsening pelvic floor muscle pain after a coccygeal and sacral trauma that was work-related. She states "I do believe that her pelvic floor dysfunction and pain that has also extended to her lower back is directly related to this injury (the injury of 2012). This is a common coccyx injury. It is a common mechanism for pelvic floor dysfunction". The ALJ finds Dr. Witzeman's opinion on causality to be more persuasive than either Dr. Fall's or Dr. Brunworth's opinions because, among other things, Dr. Witzeman has more specific expertise in pelvic matters, and her opinion is consistent with the totality of the evidence. Indeed, Dr. Witzeman's opinion solidly supports a work-related aggravation and acceleration of a pre-existing pelvic problems, and this occurred on July 2, 2012.

16. Dr. Fall stated that she has no treatment to offer the Claimant. It would be ludicrous to maintain that the Claimant should return to Dr. Fall. The Respondent offered her no other option. The ALJ infers and finds that the Claimant has considerably more confidence in Dr. Witzeman's treatment than in Dr. Fall's treatment. The Claimant has more confidence in Dr. Witzeman's ability to adequately diagnose and treat her condition. Therefore, the ALJ finds that Dr. Witzeman and her referrals are authorized treating physicians for the purposes of this claim. (W.C. No.4-891-828-03).

Medical Benefits

17. All of the medical care and treatment for the Claimant's July 2, 2012 injuries was authorized, within the authorized chain of referrals, causally related and reasonably necessary to cure and relieve the effects of those injuries.

Reasonable Notice of Change of Physician/Authorization of Dr. Witzeman and Dr. Mason as ATPs

18. The Respondent alleges that it did not have sufficient notice of the "change of physician" issue. There is no space for the "change of physician" issue on

the Application for Hearing" form, however, there is a general space for "medical benefits." Based on the denial of the 2012 claim (W.C. No. 4-891-828) and ATP Dr. Fall's ultimate referral of the Claimant to her private physician in the context of the 2012 claim, the ALJ infers and finds that the Respondent had reasonable notice that authorization of Dr. Witzeman and her referrals; and, "change of physician" would be an issue under the general heading of "medical benefits."

19. Indeed, there is no rational reason supporting a return to Dr. Fall as an ATP. On the other hand, the ALJ infers and finds that the Respondent was aware that Kaiser Permanente, Dr. Prusmack, Dr. Witzeman and Dr. Mason were of the opinion that the Claimant's present condition was related to the 2012 injury, and Dr. Prusmack had treatment recommendations for a work-related condition. The ALJ, therefore, infers and finds that the Respondent had reasonable notice, prior to the hearing, that the Claimant was seeking a change of physician to Dr. Prusmack. When the "change of physician" prong of "medical benefits" was brought up at hearing, the Respondent offered no underlying reasons concerning any prejudicial effects of not being provided specific notice. No space for "change of physician" is provided in the "Application" form or the Case Information Sheet form. The ALJ, therefore, infers and finds that the Respondent had reasonable notice that "change of physician" to Kristin Mason, M.D., would be an issue subsumed under the heading of "medical benefits."

Petition to Re-Open

20. The Claimant filed a Petition to Re-Open 4-832-902 to cover all bases. The Petition should be denied because the Finding herein is that a new incident occurred on July 2, 2012, which has caused new injuries as well as substantially aggravating and accelerating any condition for which the Claimant was treating under the earlier claim.

21. The Claimant is currently not working and testified that she does not believe she has worked since approximately July 15, 2012, however, issues concerning the periods of temporary disability owed and offsets applicable should be deferred to a subsequent hearing, if needed, by agreement of the parties.

22. The Respondent seeks recovery of an overpayment in 4-832-902. The Petition to Re-Open that claim being denied, therefore, there are no benefits owed under that claim to offset. The Claimant, however, agrees to recovery of the overpayment as part of the benefits due in 4-891-828.

Ultimate Findings

23. The ALJ finds the Claimant's testimony credible and un-impeached. Further, the ALJ finds the opinions of Dr. Fall and Dr. Brunworth lacking in credibility,

and the opinions of Dr. Witzeman, Dr. Prusmack and Dr. Mason far more credible and persuasive because of her specific expertise.

24. The ALJ makes a rational choice, between conflicting medical opinions, to accept the opinions of Dr. Mason, Dr. Prusmack and Dr. Witzeman and to reject any opinions to the contrary.

25. The Claimant has proven, by a preponderance of the evidence that she sustained an injury in course and scope of her employment on July 2, 2012 to her neck, upper and lower back, hips and pelvis and coccyx. To the extent that any of these areas were part of an earlier claim the Claimant has proven by a preponderance of the evidence that the incident of July 2, 2012 substantially aggravated and accelerated the underlying injuries to those parts of the body.

26. The Claimant has proven, by preponderant evidence that she should be allowed to proceed with the treatment recommended by Dr. Witzeman or her referrals. Dr. Fall will no longer be considered an authorized treating physician for the purposes of this claim (4-891-828). Indeed, the Respondent had reasonable notice that a change of physician was an issue subsumed under medical benefits. Further, in the earlier case, Dr. Fall refused to further treat the Claimant for non-medical reasons, the Respondent was aware that Kaiser Permanente, Dr. Prusmack, Dr. Witzeman and Dr. Mason (under the Claimant's health insurance) were providing meaningful treatment for the Claimant's July 2, 2012 injuries, and the Respondent offered no treatment alternative to these medical providers.

27. The Claimant is not at MMI for the injuries related to the incident of July 2, 2012.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

Credibility

a. In deciding whether an injured worker has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Bodensleck v. Indus. Claim Appeals Office,* 183 P.3d 684 (Colo. App. 2008);*Kroupa v. Indus. Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002); *Rockwell International v. Turnbull,* 802 P.2d 1182, 1183 (Colo. App. 1990); *Penasquitos Village, Inc. v. NLRB*, 565 F.2d 1074 (9th Cir. 1977). The ALJ determines the credibility of the witnesses. A*renas v. Indus. Claim Appeals Office*, 8 P.3d 558

(Colo. App. 2000). The weight and credibility to be assigned evidence is a matter within the discretion of the ALJ. *Cordova v. Indus. Claim Appeals Office*, 55 P.3d 186 (Colo. App. 2002); *Youngs v. Indus. Claim Appeals Office,* 297 P.3d 964, **2012 COA 85.** The same principles concerning credibility determinations that apply to lay witnesses apply to expert witnesses as well. *See Burnham v. Grant,* 24 Colo. App. 131, 134 P. 254 (1913); *also see Heinicke v. Indus. Claim Appeals Office,* 197 P.3d 220 (Colo. App. 2008). The fact finder should consider, among other things, the consistency or inconsistency of a witness' testimony and/or actions; the reasonableness or unreasonableness (probability or improbability) of a witness' testimony and/or actions (this includes whether or not the expert opinions are adequately founded upon appropriate research); the motives of a witness; whether the testimony has been contradicted; and, bias, prejudice or interest. *See Prudential Ins. Co. v. Cline,* 98 Colo. 275, 57 P. 2d 1205 (1936); CJI, Civil, 3:16 (2005). The fact finder should consider an expert witness' special knowledge, training, experience or research (or lack thereof). *See Young v. Burke,* 139 Colo. 305, 338 P. 2d 284 (1959). The ALJ has broad discretion to determine the admissibility and/or weight of evidence based on an expert's knowledge, skill, experience, training and education. *See* S 8-43-210, C.R.S; *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P.2d 501 (Colo. App. 1995). As found, the Claimant's testimony was credible and un-impeached. Further, the opinions of Dr. Fall and Dr. Brunworth were lacking in credibility, and the opinions of Dr. Prusmack, Dr. Witzeman and Dr. Mason were far more credible and persuasive because of her specific expertise.

Substantial Evidence

b. An ALJ's factual findings must be supported by substantial evidence in the record. *Paint Connection Plus v. Indus. Claim Appeals Office,* 240 P.3d 429 (Colo. App. 2010); *Leewaye v. Indus. Claim Appeals Office,* 178 P.3d 1254 (Colo. App. 2007); *Brownson-Rausin v. Indus. Claim Appeals Office,* 131 P.3d 1172 (Colo. App. 2005). *Also see Martinez v. Indus. Claim Appeals Office,* 176 P.3d 826 (Colo. App. 2007). Substantial evidence is "that quantum of probative evidence which a rational fact-finder would accept as adequate to support a conclusion, without regard to the existence of conflicting evidence." *Metro Moving & Storage Co.v. Gussert,* 914 P.2d 411 (Colo. App. 1995). Reasonable probability exists if a proposition is supported by **substantial evidence** which would warrant a reasonable belief in the existence of facts supporting a particular finding. *See F.R. Orr Construction v. Rinta,* 717 P.2d 965 (Colo. App. 1985). It is the sole province of the fact finder to weigh the evidence and resolve contradictions in the evidence. See *Pacesetter Corp. v. Collett,* 33 P. 3d 1230 (Colo. App. 2001). An ALJ's resolution on questions of fact must be upheld if supported by substantial evidence and plausible inferences drawn from the record. *Eller v. Indus. Claim Appeals Office,* 224 P.3d 397, 399-400 (Colo. App. 2009). As found, the ALJ made a rational choice, between conflicting medical opinions, to accept the opinions of Dr. Mason, Dr. Witzeman and Dr. Prusmack and to reject any opinions to the contrary.

Compensability

c. A compensable injury is one that arises out of and in the course of employment. Section 8-41-301(1) (b), C.R.S. The "arising out of" test is one of causation. If an industrial injury aggravates or accelerates a preexisting condition, the resulting disability and need for treatment is a compensable consequence of the industrial injury. Thus, a claimant's personal susceptibility or predisposition to injury does not disqualify the claimant from receiving benefits. *H & H Warehouse v. Vicory,* 805 P.2d 1167 (Colo. App. 1990). An injured worker has a compensable new injury **if the employment-related activities aggravate, accelerate, or combine with the pre-existing condition to cause a need for medical treatment or produce the disability for which benefits are sought.** § 8-41-301(1) (c), C.R.S. *See Merriman v. Indus. Comm'n,* 120 Colo. 400, 210 P.2d 448 (1949); *Anderson v. Brinkoff,* 859 P.2d 819 (Colo. 1993); *National Health Laboratories v. Indus. Claim Appeals Office,* 844 P.2d 1259 (Colo. App. 1992); *Snyder v. Indus. Claim Appeals Office,* 942 P.2d 1337 (Colo. App. 1997). An injury resulting from the concurrence of a preexisting condition and a hazard of employment is compensable. *H & H Warehouse v. Vicory*, *supra*. *Duncan v. Indus. Claims App. Office*, 107 P.3d 999 (Colo. App. 2004). Even where the direct cause of an accident is the employee's preexisting disease or condition, the resulting disability is compensable where the conditions or circumstances of employment have contributed to the injuries sustained by the employee. *Ramsdell v. Horn*, 781 P.2d 150 (Colo.App. 1989). *Also see* § 8-41-301(1) (c), C.R.S; *Parra v. Ideal Concrete,* W.C. No. 4-179-455 [Indus. Claim Appeals Office (ICAO), April 8, 1998]; *Witt v. James J. Keil Jr.,* W.C. No. 4-225-334 (ICAO, April 7, 1998). As found, the Claimant sustained compensable injuries on July 2, 2012, when bounced in the Bookmobile.

Medical Benefits

d. To be authorized, all referrals must remain within the chain of authorized referrals in the normal progression of authorized treatment. *See Mason Jar Restaurant v. Indus. Claim Appeals Office,* 862 P. 2d 1026 (Colo. App. 1993); *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P. 2d 501 (Colo. App. 1995); *City of Durango v. Dunagan,* 939 P.2d 496 (Colo. App. 1997). When an ATP refers an injured worker to his personal physician, under the mistaken belief that the claim was not compensable, the referral was nonetheless within the chain of authorized referrals and, thus, subsequent treatment was authorized. *See Cabela v. Indus. Claim Appeals Office,* 198 P.3d 1277 (Colo. App. 2008). As found, when Dr. Fall indicated that the new claim was outside the workers' compensation system, under the mistaken belief that it was not work-related, she gave the Claimant carte blanche to select a new treatment provider. The Claimant selected Dr. Prusmack who, ultimately, referred her to Dr. Witzeman. Dr. Mason had been treating the Claimant under the Claimant's health insurance. Consequently, as found, all referrals are in the authorized chain of referrals.

e. To be a compensable benefit, medical care and treatment must be

causally related to an industrial injury or occupational disease. *Dependable Cleaners v. Vasquez,* 883 P. 2d 583 (Colo. App. 1994). As found, the Claimant's medical treatment is causally related to the compensable injuries of July 2, 2012. Also, medical treatment must be reasonably necessary to cure and relieve the effects of the industrial occupational disease. § 8-42-101 (1) (a), C.R.S. *Morey Mercantile v. Flynt,* 97 Colo. 163, 47 P. 2d 864 (1935); *Sims v. Indus. Claim Appeals Office,* 797 P.2d 777 (Colo. App. 1990). As found, the Claimant's medical care and treatment, as reflected was and is reasonably necessary.

Reasonable Notice of Change of Physician/Authorization of Dr. Witzeman and Dr. Mason as ATPs

f. If the physician selected (Dr. Fall herein) refuses to treat for non-medical reasons, and the insurer fails to appoint a willing ATP after notice of the refusal to treat, the right of selection passes to the injured worker. *Weinmeister v. Cobe Cardiovascular, Inc.,* W.C. No. 4-657-812 [Industrial Claim Appeals Office (ICAO), July 10, 2006]. *Also see Lutz v. Industrial Claim Appeals Office,* 24 P.3d 29 (Colo. App. 2000); *Ruybal v. University Health Sciences Center,* 768 P.2d 1259 (Colo. App. 1988). As found, the respondent was aware that Dr. Fall had indicated that she had nothing more to offer the Claimant, and that the Claimant was treating with Dr. Mason (under health insurance), Dr. Prusmack and Dr. Witzeman, who had treatment to offer the Claimant, yet the Respondent offered no alternative treatment.

g. "The fundamental requisites of due process are notice and the opportunity to be heard." *Franz v. Indus. Claim Appeals Office,* 250 P.3d 755, 758 (Colo. App. 2010) [quoting *Hendricks v. Indus. Claim Appeals Office,* 809 P.2d 1076, 1077 (Colo. App. 1990)]. Workers' compensation benefits are a constitutionally protected property interest which cannot be taken without the due process guarantees of notice and an opportunity to be heard. *See Whiteside v. Smith,* 67 P.3d 1240, 1247 (Colo. 2003). Notice requirements apply to both parties. Reasonable notice requirements need not specify, in the application for hearing, the exact statute upon which a claimant relies in order to afford adequate notice of the legal basis of a claim. *See Carlee Carson v. Indus. Claim Appeals Office* [(No. 03CA0955, October 7, 2004) (not published), *cert. denied,* February 22, 2005]. A general request for the relief sought will suffice. *See Fang v. Showa Entetsu Co.,* 91 P.3d 419 (Colo. App. 2003). As found, the Respondent had reasonable notice that a change of physician was an issue subsumed under medical benefits. Further, in the earlier case, Dr. Fall refused to further treat the Claimant for non-medical reasons, the Respondent was aware that Kaiser Permanente, Dr. Prusmack, Dr. Witzeman, and Dr. Mason were providing meaningful treatment for the Claimant's July 2, 2012 injuries, and the Respondent offered no treatment alternative to these medical providers. At the hearing, the Claimant requested that Kristin Mason, M.D., be designated the authorized treating physician (ATP). The Respondent had reasonable notice that the "change of physician" issue was subsumed under "medical benefits."

Burden of Proof

h. The injured worker has the burden of proof, by a preponderance of the evidence, of establishing the compensability of an industrial injury and entitlement to benefits. §§ 8-43-201 and 8-43-210, C.R.S. *See City of Boulder v. Streeb,* 706 P. 2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals Office,* 12 P. 3d 844 (Colo. App. 2000); *Lutz v. Indus. Claim Appeals Office,* 24 P.3d 29 (Colo. App. 2000). *Kieckhafer v. Indus. Claim Appeals.Office*, 284 P.3d 202, 205 (Colo. App. 2012). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. C lark,* 197 Colo. 306, 592 P. 2d 792 (1979). *People v. M.A.,* 104 P. 3d 273 (Colo. App. 2004); *Hoster v. Weld County Bi-Products, Inc.,* W.C. No. 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. *Also see Ortiz v. Principi,* 274 F.3d 1361 (D.C. Cir. 2001). "Preponderance" means "the existence of a contested fact is more probable than its nonexistence." *Indus. Claim Appeals Office v. Jones*, 688 P.2d 1116 (Colo. 1984). As found, the Claimant has sustained her burden on all issues.

ORDER

IT IS, THEREFORE, ORDERED THAT:

A. The Petition to Re-Open in W.C. No. 4-832-902-03 is hereby denied and dismissed.

B. The Claimant sustained compensable injuries in W.C. No. 4-891-828 and the Respondent is liable for workers' compensation benefits arising out of these injuries.

C. Medical care and treatment provided by Dr. Prusmack, Dr. Witzeman, Dr. Mason (prospectively in the case of Dr. Mason) and their referrals was and is authorized.

D. The Respondent shall pay all the costs of authorized medical treatment arising out of the July 2, 2012 injuries, subject to the Division of Workers Compensation medical Fee Schedule.

E. Any and all issues not determined herein, including overpayment offsets relating to W.C. No. 4-832-902-03 and temporary disability benefits, are reserved for future decision.

DATED this_____day of July 2015.

ISSUES

- What was the Division Independent Medical Examination physician's "true opinion" concerning whether or not Claimant reached maximum medical improvement on August 17, 2011?

- Was the DIME physician's "true opinion" concerning the date of maximum medical improvement overcome by clear and convincing evidence?

- Are Respondents' liable to pay for a total knee replacement in order to assist the Claimant to reach maximum medical improvement?

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. At the hearing Claimant's Exhibits 1 though 19 were received into evidence. Respondents' Exhibits A through H were received into evidence. The depositions of Dr. Annu Ramaswamy and Dr. John Hughes were also received into evidence.

2. On March 25, 2010 Claimant sustained an admitted injury to his right knee.

3. Claimant initially treated with Concentra Medical Centers (Concentra). He was referred for an MRI of the right knee. The MRI was reportedly significant for an "indentation subchondral fracture of the anterior surface of the medial femoral condyle with radiating secondary subchondral microtabular fracture lines. Also noted were a horizontal tear of the posterior horn of the lateral meniscus and a mild ACL sprain. Claimant was referred to orthopedist Gary Hess, M.D., for consultation and treatment.

4. On June 3, 2010 Dr. Hess assessed right knee osteoarthritis and pain. He noted Claimant had failed "most conservative treatments" and recommended he undergo a right total knee replacement (TKR). Dr. Hess stated that he would "seek approval" for surgery "through Workers' Comp." He further noted Claimant would need vascular clearance before surgery.

5. In September 2010 Claimant changed authorized treating physicians (ATP) from Concentra to Rocky Mountain Medical Group (RMMG).

6. On September 24, 2010 Annu Ramaswamy, M.D., examined Claimant at RMMG. Dr. Ramaswamy is board certified in internal medicine and is Level II accredited. Dr. Ramaswamy diagnosed a "history of right knee contusion in the setting of lateral meniscus tear and arthritis." He noted that Dr. Hess had recommended a TKR. Dr. Ramaswamy wrote he needed to contact Dr. Hess regarding "the causality issues in regard" to the proposed TKR. Dr. Ramaswamy wrote that he explained to Claimant that his right knee exhibited "pre-existing arthritis and cartilage degeneration," and that the "lateral meniscus and bone contusions and hematomas" were likely related to the injury of March 25, 2010. Dr. Ramaswamy wrote the proposed TKR would treat all of the knee pathology, not just the "work-related pathology."

7. Dr. Hess examined Claimant in October, 2010. Dr. Hess opined Claimant's pre-existing osteoarthritis had been aggravated by the work-related injury of March 25, 2010. Dr. Hess also stated that because of Claimant's persistent "flexion contracture" that a "total knee replacement procedure" was the "only reasonable course" of treatment. Dr. Hess reiterated that a vascular evaluation was necessary before surgery to insure Claimant's wounds would heal without complication.

8. In an October 15, 2010 report Dr. Ramaswamy noted the opinion of Dr. Hess that the industrial injury aggravated Claimant's pre-existing arthritis and that he needed a TKR considering the nature of the injury and the presence of pre-existing arthritis. Dr. Ramaswamy recommended Claimant obtain a "second opinion."

9. On February 2, 2011, Hendrick Arnold, M.D., performed an independent medical examination (IME) of the Claimant. In his report Dr. Arnold opined that as a result of the March 25, 2010 fall Claimant sustained a subchondral compression fracture of the medial femoral condyle. He further opined that the fall caused "significant permanent aggravation" of the pre-existing degenerative arthritis. Dr. Arnold opined Claimant was not at maximum medical improvement (MMI) and needed to undergo a TKR "pending clearance by a vascular surgeon."

10. On July 11, 2011 Dr. Ramaswamy again examined Claimant. Claimant reported right hip and right knee pain and that the knee pain was worse. He rated the knee pain as 8 on a scale of 10 (8/10) and stated he could not kneel, squat, or climb because of the pain. However, Claimant could perform his job duties as a part-time vehicle driver. Claimant reported he was "not sure he wanted to undergo the total knee replacement" at that time. Dr. Ramaswamy wrote Claimant stated that he "knew quite a few individuals" that had "not done well" with a TKR and he was concerned about chronic pain. Claimant also reported that his "functional level [was] fairly reasonable" and he would "rather hold on such surgery." Dr. Ramaswamy noted that he discussed MMI "status" given that Claimant was "declining surgical intervention." Dr. Ramaswamy also wrote that he "most likely would keep the case open six months to a year after maximum medical improvement to see if the [Claimant's] knee pain worsens to a point where he would consider a total knee replacement."

11. On July 27, 2011 Dr. Ramaswamy examined Claimant. On this occasion Dr. Ramaswamy wrote that at the "last visit [Claimant] decided that he was not

interested in the total knee replacement at this point in time based on his tolerable pain." Dr. Ramaswamy further stated Claimant "might change his mind down the road, especially with the winter if his pain level increases.

12. On August 17, 2011 Dr. Ramaswamy placed Claimant at MMI for all of the injuries caused by the March 25, 2010 industrial injury. He assessed an overall impairment rating that included 18% impairment of the right lower extremity based on the right knee injury. Dr. Ramaswamy wrote that Claimant "felt like he would like to wait on the total knee replacement as he was concerned about complications given his age and vascular history." However Claimant wanted to keep the case "open for awhile to see if he would change his mind" about the TKR. Dr. Ramaswamy wrote that "in regard to medical maintenance, I am keeping the case open for one year to see how he does in terms of his right knee discomfort." Dr. Ramaswamy wrote that if Claimant's "right knee discomfort becomes disabling then he may wish to consider a total knee replacement."

13. On November 16, 2014 Claimant returned to Dr. Ramaswamy for treatment of his right knee. Dr. Ramaswamy took a history from Claimant that the right knee was "doing the same … 8/10 at times in the right knee." Claimant also reported that he received a "final admission of liability" to which he objected, that he had retained an attorney and that he was "possibly getting [a] DIME." Dr. Ramaswamy noted that so far Claimant "wants to hold on right TKR…he is working with an attorney re: length of maintenance care…"

14. On December 30, 2011, John Hughes, M.D., performed a Division-sponsored independent medical examination (DIME) of Claimant. Dr. Hughes took a history, reviewed pertinent medical records and performed a physical examination. Dr. Hughes noted that on August 17, 2011 Dr. Ramaswamy placed Claimant at MMI. Dr. Hughes stated that with respect to "injury-related follow-up Dr. Ramaswamy recommended keeping [Claimant's] case open for a while to see if he would change his mind about the knee replacement." Dr. Hughes agreed with Dr. Ramaswamy that Claimant had "post-traumatic right knee findings with severity in excess of the 'baseline' findings in the left knee." Dr. Hughes wrote that Claimant was considered to have reached MMI as of August 17, 2011. Dr. Hughes also wrote that, "I certainly do endorse total knee arthroplasty" and opined "the need for this surgery was substantially accelerated by the work-related injuries in question here today." Dr. Hughes completed a Division IME Examiner's Summary Sheet (WC 132) on which he wrote that Claimant reached MMI on "8/17/2011."

15. Claimant testified as follows. Prior to August 2011 he was "hesitant" to undergo a TKR because he was aware of several persons, including family members, who experienced severe complications from TKR surgery. These complications included death, amputation and infection. He expressed these concerns to his treating physicians.

16. At hearing Claimant was asked whether he knew he would be put at MMI in August 2011 if did not undergo TKR surgery. Claimant testified that based on his

conversations with Dr. Ramaswamy he believed that if he was put at MMI he would have 6 months to decide whether to undergo the TKR surgery. Claimant also testified that his condition was worsening in 2010 and by "late summer" 2011 he decided he wanted to undergo the TKR procedure.

17. Claimant testified he had a second injury in February 2012. He stated that he slipped on ice and injured his right shoulder and right knee. The knee injury resulted in a fractured patella. Claimant testified that he experienced an increase in right knee symptoms for a short period of time. Claimant further testified that he still desired to undergo the previously recommended TKR at the time of the February 2012 injury. Claimant could not recall whether at the time of the 2012 injury he was aware Insurer was denying his request for a TKR.

18. Dr. Hess examined Claimant on February 14, 2012. Dr. Hess stated x-rays of the right shoulder were negative and x-rays of the right knee demonstrated osteoarthritis and a nondisplaced facture of the right patella.

19. Dr. Ramaswamy examined Claimant on February 15, 2014. On February 15 Dr. Ramaswamy wrote that "by August" Claimant would "decide about tkr." Dr. Ramaswamy also stated the "recent patella fx will aggravate knee condition."

20. On May 16, 2012 Dr. Ramaswamy examined Claimant. On that date Dr. Ramaswamy noted Claimant "would like to undergo the TKR." On July 11, 2014 Dr. Ramaswamy placed Claimant at MMI for the February 2012 injury. Dr. Ramaswamy noted that Claimant's February 2012 right knee patella fracture was completely healed but he was still experiencing "right knee discomfort from preexisting injury."

21. Dr. Hughes testified by deposition on August 12, 2013. Dr. Hughes testified that when he wrote the DIME report on December 30, 2011 he "endorsed" the TKR procedure recommended for Claimant. However, he could not recall if he actually discussed the procedure with Claimant. Dr. Hughes opined the Claimant did not "require" a TKR in December 2011 because the surgery is a "fairly elective thing that is done for comfort and function more than preservation of life." At the time of the deposition Dr. Hughes continued to endorse the TKR procedure.

22. Dr. Hughes testified that when he completed the DIME report in December 2011 it was his opinion Claimant had reached MMI for the March 2010 injury. Dr. Hughes was asked whether Claimant's desire to undergo a TKR would "impact his MMI status." Dr. Hughes replied "yes" because Claimant's desire to undergo surgery "would create a situation where he no longer was at MMI, pending resolution after surgery."

23. Dr. Ramaswamy testified as follows in his post-hearing deposition. He placed Claimant at MMI on August 17, 2011 because a TKR was the only treatment that could "make a significant difference for him" and Claimant "was declining the treatment." If Claimant had expressed a desire to undergo the TKR in August 2011 Dr. Ramaswamy would have kept the case "open" and potentially proceeded to surgery. Because Claimant did not desire to undergo surgery Dr. Ramaswamy explained that he

offered Claimant "maintenance care" in case the knee condition should worsen and Claimant were to "change his mind" about undergoing the TKR. Dr. Ramaswamy saw Claimant on November 16, 2011 and at that time Claimant wanted to "hold" on undergoing a TKR. Dr. Ramaswamy was aware Claimant had objected to an FAL and doesn't recall Claimant's "reasoning" for filing the objection.

24. Dr. Ramaswamy remembered that at some point during "maintenance care" Claimant changed his mind about wanting the TKR. Dr. Ramaswamy pointed out that he saw Claimant on February 15, 2012 and the office note from that date states Claimant would "decide" by August about the TKR. However, on May 16, 2012 Dr. Ramaswamy recorded Claimant wanted to undergo the TKR. Dr. Ramaswamy explained that in May 2012 Claimant's right shoulder condition was "not doing well" and considering Claimant's complicated medical history he "wasn't quite the medical candidate" for a TKR. However, Dr. Ramaswamy noted that in May 2012 he "could have started a process to figure out if [Claimant] would have been a medical candidate" for the TKR.

25. Claimant's argument notwithstanding, the ALJ finds that it is Dr. Hughes's opinion as the DIME physician that Claimant reached MMI on August 17, 2011. At the time Dr. Hughes issued the DIME report on December 30, 2011 he had reviewed the records of Dr. Ramaswamy including the MMI report of August 17, 2011. Thus, Dr. Hughes was aware that Claimant had declined to undergo a recommended TKR and consequently Dr. Ramaswamy placed Claimant at MMI. Having this knowledge Dr. Hughes wrote in his DIME report and on the WC 132 that Claimant reached MMI on August 17, 2011. The ALJ infers Dr. Hughes essentially agreed with Dr. Ramaswamy that Claimant reached MMI on August 17, 2011 because he was refusing the only treatment that had a prospect for improving his condition. Indeed, Dr. Hughes "endorsed" a TKR as reasonable and necessary treatment.

26. Claimant's argument notwithstanding, Dr. Hughes's deposition testimony did not create an "ambiguity" or inconsistency with regards to whether he believed Claimant reached MMI on August 17, 2011. Rather, Dr. Hughes was asked in the deposition whether Claimant's desire to undergo a TKR would impact his MMI "status." Dr. Hughes replied that Claimant's desire to undergo surgery would "*create a situation* where he *no longer* was at MMI." (Emphasis added.) Dr. Hughes did not retract his opinion that Claimant reached MMI on August 17, 2011 when he declined to undergo TKR surgery. Dr. Hughes merely indicated that were the Claimant to change his mind about surgery his "MMI status" would change and he would "no longer" be at MMI. Thus, the ALJ finds that Dr. Hughes cannot be understood to have opined that Claimant's willingness to undergo surgery after August 17, 2011 meant that he did not reach MMI on August 17, 2011.

27. Claimant argues that the ALJ should infer from his testimony that he decided to undergo TKR surgery "soon after the MMI determination was made" by Dr. Ramaswamy. However, the ALJ does not draw that inference. Rather, Dr. Ramaswamy's credible office notes and testimony establish that Claimant did not express a desire to undergo TKR surgery until May 16, 2012. Prior to May 2012 Dr.

Ramaswamy's records, including those from November 16, 2011, and February 15, 2012, document that Claimant continued to decline TKR surgery.

28. Claimant further argues the ALJ should infer that he decided to undergo the TKR procedure soon after August 17, 2011 because he sought a DIME prior to suffering the second injury in February 2012. However, the ALJ does not draw that inference. Rather, the ALJ is persuaded by Dr. Ramaswamy's notes that Claimant did not express a desire to undergo the surgery until after February 15, 2012. Moreover, there is no indication in Dr. Hughes's DIME report that Claimant expressed a desire to undergo TKR surgery so as to negate Dr. Ramaswamy's MMI determination. Indeed Dr. Hughes could not recall that the issue of TKR surgery was even discussed during the DIME. Moreover, the mere act of requesting a DIME does not establish that Claimant had changed his mind about undergoing surgery. Claimant could have sought the DIME for the primary purpose of reviewing Dr. Ramaswamy's impairment rating.

29. Claimant asserts he did not understand the legal consequences of Dr. Ramaswamy's August 17, 2011 MMI determination. Specifically he asserts he would immediately have elected to undergo a TKR if he had understood the MMI finding meant he did not have an additional "6 months to decide" on surgery. The ALJ notes that this assertion is somewhat contrary to the contention that Claimant had recently changed his mind about undergoing TKR surgery and sought the DIME with a view towards displacing Dr. Ramaswamy's MMI determination. In any event, the ALJ concludes that even if Claimant misunderstood the consequences of the MMI determination with respect to surgery that misunderstanding is irrelevant. Claimant essentially alleges, based on his conversations with Dr. Ramaswamy, that he did not understand the *legal effect* of the MMI determination would be termination of his right to additional medical benefits including the right to take an additional 6 months to decide whether to undergo surgery. However, parties, even pro se parties, are presumed to know the law and must bear the consequences of their own legal errors. *Dyrkopp v. Industrial Claim Appeals Office,* 30 P.3d 821 (Colo. App. 2001); *Division of Workers' Compensation v. Sundance Equestrian Center*, (ICAO January 13, 2004).

30. Claimant failed to prove it highly probable and free from serious doubt that Dr. Hughes was mistaken when he placed Claimant at MMI on August 17, 2011. As determined in Finding of Fact 25, Dr. Hughes found Claimant reached MMI on August 17 because he was declining to undergo a TKR, the only medical treatment that offered a reasonable prospect for improving Claimant's condition. Dr. Hughes's opinion that Claimant reached MMI on August 17, 2011 is corroborated by Dr. Ramaswamy's report of August 17, 2011. It is further corroborated by Dr. Ramaswamy's credible testimony that in August 2011 claimant was declining a TKR but wanted to keep the claim "open" in case he changed his mind. Dr. Ramaswamy credibly explained that keeping the case "open" meant he was offering "maintenance care" in case the knee worsened and Claimant changed his mind about the only treatment that could "make a significant difference for him." Claimant cites no credible and persuasive medical opinion that he did not reach MMI on August 17, 2011 when he declined the TKR.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

The purpose of the Workers' Compensation Act of Colorado (Act), §§8-40-101, *et seq.*, C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. Except as noted below, Claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201(1), C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the Claimant nor in favor of the rights of Respondents. Section 8-43-201(1).

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005). A Workers' Compensation case is decided on its merits. Section 8-43-201(1). The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions.

DIME OPINION CONCERNING MMI

Claimant seeks a finding that he has not reached MMI for the March 25, 2010 industrial injury. He also seeks an order determining that a TKR is reasonable and necessary medical treatment the need for which is causally related to the March 2010 industrial injury. As a corollary to these contentions Claimant argues that the DIME physician's opinion (Dr. Hughes's opinion) concerning MMI was "conditioned on Claimant's desire to undergo" the TKR. Claimant reasons that since he was "pursuing the knee replacement" at the time of the DIME evaluation Dr. Hughes's true opinion is that he never reached MMI. Therefore, Claimant contends Respondents bear the burden to prove by clear and convincing evidence that he reached MMI. The ALJ disagrees with Claimant's argument that Respondents bear the burden of proof on the issue of MMI.

MMI exists at the point in time when "any medically determinable physical or mental impairment as a result of injury has become stable and when no further treatment is reasonably expected to improve the condition." Section 8-40-201(11.5), C.R.S. A DIME physician's finding that a party has or has not reached MMI is binding on the parties unless overcome by clear and convincing evidence. Section 8-42-107(8)(b)(III), C.R.S.; *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000). If a DIME physician issues conflicting or ambiguous opinions concerning whether a claimant has reached MMI the ALJ must resolve the

conflict or ambiguity as a matter of fact. *MGM Supply Co. v. Industrial Claim Appeals Office,* 62 P.3d 1001 (Colo. App. 2002).

With respect to medical benefits, MMI serves as the line of demarcation between the availability of medical treatment designed to cure or improve the claimant's condition and post-MMI medical treatment designed to relieve the ongoing effects of an injury and prevent additional deterioration of the claimant's condition. See *Stollmeyer v. Industrial Claim Appeals Office,* 916 P.2d 609 (Colo. App. 1995); *Gonzales v. Industrial Claim Appeals Office,* 905 P.2d 17 (Colo. App. 1995). Indeed, the legal definition of MMI contained in § 8-40-201(11.5) recognizes that MMI is attained when no treatment is reasonably expected to "improve" a claimant's condition.

A claimant may be found at MMI "as a matter of law" if "he or she refuses to submit to the only treatment currently proposed to improve his or her condition." *MGM Supply Co. v. Industrial Claim Appeals Office,* 62 P.3d at 1001; *see also Neidens v. Firewall Forward Aircraft Engines, Inc.,* WC 4-553-056 (ICAO August 10, 2005).

Claimant's argument notwithstanding, the ALJ concludes there is no ambiguity or conflict between the DIME physician's (Dr. Hughes's) written report and his deposition testimony. Rather, as determined in Finding of Fact 25, Dr. Hughes found Claimant reached MMI on August 17, 2011 because Claimant was declining to undergo a TKR, the only medical treatment that offered a reasonable prospect for improving his condition. Put another way, Dr. Hughes found Claimant reached MMI on August 17 as "a matter of law." As determined in Finding of Fact 26 Dr. Hughes's deposition testimony did not establish any ambiguity or conflict with his written report. Rather, Dr. Hughes merely asserted that if, at some future date, Claimant changed his mind about undergoing TKR surgery his MMI "status" would change. Dr. Hughes's testimony did not retract or contradict his December 30, 2011 finding that Claimant was at MMI on August 17, 2011.

It follows that Dr. Hughes, as the DIME physician, found that Claimant reached MMI for his March 2010 industrial injury on August 17, 2011. In these circumstances Claimant bears the burden of proof to overcome Dr. Hughes's opinion by clear and convincing evidence. *Rainwater v. Sutphin*, WC 4-815-042-04 (ICAO September 9, 2014).

OVERCOMING DIME BY CLEAR AND CONVINCING EVIDENCE

Claimant does not advance any persuasive argument that he overcame by clear and convincing evidence Dr. Hughes's opinion that he reached MMI on August 17, 2011. Rather, the bulk of Claimant's argument in his position statement assumes that the Respondents bear the burden of proof to overcome the DIME opinion. Regardless, the ALJ concludes Claimant failed to overcome by clear and convincing evidence Dr. Hughes's opinion that he reached MMI on August 17, 2011.

The party seeking to overcome the DIME physician's finding regarding MMI bears the burden of proof by clear and convincing evidence. *Magnetic Engineering, Inc.*

v. Industrial Claim Appeals Office, supra. Clear and convincing evidence is that quantum and quality of evidence which renders a factual proposition highly probable and free from serious or substantial doubt. Thus, the party challenging the DIME physician's finding must produce evidence showing it highly probable the DIME physician's finding concerning MMI is incorrect. *Metro Moving and Storage Co. v. Gussert*, 914 P.2d 411 (Colo. App. 1995). The question of whether the party challenging the DIME physician's finding regarding MMI has overcome the finding by clear and convincing evidence is one of fact for the ALJ.

As determined in Finding of Fact 30, Claimant did not overcome by clear and convincing evidence Dr. Hughes's finding that he reached MMI on August 17, 2011. Rather, Dr. Hughes essentially found that as of August 11 Claimant reached MMI as a matter of law because he declined a TKR, the only treatment with a reasonable prospect for improving his condition. Dr. Hughes's finding of MMI is corroborated by the credible findings and opinions expressed by Dr. Ramaswamy.

Insofar as Claimant argues he "changed his mind" about undergoing the TKR before the DIME, and therefore he was not at MMI on August 17, 2011, the ALJ disagrees. As a matter of fact the ALJ has determined the Claimant did not "change his mind" until after February 15, 2012. The fact that Claimant changed his mind about surgery after February 15, 2012 does not negate the fact that he reached MMI on August 17, 2011, when he declined the TKR. It is of course possible that Claimant's change of mind, or a change in his condition after August 17, 2011 could support reopening the claim for additional medical treatment under § 8-43-303(1), C.R.S. However, Claimant has not framed the issues to include "reopening" and the ALJ does not consider that question.

For these reasons Claimant's request for an order requiring the Respondents to provide a TKR is denied. In light of this determination the ALJ need not address the other issues raised by the parties.

ORDER

Based upon the foregoing findings of fact and conclusions of law, the ALJ enters the following order:

1. The request for an order requiring Respondents to pay for a total knee replacement is denied.

2. Issues not resolved by this order are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

Whether the claimant has proven by a preponderance of the evidence that the proposed multi-level cervical fusion surgery recommended by Dr. Sung is reasonable, necessary and causally related to the admitted work injury.

FINDINGS OF FACT

1. The claimant sustained an admitted work related injury involving his cervical spine on January 17, 2012.

2. The claimant fell backwards down some stairs striking his back, neck and head.

3. The claimant was referred to Emergicare Medical Clinic for treatment related to the cervical spine injury. The authorized treating physician at Emergicare was Dr. Reasoner.

4. Dr. Reasoner referred the claimant for physical therapy and chiropractic therapy. Dr. Reasoner also provided medications and other conservative care in an effort to cure and relieve the effects of the claimant's cervical injury.

5. Despite conservative care, the claimant continued with chronic neck pain, pain and numbness in both upper extremities, with left upper extremity weakness and atrophy. Dr. Reasoner referred the claimant to Dr. Roger Sung, an orthopedic surgeon, for a surgical consultation.

6. Dr. Sung's initial assessment on February 14, 2013 included cervical degenerative disk disease, neck pain and cervical stenosis. Dr. Sung noted that the claimant presented with significant limited range of motion, secondary to pain with atrophy and weakness in the left triceps, and decreased sensation and weak grip strength in the left upper extremity.

7. The claimant returned to Dr. Sung on February 28, 2013. The claimant continued with left arm symptoms including pain and numbness and right upper extremity pain, weakness identified as first, second and third digit pain. In this report, Dr. Sung notes that the claimant "...is still very limited in both extremities."

8. In his medical report of February 28, 2013, Dr. Sung notes prior electro-diagnostic studies demonstrating acute left C7 radiculopathy and mild left ulnar neuropathy. MRI findings demonstrated degenerative changes from C3 to T1 with bulging at every level and severe left neuroforaminal stenosis at C6-7 on the left. At this time, Dr. Sung indicated that he was contemplating performing surgery at the C6-7 level.

9. Dr. Sung's medical report of March 20, 2013 indicates that Dr. Sung and the claimant discussed options of either a one level surgery or doing multiple levels. Dr. Sung indicated that the claimant's request for the multi-level fusion is reasonable.

10. The claimant testified that surgical authorization for a multi or five level cervical fusion was requested subsequent to Dr. Sung's March 20, 2013 evaluation. Surgical authorization was denied by the respondent-insurer.

11. The claimant underwent an independent medical evaluation with Dr. David Wong of Denver Spine Surgeons. The date of evaluation was April 26, 2013.

12. Dr. Wong's medical report notes that the claimant presented with aching and sometimes sharp pain in the neck with radiation to both upper extremities. Dr. Wong further notes the claimant has had treatment through analgesic anti-inflammatory medication, activity modification, physiotherapy and epidural steroids without resolution. Dr. Wong's medical report indicates that the claimant's overall symptom level has not improved and is slightly worse.

13. Dr. Wong assessed that the claimant's surgical options include the C3 to T1 procedure or a two level procedure at C6-7 and C7-T1. Dr. Wong's report states that the pros and cons of the options were reviewed with the claimant and the claimant was leaning towards the multi-level procedure discussed with Dr. Sung. Dr. Wong concludes that either surgical procedure is an option for the claimant's consideration.

14. The respondents referred the claimant to Dr. Klajnbart for an independent medical evaluation. Dr. Klajnbart evaluated the claimant on October 21, 2013. Dr. Klajnbart was deposed on April 15, 2014. Dr. Klajnbart notes that the claimant has failed non-operative treatment including injections, activity modification, manual medicine and medications. Dr. Klajnbart concludes that the proposed surgical fusion procedure involving C3 through T1 is a reasonable approach to address the claimant's neck pain and left upper extremity weakness. More specifically, Dr. Klajnbart states that the proposed procedure is medically reasonable.

15. Dr. Klajnbart acknowledged that performing a five level cervical fusion would be a medical reasonably procedure for the claimant, given his condition. Dr. Klajnbart acknowledged that he is familiar with Dr. Sung, stating that Dr. Sung is a very competent physician.

16. The claimant returned to Dr. Sung on January 29, 2015. At that time, an updated MRI of the cervical spine was available for Dr. Sung's review. Dr. Sung's medical report of that date notes ongoing bilateral arm pain and numbness, particularly pain, numbness and weakness in the left upper extremity. Despite having an ulnar nerve transposition surgery in October, 2014, the claimant continued with significant weakness.

17. Dr. Sung's medical report of January 29, 2015 indicates that x-rays were obtained on that date demonstrating C3-T1 severe degenerative disk disease and varying degrees of stenosis from C3 to T1, most significant at C4-5, C5-6 and C6-7. Dr. Sung's assessment at that time included C3-7 stenosis with degenerative disk disease and multiple herniated nucleus pulposus, left arm weakness and atrophy, and radiculopathy.

18. On January 29, 2015, Dr. Sung again noted significant atrophy and concluded that limiting the surgical fusion to only a few levels would not adequately address the entire problem and would set up the claimant for more complex revision surgery. Dr. Sung recommended addressing all levels, surgically, from C3 to T1.

19. In preparation for surgery, Dr. Sung advised that the claimant would require smoking cessation, further noting that the claimant did quit for the original surgery and is very comfortable that he could stop smoking immediately in preparation for surgery.

20. Dr. Jeffrey Sabin conducted an independent medical evaluation at the request of the respondents on April 22, 2015. As part of the evaluation, Dr. Sabin conducted a records review and also a physical examination of the claimant.

21. As part of the records review, Dr. Sabin references psychological notes from Dr. Evans dated April 1, 2013 in which Dr. Evans notes that there are no obvious psychological factors that would preclude the claimant's candidacy for the proposed surgery. At that time, the proposed surgery was for the multi or five level cervical fusion.

22. Dr. Sabin states that there is no history either through medical records or patient history to establish any preexisting cervical injury, pain or related symptoms to the upper extremities. Dr. Sabin concluded that any symptoms experienced by the claimant would be related to the work injury of January 17, 2012.

23. Dr. Sabin concludes that the claimant's work injury caused his symptomatology. More specifically, Dr. Sabin concludes that within "reasonable degree of medical probability it is the fall which caused an exacerbation of preexisting asymptomatic cervical spondylosis."

24. By deposition, Dr. Sabin testified that it is more likely than not that the claimant would need more surgery if he had just one level done because of the stresses that are going to be imparted to the adjacent levels. Dr. Sabin notes that Dr. Sung initially considered a one level fusion and later recommended a multi-level fusion because of the effect on adjacent levels if only a single level is fused. Dr. Sabin concluded that Dr. Sung's recommendation for the multi-level fusion surgery is reasonable.

25. Dr. Sabin testified that proceeding with a single or multi-level fusion is a very personal, very individualized decision. Dr. Sabin confirmed that the claimant had met with Dr. Sung on at least four or five occasions and there was considerable discussion between Dr. Sung and the claimant regarding the pros and cons of the multi-level fusion surgery. Dr. Sabin further acknowledges that there was nothing in Dr. Sung's medical records to support or suggest that the claimant's desire to go forward with the multi-level fusion surgery was not given due consideration.

26. Dr. Sabin acknowledged that the claimant was cooperative and gave full effort during the examination. Dr. Sabin confirmed that the claimant presented as credible and there was no evidence of any preexisting symptoms or treatment involving the cervical spine or upper extremities.

27. Dr. Sabin agreed that all evaluating physicians, including Dr. Sung, Dr. Wong and Dr. Klajnbart, concluded that the five level cervical fusion was medically reasonable. In this regard, Dr. Sabin acknowledged that the five level cervical fusion is medically reasonable.

28. In his deposition, Dr. Sabin concluded that any cervical symptoms experienced by the claimant would be related to the work injury of January 17, 2012.

29. Dr. Sabin further agreed that the injury sustained by the claimant on January 17, 2012 either aggravated or accelerated or combined with his asymptomatic condition to the cervical spine to cause his need for treatment, including surgery.

30. In regards to the issue of future surgery subsequent to either a single or multi-level surgery, Dr. Sabin admitted that, percent wise, the claimant is more likely to require more surgeries after a one or two level fusion because of the compromised nature of the unfused levels.

31. With regards to the issue of smoking cessation, Dr. Sabin acknowledged that this issue is best left up to Dr. Sung and the claimant and more specifically to the surgeon in regards to whether there has been compliance with smoking cessation.

32. The ALJ finds the opinions and analyses of Dr. Sung and Dr. Sabin to be credible and more persuasive than analyses and opinions to the contrary.

33. The ALJ finds that the claimant has established that it is more likely than not that the multi-level fusion recommended by Dr. Sung is reasonable, necessary and related to the claimant's industrial injury of January 17, 2012.

CONCLUSIONS OF LAW

1. The purpose of the Workers' Compensation Act of Colorado in §8-40-101, et. seq. C.R.S. (2013) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers without the necessity of litigation. See §8-40-102(1).

2. A worker's compensation case is decided upon its merits. See §8-43-102, C.R.S.

3. Facts in a workers' compensation case must be interpreted neutrally neither in favor of the rights of a claimant nor in favor of the rights of the respondents. See §8-43-201, C.R.S.

4. The Judges' factual findings concern only evidence that is dispositive of the issues involved: the Judge cannot address every piece of evidence that might lead to a conflicting result. See *Magnetic Engineering, Inc. v. ICAO*, 5. P.3d 285 (Colo. App. 2000).

5. When determining credibility the fact finder should consider among other things the consistency or any inconsistencies of the witnesses testimony or actions; the reasonableness or unreasonableness (probability or improbability) of the testimony or actions; the motive of the witness: and whether the testimony would have been contradicted and bias, prejudiced, or in any. See *Impure Prudential Insurance Co. v. Coin*, 57 P.2d 1205 (1936).

6. The respondents are liable for authorized medical treatment that is reasonable and necessary to cure or relieve the effects of an industrial injury. §8-42-101(1)(a), C.R.S.; *Colorado Comp. Ins. Auth. v. Nofio,* 886 P.2d 714 (Colo. 1994). The determination of whether a particular treatment modality is reasonable and necessary to treat an industrial injury is a factual determination for the ALJ. *In re Parker,* W.C. No. 4-517-537 (ICAO, May 31, 2006); *In re Frazier,* W.C. No. 3-920-202 (ICAO, Nov. 13, 2000)

7. It is solely within the ALJ's discretionary province to weigh the evidence and determine the credibility of expert witnesses. *Youngs v. Indus. Claim Appeals Office,* 297 P.3d 964 (Colo. App. 2012).

8. **The respondents are required to furnish such medical and surgical treatment as may reasonably be needed at the time of injury and thereafter during the disability to cure and relieve the employee from the effects of the injury. (§8-42-101 (1)(a) C.R.S). Respondents assert that they are only liable for that portion of medical benefits that is attributable to the claimant's work related injury and not**

for any portion purportedly attributable to the claimant's preexisting spinal condition. This issue has been addressed on multiple occasions by Colorado Courts, including Resources One, LLC. v. Industrial Claim Appeals Office, 148 P.3d 287 (Colo. App. 2006); National Union and Fire v. Industrial Claims Appeals Office, WC 4-421-787; 4-829-364; Duncan v. Industrial Claims Appeals Office, 107 P.3d 999, (Colo. App. 2004); Geist v. Liberty Mutual Group, (Industrial Claims Appeals Office - WC No. 4-839-225).

9. The Colorado Court of Appeals noted that an employer is generally liable for the entire disability that results from a compensable accident. Resources One, LLC v. Industrial Claims Appeals Office, 149 P.3d 287 (Colo. App. 206) More specifically, where an industrial injury aggravates, accelerates or combines with a preexisting disease or infirmity to produce the need for treatment, the treatment is a compensable consequence of the industrial injury. Geist v. Liberty Mutual Group, (Industrial Claims Appeals Office - WC No. 4-839-225), H&H Bicory, 805 P.2d 1167 (Colo. App. 1990). (Cited by Industrial Claims Appeals Office in National Union and Fire, WC 4-421-787, 4-829-364).

10. In this matter, the claimant has no preexisting history of neck pain, upper extremity weakness or pain, or any functional limitations related to his cervical spine. The respondents own independent medical evaluators conclude the claimant's work injury did cause the resulting symptomatology involving the cervical spine, upper extremities and eventual need for cervical fusion surgery. While there is some medical opinion that claimant's work injury caused an acute injury only to the C6-7 level, the respondents remain liable for the entire disability or need for treatment that results from the claimant's compensable injury. Resources One, LLC v. Industrial Claims Appeals Office, 149 P.3d 287 (Colo. App. 206), H&H Bicory, 805 P.2d 1167 (Colo. App. 1990). (Cited by Industrial Claims Appeals Office in National Union and Fire, WC 4-421-787, 4-829-364).

11. The ALJ concludes that the opinions and analyses of Dr. Sung and Dr. Sabin are credible and more persuasive than analyses and opinions to the contrary.

12. The ALJ concludes that the claimant has established by a preponderance of the evidence that the multi-level fusion recommended by Dr. Sung is reasonable, necessary and related to the claimant's industrial injury of January 17, 2012.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The respondent-insurer shall authorize and pay for the multi-level fusion surgery as recommended by Dr. Sung.

2. The respondent-insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

3. All matters not determined herein, and not closed by operation of law, are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

OFFICE OF ADMINISTRATIVE COURTS
STATE OF COLORADO

W.C. No. 4-896-875-03

FULL FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

IN THE MATTER OF THE WORKERS' COMPENSATION CLAIM OF:

Claimant,

v.

Employer,

and

Self-Insured Respondent.

Hearing in the above-captioned matter was held before Edwin L. Felter, Jr., Administrative Law Judge (ALJ), on June 24, 2015, in Denver, Colorado. The hearing was digitally recorded (reference: 6/24/15, Courtroom 4, beginning at 8:30 AM, and ending at 11:35 AM).

Claimant's Exhibits 1 through 16 were admitted into evidence, without objection. Respondent's Exhibits A through I were admitted into evidence, without objection.

At the conclusion of the hearing, the ALJ ruled from the bench and referred preparation of a proposed decision to counsel for the Claimant. The proposed decision was filed, electronically, on June 26, 2015. On June 29, 2015, counsel for the respondent indicated no objection as to form. After a consideration of the proposed decision, the ALJ has modified the proposal and hereby issues the following decision.

ISSUES

The matter is set, primarily, on the Respondent's application to overcome the Division Independent Medical Examiner's (DIME's) [Franklin Shih, M.D.] determination that the Claimant sustained a14% whole person impairment to her cervical spine. Additional issues concern whether the Claimant is entitled to a permanent scheduled

rating for her left lower extremity (LLE); whether she is entitled to a permanent scheduled rating for her right upper extremity (RUE); and whether she is entitled to post maximum medical improvement (MMI) maintenance medical benefits (*Grover* medicals).

The Respondent bears the burden of proof, by clear and convincing evidence, to overcome Dr. Shih's DIME opinions on degree of whole person impairment and MMI. The Claimant bears the burden, by preponderant evidence, concerning scheduled ratings for the LLE and RUE, and for entitlement to post-MMI medical maintenance benefits (*Grover* medicals).

FINDINGS OF FACT

Based on the evidence presented at hearing, the ALJ makes the following Findings of Fact:

Preliminary Findings

1. The Claimant worked for the Employer as a paraprofessional. As part of her duties, she worked with special needs students, including those with profound disabilities.

2. On August 30, 2012, the Claimant was transporting students after a school program when she was involved in a motor vehicle accident (MVA) at the intersection of Santa Fe Drive (Colorado Highway 85) and Meadows Boulevard in Castle Rock. The Claimant was trapped in the vehicle and was then extricated by Castle Rock Fire and Rescue.

3. The Claimant waited with her students at the accident scene and then went to the Emergency Department (ER) at Castle Rock Adventist Health. She felt pain in her LLE and RUE. X-rays were taken at the hospital. The Claimant was diagnosed as suffering a left comminuted distal radius fracture, left lower leg crush injury, right lower leg laceration, right upper arm strain and right forearm strain.

Medical Treatment

4. The Claimant was referred to Sharon Walker, M.D., who was designated as the authorized treating physician (ATP) by the Respondent. Dr. Walker saw the Claimant the next day on August 31, 2012, noting that the Claimant's complaints involved the neck, left lower back, left wrist, left elbow, right knee, right lower leg, left jaw and right arm. Dr. Walker's records, which were admitted into evidence as Claimant's Exhibit 2 documented pain in those areas. Dr. Walker prescribed Ibuprofen, Cyclobenzaparine, Percocet and gave the Claimant a prescription for a wheelchair. Dr. Walker also referred the Claimant to In Sok Yi, M.D., a hand surgeon for an evaluation.

5. Dr. Yi's diagnosis was left distal radius fracture. The Claimant underwent surgical repair (open reduction and internal fixation) of her left wrist, which was performed by Dr. Yi on September 5, 2012. Dr. Yi's records were admitted into evidence as Claimant's Exhibit 3.

6. The Claimant next saw Dr. Walker on September 7, 2015, and Dr. Walker provided treatment for a left corneal abrasion and referred the Claimant for physical therapy (PT).

7. The Respondent filed its first General Admission of Liability (GAL) on September 12, 2012, admitting for wage indemnity and medical benefits under the Colorado Worker's Compensation Act (Claimant's Exhibit 4, page 17). This GAL admitted for an average weekly wage (AWW) of $369.04, which was subsequently changed to a higher AWW.

8. A MRI (magnetic resonance imaging) was taken of the Claimant's right knee on September 12, 2012. The indication on the MRI was right knee pain, swelling, instability and clicking two weeks after motor vehicle crash. The MRI documented a "significant subcutaneous hematoma formation just anterior to the patellar tendon insertion on the tibial tubercle". The MRI documented an auterolateral tibia impaction injury with bowing on the articular surface. The MRI was negative for gross linear meniscal tear and cruciate ligament disruption (Claimant's Exhibits 3 and 9).

9. Dr. Walker referred the Claimant to Peak Orthopedics. The Claimant was evaluated by Michael Hewitt M.D. on September 26, 2012. Dr. Hewitt diagnosed tibial plateau fracture and noted that the fracture was nondisplaced. He recommended conservative treatment and placed the Claimant into a knee brace (Claimant's Exhibit 7).

10. A Revised GAL was filed on September 26, 2012, admitting for a higher average weekly wage (AWW), $543.39 (Claimant's Exhibit 4, page 16). This AWW was admitted in the Final Admission of Liability (FAL).

11. The Claimant received treatment from chiropractor Dr. Jason Gridley, D.C., from November 14, 2012 through December 19, 2012. She was chiropractically diagnosed as suffering from a cervicothoracic strain with muscle spasm.

12. An Amended GAL was filed on November 7, 2012, reflecting Claimant's return to modified work on October 22, 2012, and variable temporary partial disability (TPD) benefits from October 22, 2012 to "unknown."

Additional Medical Evaluations

13. According to the Claimant, other physicians in Dr. Walker's office provided her with care in late 2012.

14. The Claimant was evaluated by Sander Orent, M.D. on December 3, 2012. Dr. Orent noted that the Claimant continued to have pain complaints in her knee, stiffness in her neck and left wrist. Dr. Orent released the Claimant to work eight hours per day.

15. The Claimant was evaluated on December 17, 2012, by John Raschbacher, M.D., whose assessment was: left radius fracture, right leg laceration and crush injury, left corneal abrasion, cervical strain, with numerous other injuries. Dr. Raschbacher ordered a recheck on January 3, 2013.

16. On January 29, 2013, Dr. Walker saw the Claimant again and Dr. Walker assessed left comminuted distal radius fracture, right lower leg crush injury, right lower leg laceration, right upper arm strain, right forearm strain, left corneal abrasion, cervical strain, right tibial plateau fracture and right leg vascular insufficiency. The Claimant was also noted to have some anxiety related to the MVA and physical therapy was discontinued at that time. The Claimant was continued on modified duty at work.

17. The Claimant's next evaluation with Dr. Walker was on February 26, 2013, at which time the aforementioned diagnoses were identified. Dr. Walker anticipated maximum medical improvement (MMI) in two weeks.

Dr. Walker's Impairment Rating

18. Dr. Walker performed an impairment rating on March 13, 2013. Dr. Walker assigned an 8% scheduled RUE rating and a 0% LLE rating. Dr. Walker assigned no rating for Claimant's cervical spine, despite the fact that pain in the cervical spine was noted as one of the Claimant's chief complaints, and Dr. Walker's assessment included cervical strain. Dr. Walker assigned an MMI date of March 13, 2013. The ALJ infers and finds that Dr. Walker failed to rate the cervical spine due to an oversight.

19. Dr. Walker stated the opinion that for maintenance care, the Claimant should be allowed to continue her gym membership that was already put into place. Dr. Walker also stated that the Claimant's HGV stimulation unit should be purchased and supply should be provided for one year. Dr. Walker further was of the opinion that the Claimant should be allowed to maintenance visits as needed within one year with both Dr. Hewitt and Dr. Yi.

The Final Admission of Liability (FAL)

20. The Respondent filed a FAL on April 12, 2013, admitting for Dr. Walker's MMI date of March 13, 2013,, zero whole person permanent impairment, zero scheduled impairment of the LLE and 8% scheduled impairment of the RUE (Respondent's Exhibit B). The Claimant filed a timely objection and requested a Division independent Medical Examination (DIME).

The Division Independent Medical Examination (DIME)

21. Franklin Shih, M.D. was selected as the DIME and as a member of the DOWC IME panel, Dr. Shih was fully Level II accredited. Dr. Shih evaluated the Claimant on June 11, 2013. At that time, he noted that the Claimant was not at MMI. He recommended further diagnostic testing and treatment. He made a tentative assessment of the Claimant's permanent impairment, assigning an11% whole person impairment for her cervical spine, which included aTable 53 impairment and a loss of range of motion (ROM). Dr. Shih assigned a 2% scheduled impairment to the right knee and a 4% scheduled impairment to the left wrist (Claimant's Exhibit 10 and Respondent's Exhibit D). After his follow up DIME of February 17, 2015, Dr. Shih increased the tentative ratings, after determining that the Claimant had reached MMI on October 15, 2014.

22. The Respondent filed a new GAL on June 5, 2013 and additional treatment was provided to the Claimant (Respondent's Exhibit A).

23. A second MRI of the Claimant's knee was done on October 22, 2013 (Respondent's Exhibit H.) The MRI noted that there was sequelae of the prior anterolateral tibial plateau fracture. Chondral thinning along the far interior margins of the plateau was noted and there was a small area of chondral fissuring with minimal subcortical reactive marrow-type change/residual subcortical cystic change noted. Quadriceps and patellar tendons showed mild tendinosis/tendinopathy change. Mild pre-patellar soft tissue edema was noted (Respondent's Exhibit H).

Subsequent Medical Evaluations and Treatment

24. The Claimant was evaluated on November 5, 2013 by John Sacha, M.D., who diagnosed: (1) cervical facet syndrome; (2) headaches secondary to number 1; (3) left radial wrist fracture resolved; (4) right tibial plateau fracture; and (5) history of facial and extremity contusions and abrasions. Dr. Sacha recommended a right C2-5 intra-articular facet injection to be diagnostic, therapeutic and also for causality (Claimant's Exhibit 11).

25. Neil Pitzer, M.D., saw the Claimant on November 20, 2013 for persistent numbness in her hand and palm. An EMG was performed at that time, which documented no median neuropathy at this forearm (Claimant's Exhibit 12).

26. Dr. Sacha again evaluated the Claimant on April 28, 2014, and he recommended a right C2-5 medial branch block. This was performed on July 3, 2014. Dr. Sacha noted a therapeutic response to the treatment. He also recommended that the Claimant receive PT, which she received at Select Physical Therapy (Claimant's Exhibit 14).

27. Dr. Sacha again examined the Claimant on September 22, 2014, at which time the Claimant reported 70% improvement. MMI was anticipated in approximately three weeks.

28. Dr. Sacha responded to an inquiry sent by the TPA on September 30, 2014, noting that the Claimant had not reached MMI as of that date. The Claimant had just started her PT after the radial frequency protocol for her cervical spine, which was anticipated and completed within three weeks (Claimant's Exhibit 15).

29. Dr. Sacha concluded that the Claimant reached MMI when he examined her on November 3, 2014.

Dr. Shih's Follow Up DIME

30. The Claimant underwent a follow-up DIME, which was performed by Dr. Shih on February 27, 2015. Dr. Shih concluded that Claimant reached MMI as of October 15, 2014 and had a permanent medical impairment of the cervical spine, left upper extremity (LUE) and right lower extremity (RLE). He assigned a 14% whole person impairment of the spine, which included a Table 53 rating of 7% and an additional 8% impairment, based upon range of motion.

31. For the Claimant's LUE, he assigned a 3% scheduled rating.

32. Dr. Shih noted that his analysis for the right knee (RLE) remained the same and she would have no impairment for range of motion. Impairment was warranted given the plateau fracture, with depression noted on imaging. Dr. Shih stated: "I would utilize Table 40, Subsection 5 for arthritis, which I would place at 5% lower extremity . . ."

Independent Medical Examination (IME) by Carlos Cebrian, M.D.

33. The Respondent sent the Claimant for an IME with Dr. Cebrian, which took place on June 4, 2015. Dr. Cebrian was called as a witness by the Respondent at the hearing. He testified as an expert. H he is board certified in family practice and fully Level II Accredited.

34. In his report (Respondent's Exhibit H), Dr. Cebrian noted that the Claimant's current complaints were cervical spine, left wrist and right leg pain. He agreed with Dr. Shih's determination that Claimant reached MMI on October 15, 2014.

With regard to the Claimant's cervical spine, Dr. Cebrian was of the opinion that he would have anticipated the Claimant's impairment rating to be lower, since she received treatment after Dr. Shih's first DIME. Such an opinion is speculative and without foundation in objective medicine. Dr. Cebrian conceded that the ROM testing done by Dr. Shih in his evaluation on February 17, 2015 was valid, pursuant to the *AMA Guides to the Evaluation of Permanent Impairment*, 3rd Ed., Rev. (hereinafter referred to as the "AMA Guides").

35. Dr. Cebrian also disagreed with Dr. Sacha that there was facet pathology which required treatment. According to Dr. Cebrian, the medical records documented pain relief after the facet injection, which Dr. Cebrain acknowledged. Nonetheless, Dr. Cebrian's opinion in this regard is speculative and without foundation in objective medicine.

36. Dr. Cebrian disagreed with Dr. Shih's assessment of a 5% impairment to the Claimant's right knee. He agreed that the ROM did not require an impairment, but he stated the opinion that there was no evidence of post-traumatic arthritis with findings such as inflammation and swelling of the joint. The ALJ finds that Dr. Cebrian's opinion in this regard is partially speculative and without ample support in the totality of the Claimant's medical case. Consequently, Dr. Shih's opinion in this regard is considerably more credible than Dr. Cebrian's opinion.

37. Dr. Cebrian assessed a 2% scheduled impairment rating for the Claimant's left wrist. This represents a mere difference of opinion whereby Dr. Cebrian's opinion is insufficiently supported by the totality of the evidence. The Respondent made a judicial admission that Dr. Shih's 3% rating with regard to the left wrist was supported by a preponderance of the evidence.

38. According to the Claimant, she continues to experience swelling and clicking in the right knee. She estimated that the swelling occurs at least once a week and the clicking occurs when she uses her knee.

39. According to the Claimant, her injuries have limited her activities, including the playing and coaching softball. She has also not been able to participate in water sports, including waterskiing because of her physical limitations.

Ultimate Findings

40. The ALJ finds the Claimant's testimony credible and un-impeached. Further, the ALJ finds the opinions of DIME Dr. Shih more credible and persuasive than the opinions of IME Dr. Cebrian because Dr. Shih's opinions are more consistent with the totality of the medical evidence and the product of a more thorough treatment of the Claimant's medical case.

41. The ALJ makes a rational choice, between conflicting medical opinions, to accept the opinions of Dr. Shih and to reject any and all opinions to the contrary.

42. The Respondent has failed to prove that it is highly probable, unmistakable and free from serious and substantial doubt that Dr. Shih's ultimate opinion, rating the Claimant's whole person impairment for the cervical spine at 14% whole person, with a final MMI date of October 15, 2014, was in error. Therefore, the Respondent failed to overcome Dr. Shih's DIME opinions, in this regard, by clear and convincing evidence. Dr. Cebrian maintains a mere difference of opinion with Dr. Shih, and even that difference of opinion is not that well supported by the aggregate medical record.

43. Dr. Shih, in the follow up DIME, rated the Claimant's LUE at 3% of the LUE, and the respondent made a judicial admission that this rating was appropriate.

44. The Claimant has proven, by preponderant evidence, that Dr. Shih's 5% scheduled rating for the RLE is adequately supported by the totality of the medical record, appropriate and, therefore, the Claimant is entitled to a 5% rating for the RLE.

45. The Claimant has proven, by a preponderance of the evidence, that post-MMI medical maintenance care is warranted in the discretion of the Claimant's ATPs.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

Credibility

a. In deciding whether an injured worker has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Bodensleck v. Indus. Claim Appeals Office,* 183 P.3d 684 (Colo. App. 2008);*Kroupa v. Indus. Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002); *Rockwell International v. Turnbull,* 802 P.2d 1182, 1183 (Colo. App. 1990); *Penasquitos Village, Inc. v. NLRB*, 565 F.2d 1074 (9th Cir. 1977). The ALJ determines the credibility of the witnesses. A*renas v. Indus. Claim Appeals Office*, 8 P.3d 558 (Colo. App. 2000). The weight and credibility to be assigned evidence is a matter within the discretion of the ALJ. *Cordova v. Indus. Claim Appeals Office*, 55 P.3d 186 (Colo. App. 2002); *Youngs v. Indus. Claim Appeals Office,* 297 P.3d 964, **2012 COA 85.** The same principles concerning credibility determinations that apply to lay witnesses apply to expert witnesses as well. *See Burnham v. Grant,* 24 Colo. App. 131, 134 P. 254 (1913); *also see Heinicke v. Indus. Claim Appeals Office,* 197 P.3d 220 (Colo. App. 2008). The fact finder should consider, among other things, the consistency or

inconsistency of a witness' testimony and/or actions; the reasonableness or unreasonableness (probability or improbability) of a witness' testimony and/or actions (this includes whether or not the expert opinions are adequately founded upon appropriate research); the motives of a witness; whether the testimony has been contradicted; and, bias, prejudice or interest. *See Prudential Ins. Co. v. Cline,* 98 Colo. 275, 57 P. 2d 1205 (1936); CJI, Civil, 3:16 (2005). The fact finder should consider an expert witness' special knowledge, training, experience or research (or lack thereof). *See Young v. Burke,* 139 Colo. 305, 338 P. 2d 284 (1959). The ALJ has broad discretion to determine the admissibility and/or weight of evidence based on an expert's knowledge, skill, experience, training and education. *See* S 8-43-210, C.R.S; *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P.2d 501 (Colo. App. 1995). As found, *See, Annotation, Comment: Credibility of Witness Giving Un-contradicted Testimony as Matter for Court or Jury,* 62 ALR 2d 1179, maintaining that the fact finder is not free to disregard un-contradicted testimony. As found, the Claimant's testimony was credible and un-impeached. Further, as found, the opinions of DIME Dr. Shih were more credible and persuasive than the opinions of IME Dr. Cebrian because Dr. Shih's opinions were more consistent with the totality of the medical evidence and the product of a more thorough treatment of the Claimant's medical case.

Substantial Evidence

b. An ALJ's factual findings must be supported by substantial evidence in the record. *Paint Connection Plus v. Indus. Claim Appeals Office,* 240 P.3d 429 (Colo. App. 2010); *Leewaye v. Indus. Claim Appeals Office,* 178 P.3d 1254 (Colo. App. 2007); *Brownson-Rausin v. Indus. Claim Appeals Office,* 131 P.3d 1172 (Colo. App. 2005). *Also see Martinez v. Indus. Claim Appeals Office,* 176 P.3d 826 (Colo. App. 2007). Substantial evidence is "that quantum of probative evidence which a rational fact-finder would accept as adequate to support a conclusion, without regard to the existence of conflicting evidence." *Metro Moving & Storage Co.v. Gussert,* 914 P.2d 411 (Colo. App. 1995). Reasonable probability exists if a proposition is supported by **substantial evidence** which would warrant a reasonable belief in the existence of facts supporting a particular finding. *See F.R. Orr Construction v. Rinta,* 717 P.2d 965 (Colo. App. 1985). It is the sole province of the fact finder to weigh the evidence and resolve contradictions in the evidence. See *Pacesetter Corp. v. Collett,* 33 P. 3d 1230 (Colo. App. 2001). An ALJ's resolution on questions of fact must be upheld if supported by substantial evidence and plausible inferences drawn from the record. *Eller v. Indus. Claim Appeals Office,* 224 P.3d 397, 399-400 (Colo. App. 2009). As found, The ALJ made a rational choice, between conflicting medical opinions, to accept the opinions of Dr. Shih and to reject any and all opinions to the contrary.

Overcoming the DIME on Degree of Whole Person Impairment

c. The party seeking to overcome a DIME physician's opinions bears the burden of proof by clear and convincing evidence. *Magnetic Engineering, Inc. v. Indus.*

*Claim Appeals Office***,** 5 P.3d 385 (Colo. App. 2000). *Also see Leprino Foods Co. v. Indus. Claim Appeals Office,* 134 P.3d 475 (Colo. App. 2005). The DIME physician's determination of MMI is binding unless overcome by "clear and convincing evidence." *Metro Moving & Storage Co. v. Gussert,* 914 P.2d 411 (Colo. App. 1995); *See also Peregoy v. Indus. Claim Appeals Office,* 87 P.3d 261 (2004); and § 8-42-107(b)-(c), C.R.S. *Also see Whiteside v. Smith,* 67 P.3d 1240 (Colo. 2003). Where the threshold determination of compensability is not an issue, a DIME physician's conclusion that an injured worker's medical problems were components of the injured worker's overall impairment constitutes a part of the diagnostic assessment that comprises the DIME process and, as such the conclusion must be given presumptive effect and can only be overcome by clear and convincing evidence. *Qual-Med, Inc. v. Indus. Claim Appeals Office*, 961 P.2d 590 (Colo. App. 1998); *Leprino Foods Co. v. Indus. Claim Appeals Office,* 134 P.3d 475, 482 (Colo. App. 2005); *Eller v. Indus. Claim Appeals Office,* 224 P.3d 397, 400 (Colo. App. 2009). "Clear and convincing evidence" is evidence, which is stronger than preponderance, is unmistakable, makes a fact or facts highly probable or the converse, and is free from serious or substantial doubt. *Metro Moving & Storage Co. v. Gussert, supra; Leming v. Indus. Claim Appeals Office,* 62 P.3d 1015, 1019 (Colo. App. 2002). In other words, a DIME physician's finding may not be overcome unless the evidence establishes that it is "highly probable" that the DIME physician's opinion is incorrect. *Postelwait v. Midwest Barricade,* 905 P. 2d 21 (Colo. App. 1995). To overcome a DIME physician's opinion, "there must be evidence establishing that the DIME physician's determination is incorrect and this evidence must be unmistakable and free from serious or substantial doubt". *Adams v. Sealy, Inc.,* W.C. No. 4-476-254 [Indus. Claim Appeals Office (ICAO), Oct. 4, 2001]. A mere difference of medical opinion does not constitute clear and convincing evidence to overcome the opinion of the DIME physician. *Javalera v. Monte Vista Head Start, Inc.,* W.C. Nos. 4-532-166 & 4-523-097 (ICAO, July 19, 2004); *see Shultz v. Anheuser Bush, Inc.,* W.C. No. 4-380-560 (ICAO, Nov. 17, 2000). As found, the Respondent failed to prove that it is highly probable, unmistakable and free from serious and substantial doubt that Dr. Shih's ultimate opinion, rating the Claimant's whole person impairment for the cervical spine at 14% whole person, with a final MMI date of October 15, 2014, was in error. Therefore, the Respondent failed to overcome Dr. Shih's DIME opinions, in this regard, by clear and convincing evidence. Dr. Cebrian maintains a mere difference of opinion with Dr. Shih, and even that difference of opinion is not that well supported by the aggregate medical record.

Judicial Admission of 3% LUE Rating

d. A judicial admission is defined as a "formal, deliberate declaration that a party or his or her counsel makes in a judicial proceeding for the purpose of dispensing with proof of formal matters or facts about which there is no real dispute." *Kempter v. Hurd,* 713 P.2d 1274 (Colo. App. 1986); *Gen. Steel Domestic Sales, LLC v. Hogan & Hartson, LLP,* 230 P.3d 1275, 1283 (Colo. App. 2010). Judicial admissions must be unequivocal but become binding once they are made. *Salazar v. American Sterilizer Co.,* 5 P.3d 357 (Colo. App. 2000). *Also see Valdez v. Texas Roadhouse,* W.C. No. 4-366-133 [Industrial Claim Appeals Office (ICAO), January 25, 2001]. Stipulations are a form of judicial admission and are binding on the party who makes them. *Maloney v, Brassfield,* 251 P.3d 1097, 1108 (Colo. App. 2010). As found, the Respondent made a

judicial admission that Dr. Shih's 3% rating for the LUE was appropriate. Therefore, the Claimant is entitled to a 3% rating for the LUE.

Scheduled and Whole Person ratings May not be Combined

e. Section 8-42-107 (7) (b) (II), C.R.S., provides that scheduled and whole person losses shall be compensated separately. As found, the Claimant sustained a 14% whole person rating, a 3% LUE rating, and a 5% RLE rating, all of which must be awarded separately, which must be awarded separately.

Post-MMI Maintenance Medical Benefits

f. An employee is entitled to continuing medical benefits after MMI if reasonably necessary to relieve the employee from the effects of an industrial injury. *See Grover v. Indus. Comm'n of Colorado*, 759 P.2d 705 (Colo. 1988). The record must contain substantial evidence to support a determination that future medical treatment will be reasonably necessary to relieve a claimant from the effects of an injury or to prevent further deterioration of his condition. *Stollmeyer v. Indus. Claim Appeals Office*, 916 P.2d 609 (Colo. App. 1995); *Grover v. Indus. Comm'n, supra*. Such evidence may take the form of a prescription or recommendation for a course of medical treatment necessary to relieve a claimant from the effects of the injury or to prevent further deterioration. *Stollmeyer v. Indus. Claim Appeals Office, supra*. An injured worker is ordinarily **entitled to a general award of future medical benefits**, subject to an employer's right to contest causal relatedness and reasonable necessity. *See Hanna v. Print Expediters,* 77 P.3d 863 (Colo. App. 2003). As found, the Claimant is entitled to maintenance medical care, as determined by her ATPs, which is reasonably necessary to address her injuries.

Burden of Proof

g. The injured worker has the burden of proof, by a preponderance of the evidence, of establishing entitlement to benefits beyond those admitted. §§ 8-43-201 and 8-43-210, C.R.S. *See City of Boulder v. Streeb,* 706 P. 2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals Office,* 12 P. 3d 844 (Colo. App. 2000); *Lutz v. Indus. Claim Appeals Office,* 24 P.3d 29 (Colo. App. 2000). *Kieckhafer v. Indus. Claim Appeals.Office*, 284 P.3d 202, 205 (Colo. App. 2012). Also, the burden of proof is generally placed on the party asserting the affirmative of a proposition. *Cowin & Co. v. Medina,* 860 P.2d 535 (Colo. App. 1992). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark,* 197 Colo. 306, 592 P. 2d 792 (1979). *People v. M.A.,* 104 P. 3d 273 (Colo. App. 2004); *Hoster v. Weld County Bi-Products, Inc.,* W.C. No. 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. *Also see Ortiz v.*

Principi, 274 F.3d 1361 (D.C. Cir. 2001). "Preponderance" means "the existence of a contested fact is more probable than its nonexistence." *Indus. Claim Appeals Office v. Jones*, 688 P.2d 1116 (Colo. 1984). As found, the Claimant has sustained her burden with respect to the 3% rating for the LUE; the 5% rating for the RLE; and, with respect to post-MMI maintenance medical benefits as dictated by the Claimant's ATPs.

ORDER

IT IS, THEREFORE, ORDERED THAT:

A. The Respondent shall pay the costs of all causally related and reasonably necessary post-maximum medical improvement maintenance medical benefits, as determined to be appropriate by her authorized treating physicians, subject to the Division of Workers Compensation medical Fee Schedule.

B. The Respondent shall pay the Claimant permanent whole person medical impairment benefits, based on 14% whole person, attributable to the cervical spine, from October 15, 2014, the date of maximum medical improvement, and continuing until paid in full.

C. The respondent shall pay the Claimant permanent scheduled impairment benefits, based on 3% of the left upper extremity and 5% of the right lower extremity, from October 15, 2014, and continuing until paid in full.

D. The Respondent is entitled to a credit for any permanent scheduled impairment benefits previously paid.

E. The Respondent shall pay the Claimant statutory interest at the rate of eight per cent (8%) per annum on all amounts due and not paid when due.

DATED this_____day of July 2015.

ISSUES

I. Whether Claimant has proven by a preponderance of the evidence that she is entitled to maintenance medical treatment in the form of a venous Doppler ultrasound, a triple phase bone scan and evaluation by a vascular (vein) specialist as maintenance care. The question to be answered is whether the recommended diagnostic testing and specialist evaluation are reasonable, necessary and related to claimant's November 24, 2012 industrial injury.

II. Whether Claimant is entitled to additional compensation for serious permanent disfigurement.

FINDINGS OF FACT

Based upon the evidence presented, including the deposition testimony of Drs. McFadden and Thurston, the ALJ enters the following findings of fact:

1. On November 24, 2012 Claimant sustained admitted injuries to her left knee after falling from a ladder at work.

2. A course of conservative care proved unsuccessful in ameliorating Claimant's condition. Consequently, she was referred for an orthopedic evaluation with Dr. Wily Jinkins. On April 18, 2013, Dr. Jinkins performed a diagnostic arthroscopy of the left knee during which the following procedures were performed: a patella chondroplasty, a lateral femoral condyle chondroplasty, microfracture subchondral plate, resection of synovial shelf and injection with primary portal closure.

3. On May 3, 2013 Claimant developed a sudden onset of cramping in her left calf which she was unable to relieve. She sought treatment in the emergency room of Memorial Hospital where a Venous Doppler study revealed a "clot in the left popliteal vein and gastrocutaneous veins." Subsequent pulmonary imaging demonstrated "small bilateral pulmonary emboli" characterized as mild, nonspecific patchy ground glass opacity bilaterally. Claimant was assessed with left lower extremity deep vein thrombosis (DVT) and pulmonary emboli (PE). Dr. William Kimble admitted Claimant to the hospital for additional treatment noting that the DVT and PE were "probably related to her recent left knee surgery."

4. On September 10, 2013, Dr. Jinkins opined that Claimant's DVT was related to her surgery of April 18, 2013. He also felt that Claimant was still in need of further treatment for the same. Claimant was placed on a prolonged course of anti-coagulant medication therapy.

5. A second venous duplex imaging of the left leg on January 10, 2014 revealed no evidence of persistent DVT.

6. At a return appointment dated February 7, 2014 Dr. Jinkins noted that although claimant did not have a great deal of calf pain; she had experienced an episode of chest pain while getting out of the bath. He also noted that he had recommended further imaging one week prior to the February 7, 2014 appointment due to the possibility that claimant was "redeveloping a DVT." Dr. Jinkins renewed his request for a venous Doppler ultrasound as "soon as possible at Penrad." Respondents initially denied the request; however, the study was ultimately approved and claimant underwent the recommended Doppler study on May 6, 2014. The study reflected a "continued absence of deep vein thrombosis."

7. Claimant was placed at MMI on June 17, 2014. Claimant subsequently requested a DIME, which was completed by Dr. Lee McFadden on November 6, 2014. In accordance with the DIME opinion, Respondents filed a Final Admission of Liability on December 5, 2014 admitting for 16% lower extremity impairment and post-MMI care.

8. Claimant has received maintenance medical care for her left knee from Dr. Jinkins. On December 16, 2014, Dr. Jinkins recommended a fourth venous Doppler ultrasound for continued pain and persistent swelling in her left lower leg. Respondents denied authorization for the recommended study requesting further that the recommendation be reviewed by Dr. Lloyd Thurston per W.C.R.P. 16-10.

9. In opining that the requested Doppler ultrasound was not reasonable necessary, or related maintenance care, Dr. Thurston opined that claimant's "only current risk factors for DVT are obesity and a prior episode of DVT and that "she had not suffered any recent trauma to her left lower extremity, had not experienced prolonged bed rest or immobilization, was not taking estrogens or any agents which would induce a hypercoaguable state, and had discontinued smoking in February 2014." Consequently, according to his report, the request for additional Doppler study was not reasonable, necessary or related to claimants admitted work injury.

10. Claimant returned to Dr. Jinkins on February 10, 2015 at which time she complained of burning in her left lower leg down to her foot, discomfort to the slightest pressure and significant calf pain and swelling. Dr. Jinkins noted:

> "I told Laura I would still recommend that a venous Doppler ultrasound be accomplished, however, to date, this has not been approved. I would recommend that she have a 3-phase bone scan. There are some physical findings, but also her history is consistent with a component of her present symptomology being sympathetically mediated."

11. Respondents requested that Dr. Jenkins' recommendation for a 3-phase bone scan be reviewed by Dr. Thurston per W.C.R.P. 16-10. In opining that the 3- phase bone scan was not reasonable, necessary, and related maintenance care, Dr. Thurston opined that Claimant's symptoms do not meet the clinical criteria for chronic regional

pain syndrome (CRPS). He further opined that vague descriptions of physical findings do not adequately document edema or "describe symptoms consistent with true allodynia."

12. Based upon careful review of Dr. Thurston's February 16, 2015 report, the ALJ finds, contrary to Dr. Thurston's assessment that Dr. Jinkins descriptions of claimant's ongoing symptoms are sufficiently specific to adequately document clinical findings consistent with a component of claimant's symptoms emanating from a sympathetically mediated cause. Crediting Dr. Jinkins report that claimant has 2+ edema in addition to "burning" and discomfort with the exertion of light pressure, the ALJ finds that claimant has proven, by a preponderance of the evidence, that a triple phase bone scan is reasonably necessary and related to claimant's work injury to further assess whether claimant's ongoing symptoms are sympathetically mediated as no other diagnosis better explains her current signs and symptoms.

13. Respondents requested the deposition of Dr. Lee McFadden, the DIME physician. This deposition occurred on March 31, 2015 and is marked as Respondents' Exhibit G. During his deposition, Dr. McFadden testified that continued calf and foot swelling constitutes a management of a perfusion problem in the leg, which was outside of his purview as an orthopedist. According to Dr. McFadden, claimant's continued swelling may be related to her prior vein issue but because vascular conditions were outside of his area of expertise management of the same would be addressed by "the vascular guys". Dr. McFadden was asked, "Would you recommend that she have an evaluation with a vein specialist?" He replied, "I don't think it's unreasonable" (Respondents' Exhibit G, page 24, lines 16-25 and page 25-26, lines 1-11).

14. Respondents also took the deposition of Dr. Lloyd Thurston, a Family Medicine Practitioner. During his deposition Dr. Thurston testified that he neither evaluates nor treats sympathetically mediated pain/CRPS, nor does he treat DVT or subsequent vein issues related to DVT. While Dr. Thurston indicated that the requested ultrasound would be reasonable, which opinion the ALJ finds constitutes a deviation from that expressed in his December 26, 2014 report, he testified that he did not feel the need for it was related to claimant's industrial injury. As noted by Dr. Thurston, claimant's risk factors for the development of a subsequent DVT are her obesity and her prior episode of DVT. Considering that claimant's obesity was pre-existing and there is, by Dr. Thurston's account an absence of other risk factors that cause hypercoaguable states, the ALJ finds that claimant's prior work related DVT is the most probable cause of any subsequent DVT and the need for additional diagnostic study, i.e. Doppler ultrasound. Consequently, the ALJ finds Dr. Thurston's opinion that the need for the additional ultrasound is unrelated to the "previous injury" unconvincing.

15. Claimant has residual arthroscopic scarring, described as two (2) red, 3/8 semi-circular scars, on either side of the left knee accompanied by mild swelling of the knee in general which alters the natural appearance of her skin and joint in this area.

16. Claimant's testimony regarding her ongoing symptoms and swelling is credible

and convincing. As noted above, the undersigned ALJ viewed the swelling described by claimant first hand during the disfigurement viewing phase of the hearing.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

General Legal Principals

A. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. C.R.S. § 8-40-102(1). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of claimant nor in favor of rights of respondents. §8-43-201, C.R.S. (2005). A preponderance of the evidence is that which leaves the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979).

B. The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

C. When determining credibility, the fact finder should consider, among other things the consistency or inconsistency of the witness' testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline,* 57 P.2d 1205 (1936). A Workers' Compensation case is decided on its merits. Section 8-43-210, C.R.S. As found, Claimant is a credible witness and his testimony is both persuasive and consistent with the medical records in the case. Furthermore, the ALJ concludes that Dr. Fall's testimony to be contradicted by the more persuasive opinions of Drs. Larimore and Jones.

Medical Benefits

D. The claimant bears the burden of establishing entitlement to medical treatment. *See Snyder v. Industrial Claim Appeals Office*, 942 P.2d 1337 (Colo. App. 1997); *Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990). The claimant is only entitled to benefits as long as the industrial injury is the proximate cause of the claimant's need for medical treatment. *Merriman v. Indus. Comm'n*, 210 P.2d 448 (Colo. 1949). Ongoing benefits may be denied if the current and ongoing need for medical treatment or disability is not proximately caused by an injury arising out of and

in the course of the employment. *Snyder v. City of Aurora*, 942 P.2d 1337 (Colo. App. 1997). In other words, the mere occurrence of a compensable injury does not require an ALJ to find that all subsequent medical treatment and physical disability was caused by the industrial injury. To the contrary, the range of compensable consequences of an industrial injury is limited to those which flow proximately and naturally from the injury. *Standard Metals Corp. v. Ball,* 172 Colo. 510, 474 P.2d 622 (1970); § 8-41-301(1)(c), C.R.S. 1997. Based upon the totality of the evidence presented, the ALJ concludes that claimant has proven that the requested diagnostic testing and the need for a vascular evaluation are reasonable, necessary and related to her compensable left knee injury. Although Dr. Thurston opined the request for DVT ultrasound was not reasonable, necessary and related maintenance care, he admitted that Claimant has some risk factors for the development of DVT, including having had a prior DVT culminating in pulmonary emboli (PE) which were treated as work related conditions. Outside of her obesity and having had a prior DVT, Claimant's risk for development of additional DVT appears low based upon the testimony of Dr. Thurston. Yet, Claimant continues to experience symptoms associated with DVT or a sympathetically mediated pain complex. Consequently, the ALJ concludes it is reasonable and necessary, given the morbidity associated with DVT progressing to PE and Claimant's ongoing burning pain and swelling in the skin surrounding her left knee, to proceed with additional diagnostic testing and evaluation in an effort to determine the cause of Claimant's continued symptoms. While the risk for DVT may be low, it does not negate the fact, that the most probable cause of any new DVT is more probably than not related to her prior development of DVT over other causes. Consequently, the ALJ concludes that Claimant has established the requisite causal connection between her need for a Doppler study, a triple phase bone scan and an evaluation with a vascular specialist and her November 24, 2012 industrial injury.

E. The ALJ acknowledges that the Medical Treatment Guidelines (Guidelines) are regarded as accepted professional standards for care under the Workers' Compensation Act. *Rook v. Industrial Claim Appeals Office*, 111 P.3d 549 (Colo. App. 2005). While it is appropriate for an ALJ to consider the Guidelines in deciding whether a certain medical treatment is reasonable and necessary for the claimant's condition, *Deets v. Multimedia Audio Visual,* W. C. No. 4-327-591 (March 18, 2005); *see Eldi v. Montgomery Ward* W. C. No. 3-757-021 (October 30, 1998)(medical treatment guidelines are a reasonable source for identifying the diagnostic criteria), the Respondents have not cited any authority, nor is the undersigned aware of any, which requires an ALJ to award or deny medical benefits based on the Guidelines. Indeed the Guidelines permit deviation as individual cases dictate. As noted here, claimant has continuing pain which is disproportionate to any inciting event; she has persistent edema and reports functional decline with the use of her left knee. Thus, while claimant may not meet all criteria as listed in the Guidelines, no other diagnosis, outside of a sympathetically mediated pain complex better explains her ongoing signs and symptoms. Consequently, the ALJ concludes that deviation from the Guidelines to allow for additional diagnostic testing in the form of a 3-phase bone scan is warranted in this case.

F. In *Arkin v. Industrial Commission*, 145 Colo. 463, 358 P.2d 879 (1961), the

Court held that the term “disfigurement” as used in the statute, contemplates that there be an “observable impairment of the natural person.” In this case, The ALJ concludes that Claimant’s swelling and scarring constitutes a disfigurement as provided for by Section 8-42-108 (1), C.R.S.

ORDER

It is therefore ordered that:

1. Respondent-Insurer shall pay for all medical expenses to cure and relieve claimant from the effects of her November 24, 2012 left knee injury, including but not limited to the venous Doppler ultrasound, a triple phase bone scan and an evaluation with a vascular specialist as requested by Dr. Wily Jenkins.

2. Respondent-Insurer shall pay Claimant $1,200.00 for her visible disfigurement; however, Respondent-Insurer shall be given credit for any amount of disfigurement previously paid in connection with this claim.

3. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

4. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

I. Whether Claimant has proven by a preponderance of the evidence that she is entitled to maintenance medical treatment in the form of a venous Doppler ultrasound, a triple phase bone scan and evaluation by a vascular (vein) specialist as maintenance care. The question to be answered is whether the recommended diagnostic testing and specialist evaluation are reasonable, necessary and related to claimant's November 24, 2012 industrial injury.

II. Whether Claimant is entitled to additional compensation for serious permanent disfigurement.

FINDINGS OF FACT

Based upon the evidence presented, including the deposition testimony of Drs. McFadden and Thurston, the ALJ enters the following findings of fact:

1. On November 24, 2012 Claimant sustained admitted injuries to her left knee after falling from a ladder at work.

2. A course of conservative care proved unsuccessful in ameliorating Claimant's condition. Consequently, she was referred for an orthopedic evaluation with Dr. Wily Jinkins. On April 18, 2013, Dr. Jinkins performed a diagnostic arthroscopy of the left knee during which the following procedures were performed: a patella chondroplasty, a lateral femoral condyle chondroplasty, microfracture subchondral plate, resection of synovial shelf and injection with primary portal closure.

3. On May 3, 2013 Claimant developed a sudden onset of cramping in her left calf which she was unable to relieve. She sought treatment in the emergency room of Memorial Hospital where a Venous Doppler study revealed a "clot in the left popliteal vein and gastrocutaneous veins." Subsequent pulmonary imaging demonstrated "small bilateral pulmonary emboli" characterized as mild, nonspecific patchy ground glass opacity bilaterally. Claimant was assessed with left lower extremity deep vein thrombosis (DVT) and pulmonary emboli (PE). Dr. William Kimble admitted Claimant to the hospital for additional treatment noting that the DVT and PE were "probably related to her recent left knee surgery."

4. On September 10, 2013, Dr. Jinkins opined that Claimant's DVT was related to her surgery of April 18, 2013. He also felt that Claimant was still in need of further treatment for the same. Claimant was placed on a prolonged course of anti-coagulant medication therapy.

5. A second venous duplex imaging of the left leg on January 10, 2014 revealed no evidence of persistent DVT.

6. At a return appointment dated February 7, 2014 Dr. Jinkins noted that although claimant did not have a great deal of calf pain; she had experienced an episode of chest pain while getting out of the bath. He also noted that he had recommended further imaging one week prior to the February 7, 2014 appointment due to the possibility that claimant was "redeveloping a DVT." Dr. Jinkins renewed his request for a venous Doppler ultrasound as "soon as possible at Penrad." Respondents initially denied the request; however, the study was ultimately approved and claimant underwent the recommended Doppler study on May 6, 2014. The study reflected a "continued absence of deep vein thrombosis."

7. Claimant was placed at MMI on June 17, 2014. Claimant subsequently requested a DIME, which was completed by Dr. Lee McFadden on November 6, 2014. In accordance with the DIME opinion, Respondents filed a Final Admission of Liability on December 5, 2014 admitting for 16% lower extremity impairment and post-MMI care.

8. Claimant has received maintenance medical care for her left knee from Dr. Jinkins. On December 16, 2014, Dr. Jinkins recommended a fourth venous Doppler ultrasound for continued pain and persistent swelling in her left lower leg. Respondents denied authorization for the recommended study requesting further that the recommendation be reviewed by Dr. Lloyd Thurston per W.C.R.P. 16-10.

9. In opining that the requested Doppler ultrasound was not reasonable necessary, or related maintenance care, Dr. Thurston opined that claimant's "only current risk factors for DVT are obesity and a prior episode of DVT and that "she had not suffered any recent trauma to her left lower extremity, had not experienced prolonged bed rest or immobilization, was not taking estrogens or any agents which would induce a hypercoaguable state, and had discontinued smoking in February 2014." Consequently, according to his report, the request for additional Doppler study was not reasonable, necessary or related to claimants admitted work injury.

10. Claimant returned to Dr. Jinkins on February 10, 2015 at which time she complained of burning in her left lower leg down to her foot, discomfort to the slightest pressure and significant calf pain and swelling. Dr. Jinkins noted:

> "I told Laura I would still recommend that a venous Doppler ultrasound be accomplished, however, to date, this has not been approved. I would recommend that she have a 3-phase bone scan. There are some physical findings, but also her history is consistent with a component of her present symptomology being sympathetically mediated."

11. Respondents requested that Dr. Jenkins' recommendation for a 3-phase bone scan be reviewed by Dr. Thurston per W.C.R.P. 16-10. In opining that the 3- phase bone scan was not reasonable, necessary, and related maintenance care, Dr. Thurston opined that Claimant's symptoms do not meet the clinical criteria for chronic regional

pain syndrome (CRPS). He further opined that vague descriptions of physical findings do not adequately document edema or "describe symptoms consistent with true allodynia."

12. Based upon careful review of Dr. Thurston's February 16, 2015 report, the ALJ finds, contrary to Dr. Thurston's assessment that Dr. Jinkins descriptions of claimant's ongoing symptoms are sufficiently specific to adequately document clinical findings consistent with a component of claimant's symptoms emanating from a sympathetically mediated cause. Crediting Dr. Jinkins report that claimant has 2+ edema in addition to "burning" and discomfort with the exertion of light pressure, the ALJ finds that claimant has proven, by a preponderance of the evidence, that a triple phase bone scan is reasonably necessary and related to claimant's work injury to further assess whether claimant's ongoing symptoms are sympathetically mediated as no other diagnosis better explains her current signs and symptoms.

13. Respondents requested the deposition of Dr. Lee McFadden, the DIME physician. This deposition occurred on March 31, 2015 and is marked as Respondents' Exhibit G. During his deposition, Dr. McFadden testified that continued calf and foot swelling constitutes a management of a perfusion problem in the leg, which was outside of his purview as an orthopedist. According to Dr. McFadden, claimant's continued swelling may be related to her prior vein issue but because vascular conditions were outside of his area of expertise management of the same would be addressed by "the vascular guys". Dr. McFadden was asked, "Would you recommend that she have an evaluation with a vein specialist?" He replied, "I don't think it's unreasonable" (Respondents' Exhibit G, page 24, lines 16-25 and page 25-26, lines 1-11).

14. Respondents also took the deposition of Dr. Lloyd Thurston, a Family Medicine Practitioner. During his deposition Dr. Thurston testified that he neither evaluates nor treats sympathetically mediated pain/CRPS, nor does he treat DVT or subsequent vein issues related to DVT. While Dr. Thurston indicated that the requested ultrasound would be reasonable, which opinion the ALJ finds constitutes a deviation from that expressed in his December 26, 2014 report, he testified that he did not feel the need for it was related to claimant's industrial injury. As noted by Dr. Thurston, claimant's risk factors for the development of a subsequent DVT are her obesity and her prior episode of DVT. Considering that claimant's obesity was pre-existing and there is, by Dr. Thurston's account an absence of other risk factors that cause hypercoaguable states, the ALJ finds that claimant's prior work related DVT is the most probable cause of any subsequent DVT and the need for additional diagnostic study, i.e. Doppler ultrasound. Consequently, the ALJ finds Dr. Thurston's opinion that the need for the additional ultrasound is unrelated to the "previous injury" unconvincing.

15. Claimant has residual arthroscopic scarring, described as two (2) red, 3/8 semi-circular scars, on either side of the left knee accompanied by mild swelling of the knee in general which alters the natural appearance of her skin and joint in this area.

16. Claimant's testimony regarding her ongoing symptoms and swelling is credible

and convincing. As noted above, the undersigned ALJ viewed the swelling described by claimant first hand during the disfigurement viewing phase of the hearing.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

General Legal Principals

A. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. C.R.S. § 8-40-102(1). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of claimant nor in favor of rights of respondents. §8-43-201, C.R.S. (2005). A preponderance of the evidence is that which leaves the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979).

B. The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

C. When determining credibility, the fact finder should consider, among other things the consistency or inconsistency of the witness' testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline,* 57 P.2d 1205 (1936). A Workers' Compensation case is decided on its merits. Section 8-43-210, C.R.S. As found, Claimant is a credible witness and his testimony is both persuasive and consistent with the medical records in the case. Furthermore, the ALJ concludes that Dr. Fall's testimony to be contradicted by the more persuasive opinions of Drs. Larimore and Jones.

Medical Benefits

D. The claimant bears the burden of establishing entitlement to medical treatment. *See Snyder v. Industrial Claim Appeals Office*, 942 P.2d 1337 (Colo. App. 1997); *Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990). The claimant is only entitled to benefits as long as the industrial injury is the proximate cause of the claimant's need for medical treatment. *Merriman v. Indus. Comm'n*, 210 P.2d 448 (Colo. 1949). Ongoing benefits may be denied if the current and ongoing need for medical treatment or disability is not proximately caused by an injury arising out of and

in the course of the employment. *Snyder v. City of Aurora*, 942 P.2d 1337 (Colo. App. 1997). In other words, the mere occurrence of a compensable injury does not require an ALJ to find that all subsequent medical treatment and physical disability was caused by the industrial injury. To the contrary, the range of compensable consequences of an industrial injury is limited to those which flow proximately and naturally from the injury. *Standard Metals Corp. v. Ball,* 172 Colo. 510, 474 P.2d 622 (1970); § 8-41-301(1)(c), C.R.S. 1997. Based upon the totality of the evidence presented, the ALJ concludes that claimant has proven that the requested diagnostic testing and the need for a vascular evaluation are reasonable, necessary and related to her compensable left knee injury. Although Dr. Thurston opined the request for DVT ultrasound was not reasonable, necessary and related maintenance care, he admitted that Claimant has some risk factors for the development of DVT, including having had a prior DVT culminating in pulmonary emboli (PE) which were treated as work related conditions. Outside of her obesity and having had a prior DVT, Claimant's risk for development of additional DVT appears low based upon the testimony of Dr. Thurston. Yet, Claimant continues to experience symptoms associated with DVT or a sympathetically mediated pain complex. Consequently, the ALJ concludes it is reasonable and necessary, given the morbidity associated with DVT progressing to PE and Claimant's ongoing burning pain and swelling in the skin surrounding her left knee, to proceed with additional diagnostic testing and evaluation in an effort to determine the cause of Claimant's continued symptoms. While the risk for DVT may be low, it does not negate the fact, that the most probable cause of any new DVT is more probably than not related to her prior development of DVT over other causes. Consequently, the ALJ concludes that Claimant has established the requisite causal connection between her need for a Doppler study, a triple phase bone scan and an evaluation with a vascular specialist and her November 24, 2012 industrial injury.

E. The ALJ acknowledges that the Medical Treatment Guidelines (Guidelines) are regarded as accepted professional standards for care under the Workers' Compensation Act. *Rook v. Industrial Claim Appeals Office*, 111 P.3d 549 (Colo. App. 2005). While it is appropriate for an ALJ to consider the Guidelines in deciding whether a certain medical treatment is reasonable and necessary for the claimant's condition, *Deets v. Multimedia Audio Visual,* W. C. No. 4-327-591 (March 18, 2005); *see Eldi v. Montgomery Ward* W. C. No. 3-757-021 (October 30, 1998)(medical treatment guidelines are a reasonable source for identifying the diagnostic criteria), the Respondents have not cited any authority, nor is the undersigned aware of any, which requires an ALJ to award or deny medical benefits based on the Guidelines. Indeed the Guidelines permit deviation as individual cases dictate. As noted here, claimant has continuing pain which is disproportionate to any inciting event; she has persistent edema and reports functional decline with the use of her left knee. Thus, while claimant may not meet all criteria as listed in the Guidelines, no other diagnosis, outside of a sympathetically mediated pain complex better explains her ongoing signs and symptoms. Consequently, the ALJ concludes that deviation from the Guidelines to allow for additional diagnostic testing in the form of a 3-phase bone scan is warranted in this case.

F. In *Arkin v. Industrial Commission*, 145 Colo. 463, 358 P.2d 879 (1961), the

Court held that the term “disfigurement” as used in the statute, contemplates that there be an “observable impairment of the natural person.” In this case, The ALJ concludes that Claimant’s swelling and scarring constitutes a disfigurement as provided for by Section 8-42-108 (1), C.R.S.

ORDER

It is therefore ordered that:

1. Respondent-Insurer shall pay for all medical expenses to cure and relieve claimant from the effects of her November 24, 2012 left knee injury, including but not limited to the venous Doppler ultrasound, a triple phase bone scan and an evaluation with a vascular specialist as requested by Dr. Wily Jenkins.

2. Respondent-Insurer shall pay Claimant $1,200.00 for her visible disfigurement; however, Respondent-Insurer shall be given credit for any amount of disfigurement previously paid in connection with this claim.

3. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

4. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: July 22, 2015

/s/ Richard M. Lamphere

Richard M. Lamphere
Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Drive, Suite 230
Colorado Springs, CO 80906

ISSUES

The issues for determination are:

1. Post-maximum medical improvement (MMI) or "Grover" medical benefits without limitation.

2. Average weekly wage (AWW).

3. Whether the claimant overcame the division independent medical examination (DIME) opinions regarding MMI and permanent partial disability (PPD) by clear and convincing evidence.

4. In the event the claimant did not overcome the DIME opinions regarding MMI and PPD, whether the claimant proved his claim should be reopened based on a worsening of condition subsequent to MMI.

5. Temporary total disability (TTD) benefits from September 27, 2013, ongoing.

At hearing, the respondents' counsel stated the respondents now admit generally to Grover medical benefits, without the limitation on such medical benefits contained in the respondents' latest FAL, filed on June 12, 2014. Thus, the ALJ concludes this issue is moot. Also at hearing, and regarding AWW, the parties agreed the admitted AWW is $814.86, and that the claimant's weekly cost of continuing his healthcare coverage pursuant to COBRA is $131.97. The parties agreed that if the cost of continuing healthcare coverage is included, the claimant's AWW is $946.83.

FINDINGS OF FACT

1. The claimant sustained a work-related right inguinal hernia injury on December 27, 2012. He received primary treatment at Colorado Springs Health Partners (CSHP). Khurram Khan, M.D., performed hernia surgery on January 23, 2013.

2. On February 19, 2013, Dr. Khan noted the claimant complained he was "…still having a lot of pain, and tightness around surg area." Dr. Khan noted, "…c/o muscle spasm possibly from irritation from securing staples. Prescribed muscle relaxant and fill f/u in 2 weeks if symptoms do not resolve…"

3. The respondents admitted liability for the claimant's injury. The respondents paid temporary total disability (TTD) benefits from January 3, 2013 through March 3, 2013. The claimant returned to work with restrictions but at full wages on March 4, 2013.

4. On March 8, 2013, Dr. Rudderow at CSHP reported the claimant, "…Had surgery Jan 23, 2013. Mesh was implanted. Is in much pain today. R pelvic area…Pain was getting better until started working 3/4/13, then pain started to get worse again. Pt worried something is wrong. Has seen surgeon – told might be muscle strain or staple irritation. Good appetite. More comfortable standing than sitting, but then legs get numb and will give out because on feet for so long…" Work restrictions were continued.

5. On March 18, 2013, Dr. Rudderow reported, "…pain 4/10, goes up to 8-9/10 with bending down. Has appt w/surgeon 4/4/13. Can't lift anything on rt side [secondary to] pain. Pt walking slow. Pain a little better than last time seen. Rt handed. Had surgery on rt inguinal. Other night pt lifted something w/left hand and it causes pain. No known swelling. Still tender. Was taking ultram and naproxen – ran out – they did help with pain. No radiation of pain." Work restrictions were continued.

6. On April 4, 2013, Dr. Khan reported that he "Injected the area of tenderness with anesthetic with some relief. If patient symptoms improve over the next 24 hrs. will consider steroid injection in the area. F/u in 1 week." The claimant was restricted to lifting less than 20 pounds.

7. CT scan on April 16, 2013 revealed no inguinal hernia. An ultrasound on April 19, 2013 revealed no deep vein thrombosis.

8. On May 17, 2013, Dr. Rudderow reported, "…Not feeling well, pain now in rt testicle, had [ultrasound] to r/o clot 2 wks ago, was referred to Dr. Ford for pain mgmt by Dr. Kahn. Ford gave rx Lyrica, ins would not cover, Dr. Khan's office gave pt Gabapentin, makes pt dizzy at work, feels hazy. Told it may affect cog skills. Pt is working FT, doing bending, difficulty getting back up, etc…Pt has burning pain, feels like a bulge under area of surgery. Pain is min at rest and slouching in chair. Shooting pain worse with excessive walking and lifting…" Dr. Rudderow maintained work restrictions, and referred the claimant to "pain management."

9. Dr. Ballard at CSHP saw the claimant on June 12, 2013 and noted, "pt here for groin pain, and testicular pain, pt is also concerned on blood in stool and incontinence." Dr. Ballard reported, "…he has multiple issues and we will do the testing

for the back and the stomach and the melena and we will then address the prostate and the atrophy of the right testicle. At this time [it] is presumed that the right groin pain is a nerve entrapment of scar tissue but he also may have a nerve pain from the back from the scoliosis. The right groin pain is worse when he is sitting not standing."

10. Dr. Rudderow placed the claimant at maximum medical improvement (MMI) on June 20, 2013. The doctor issued permanent work restrictions and recommendations for post-MMI treatment, but opined the claimant sustained no permanent impairment.

11. The respondents filed a final admission of liability (FAL) consistent with Dr. Rudderow's findings on July 17, 2013.

12. On June 27, 2013, Dr. Rudderow reported, "…patient's surgical wounds healed well without complication, however patient has had persistent moderate to severe pain in the right inguinal area which has not significantly improved since surgery. Pt has been treated with pain medications including NSAIDS, narcotics, ultram and neurontin with minimal success….Due to patient's pain, he has not been able to return to full duty…Patient has healed from his surgical wounds, but continues to have chronic pain which is exacerbated by work. His chronic pain may or may not fade with the passage of time. He has no structural defect and improvement is possible but not definite…" Dr. Rudderow noted the claimant reported his pain "at rest" was 7/10.

13. The respondent-employer terminated the claimant's employment on September 26, 2013.

14. The claimant was issued a COBRA letter on October 4, 2013. It advised him that his cost to continue his medical, dental and vision healthcare benefits was $571.88 per month, effective October 1, 2013.

15. The claimant returned to Dr. Ballard on November 12, 2013 and the doctor reported, "…He is here for several reasons and he indicates he is depressed and he has a spot on his arm and he wants to see another surgeon to get the mesh removed…He has anhedonia and he has difficulty with focus and concentration. He is not exercising. He has no libedo {*sic*} and it is not ok with the wife. He has pain with the erection and the orgasm…" From a psychiatric perspective, Dr. Ballard reported, "sleep disturbances, depression, personality change and emotional problems, but not suicidal and no anxiety." Dr. Ballard reported, "…he has depressed affect and mood." Dr. Ballard indicated, "We will start him on fluoxetine [Prozac] since he has had success

with it before and we will refer him to urology for the frequency and noctuia and the pain from the results of the surgery and the testicular atrophy…"

16. Brian Beatty, M.D., performed a division independent medical examination (DIME) on April 29, 2014. Dr. Beatty reported, "…The patient notes that his symptoms have worsened since the injury. He has pain that radiates from his right lower abdomen into his testicle. His discomfort is constant." Dr. Beatty noted, "…The pain drawing reveals a burning pain in the right lower abdomen with a sharp stabbing pain in the inguinal region." He noted the claimant rated his pain "…as a 9 on a 0-10 scale…"

17. Dr. Beatty diagnosed "right inguinal hernia with repair, right ilioinguinal neuroitis." Dr. Beatty agreed the claimant had reached MMI as determined by Dr. Rudderow; however, he recommended that the claimant "…should have a second opinion with a general surgeon well-versed in hernia injuries with postop ilioinguinal nerve disorders. If it is felt the patient would benefit from injections to resolve his problem then I believe these could be done from a maintenance care standpoint. If it is determined that the patient would require a second surgery to remove the mesh or to perform an ilioinguinal neurotomy, then I do not believe he would remain at maximum medical improvement until he recovered from the surgery. Also, an evaluation with a physiatrist, knowledgeable in post surgical ilioinguinal nerve injuries would be appropriate."

18. Dr. Beatty issued a 4% whole-person permanent partial disability (PPD) rating. On June 12, 2014 the respondents admitted liability consistent with Dr. Beatty's findings.

19. The claimant's counsel wrote to Dr. Rudderow on June 3, 2014 regarding Dr. Beatty's recommendations. Dr. Rudderow responded on June 12, 2014, indicating she agreed it was reasonable to send the claimant to both a general surgeon and physiatrist per Dr. Beatty, and that, "…We will need to reopen this case to address your concerns and possibly review the MMI."

20. On July 7, 2014, Dr. Ballard responded to a written inquiry and confirmed that the claimant suffers from depression as a result of his ongoing chronic pain. Dr. Ballard confirmed he prescribed fluoxetine to treat that depression.

21. Dr. Ballard saw the claimant on September 16, 2014 and noted, "…He is now also divorced and is still having pain in the right inguinal area. He is not working and workmans {*sic*} comp is out and he is applying for social security disability…" Dr. Ballard reported, "…He feels that the titanium mesh is the cause of all his discomfort

and he wants it out and plastic product replacing it. He has had injections in the wound area with some benefit but it was only minimal and did not last." Dr. Ballard's diagnosis included chronic postoperative pain, depression, right groin pain and testicular atrophy.

22. Pursuant to Dr. Beatty's recommendations, the respondents arranged for the claimant to see physiatrist John Sacha, M.D., on September 23, 2014. Dr. Sacha reported, "…The patient has pain localized to the right groin that radiates into the right scrotum with burning, numbness, and tingling. He denies any back pain, leg pain, weakness, or pain in other areas." Dr. Sacha noted, "…There is some insomnia secondary to pain. He does have some slight increase in anxiety and depression…" Dr. Sacha opined that, "…the only consideration I would recommend for this patient is doing a one-time right ilioinguinal radiofrequency procedure…"

23. Pursuant to Dr. Beatty's recommendations, the respondents arranged for the claimant to see general surgeon Robert McDonald, M.D., on September 30, 2014. Dr. McDonald reported, "…He has consulted with a pain specialist in the area, and apparently he plans on undergoing a non-surgical procedure that involves nerve ablation. I told the patient I did not have any expertise in this area. I do, however, feel a pain specialist is the most appropriate person to be managing Daniel's pain…"

24. On October 10, 2014, Dr. Sacha performed "right ilioinguinal radiofrequency neurotomy." The claimant credibly testified this procedure was of no benefit whatsoever, and in fact made his pain worse.

25. Urologist Michael Crissey, M.D., saw the claimant on referral from Dr. Ballard on November 17, 2014. Dr. Crissey noted he was seeing the claimant, "…for an urological evaluation for pain involving the right testicle that started approximately 2 years ago following a mesh hernia repair. The pain is more in the inguinal area than in the testis. The patient denies an associated testicular mass or groin adenopathy. He does not have ED [erectile dysfunction], but says that a full erection will aggravate the pain, and an ejaculation even more so. Says he is therefore unable to have sex, and that his wife left him over the issue. There is not associated swelling. He has been treated with Neuronton and Tramadol. He has had an RFA procedure 1 month ago which he says made the pain worse. He has also developed pain in the arch of his right foot which he feels is a result of chronic limping…"

26. The claimant's examination revealed no evidence of hernia, but "…There is extreme tenderness in the right inguinal area, especially on digital exam of external ring." Dr. Crissey's recommendations included, "repeat surgical exploration with lysis

and possible mesh removal," "repeat RFA of inguinial nerve," and, "consider trial of Lyrica."

27. On December 4, 2014, Christa Coolidge, NP, at CSHP saw the claimant and reported, "…Evaluation of chronic right groin pain (hernia mesh repair). Pain right groin radiating to mid inner thigh. Feels like RLE is going to give out…Would like another referral for general surgery. Discussed Dr. Zimmerman." Ms. Coolidge also referred the claimant to Dr. Tyler for pain management.

28. Ms. Coolidge also prescribed a "cane for ambulation" on December 4, 2014. On January 21, 2015, Dr. Ballard confirmed the claimant's need for the cane to assist with ambulation is "directly related to his work injury."

29. Surgeon Peter Zimmer, M.D., saw the claimant on December 15, 2014 on referral from Dr. Ballard. Dr. Zimmer diagnosed "chronic inguinodynia following right inguinal hernia repair." He recommended against mesh removal surgery, but noted, "…I have discussed with him that neurectomy may be of benefit and have given him information about the Lichtenstein Amid Hernia Clinic at UCLA if wishes further evaluation there regarding neurectomy; I do not perform that procedure. MRI may be of possible benefit as well to evaluate for occult recurrence or other problem causing his pain; this can be ordered by Dr. Ballard as necessary…"

30. On January 12, 2015, Dr. Ballard reported, "…He has ongoing pain in the right leg and right lower abd and groin and he indicates he is not sleeping and he finally got ok to see Dr. Tyler and wants to get some relief so he can sleep. Patient rates their health as: poor."

31. The claimant began treating with Dr. Jeffrey Jenks, in lieu of Dr. Tyler, on February 24, 2015. On that date Dr. Jenks noted, "…He describes pain in his right groin region with radiation into the proximal aspect of his right leg. It is aggravated with Valsalva maneuvers. He also has increased pain with weightbearing on his right leg. He did have a right ilioinguinal nerve radiofrequency procedure done by Dr. Sacha on October 10, 2014. He states that following this his pain became much worse and his continued to be worse since then." Dr. Jenks noted, "...Additionally, he has developed significant depression due to the pain. He has seen Dr. Ballard for this. He has been on Prozac for at least 2 years for the depression. He is unsure if it is helping a lot at this point, however…"

32. On examination, Dr. Jenks found, "…There is significant tenderness in the right lower quadrant in the area of the ilioinguinal nerve. He has decreased sensation in

the distribution of the right ilioinguinal nerve…" Dr. Jenks diagnosed "status post right herniorraphy with subsequent right ilioinguinal neuropathy" and "secondary depression." Dr. Jenks started the claimant on Butrans patches; recommended he discontinue gabapentin and start Lyrica. He also changed from Prozac to Cymbalta, "…to continue with his antidepressant treatment, but also to hopefully help his neuropathic pain." Finally, Dr. Jenks referred the claimant to Bruce Ramshaw, M.D., at Advanced Hernia Solutions in Daytona Beach, Florida, noting that "Dr. Ramshaw is known nationally for revision surgery on failed herniorrhaphies with entrapment of the ilioinguinal nerve."

33. Dr. Jenks increased the dosage of the Butrans patches from 5 mcg to 10 mcg on March 24, 2015. On April 21, 2015 he noted the claimant was getting better pain relief with the increased dosage, and increased it again to 15 mcg. Dr. Jenks noted "The patient is ambulating with a cane."

34. Dr. Jenks testified by deposition on May 13, 2015 as an expert in the fields of physical medicine and rehabilitation, and pain medicine. Dr. Jenks explained the claimant has an ilioinguinal nerve problem due to the surgery he had. Dr. Jenks testified regarding the outcome of the claimant's hernia surgery indicating that although the surgery had not failed there were major complications.

35. Dr. Jenks testified that the claimant remains at MMI, but that if the claimant sees Dr. Ramshaw and Dr. Ramshaw recommends further surgery, then the claimant would no longer be at MMI.

36. Dr. Ballard testified by deposition on May 13, 2015 as an expert in the fields of family medicine and psychiatry. Dr. Ballard testified regarding the causes of the claimant's depression:

Q. What caused the pain -- excuse me – the depression?

A. What caused the depression. Chronic pain can cause depression. Not being able to have sexual relations without discomfort can cause depression. Not being able to work effectively can cause depression. Which exactly one of those was more than another, I did not determine.

Q. Was his depression a combination of the effects of all of those things you mentioned?

A. Yes.

37. Dr. Ballard testified regarding the cause of the claimant's sexual dysfunction:

Q. What about the problem with erection and orgasm?

A. That apparently was pain secondary to his inguinal area, compromise of the ilioinguinal nerve.

38. Dr. Ballard confirmed that he did not diagnose the claimant as having any problems with sexual dysfunction or depression prior to November 12, 2013.

39. Dr. Ballard testified that he made referrals to general surgery and for pain management in December, 2014 "because of ongoing difficulties with the right groin pain and continuing pain affecting his life."

40. Dr. Ballard testified regarding the worsening of the claimant's condition:

Q. Did [the claimant's] symptoms change after maximum medical improvement on June 20, 2013?

A. Not for any improvement. They may have worsened with the depression, with sleep deprivation and stuff. So I would say they worsened, yes.

Q. Specifically, what worsened after maximum medical improvement?

A. His depression worsened. He began to have back problems and continued to have pain.

41. Dr. Ballard explained the claimant developed back pain due to age, lack of activity, and weight gain. He explained that, "Well, I assume he limited his activities secondary to the effects of medication, depression and pain."

42. Dr. Ballard testified regarding the worsening of the claimant's leg pain:

Q. Why did you prescribe a cane for [the claimant] on December 4, 2014?

A. Because of his leg pain.

Q. Did his leg pain worsen subsequent to when you first saw him in June of 2013?

A. Yes. From the first to the last visit, it was worse, not better.

43. The ALJ finds the testimony of Drs. Jenks and Ballard to be credible, persuasive, and entitled to greater weight than opinions to the contrary.

44. The claimant testified that after being placed at MMI, his right groin pain began radiating to his genital area. He testified that subsequent to MMI, his pain has "really increased." He described his pain as "burning," and that "most of the time it's excruciating." The pain is in the claimant's right groin area, and radiates to his testicles and penis. The pain radiates to the right upper thigh area. The claimant takes prescribed medications, but very little relieves his pain.

45. The claimant testified he experiences problems with depression. The depression began several months after MMI. Dr. Ballard has prescribed Prozac for depression. Dr. Jenks prescribed Cymbalta, in part to treat depression. The claimant experiences depression as a result of the severe pain in his right groin.

46. The claimant testified he experiences problems with sexual dysfunction. The problems initially began after the hernia surgery. The claimant had some problems with sex due to pain while healing from the hernia surgery. The problems worsened after MMI, to point where the claimant is unable to have sexual relations due to the pain in his groin and genital area. The claimant's wife left him 13-14 months prior to hearing, because he was "unable to perform" sexually. The claimant experienced no problems with sexual dysfunction prior to the work injury.

47. The claimant testified he reviewed the surveillance video the respondents obtained in December 2014. He testified that on the video, he was walking with a limp and using a cane because of pain in his right groin area. He testified his right leg was "giving out more and more." This has caused the claimant to fall down. The claimant testified that prior to MMI, he had a limp, but did not walk in the manner shown in the surveillance video. He did not require the use of a cane. The claimant described his right leg as being the weakest it has ever been in his life. He attributes this to referred pain from his hernia injury.

48. The claimant testified he has not worked since being terminated by the respondent-employer. He testified he cannot work because his pain is too great and he has to use a cane, and "nobody will hire me." The claimant has looked for work and submitted job applications. The claimant survives by borrowing money from relatives.

49. The claimant testified his pain affects his ability to sleep, and he gets only 2-3 hours of sleep per night. The pain wakes him and he has difficulty falling asleep. He described the pain as "excruciating." Prior to MMI, the claimant was able to get 4-6 hours of sleep per night.

50. The claimant testified regarding the radiofrequency procedure performed by Dr. Sacha. The procedure did not help, and in fact made the claimant's pain worse. After the procedure, the claimant's leg gave out more frequently, and his groin pain was worse.

51. The claimant testified his pain is much worse now than even at the time of DIME examination on April 29, 2014. He described it as more of a "burning pain" that is consistent.

52. When Dr. Rudderow placed the claimant at MMI on June 20, 2013, she recommended continued use of Gabapentin and Ultram. The claimant now requires Butrans patches, Lyrica, and Cymbalta. The claimant's medication regimen has changed subsequent to MMI.

53. The ALJ finds the claimant's testimony to be credible and persuasive. The ALJ finds the claimant's condition has worsened since being placed at MMI on June 20, 2013, and that he no longer at MMI effective as of the date of hearing, May 20, 2015.

54. The ALJ finds that the claimant has failed to establish that Dr. Beatty's DIME opinion concerning MMI or PPD were clearly erroneous.

55. The ALJ finds that the claimant has established that it is more likely than not that he is entitled to TTD benefits beginning with the date of hearing, May 20, 2015, and continuing until terminated by operation of law.

CONCLUSIONS OF LAW

1. The purpose of the Workers' Compensation Act of Colorado (Act), Sections 8-40-101, C.R.S. (2007), *et seq.*, is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. In general, the claimant has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of the respondents. Section 8-43-201, C.R.S.

2. A workers' compensation case is decided on its merits. Section 8-43-201, C.R.S. The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved. The ALJ need not address every piece of evidence or every inference that might lead to conflicting conclusions. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P. 3d 385 (Colo. App. 2000).

3. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of a witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005).

4. Per C.R.S. §8-42-107(8)(b)(III), the findings of the Division independent medical examiner regarding MMI and PPD may be overcome only by clear and convincing evidence. This means evidence which proves that it is "highly probable" the DIME physician's opinion is incorrect. *Metro Moving & Storage Co. v. Gussert*, 914 P.2d 411 (Colo. App. 1995). The question of whether the DIME physician's rating has been overcome by clear and convincing evidence is a matter of fact for determination by the ALJ. *Metro Moving & Storage*, supra.

5. The ALJ concludes the claimant has failed to prove by clear and convincing evidence that Dr. Beatty's DIME findings regarding MMI and PPD are incorrect. Accordingly, except as to admitted post-MMI treatment, the claimant's claim is closed, subject to reopening.

6. C.R.S. §8-43-303(1) provides in pertinent part that; "At any time within six years after the date of injury, the director or an administrative law judge may, after notice to all parties, review and reopen any award on the ground of fraud, an overpayment, an error, a mistake, or a change in condition, except for those settlements entered into pursuant to section 8-43-204 in which the claimant waived all right to reopen an award…If an award is reopened on grounds of an error, a mistake, or a change in condition, compensation and medical benefits previously ordered may be ended, diminished, maintained, or increased. No such reopening shall affect the earlier award as to moneys already paid except in cases of fraud or overpayment. Any order entered under this subsection (1) shall be subject to review in the same manner as other orders."

7. The ALJ concludes the claimant has proved by a preponderance of the evidence that his condition has worsened since MMI, thus justifying the reopening of his claim. Factors supporting the determination that the claimant's condition has worsened

include the following; the claimant's ability to engage in sexual relations has been greatly curtailed, if not eliminated, due to increased groin pain subsequent to MMI. The claimant experiences depression as a result of the effects of his work injury. His depression was first diagnosed by Dr. Ballard on November 12, 2013, at which time Dr. Ballard prescribed Prozac. The claimant had not been diagnosed with work-related depression, nor was he prescribed medications to treat that condition, prior to November 12, 2013. In his deposition, Dr. Ballard confirmed the claimant's depression has worsened. Dr. Ballard testified the claimant's leg pain worsened subsequent to their first meeting on June 27, 2013. This worsening led Ms. Coolidge in Dr. Ballard's office to prescribe a cane for the claimant to use to assist with his ambulation. The claimant has been unable to find work due to the worsening effects of his work injury. The claimant's pain and dysfunction have increased subsequent to MMI.

8. To prove entitlement to TTD benefits, the claimant must prove that the industrial injury caused a disability lasting more than three work shifts, that she left work as a result of the disability, and that the disability resulted in an actual wage loss. *PDM Molding, Inc. v. Stanberg*, supra. Section 8-42-103(1)(a), requires claimant to establish a causal connection between a work-related injury and a subsequent wage loss in order to obtain TTD benefits. *PDM Molding, Inc. v. Stanberg, supra*.

9. The ALJ concludes that the claimant is no longer at MMI effective May 20, 2015 and thus is entitled to TTD benefits beginning that date and continuing until terminated by operation of law.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The claimant's request to overcome the DIME with respect to MMI and PPD is denied and dismissed.

2. The claimant's request to reopen his claim is granted. The claimant's claim is reopened.

3. The respondent-insurer shall pay the claimant TTD benefits beginning May 20, 2015 and ongoing until terminated by operation of law.

4. The claimant's AWW effective October 1, 2013 is $946.83.

5. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

6. All matters not determined herein, and not closed by operation of law, are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATE: July 21, 2015

Donald E. Walsh
Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Dr Ste 230
Colorado Springs, CO 80906

STIPULATIONS

1. The parties agreed that the claims adjuster would testify that, pursuant to the Final Admission of Liability filed on February 27, 2014 referencing the DIME report of Dr. Castrejon, Insurer paid permanent partial disability benefits based on an 11% scheduled impairment. The parties further agreed that the claims adjuster would testify that she did not notice the part of Dr. Castrejon's DIME report dealing with apportionment of 10% of the rating to a prior injury and inadvertently paid benefits on the full 11% without accounting for the difference due to apportionment. The parties do not stipulate that the above statements are fact, only that this would have been the testimony of the claims adjuster had she testified.

ISSUES

The following issues were raised for consideration at hearing:

1. Whether the Claimant proved, by a preponderance of the evidence, that the right shoulder surgery recommended by Dr. Hatzidakis is reasonably necessary to cure and relieve the Claimant from the effects of his January 12, 2013 work injury.

2. Whether the Claimant proved, by clear and convincing evidence, that DIME physician Miguel Castrejon, M.D. erred in finding that the Claimant reached MMI on June 4, 2013.

3. Whether the Respondents proved, by clear and convincing evidence, that DIME physician Miguel Castrejon, M.D. erred in finding that the Claimant's right shoulder condition, for which he provided an impairment rating, was causally related to the Claimant's January 12, 2013 work injury.

4. Whether apportionment of the Claimant's impairment rating is applicable pursuant to C.R.S. § 8-42-104(5)(a). If apportionment applies, the appropriate calculation for apportionment.

5. If apportionment is applicable pursuant to C.R.S. § 8-42-104(5)(a), whether Respondents proved that their final admission should be withdrawn, and modified, to permit Respondents to admit to Dr. Castrejon's post apportionment impairment rating of 1% upper

extremity, and claim an overpayment for permanent impairment benefits paid above that amount.

6. Whether Claimant proved by a preponderance of the evidence that he suffered a functional impairment contained off the schedule of injuries set forth at Section 8-42-107(2), C.R.S. and is entitled to permanent partial disability benefits based upon a whole person conversion of the upper extremity rating.

7. If the Claimant is at MMI, whether Claimant has proved, by a preponderance of the evidence, that future medical benefits are reasonably necessary to relieve the effects of his injury or prevent deterioration of his condition.

FINDINGS OF FACT

Based upon the evidence presented at hearing and through post-hearing deposition testimony, the ALJ finds as fact:

1. The Claimant is a 52 year old male who worked in construction industries for more than thirty years. The Claimant was hired by Employer on September 28, 2010 to work as a vacuum truck driver and operator. The Claimant's job was a very physical job requiring him to lift and move hoses weighing 75 lbs., if empty, and more if they were full. The Claimant's job required him to suction debris from pits and tanks using the vacuum hose attached to the vacuum truck. At times, the job required Claimant to use other tools, such as picks, shovels and water pressure to free debris off of the sides of tanks. The Claimant would typically work with another worker and his shifts were generally 12 to 16 hours long.

2. The Claimant has a history of right shoulder problems that pre-date the injury that is the subject of this claim and pre-date his employment with Employer.

3. In the 1980s, Claimant had a motorcycle accident, which resulted in a right shoulder injury, an AC joint separation, and a distal clavicle fracture (Hrg. Trans. p. 45, lines 16-24).

4. The Claimant also had a previous right rotator cuff repair and right open reduction of his ulna due to a work related fall. The Claimant testified that he was working on a pole barn and fell about 12 feet onto a concrete floor, shattering his elbow and pulling and tearing the tendons in his shoulder on the right side (Hrg. Trans. pp. 28-29). On March 16, 2002, the Claimant was seen at McKee Medical Center by Mark Durbin, M.D., a surgeon, who noted that Claimant had been working when he fell fourteen feet onto a concrete base. On physical examination for this injury, Dr. Durbin further noted the Claimant's right shoulder had an old injury with a large deformity of the AC joint. Dr. Durbin interpreted right shoulder x-rays as showing an old change from AC joint disruption with significant calcification (Respondents' Exhibit A, p. 1). On March 26,

2002, Dr. Durbin ordered a right shoulder MRI to rule out a rotator cuff tear (Respondents' Exhibit A, p. 5).

5. On April 9, 2002, a right shoulder MRI was read as showing a "large rotator cuff tear with complete detachment of the supraspinatus and infraspinatus tendons as well as a smaller focus of tear of the subscapularis tendon ...." There was also mild atrophy of the infraspinatus and scapularis muscles and mild to moderate atrophy of the supraspinatus muscle. Additionally, there was a medial dislocation of the biceps tendon extending through the full thickness tear of the subscapularis tendon, and a post-traumatic deformity of the acromioclavicular joint (Respondents' Exhibit B).

6. On May 1, 2002, Dr. Durbin operated on the Claimant's right shoulder, performing a diagnostic arthroscopy, arthroscopic acromioplasty, and open right rotator cuff repair (Respondents' Exhibit A, pp, 8-9; Respondents' Exhibit C).

7. The Claimant saw Dr. Durbin on May 9, 2002 and Dr. Durbin noted that the Claimant reported a noticeable significant difference in the pain in his shoulder. Dr. Durbin referred the Claimant for physical therapy (Claimant's Exhibit 7, p. 32; Respondents' Exhibit A, p. 12). On June 28, 2002, Dr. Durbin noted that the Claimant had some improvement in his range of motion, and his plan was to continue Claimant with aggressive range of motion and strengthening. Dr. Durbin anticipated seeing the Claimant in about four weeks for a final release (Claimant's Exhibit 7, p. 34; Respondents' Exhibit A, p. 12).

8. On May 10, 2007, the Claimant was evaluated by Dr. Kenneth Duncan at the Orthopaedic Center of the Rockies, who noted that three weeks earlier the Claimant was putting up sheet rock and had the gradual onset of right-sided neck pain and burning down his right arm. The Claimant reported that the symptoms were gradually getting worse and if he extends his neck it is worse and if he flexes, it is better. The Claimant reported seeing a chiropractor which did not help. The Claimant also reported taking Aleve and Advil which provides temporary improvement. Dr. Duncan opined that the symptoms were most likely related to an HNP involving C7 (Claimant's Exhibit 8; Respondents' Exhibit D).

9. The Claimant testified that on January 12, 2013, a Saturday, he was cleaning out a water jet system. He had run 75 feet of hose inside of a building to clean out a tank that was approximately 3 feet deep by 7-8 feet wide. The Claimant testified that once the corner was cleaned out with the hoses, he and his helper would then get inside the tank and, using shovels, picks and water, they would break up the material that was inside the tank in order to get it to go through the vacuum hoses and into the truck. During the course of this job, the Claimant was taking little swings with the pick to break up the material. Towards the end of this job, the Claimant testified that his shoulder was sore and he advised his coworker that he could hardly swing the pick anymore. The Claimant and his coworker finished the job and put the hoses back on the truck, but the Claimant testified that he could hardly get the hoses back up onto the truck. The Claimant testified that when he got into the truck as he prepared to drive it

back to the yard, he felt pain all down his whole right arm and his shoulder hurt so much, he couldn't lift his arm. The Claimant testified that he had not had this pain prior to January 12, 2013. After that day, the Claimant testified that his shoulder and arm never returned to the way it was before January 12, 2013 (Hrg. Trans., pp. 30-33).

10. The Claimant testified that he waited until Monday to report his injury to his boss, Mark McDonald, because it was his understanding that his boss only worked Monday – Friday. The Claimant testified that he also tried alternating ice and heat to see if he could make the shoulder feel better, but as of Monday morning, he still had to hold his shoulder due to the pain and couldn't even put his hand up to the steering wheel while driving to work (Hrg. Trans. pp. 33-34).

11. On January 14, 2013, Mark McDonald completed the First Report of Injury or Illness listing an injury/illness date of January 12, 2013 and noting that the Claimant, "overworked right shoulder" while cleaning water jets and using the vac, pick and shovel. A witness named Steve Meeks was listed (Claimant's Exhibit 1; Respondents' Exhibit E).

12. The Claimant was first seen by Dr. Michael McKenna at Care Plus Medical Center on January 14, 2013 (Hrg. Trans. p. 34). Dr. McKenna noted that the Claimant reported that,

> While working on Saturday and using a shovel and pick, he had sudden pain and indicates the anterior aspect of the right shoulder. He was really no longer able to use it anywhere near normally whatsoever. He has a significant past history 18 years ago that he did have surgery on the elbow, shoulder and I believe pelvis all on the right side. He has worked construction, etc, since then and states he has had no problems. He denies any other injuries from this incident on Saturday. Increasing pain over the weekend prompted his presentation this morning. He also complains of significant lack of range of motion in that shoulder.

Dr. McKenna diagnosed the Claimant with an acute injury, probable rotator cuff tear and possible supraspinatus issues. Dr. McKenna was not certain that an MRI could be performed due to the metal in the Claimant's shoulder and elbow from the prior injury, so he recommended that Claimant see Dr. Durbin and to check to see if an MRI could be performed. In the meantime, Dr. McKenna provided work restrictions and prescribed pain medication.

13. Dr. Durbin evaluated the Claimant on January 15, 2013. Dr. Durbin noted that the Claimant reported that "he was out doing some ax and pick work and was doing okay. He had a long day to finish and by the time he was done he had overworked it and was unable to raise his arm. He is having a moderate amount of pain in the arm and still cannot raise it up and is still pretty sore." Dr. Durbin stated his belief that the Claimant had "more of a rotator cuff strain than a tear" but was not certain. He recommended gentle range of motion exercises for the Claimant and if there was no

improvement, he would see the Claimant in 2-3 weeks and set up an MRI or consider a cortisone shot (Claimant's Exhibit 10, p. 52; Respondents' Exhibit G, p. 24).

14. From January 13, 2013 through January 22, 2013, the Claimant was off work and received temporary total disability benefits (Claimant's Exhibit 2, p. 3).

15. On January 24, 2013, Dr. McKenna noted that the Claimant reported that he thought his shoulder was less painful than the first visit with Dr. McKenna (Claimant's Exhibit 9, p. 39; Respondents' Exhibit F, p. 22). Dr. McKenna provided work restrictions that enabled the Claimant to return to modified duty with no use of the right upper extremity, and no commercial driving (Claimant's Exhibit 9, p. 38). The Claimant began receiving TPD benefits starting on January 23, 2013 (Claimant's Exhibit 2). He was provided modified duties working in the parts room.

16. On February 7, 2013, the Claimant returned to see Dr. Durbin in follow up from the shoulder injury. Dr. Durbin noted the Claimant was doing a little bit better, "slowly improving," and he was a little bit stronger in his rotator cuff muscles, but still had a little weakness on supraspinatus resistance testing. The Claimant reported that he would get sore with heavier overhead activities, but otherwise he felt he was "significantly improved." Dr. Durbin loosened the Claimant's restrictions to permit lifting up to 50 pounds, but he did not want the Claimant lifting heavy vacuums or performing overhead activities (Claimant's Exhibit 10, p. 56; Respondents' Exhibit G, p. 27).

17. On February 14, 2013, Dr. McKenna reviewed Dr. Durbin's report with the Claimant, and the Claimant concurred with Dr. Durbin's findings and recommendations. Dr. McKenna noted that the Claimant had "good range of motion, etc." on that date. His assessment was "Injury, right shoulder – improved". Dr. McKenna indicated the Claimant would be released to "essentially full duty", with a 50 pound lifting restriction, starting on February 18, 2013. The Claimant was scheduled for follow up with Drs. Durbin and McKenna (Claimant's Exhibit 9, p. 41; Respondents' Exhibit F, p. 23).

18. On February 18, 2013, due to his updated restrictions, the Claimant was placed in a new modified position with Employer driving tanker trucks and dumps. This position required the Claimant to drive a tanker truck to Colorado Springs twice a night. He would hook up a trailer to his truck at one location, drive, and then unhook the trailer at the second location. To hook up the trailer, the Claimant would turn a crank to raise and lower the hitch. He could do this with either arm. The crank was at waist level and when he turned the crank it would come up to eye level which was over his shoulder. The Claimant performed the cranking duty four to eight times per night. The Claimant testified that this activity increased his pain while he was doing it.

19. The Claimant testified that he did not want to keep doing the tanker driver work because it was painful to use the crank and because his pay was cut down to $10 per hour and he was only able to work 40 hours a week. So, overall, the Claimant was not happy with the work situation. He testified that he called his brother who informed the Claimant that he had all kinds of work and the Claimant would be paid $30 per hour.

The Claimant testified that he voluntarily resigned his job with Employer and has worked for his brother ever since February 28, 2013. The Claimant performs construction work including tenant finish, tile work and remodeling. The Claimant characterized this work as less physically demanding than the work he had been performing for Employer. The Claimant testified that he did not have any injuries or accidents to his right shoulder working for his brother (Hrg. Trans. pp. 39-41, also see Respondents' Exhibit H, p. 28).

20. On March 28, 2013, the Claimant failed to show up to his appointment with Dr. McKenna (Claimant's Exhibit 9, p. 41; Respondents' Exhibit I). On March 29, 2013, Insurer's representative called Care Plus, and scheduled a mandatory appointment for April 12, 2013 (Respondents' Exhibit J, p. 30).

21. On April 3, 2013, the Claimant was video recorded working construction with his brother. The video was reviewed in its entirety and in the video the Claimant can be seen performing the following activities, at the following times (as the times are noted on the video recording):

Time	*Activity*
7:56:32 a.m.	Claimant climbs into the back bed of a large truck and moves various pails, and other objects around in his truck bed using both arms, and then he climbs out the back of the truck bed with both arms on the hatch.
8:05:26	unloads objects from another large truck. closes the truck door with right arm.
8:07:13	coils hose, and is able to flex and abduct right arm without difficulty.
8:16:27	Claimant is seen reaching into the bed of the large pick-up truck with both arms over the back of the truck. Claimant pulls objects up and over the back hatch using his right arm, which is flexed greater than 100 degrees. Claimant pulls down the back hatch and pulls out more objects.
8:18	Claimant carries a metal and wood frame/equipment with his right arm (and not his left) while walking into a building.
8:23	Claimant on a second story balcony lifting and carrying work items in both hands.
8:24	Claimant throws a small object over the balcony, stretching his right arm out and down over the railing.
8:26-8:29	Claimant throws large rolls of materials off the balcony with both arms multiple times, using his right arm normally without hesitation; Claimant moves his arms while holding objects, up over his shoulders without apparent trouble. Claimant lifts objects from the floor without apparent trouble.
9:39	Claimant seen sweeping on balcony, moving right arm without apparent trouble.
9:40	Claimant abducts his right arm with broom to sweep debris into shovel.
9:41	Claimant moves a large machine with both arms, twists handles with right arm tightening object onto that machine.

9:47	Claimant moving a metal and wood object attempting to open the object; uses right arm without apparent difficulty.
9:48	Claimant moves large pails with both arm to another location.
9:50	Claimant lifts up tile saw machine with his right arm. Claimant moves object while abducting, flexing and pushing with the right arm to move the machine to the correct location.
9:51	Claimant lifts up a machine with right and left arms and places it in a different locations.
9:52	Claimant working with a tile saw machine, and he sets it up using both hands.
9:54	Claimant takes objects out of pails and sets them down on the ground. Lifts up another pail with water in it with right arm and holds it out.
9:55	Claimant holds another machine in his right arm and then hands it to another worker.
9:56	Claimant moves a saw and table with both arms into another location.
9:57	Claimant grabs two pails; one in each arm and walks into building.
10:04	Claimant comes out of building holding pails in each hand. Both pails are full and appear heavier but are being held in each hand.
10:04	Claimant lifts one of the full pails with his right arm and moves it to a different location.
10:05	Claimant lifts objects with right and left arms. Claimant moves them nearer to building.
10:06	Claimant lifts pail without apparent issue with right arm, and then he assembles a large hand held mixer and moves it to another location.
10:07	Claimant rolls out tarp and drags it into place with both hands.
10:08	Claimant moves pails with right arm without apparent issue and then he pours the contents of pail out.
10:10	Claimant holds the large mixer with both hands and mixes cement; mixer clearly causing vibration to upper arms.
10:11	Claimant uses large mixer again as other worker adds water to the cement mix.
10:16	Claimant comes out of building with pail filled with water in right hand, and he empties water from one pail into another.
10:21	Claimant checks watch and then lifts up mixer and mixes cement in pail again. Claimant then lifts mixer out of the pail using his right arm.
10:23	Claimant lifts up cap with right hand and places it back. Claimant's right arm comes up in >90 degrees of flexion.
10:29	Claimant picks up tile and places it on the tile saw, and then holds the tile in place with both hands.
10:30	Claimant flips a switch on his saw with his right hand and pushes tile through tile saw with both hands. Claimant pulls tile back from saw and takes piece off with right hand.
10:33	Claimant cuts another piece of tile by pushing it through the saw. Takes piece into building. Thereafter, Claimant repeats this numerous times.

10:37	Claimant exits the building with pail filed with water. Claimant picks up the large mixer and mixes cement in pail again. Claimant lifts pail up with cement in right hand and carries into building.
10:56	Claimant repeats tile cutting with saw, using both arms, and applying pressure while pushing tile through machine.
10:57	Claimant comes out of the building with empty pail, puts cement mix from sack into the pail. Claimant then puts water into pail, and then uses the mixer to mix.
10:58:41	Claimant empties more cement mix into pail. Claimant uses the large mixer again. Which he does again at 11:04; thereafter, Claimant uses his right arm to repeat this process, including pushing tile through tile saw process, reaching and stretching with his right arm.
11:21	Claimant reaches behind his back with right arm to put item in back pocket.
11:34	Claimant uses his right arm to reach in a bucket, and brush/scrape material off of tool using his right arm, while holding the tool in his left.
11:42	Claimant again using the large two hand mixer, causing vibrations to upper extremities.

22. During testimony at the hearing, the Claimant agreed that the video shows the Claimant using his left and right arm constantly below the waist, reaching over the trailer of a truck, taking carpet remnants over his shoulder and throwing them off a balcony, using his shoulder to mix grout with a vibrating mixer, and, one time during the video recording, using his arms overhead (Hrg. Trans., pp. 65-66).

23. On April 8, 2013, the Claimant called Dr. McKenna's office and requested that he be seen sooner than April 12, 2013. Care Plus obtained approval from Insurer, and the Claimant's appointment was moved to April 9, 2013 (Respondents' Exhibit J, p. 30). The Claimant could not recall at the hearing why he requested to move up his appointment with Dr. McKenna (Hrg. Trans. p. 67).

24. On April 9, 2013, Dr. McKenna noted that the Claimant had continued improvement. Dr. McKenna noted that the Claimant had last seen Dr. Durbin in February 2013 and Dr. Durbin had recommended a follow up visit with the Claimant in 6 weeks but was anticipating discharge. He was no longer working for Employer and he was not working with any particular restrictions, and while he noticed an occasional pop out of the shoulder, there hadn't been any real pain or discomfort. Dr. McKenna suggested that the Claimant follow-up with Dr. Durbin as scheduled and anticipated discharge with no rating (Respondents' Exhibit J, p. 31).

25. However, only 2 days later, on April 11, 2013, Dr. Durbin evaluated the Claimant and provided a significantly different opinion. In addition, Dr. Durbin noted that, contrary to the report provided to Dr. McKenna, the Claimant stated he had never regained full function to his shoulder, and that he always had pain limitations with abduction. Dr. Durbin recommended a right shoulder MRI "just to document integrity of

his rotator cuff" and scheduled a follow up appointment after the MRI (Claimant's Exhibit 10, p. 58; Respondents' Exhibit L, p. 42).

26. On April 16, 2013, a right shoulder MRI was interpreted as showing (1) a recurrent, complete tear of the supraspinatus and infraspinatus tendons with torn fibers retracted to the glenoid fossa, and subtle fatty atrophy of the infraspinatus muscle, (2) chronic, near full thickness tearing of the subscapularis tendon, and subtle fatty atrophy of the subscapularis muscle, (3) chronic, degenerative appearance of the superior labrum, (4) medial dislocation of the long head of the bicep tendon, and (5) post subacromial decompression and distal clavicular excision changes (Claimant's Exhibit 11, p. 61; Respondents' Exhibit M, p. 43).

27. On April 22, 2013, Dr. Durbin reviewed the MRI, noting that the Claimant had a "massive rotator cuff tear with significant atrophy, chronic-full thickness tearing of the supraspinatus, which has retracted significantly." Dr. Durbin further observed significant atrophy of the infraspinatus and supraspinatus muscles, and a medial dislocation of the long head of the biceps. Dr. Durbin opined the shoulder was "probably unfixable at this point." Dr. Durbin noted the Claimant was doing well functionally, except when he lifts in one certain direction. Dr. Durbin advised the Claimant that, ultimately, he would probably need a shoulder replacement. As the Claimant did not want to do that at the time, Dr. Durbin recommended conservative care, and opined that the Claimant could be placed at MMI (Claimant's Exhibit 10, p. 59; Respondents' Exhibit N, p. 44).

28. On April 26, 2013, the Claimant saw Dr. McKenna. Dr. McKenna reviewed the MRI findings and Dr. Durbin's report with the Claimant. The surgery discussed was a shoulder replacement, or a reverse arthroplasty for rotator cuff arthropathy. Dr. McKenna noted that Dr. Durbin instead recommended conservative therapy and he also noted that the Claimant was not excited about an extensive shoulder replacement surgery. Dr. McKenna concurred with Dr. Durbin that the Claimant was at MMI once a determination was made via Functional Capacity Exam (FCE) to determine the Claimant's range of motion and strength. Dr. McKenna further opined that he believed that the Claimant's restrictions would be made permanent, perhaps with some additional restrictions added per the results of the FCE (Claimant's Exhibit 9, p. 42; Respondents' Exhibit O, p. 45).

29. At the hearing, the Claimant testified that his thoughts, after having the MRI and discussing his condition with his doctors, were that the total shoulder replacement sounded like a lot of pain and he wasn't sure if it would be covered by workers' compensation. So, at that time, the Claimant opted to wait and see if it got better and if it didn't, then see what he needed to do to take care of the shoulder (Hrg. Trans., p. 43).

30. On May 6, 2013, the Claimant underwent an FCE with evaluator Heather Stokes at Physiotherapy Associates. The Claimant's shoulder range of motion and strength was tested and measured during a variety of physical tasks and Ms. Stokes

prepared a written report with the data entry points and a summary of the results (Claimant's Exhibit 12; Respondents' Exhibit P). The test was considered valid and the Claimant demonstrated consistent effort. The Claimant had no positive indicators of poor psychometrics or indicators of exaggerated symptoms. The level of pain was consistent with observed movement patterns. The test was limited by right shoulder pain (Claimant's Exhibit 12, p. 69 and 76; Respondents' Exhibit P, p. 52 and 59). The evaluation placed Claimant in the light work category and recommended maximum occasional and frequent lift of 35 lbs for floor to waist. The Claimant's ability to lift overhead with his right extremity was limited to 2lbs. Lifting with one hand to shoulder was limited to 7 lbs. on the right side (Claimant's Exhibit 12, pp. 69-70; Respondents' Exhibit P, pp. 52-53). The Claimant's right shoulder active range of motion was measured at 145 degrees flexion, 122 degrees abduction (133 degrees with pain), external rotation at 90 degrees with abduction at 75 degrees, and internal rotation at 90 degrees of abduction at 53 degrees. The Claimant's strength was normal, but painful (Claimant's Exhibit 12, p. 75; Respondents' Exhibit P, p. 58).

31. On May 28, 2013, the Claimant saw Dr. McKenna again and confirmed that he did not feel surgical intervention was appropriate at this time as he was not interested in the shoulder replacement. Dr. McKenna reviewed the FCE with the Claimant and discussed MMI and took range of motion shoulder measurements. Per Dr. McKenna's measurements the Claimant had a 19% impairment rating of the right upper extremity which, if converted, would be an 11% whole person impairment. Dr. McKenna indicated he would review the Claimant's full chart and if a rating were appropriate, he would do one. Dr. McKenna noted the restrictions were no use of the right arm above the shoulder level (Claimant's Exhibit 9, pp. 44-45; Respondents' Exhibit Q, pp, 61-62).

32. On June 4, 2013, Dr. McKenna placed the Claimant at MMI for this claim with a 19% right upper extremity rating. Dr. McKenna noted that apportionment may be appropriate if the Claimant had a previous rating secondary to his prior injuries. Dr. McKenna outlined restrictions of no use of the right upper extremity above the shoulder level, and no lifting, pushing, pulling greater than 50 pounds (Claimant's Exhibit 9, p. 48; Respondents' Exhibit Q, p. 63). Dr. McKenna noted that, "no formal maintenance care anticipated" (Claimant's Exhibit 9, p. 47; Respondents' Exhibit Q, p. 64).

33. On July 22, 2013, per Dr. McKenna's chart notes, the Claimant's wife called to see if the Claimant could proceed with the total shoulder replacement surgery. The notes indicate that the Claimant was authorized for a one time evaluation to discuss total shoulder replacement (Claimant's Exhibit 9, pg. 49).

34. On July 30, 2013, Dr. McKenna re-evaluated the Claimant, noting that the Claimant had reconsidered and was now interested in pursuing a surgical option for his shoulder and was requesting a second opinion. Dr. McKenna agreed that a second opinion was appropriate, but noted "I have cautioned him strongly that I am sure he can find a surgeon who is willing to operate but the question the question that he has to ask has to do more with how much improvement, particular in range of motion and strength, that he can possibly obtain versus the potential risk of any surgery." Dr. McKenna

nevertheless provided the referral. Dr. McKenna also noted that there were no changes to the rating or restrictions (Claimant's Exhibit 9, p. 50; Respondents' Exhibit R, p. 65).

35. On September 24, 2013, Insurer filed a final admission consistent with Dr. McKenna's opinions admitting for a 19% upper extremity impairment rating and MMI effective May 28, 2013. Liability for medical treatment and medications after MMI were specifically denied (Claimant's Exhibit 3; Respondents' Exhibit S).

36. On October 17, 2013, Dr. Armodios Hatzidakis performed a second opinion surgical evaluation. Dr. Hatzidakis examined the Claimant's shoulder, noting that on that date the Claimant had significantly limited range of motion, and significant tenderness over the long head of the biceps and over the lesser tuberosity. The Claimant had minimal tenderness over the AC joint. Dr. Hatzidakis reviewed prior medical records, including the right shoulder MRI, and he also reviewed nearly four hours of surveillance (Claimant's Exhibit 13, p. 99; Respondents' Exhibit T, p. 72). In reviewing the video surveillance from April 3, 2013, Dr. Hatzidakis noted that the Claimant worked a full day engaged in activities including, driving, lifting his arms to unload a truck, throwing objects off a balcony, using his right arm to assemble a tile table saw, mixing grout with a motorized mixer, lifting 30-50 lb. bags of cement and hoisting them to his right shoulder and working a sander. Dr. Hatzidakis notes that most of the activities were performed with the Claimant's arm below the shoulder, but while working with the tile cutter, the Claimant "lifts his arm seemingly quite easily multiple times above his shoulder to work the tile saw." Dr. Hatzidakis opined that the Claimant's current limited ability to actively elevate his arm is "in contradistinction to the reviewed video from April 3, 2013." Although, the doctor noted that it could simply be that the Claimant's shoulder has become worse over the last six months (Claimant's Exhibit 13, pp. 99-100; Respondents' Exhibit T, pp. 72-73). Dr. Hatzidakis interpreted the right shoulder MRI as showing grade 2 fatty infiltration. Dr. Hatzidakis also discussed further testing, therapy and surgical options (Claimant's Exhibit 13, pp. 102-103).

37. On November 5, 2013, the Claimant underwent a fluoro-guided right shoulder arthrogram with aspiration (Claimant's Exhibit 14; Respondents' Exhibit U, p. 81). The joint fluid was sent to the lab for analysis and cultures and no organisms were noted (Claimant's Exhibit 13, pp. 105-107). An EMG was conducted on November 14, 2013 and was found to be basically a normal study (Claimant's Exhibit 15, p. 111; Respondents' Exhibit V, p. 82).

38. On November 25, 2013, consistent with recommendations he made in his October 17, 2013 note, Dr. Hatzidakis' office wrote Insurer requesting authorization for a right shoulder arthroscopic rotator cuff repair, longhead biceps tenodesis, subacromial decompression with possible distal clavicle resection and open pectoralis major transfer (Claimant's Exhibit 13, p. 108; Respondents' Exhibit W, p. 84).

39. On December 2, 2013, Dr. Jon Erickson, an orthopedic surgeon, performed a physician advisor review in response to the surgical request from Dr. Hatzidakis. He noted that the Claimant's "medical records are extremely confusing." Dr.

Erickson opined that it was difficult to understand how all the damage seen on the MRI could occur from simple overuse. Dr. Erickson noted that there were "more questions concerning this case that one could reasonably list" and he stated that he had never before seen a case such as this "which begs an IME." Of particular concern to Dr. Erikson was that there were four hours of surveillance showing the Claimant using his shoulder aggressively, but Dr. Hatzidakis did not adequately explain how the Claimant's function had deteriorated so severely between April and October of 2013, other than to say it simply got worse over time. Dr. Erikson recommended denial of the procedure pending the results of an IME of the Claimant to "determine just how severely impaired he is" and "how this shoulder could become so severely involved when there was no clear work-related injury" (Respondents' Exhibit X).

40. On December 5, 2013, the Claimant's attorney was notified that the request for authorization for the surgery recommended by Dr. Hatzidakis was denied (Respondents' Exhibit Y).

41. On January 20, 2014, Dr. Miguel Castrejon performed a Division IME. He reviewed available records, but he did not review the surveillance. He took a history from the Claimant and noted that he found the Claimant to be a reliable historian (Claimant's Exhibit 16, p. 113; Respondents' Exhibit Z, p. 87). Although, the Claimant himself admitted that while he told Dr. Castrejon that working modified duties on the tanker truck aggravated his shoulder condition, he did not tell the doctor that he only worked four or five shifts on the tanker truck performing those duties (Hrg. Trans., p. 72). The Claimant also described to Dr. Castrejon his job duties when he worked the vacuum truck, stating that he worked 12-14 hour days and he used 75-pound vacuum hoses, picks and shovels to break up and remove materials inside tanks and pits (Claimant's Exhibit 16, p. 113; Respondents' Exhibit Z, p. 87). The Claimant advised Dr. Castrejon that, on January 12, 2013, he had been working with a coworker all day using a pick and shovel, but receiving little help from the coworker. The Claimant reported that he noticed discomfort involving the right shoulder but he continued to work as he needed to finish the job. The Claimant further reported to Dr. Castrejon that by the time he had to put the hoses back on the truck at the end of the job, he was having difficulty with this due to weakness and pain in his right shoulder. The Claimant advised Dr. Castrejon that he was concerned about this but could not contact his supervisor until Monday since he did not typically answer the phone on weekends. The Claimant advised that he did report the injury on Monday, January 14, 2013 and was referred for medical care with Dr. Durbin and he was placed on light duty. Dr. Castrejon also noted that the Claimant treated with Dr. McKenna. Through Dr. McKenna's records, Dr. Castrejon was advised of the Claimant's significant past history of right shoulder injury (Claimant's Exhibit 16, p. 114; Respondents' Exhibit Z, p. 88). The Claimant advised that subsequent to the date of injury until February 28, 2013, he worked the modified duty position with the tanker truck. As noted above, the Claimant did not tell Dr. Castrejon that he only worked four or five shifts in that modified position. Dr. Castrejon surmised that the modified work may have aggravated the Claimant's condition because the turning of the crank on the tanker truck "require a moderate amount of force" implicating his right upper limb as the Claimant is right handed (Claimant's Exhibit 16, p.

120; Respondents Exhibit Z, p. 94). Dr. Castrejon notes that the Claimant admitted that after leaving his employment with Employer, his pain symptoms improved.

42. Dr. Castrejon then addressed the surgical recommendation of Dr. Hatzidakis and noted that the Claimant wishes to proceed with this surgical intervention "with the goal of improving strength and motion to his limb" although the Claimant admitted that "his pain has improved and is present only with lifting in an above the shoulder manner" and "he is able to perform his current work activities as he limits any above shoulder activities" (Claimant's Exhibit 16, p. 121; Respondents' Exhibit Z, p. 95). With regard to right shoulder surgery, Dr. Castrejon opined as follows:

> On examination today there is an adequate and functional range of motion. There is no discomfort. There is one grade motor loss yet this does not functionally limit activities of daily living and current work activities. This examiner notes that when evaluated by Dr. Hatzidakis shoulder range of motion was significantly decreased when compared to today's findings. Dr. Hatzidakis documented flexion to 80 degrees, abduction to 80 degrees, and external rotation to 30 degrees. Today his flexion is 156 degrees, abduction is 122 degrees, internal rotation to 65 degrees and external rotation to 75 degrees. Based upon his examination today I question whether proceeding with surgery is appropriate. In this examiner's professional opinion it is unlikely that the Claimant's range of motion and strength will appreciably increase with surgery, given the MRI findings. And, if pain is not an issue, then this would not be considered an indication to proceed with surgery (Claimant's Exhibit 16, pp. 121-122; Respondents' Exhibit Z, pp. 95-96).

43. Dr. Castrejon opined that based upon his physical examination of the Claimant and review of the medical records he concluded that the Claimant was at MMI as of June 4, 2013 and he has remained stable since that date, he found no evidence to support a significant worsening of condition, and he noted that the Claimant's range of motion was very similar to that found during the May 6, 2013 FCE. Dr. Castrejon further noted that the Claimant continued to work in a new position, reporting minimal pain with the primary complaint of weakness and pain with elevation of weight, which he felt was not likely to improve with surgery (Claimant's Exhibit 16, p. 122; Respondents' Exhibit Z, p. 96).

44. Dr. Castrejon assigned a 7% impairment of the upper extremity for loss of range of motion and a 4% impairment for loss of function due to loss of strength (Claimant's Exhibit 16, p. 122; Respondents' Exhibit Z, p. 96). These combined for the upper extremity impairment rating of 11%, which, if converted per table 3, would result in a 7% whole person impairment rating, prior to apportionment.

45. Considering the issue of apportionment, Dr. Castrejon noted the Claimant sustained a prior work related injury to his right shoulder[1] which he opines, "would have been eligible for 10% impairment of upper extremity based upon distal clavical resection. After apportioning 10%, Dr. Castrejon opines a 1% upper extremity (and, if converted, a 1% whole person) impairment rating remains (Respondents' Exhibit Z, p. 97).

46. With respect to the issue of maintenance care, Dr. Castrejon noted that none was recommended by Dr. McKenna. Dr. Castrejon did not make any specific recommendation for maintenance care either, but he did state that, "based upon the Claimant's medical condition, it is reasonable for the claimant to retain access to surgical intervention should he experience a significant change in his condition that is found to be directly related to the industrial condition" (Respondents' Exhibit Z, p. 97).

47. On February 27, 2014, Insurer filed a Final Admission of Liability consistent with Dr. Castrejon's opinion regarding MMI (Claimant's Exhibit 4; Respondents' Exhibit AA). However, in error, the Insurer admitted to the original, unapportioned 11% upper extremity rating, failing to notice the apportionment section of Dr. Castrejon's report. At hearing, the parties stipulated that Insurer claims representative Felicia Hall would testify that Insurer mistakenly admitted to the 11% pre-apportionment upper extremity rating, and not the 1% upper extremity post-apportionment rating (Hrg. Trans. p. 15-16). The difference between the 11% scheduled rating and 1% rating is $5,553.18.

48. On March 12, 2014, Dr. Hatzidakis' office again requested authorization for surgery, including: right shoulder arthroscopic biopsies/cultures, rotator cuff repair, longhead biceps tenodesis, subacromial decompression with possible distal clavical resection and open pectoralis major transfer (Claimant's Exhibit 13, p. 109; Respondents' Exhibit BB, pp. 104).

49. On March 16, 2014, Dr. Erickson was again asked to review and address the surgical authorization requested and opine regarding the DIME report . Dr. Erickson noted Dr. Castrejon failed to address the very important issue of causality and whether the Claimant sustained a work related injury versus a cumulative trauma disorder. Dr. Erikson opined that if the Claimant's claim was a cumulative trauma disorder, then he had serious doubt that his work activities would justify the severe damaged noted on the MRI as a work related condition. Dr. Erickson stated that until the causation issue was properly addressed, he still saw no reason to approve the request for surgery (Respondents' Exhibit CC).

50. On March 17, 2014, Insurer issued a letter again denying Dr. Hatzidakis' surgery request (Claimant's Exhibit 6; Respondents' Exhibit DD).

---

[1] In the section of his DIME report on apportionment on the 11th page of his report, Dr. Castrejon refers to a left shoulder work related injury on March 16, 2002. However, in his review of the medical records from 2002 on the 7th and 8th pages of his report, Dr. Castrejon correctly refers to a right shoulder injury.

51. On March 27, 2014, the Claimant applied for hearing on issues that included overcoming the DIME on MMI, medical benefits, namely authorization of the surgery recommended by Dr. Hatzidakis, disfigurement, and permanent partial disability benefits (related to conversion)(Respondents' Exhibit EE).

52. On April 25, 2014, Respondents filed their Response to March 27, 2014 Application for Hearing, indicating as additional issues causation/relatedness, apportionment of the impairment rating, intervening injury/aggravation at subsequent employment, offsets and overpayment, causation of disfigurement and failure to accept modified job offer (Respondents' Exhibit FF).

53. On July 23, 2014, Kathleen D'Angelo issued an IME report. Dr. D'Angelo obtained a detailed history from the Claimant regarding his prior shoulder issues, his work injury, his subsequent modified work for Employer, his subsequent work for his brother, and his ongoing shoulder issues. As part of her IME, Dr. D'Angelo also thoroughly reviewed available medical records, and examined the Claimant. Per the questionnaire completed by the Claimant, the Claimant provided the following mechanism of injury for the incident on January 12, 2013:

> I was using a pick and shovel all day to clean out a water jet tank. During this time I noticed some discomfort in my right shoulder but continued working as we needed to complete the job. At the end of the job I had [sic] difficult time putting the hoses back on the truck due to weakness and pain in right shoulder. When I go in the truck to go back to the yard I had to lift my right hand with my left hand to put it on the gear shift (Respondents' Exhibit GG, p. 114).

54. Dr. D'Angelo reviewed in detail the time period right after his reported injury with the Claimant as well as the period when he worked modified duty and when he left Employer to work for his brother. During the course of the interview, the Claimant indicated to Dr. D'Angelo that he believed working with the tanker truck and having to rotate the crank to raise and lower the trailers was damaging to his shoulder and he should not have been asked to do this. However, Dr. D'Angelo noted that this activity would have occurred prior to the Claimant's February 28, 2013 resignation from Employer. On April 9, 2013, Dr. McKenna noted the Claimant was not having pain and was much improved except for occasional popping. Dr. D'Angelo noted that it wasn't until 2 days after this when the Claimant saw Dr. Durbin that the Claimant complained of persistent, ongoing pain. Thus, she questioned whether the Claimant suffered a new injury between these 2 doctor appointments at a time when he no longer worked for Employer (Respondents' Exhibit GG, pp. 119-120). On physical examination, Dr. D'Angelo noted that range of motion "is full in all directions without apparent distress or pain. Range of motion of the right shoulder and left shoulder are equal" (Respondents' Exhibit GG, p. 125). Upon review of the impressions from the April 16, 2013 MRI, Dr. D'Angelo opined that the MRI revealed "changes which are not acute and do not date from his January 2013 work incident. The radiological study reveals chronic and subacute finding, which do not correspond to the time interval of 3 months." Dr. D'Angelo specifically notes that "fatty infiltration" and "atrophy" are indicative of chronic

tearing and also portend poor prognostic outcome for surgical repair and/or debridement of the tendons (Respondents' Exhibit GG, p. 128).

55. Ultimately, Dr. D'Angelo opined that the Claimant's right shoulder massive rotator cuff tears associated with retraction, atrophy and fatty infiltration were not causally related to his described work incident." She further opined that while she thought it was likely that the Claimant's work duties aggravated Claimant's his underlying degenerative shoulder condition, this was a temporary flare or aggravation, as evidenced by his improvement and reports on April 9, 2013. By that date, Claimant had been working for his brother in a physically demanding position for 6 weeks (Respondents' Exhibit GG, p. 131). Dr. D'Angelo concluded that "[Claimant's] present symptoms related to his right shoulder as well as his massive rotator cuff tears and the need for treatment are independent, and unrelated and incidental to work activities at [Employer]." Dr. D'Angelo opined that Dr. Castrejon erred in finding the Claimant's ongoing right shoulder issues were work related. She indicated Dr. Castrejon failed to take into account the MRI findings, and the interval amount of time it would take to develop those findings. She explained that the reason the Claimant was able to function at a high level with those issues was the length of time he had been compensating for his right shoulder cuff damage. She found that to the extent the Claimant requires any right shoulder surgery, whether for joint replacement or rotator cuff debridement, it is unrelated to a January 2013 work incident, but is rather, related to prior and chronic rotator cuff trauma and tears which predate the 2013 work incident (Respondents' Exhibit GG, p. 132).

56. At the hearing, Scott McDonald testified as the general manager for McDonald Farms. Mr. McDonald testified that he was familiar with the Claimant and had known him since they were both either ten or eleven years old (Hrg. Trans., p. 80). Mr. McDonald testified that he was working on the day that the Claimant stated he was injured and over the course of the weekend had been on the phone for a total of eight hours. He testified that his phone is with him 24/7 and he checks his voice messages regularly (Hrg. Trans., p. 82). Although Mr. McDonald conceded that the Claimant's pay was reduced when he worked in the parts room, the Claimant's pay went back up to his regular rate of pay as soon as he started driving the tanker truck (Hrg. Trans., pp. 83-84). Mr. McDonald testified that the Claimant worked modified duty on the tanker truck between February 18, 2013 and February 26, 2013 (Hrg. Trans., p. 87). During the time frame when the Claimant worked on the tanker truck, Mr. McDonald testified that the Claimant never called him to report that he was having shoulder problems (Hrg. Trans., p. 88). Mr. McDonald also testified that if you put the crank in the low gear, you can crank it with one arm (Hrg. Trans., pp. 89-90). He noted that if the cranking is done in a high gear it can be done very quickly, but it could take 10-15 minutes in the low gear. However, using the low gear requires much less strength (Hrg. Trans., pp. 92-93).

57. Dr. D'Angelo testified at the hearing as an expert in the areas of internal medicine, occupational medicine and as to Level II accreditation matters for workers' compensation. Consistent with her written IME report of July 23, 2014, Dr. D'Angelo testified that her opinion was that the Claimant sustained an aggravation of his

underlying right shoulder inflammatory process due to the mechanism of injury he described to her as occurring in January of 2013. Dr. D'Angelo agreed that there was a basis for a compensable claim due to the January 2013 work injury (Hrg. Trans., p. 117). Dr. D'Angelo testified that subsequently the Claimant was placed at MMI and he remains at MMI. She bases this opinion, in part, on the Claimant's reporting of improvement and on the range of motion measurements taken by her and Dr. Castrejon, which were similar (Hrg. Trans., p. 119). Dr. D'Angelo also testified that in her review of the MRI, in terms of causality, the findings were significant for the fatty infiltration of the torn rotator cuffs, the atrophy and the retraction. She opined that these three findings are seen in chronic rotator cuff tears as opposed to an acute injury (Hrg. Trans., p. 120 see also, pp. 132-133). She based this on medical literature that provides that although you will see fatty infiltration in patients over 68 years old within 2 ½ years following a massive tear. However, for patients under the age of 68, it takes, on average, three to four years before fatty infiltration and atrophy of the musculature develops. Since the Claimant's MRI was performed three ½ months after the injury in January, this would not support the time frame during which fatty infiltration or muscle atrophy is known to occur (Hrg. Trans., pp. 120-121). Dr. D'Angelo also testified that the mechanism of injury that the Claimant described to her was also an indication that the rotator cuff tear seen on the MRI could not be attributed to that activity for a couple of reasons: (1) his pain increased gradually throughout the day and there was no one moment where he could no longer work and, (2) the Claimant was working with a pick but was not doing overhead activity. Therefore, Dr. D'Angelo opined that the activities the Claimant was doing at work on January 12, 2013 would have increased inflammation in a person with the Claimant's long history of degenerative changes in his shoulder which would have caused pain and difficulty with range of motion. However, this is a temporary aggravation which resolves. She found that this conclusion fit the mechanism of injury, the duration of his issues per the medical records and the fact that he recouped his range of motion after a period of time (Hrg. Trans., p. 127-128). With respect to the surgery recommended by Dr. Hatzidakis, Dr. D'Angelo opined that she does not believe it is reasonable and necessary as patients with findings as severe as the Claimant's do not typically respond well to repair of severely damaged and atrophied rotator cuffs and the risk of re-injury is greater. Dr. D'Angelo acknowledged she is not a surgeon but opined that it is within her work and expertise as an internist to render opinions as to whether or not a surgery can benefit a patient (Hrg. Trans., pp. 128-132). Dr. D'Angelo also testified that she agreed with Dr. Castrejon that the Claimant was at MMI for his claim, although she disagrees that Dr. Castrejon's diagnosis is claim related since she finds the Claimant's shoulder condition wholly unrelated to the work incident (Hrg. Trans., p. 140). Thus, she would not have provided the Claimant with an impairment rating as Dr. Castrejon did. Nevertheless, to the extent that he provided an impairment rating, Dr. D'Angelo found no errors with his impairment rating process, including the apportionment (Hrg. Trans., pp. 141-142, see also pp. 145-146). Dr. D'Angelo further opined that Claimant's impairment, if any, should be compensated as a scheduled rating, as there was no indication Claimant had any functional disability outside of the right shoulder joint (Hrg Trans. p. 142).

58. Dr. D'Angelo's testimony was completed by deposition on October 17, 2014. On cross-examination, Dr. D'Angelo testified that at the time of her examination the Claimant had asymmetry of his upper periscapular muscle with atrophy of the right infraspinatus and supraspinatus on examination which are muscles of the rotator cuff located on his scapula which is proximal to the glenohumeral joint and located on his body (Kathy D'Angelo Depo. Trans., pp. 24-25). She also testified that the purpose of the rotator cuff is to assist in the use of the arm. The Claimant has testified that when he uses his arm over head or out to the side while weight bearing he has pain. Dr. D'Angelo also testified that the Claimant indicated he had pain on her examination which would go into his neck and that was when she noted significant atrophy on examination of the thoracic spine area (Kathy D'Angelo Depo. Trans., pp. 39-40). The Claimant's counsel also reviewed the issue of apportionment and argued that the total impairment of the Claimant's shoulder would be 10% for the distal clavical surgery plus the 11% for the range of motion and strength deficits for a 21% pre-apportionment rating and then the 10% would be apportioned from this amount (Kathy D'Angelo Depo. Trans., pp. 33-35). However, Dr. D'Angelo adamantly disagreed and testified that it was her opinion that it is not appropriate, per the AMA Guides, to have added in the 10% for the distal clavicle as it was not an issue in the Claimant's current condition (Kathy D'Angelo Depo. Trans., pp. 33-35). On redirect examination, Dr. D'Angelo again testified that it is her opinion that the rater does not include all prior surgeries in the pre-apportionment rating (Dr. Kathy D'Angelo Depo. Trans., p. 53).

59. Dr. Hatzidakis testified by deposition on January 29, 2015. Dr. Hatzidakis is a board certified orthopedic surgeon who specializes in shoulder surgery (Dr. Armodios Hatzidakis Depo. Trans., p. 3). Dr. Hatzidakis is also Level II accredited by the Division of Worker's Compensation (Dr. Armodios Hatzidakis Depo. Trans., p. 4). Dr. Hatzidakis saw the Claimant for a second opinion regarding medical treatment on October 17, 2013 (Dr. Armodios Hatzidakis Depo. Trans., p. 4). Based on his review of the MRI, Dr. Hatzidakis opined that the Claimant had Grade 2 fatty infiltration, which means that there were significant streaks of fat in the muscle. However, this was not to the level of a Grade 4 fatty infiltration where there is essential no muscle left. Since the fatty infiltration was still not too severe and the Claimant's humeral head wasn't excessively high-riding, Dr. Hatzidakis opined that this could still be consistent with an acute injury (Dr. Armodios Hatzidakis Depo. Trans., pp. 6-7). He did not agree with Dr. D'Angelo that the existence of fatty infiltration in an MRI taken 3 ½ months after the Claimant's work injury meant that the MRI findings could not be acute and related to the work injury (Dr. Armodios Hatzidakis Depo. Trans., p. 7). Dr. Hatzidakis testified that when he evaluated the Claimant he recommended an arthroscopic evaluation, debridement, removal of torn tissue, treatment of the biceps and possibly and open pectoralis major transfer to help the weak subscapularis (Dr. Armodios Hatzidakis Depo. Trans., p. 8). Dr. Hatzidakis testified that he disagrees with Dr. D'Angelo's opinion that the Claimant is not likely to do well with the repair. He further testified that in his practice, he has seen patients with tears like the Claimant who are treated successfully with surgery and have pain relief, improved function, improved range of motion and improved strength. Although he does agree that the prognosis for regaining full strength is less than if the tear were smaller. Yet, Dr. Hatzidakis maintains that the results can be

good and improve a patient's quality of life (Dr. Armodios Hatzidakis Depo. Trans., p. 9). He opined that, "[i]t's well-documented in the literature, repair of extensive rotator cuff tears has been well-documented to have good results. The treatment of biceps lesions with massive cuff tears, even in the state – in the setting of an irreparable rotator cuff, can help the patient's function and pain relief significantly. And even a simple debridement without any repair or treatment of an associated biceps lesion can result in pain relief" (Dr. Armodios Hatzidakis Depo. Trans., p. 11). Dr. Hatzidakis testified that since it had been a year and three months between the time he examined the Claimant and the date of his deposition, he would need to evaluate the Claimant again and he would recommend a repeat MRI to evaluate the progression of the tear and the fatty infiltration (Dr. Armodios Hatzidakis Depo. Trans., p. 14).

60. On cross-examination, Dr. Hatzidakis testified that he was only asked to provide a surgical opinion, and he did not assess causation (Dr. Armodios Hatzidakis Depo. Trans., pp. 19-20). As of the date of his deposition, Dr. Hatzidakis had not been provided with any additional documentation, he never reviewed the reports of Dr. Castrejon or Dr. D'Angelo, and he had not reviewed Dr. D'Angelo's testimony (Dr. Armodios Hatzidakis Depo. Trans., pp. 18-19). Dr. Hatzidakis admitted that his opinion regarding Claimant being a surgical candidate was based upon how Claimant presented to him on October 17, 2013 (Dr. Armodios Hatzidakis Depo. Trans., pp. 21-22). In discussing the video surveillance of the Claimant from April 3, 2013, Dr. Hatzidakis agreed that his function seemed better in the video that it did during the evaluation at Dr. Hatzidakis' office (Dr. Armodios Hatzidakis Depo. Trans., p. 22). Dr. Hatzidakis "absolutely" agreed that the question of whether a patient is a surgical candidate is a question two surgeons seeing the patient on the same date could disagree on. (Dr. Armodios Hatzidakis Depo. Trans., p. 28). Dr. Hatzidakis testified that the considerations that made him decide to recommend surgery on October 17, 2013 were his pain and his shoulder dysfunction (which included limited motion, weakness and pain with motion) (Dr. Armodios Hatzidakis Depo. Trans., pp. 29-29). On cross examination, Dr. Hatzidakis again testified that he didn't think he could currently make an assessment regarding whether the surgery he previously recommended could assist the Claimant with an increase in function since he hadn't seen the Claimant in over a year (Dr. Armodios Hatzidakis Depo. Trans., pp. 31-32).

Ultimate Findings of Fact

61. The Claimant's testimony regarding his mechanism of injury on January 12, 2013 is generally consistent with his reporting of the same to treating and evaluating physicians, is credible, and is found as fact. Specifically, it is found that the Claimant suffered an injury to his right shoulder while performing his job duties using vacuum hoses, a pick and a shovel to remove debris from a water jet tank.

62. The medical records of Drs. McKenna and Durbin and the May 6, 2013 FCE report, along with the video surveillance taken of the Claimant working for a subsequent employer on April 3, 2013, are persuasive in terms of establishing that the

Claimant's right shoulder condition improved significantly subsequent to January 12, 2013.

63. The surgery recommended by Dr. Hatzidakis for which he has submitted two requests for authorization is not reasonably necessary to cure and relieve the Claimant from an injury that he sustained on January 12, 2013. Per the medical records of Drs. McKenna and Durbin, it is more likely than not that the injury suffered by the Claimant on January 12, 2013 was a strain that resolved and the Claimant's function, range of motion and strength returned to his pre-injury baseline. That pre-injury baseline is not a healthy shoulder given that the Claimant sustained a prior work related injury and a non-work related injury to the right shoulder and the Claimant also has degenerative changes secondary to these prior injuries. The opinions of Drs. Castrejon, McKenna, Durbin, Erickson and D'Angelo are found to be more persuasive than that of Dr. Hatzidakis regarding whether the proposed surgery is reasonably necessary.

64. There was no testimony or evidence offered at the hearing or in subsequent deposition testimony of (a) an actual permanent impairment rating from the Claimant's prior work related injury; or (b) that the Claimant received an award or settlement under the Workers' Compensation Act of Colorado or similar act from another state.

CONCLUSIONS OF LAW

Generally

The purpose of the Workers' Compensation Act of Colorado (Act), C.R.S. §§ 8-40-101, *et seq.*, is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. C.R.S. § 8-40-102(1). The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. C.R.S. § 8-43-201. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979) The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of respondents and a workers' compensation claim shall be decided on its merits. C.R.S. § 8-43-201.

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. See *Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); *Bodensieck v. Industrial Claim Appeals Office*, 183 P.3d 684 (Colo. App. 2008); *Kroupa v. Industrial Claim Appeals Office*, 53 P.3d 1192 (Colo. App. 2002).

The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or

every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

Medical Benefits – Causally Related and Reasonably Necessary

Respondents are liable for medical treatment reasonably necessary to cure or relieve the employee from the effects of the injury. C.R.S. § 8-42-101, C.R.S. However, the right to workers' compensation benefits, including medical benefits, arises only when an injured employee establishes by a preponderance of the evidence that the need for medical treatment was proximately caused by an injury arising out of and in the course of the employment. C.R.S. § 8-41-301(1)(c); *Faulkner v. Indus. Claim Appeals Office,* 12 P.3d 844, 846 (Colo. App. 2000). The evidence must establish the causal connection with reasonable probability, but it need not establish it with reasonable medical certainty. *Ringsby Truck Lines, Inc. v. Industrial Commission*, 30 Colo. App. 224, 491 P.2d 106 (Colo. App. 1971); *Industrial Commission v. Royal Indemnity Co.,* 124 Colo. 210, 236 P.2d 2993. A causal connection may be established by circumstantial evidence and expert medical testimony is not necessarily required. *Industrial Commission of Colorado v. Jones*, 688 P.2d 1116 (Colo. 1984); *Industrial Commission v. Royal Indemnity Co.,* 124 Colo. 210, 236 P.2d 293 (1951).

All results flowing proximately and naturally from an industrial injury are compensable. *See Standard Metals Corp. v. Ball,* 172 Colo. 510, 474 P.2d 622 (1970). However, no compensability exists when a later accident or injury occurs as the direct result of an independent intervening cause. An unrelated medical problem may be considered an independent intervening cause even where an industrial injury impacts the treatment choices for the underlying medical condition. *Owens v. Industrial Claim Appeals Office*, 49 P.3d 1187 (Colo. App. 2002); *Post Printing & Publishing Co. v. Erickson,* 94 Colo. 382, 30 P.2d 327 (1934).

In order to prove causation, it is not necessary to establish that the industrial injury was the sole cause of the need for treatment. Rather, it is sufficient if the injury is a "significant" cause of the need for treatment in the sense that there is a direct relationship between the precipitating event and the need for treatment. A preexisting condition does not disqualify a claimant from receiving workers' compensation benefits. Rather, where the industrial injury aggravates, accelerates, or combines with a preexisting disease or infirmity to produce the need for treatment, the treatment is a compensable consequence of the industrial injury. *Joslins Dry Goods Co. v. Industrial Claim Appeals Office,* 21 P.3d 866 (Colo. App. 2001); *H and H Warehouse v. Vicory,* 805 P.2d 1167 (Colo. App. 1990); *Seifried v. Industrial Commission,* 736 P.2d 1262 (Colo. App. 1986). However, where an industrial injury merely causes the discovery of the underlying disease to happen sooner, but does not accelerate the need for the surgery for the underlying disease, treatment for the preexisting condition is not compensable. *Robinson v. Youth Track*, 4-649-298 (ICAO May 15, 2007).

Here, the Claimant's treating and examining physicians for the most part agree that, ultimately, the Claimant will require a shoulder replacement surgery. However, given his current level of function, range of motion and management of pain symptoms, none of the physicians recommend proceeding with this surgery at this time. Even Dr. Hatzidakis acknowledged that he had not evaluated the Claimant since October and November of 2013 and reevaluation would be required before he could opine if the Claimant were a candidate for surgery.

As for the surgical authorization request from Dr. Hatzidakis to perform right shoulder arthroscopic biopsies/cultures, rotator cuff repair, longhead biceps tenodesis, subacromial decompression with possible distal clavical resection and open pectoralis major transfer, Dr. Hatzidakis is alone among the physicians who have treated and evaluated the Claimant in recommending these procedures. All of the other physicians reject these proposed procedures due to questions regarding causation or the likelihood that the proposed procedures are not reasonably necessary to cure and relieve the Claimant of the effects of his work injury, or both. In fact, several physicians have opined that the procedures proposed by Dr. Hatzidakis are not likely to improve the Claimant's condition and may actually cause greater harm. Dr. Durbin, the orthopedic surgeon who performed a right rotator cuff repair in 2002, and was also an authorized treating physician over the course of this claim, opined that the Claimant's shoulder was probably unfixable at this point but that the Claimant was actually doing well functionally except when he lifted in one certain direction. Dr. Durbin recommended conservative care until such time as the Claimant ultimately required a shoulder replacement. The Claimant's other treating physician, Dr. McKenna, strongly cautioned that, given the Claimant's current range of motion and strength, the Claimant had to seriously consider how much he could gain from surgery versus the potential risks. The DIME physician Dr. Castrejon opined that, based upon his physical examination of the Claimant on January 20, 2014, he documented a significantly improved range of motion compared to the measurements documented by Dr. Hatzidakis earlier. He opined that the proposed surgery was not likely to appreciably increase the Claimant's range of motion and strength, so, if pain was not an issue, then he found surgery was not indicated. As for the issue of pain, the Claimant advised Dr. Castrejon, as well as other treating and evaluating physicians, that his pain had improved and was only present with lifting in an above the shoulder manner and the Claimant was able to perform his current work duties and he was not functionally limited in his activities of daily living. Dr. D'Angelo also took range of motion measurements and found the Claimant's range of motion to be full in all directions without apparent distress or pain and noted that range of motion of his right and left shoulders was equal. Based on reports in the medical records, Dr. D'Angelo also concluded that the Claimant's pain symptoms significantly improved between the January 12, 2013 incident and April 9, 2013. She opined that the Claimant's work duties temporarily aggravated his underlying condition and caused inflammation, but that these issues resolved.

Further, while the Claimant's testimony regarding the incidents of January 12, 2013 was credible, and it is found that the events that the Claimant consistently related to his Employer and medical providers did occur as he testified, this is not sufficient to

establish a causal relation to the need for the recommended surgery in light of the conflicting evidence. Per the credible and persuasive opinion of Dr. D'Angelo, as supported by the opinion of Dr. Erickson and the medical records of Drs. McKenna and Durbin, the mechanism of injury described by the Claimant would be more consistent with a strain but would not be consistent with the development of the condition of his shoulder as seen on the April 16, 2013 MRI which was interpreted as showing (1) a recurrent, complete tear of the supraspinatus and infraspinatus tendons with torn fibers retracted to the glenoid fossa, and subtle fatty atrophy of the infraspinatus muscle, (2) chronic, near full thickness tearing of the subscapularis tendon, and subtle fatty atrophy of the subscapularis muscle, (3) chronic, degenerative appearance of the superior labrum, (4) medial dislocation of the long head of the bicep tendon, and (5) post subacromial decompression and distal clavicular excision changes. Both Drs. D'Angelo and Erickson questioned how the mechanism of injury described by the Claimant could have caused, or even aggravated or accelerated, the structural condition of the Claimant's shoulder as shown on the April 16, 2013 MRI images. The fact that subsequent to the January 12, 2013 injury, but before the MRI, the Claimant was seen working at his new job duties for another employer in a manner demonstrating a relatively high level of function further supports the opinions of Drs. D'Angelo and Erickson. A number of actions the Claimant takes on the video using his right upper extremity, including, but not limited to the following, demonstrate the Claimant's improved level of function, range of motion, and apparent lack of pain with right shoulder and arm use:

8:16:27	Claimant is seen reaching into the bed of the large pick-up truck with both arms over the back of the truck. Claimant pulls objects up and over the back hatch using his right arm, which is flexed greater than 100 degrees. Claimant pulls down the back hatch and pulls out more objects.
8:26-8:29	Claimant throws large rolls of materials off the balcony with both arms multiple times, using his right arm normally without hesitation; Claimant moves his arms while holding objects, up over his shoulders without apparent trouble. Claimant lifts objects from the floor without apparent trouble.
9:50	Claimant lifts up tile saw machine with his right arm. Claimant moves object while abducting, flexing and pushing with the right arm to move the machine to the correct location.
9:51	Claimant lifts up a machine with right and left arms and places it in a different locations.
9:52	Claimant working with a tile saw machine, and he sets it up using both hands.
10:11	Claimant uses large mixer again as other worker adds water to the cement mix.

Dr. Castrejon ultimately opined that, as the Claimant continued to work in a new position, reporting minimal pain, with the primary complaint of weakness and pain with elevation of weight, he felt this was not likely to improve with surgery. The opinions of

Dr. Castrejon, Dr. D'Angelo, Dr. Erickson, Dr. Durbin and Dr. McKenna are more persuasive than that of Dr. Hatzidakis regarding the surgical recommendation to repair (rather than replace) the Claimant's right shoulder.

Moreover, the proposed medical treatment consisting of right shoulder arthroscopic biopsies/cultures, rotator cuff repair, longhead biceps tenodesis, subacromial decompression with possible distal clavical resection and open pectoralis major transfer, as recommended by Dr. Hatzidakis, is treatment for a pre-existing condition unrelated to the Claimant's January 12, 2013 industrial incident. The Claimant's January 12, 2013 work injury did not cause, combine with, or aggravate the Claimant's pre-existing right shoulder condition, nor did it accelerate the need for the surgical treatment proposed. As a result, the Claimant's request for medical benefits consisting of right shoulder arthroscopic biopsies/cultures, rotator cuff repair, longhead biceps tenodesis, subacromial decompression with possible distal clavical resection and open pectoralis major transfer is denied.

Burden of Proof to Overcome the MMI Opinion of a DIME Physician

The DIME physician's findings include his or her subsequent opinions, as well as his or her initial report. *Andrade v. Industrial Claim Appeals Office,* 121 P.3d 328, 330 (Colo. App. 2005). The party seeking to overcome that opinion concerning a claimant's MMI status bears the burden of proof by clear and convincing evidence. C.R.S. § 8-42-107(8)(b)(III); *Clark v. Hudick Excavating*, W.C. No. 4-524-162 (November 5, 2004); *MGM Supply Co. v. Industrial Claim Appeals Office*, 62 P.3d 1001 (Colo. App. 2002); *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). Clear and convincing evidence is that which is "highly probable and free from serious or substantial doubt." Thus, the party challenging the DIME physician's finding must produce evidence contradicting the DIME which is unmistakable and free from serious or substantial doubt showing it highly probable the DIME physician is incorrect. *Metro Moving and Storage Co. v. Gussert*, 914 P.2d 411 (Colo. App. 1995); *Leming v. Industrial Claim Appeals Office,* 62 P.3d 1015 (Colo. App. 2002).

MMI exists at the point in time when "any medically determinable physical or mental impairment as a result of injury has become stable and when no further treatment is reasonably expected to improve the condition." C.R.S. §8-40-201(11.5), C.R.S. Under the statute, MMI is primarily a medical determination involving diagnosis of the claimant's condition. *Berg v. Industrial Claim Appeals Office,* 128 P.3d 270 (Colo. App. 2005); *Monfort Transportation v. Industrial Claim Appeals Office,* 942 P.2d 1358 (Colo. App. 1997). A DIME physician's findings concerning the diagnosis of a medical condition, the cause of that condition, and the need for specific treatments or diagnostic procedures to evaluate the condition are inherent elements of determining MMI. *Mosley v. Industrial Claim Appeals Office,* 78 P.3d 1150 (Colo. App. 2003); *Qual-Med, Inc. v. Industrial Claim Appeals Office,* 961 P.2d 590 (Colo. App. 1998). Therefore, a DIME physician's finding that a party has or has not reached MMI is binding unless overcome by clear and convincing evidence. Whether a party has overcome the Division IME's opinion as to MMI is a question of fact for the ALJ as the sole arbiter of conflicting

medical evidence. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

A finding that the claimant needs additional medical treatment (including surgery) to improve his condition by reducing pain or improving function is inconsistent with a finding of MMI. *MGM Supply Co. v. Industrial Claim Appeals Office,* 62 P.3d 1001 (Colo. App. 2002); *Reynolds v. Industrial Claim Appeals Office,* 794 P.2d 1080 (Colo. App. 1990); *Sotelo v. National By-Products, Inc.,* W.C. No. 4-320-606 (I.C.A.O. March 2, 2000). Similarly, a finding that additional diagnostic procedures which offer a reasonable prospect for defining the claimant's condition or suggesting further treatment are warranted would be consistent with a finding that a Claimant was not at MMI. *Hatch v. John H. Harland Co.,* W.C. No. 4-368-712 (I.C.A.O. August 11, 2000). However, the requirement for future medical maintenance which will not significantly improve the condition or the possibility of improvement or deterioration resulting from the passage of time shall not affect a finding of MMI per C.R.S. § 8-40-201(11.5), nor does the need for recommended diagnostic testing solely to assist in the maintenance of a claimant's condition. *Brownson-Rausin v. Industrial Claim Appeals Office*, 131 P.3d 1172 (Colo. App. 2005).

On April 22, 2013, Dr. Durbin reviewed the Claimant's MRI, noting that the Claimant had a "massive rotator cuff tear with significant atrophy, chronic-full thickness tearing of the supraspinatus, which has retracted significantly." Dr. Durbin further observed significant atrophy of the infraspinatus and supraspinatus muscles, and a medial dislocation of the long head of the biceps. Dr. Durbin opined the shoulder was "probably unfixable at this point." Dr. Durbin noted the Claimant was doing well functionally, except when he lifts in one certain direction. Dr. Durbin advised the Claimant that, ultimately, he would probably need a shoulder replacement. As the Claimant did not want to do that at the time, Dr. Durbin recommended conservative care, and opined that the Claimant could be placed at MMI. On April 26, 2013, the Claimant saw Dr. McKenna. Dr. McKenna reviewed the MRI findings and Dr. Durbin's report with the Claimant. The surgery discussed was a shoulder replacement, or a reverse arthroplasty for rotator cuff arthropathy. Dr. McKenna noted that Dr. Durbin instead recommended conservative therapy and he also noted that the Claimant was not excited about an extensive shoulder replacement surgery. Dr. McKenna concurred with Dr. Durbin that the Claimant was at MMI once a determination was made via Functional Capacity Exam (FCE) to determine the Claimant's range of motion and strength.

On May 6, 2013, the Claimant underwent an FCE with evaluator Heather Stokes at Physiotherapy Associates. The test was considered valid and the Claimant demonstrated consistent effort. The evaluation placed Claimant in the light work category and recommended maximum occasional and frequent lift of 35 lbs for floor to waist. The Claimant's ability to lift overhead with his right extremity was limited to 2lbs. Lifting with one hand to shoulder was limited to 7 lbs. on the right side. The Claimant's right shoulder active range of motion was measured at 145 degrees flexion, 122 degrees abduction (133 degrees with pain), external rotation at 90 degrees with

abduction at 75 degrees, and internal rotation at 90 degrees of abduction at 53 degrees. The Claimant's strength was normal, but painful.

On May 28, 2013, the Claimant saw Dr. McKenna again and confirmed that he did not feel surgical intervention was appropriate at this time as he was not interested in the shoulder replacement. Dr. McKenna reviewed the FCE with the Claimant and discussed MMI and took range of motion shoulder measurements. On June 4, 2013, Dr. McKenna placed the Claimant at MMI for this claim.

On January 20, 2014, Dr. Miguel Castrejon performed a Division IME. He reviewed available records, but he did not review the surveillance. He took a history from the Claimant and noted that he found the Claimant to be a reliable historian. Through Dr. McKenna's records, Dr. Castrejon was advised of the Claimant's significant past history of right shoulder injury. The Claimant advised that subsequent to the date of injury until February 28, 2013, he worked the modified duty position with the tanker truck. Dr. Castrejon surmised that the modified work may have aggravated the Claimant's condition because the turning of the crank on the tanker truck "require a moderate amount of force" implicating his right upper limb as the Claimant is right handed. Dr. Castrejon noted that the Claimant admitted that after leaving his employment with Employer, his pain symptoms improved. Upon physical examination, Dr. Castrejon noted that the Claimant exhibited adequate and functional range of motion without discomfort. He noted one grade motor loss yet found this did not functionally limit the Claimant's activities of daily living and current work activities. Dr. Castrejon noted that when the Claimant was evaluated by Dr. Hatzidakis, his shoulder range of motion was significantly decreased when compared to Dr. Castrejon's findings. Dr. Hatzidakis documented flexion to 80 degrees, abduction to 80 degrees, and external rotation to 30 degrees. However, Dr. Castrejon measured the Claimant's flexion as 156 degrees, abduction at 122 degrees, internal rotation to 65 degrees and external rotation to 75 degrees. Dr. Castrejon opined that based upon his physical examination of the Claimant and review of the medical records he concluded that the Claimant was at MMI as of June 4, 2013 and he has remained stable since that date, he found no evidence to support a significant worsening of condition, and he noted that the Claimant's range of motion was very similar to that found during the May 6, 2013 FCE. Dr. Castrejon further noted that the Claimant continued to work in a new position, reporting minimal pain with the primary complaint of weakness and pain with elevation of weight. In addressing the surgery proposed by Dr. Hatzidakis, Dr. Castrejon found that surgery to be contraindicated.

Consistent with her written IME report of July 23, 2014, Dr. D'Angelo testified that her opinion was that the Claimant sustained an aggravation of his underlying right shoulder inflammatory process due to the mechanism of injury he described to her as occurring in January of 2013. Dr. D'Angelo agreed that there was a basis for a compensable claim due to the January 2013 work injury. Dr. D'Angelo testified that subsequently the Claimant was placed at MMI and he remains at MMI. She bases this opinion, in part, on the Claimant's reporting of improvement and on the range of motion measurements taken by her and Dr. Castrejon, which were similar.

Claimant's position that Dr. Castrejon is in error regarding whether the Claimant is at maximum medical improvement rests largely on the argument that the Claimant requires the surgery proposed by Dr. Hatzidakis. As set forth above, the recommended procedures were not found to be reasonably necessary to cure and relieve the Claimant from the effects of his work injury. Moreover, per Drs. Castrejon and D'Angelo, the Claimant's range of motion and strength are significantly improved and his condition has been stable since June 4, 2013, and arguably even prior to that date. Thus, the Claimant has failed to prove that Dr. Castrejon's opinion with regard to MMI is in error. Dr. Castrejon's opinion that the Claimant reached MMI as of June 4, 2013 will not be disturbed.

Overcoming the DIME on Impairment – Causation and Apportionment

The apportionment issues in this case involve apportionment of PPD benefits pursuant to C.R.S. § 8-42-104(5)(a). As the PPD benefits hinge on the impairment rating provided by the DIME physician in this case, there is also interplay with § 8-42-107(8)(c) because, since 1991, the medical impairment determination of the DIME is binding unless overcome by clear and convincing evidence. In this case, the DIME physician determined that there was an 11% upper extremity impairment, 7% for range of motions deficits and 4% for loss of function due to loss of strength. The DIME further determined that apportionment applied in this case and opined that because the Claimant had a distal clavical resection as part of his 2002 work-related injury, he would have been entitled to a 10% impairment rating for that procedure. Thus, per Dr. Castrejon, the post-apportionment residual scheduled impairment rating was 1%, which, if converted, would convert to a 1% whole person impairment.

A DIME physician must apply the AMA Guides when determining the claimant's medical impairment rating. C.R.S. § 8-42-101(3.7); C.R.S. §8-42-107(8)(c). The finding of a DIME physician concerning the claimant's medical impairment rating shall be overcome only by clear and convincing evidence. Clear and convincing evidence is that which is "highly probable and free from serious or substantial doubt." Thus, the party challenging the DIME physician's finding must produce evidence contradicting the DIME which is unmistakable and free from serious or substantial doubt showing it highly probable the DIME physician is incorrect. *Metro Moving and Storage Co. v. Gussert*, 914 P.2d 411 (Colo. App. 1995); *Leming v. Industrial Claim Appeals Office,* 62 P.3d 1015 (Colo. App. 2002).

As a matter of diagnosis, the assessment of permanent medical impairment inherently requires the DIME physician to identify and evaluate all losses that result from the injury, including whether the various components of the Claimant's medical condition are causally related to the industrial injury. *Mosley v. Industrial Claim Appeals Office,* 78 P.3d 1150 (Colo. App. 2003); *Martinez v. Industrial Claim Appeals Office, 176 P.3d 826* (Colo. App. 2007). Consequently, a DIME physician's finding that a causal relationship does or does not exist between an injury and a particular impairment must

be overcome by clear and convincing evidence. *Cordova v. Industrial Claim Appeals Office,* 55 P.3d 186 (Colo. App. 2002); *Qual-Med, Inc. v. Industrial Claim Appeals Office,* 961 P.2d 590 (Colo. App. 1998). The rating physician's determination concerning the cause or causes of impairment should include an assessment of data collected during a clinical evaluation and the mere existence of an impairment does not create a presumption of contribution by a factor with which the impairment is often associated. *Wackenhut Corp. v. Industrial Claim Appeals Office,* 17 P.3d 202 (Colo. App. 2000).

Ultimately, the questions of whether the DIME physician properly applied the AMA Guides, and whether the rating was overcome by clear and convincing evidence present questions of fact for determination by the ALJ. *Wackenhut Corp. v. Industrial Claim Appeals Office, supra*. Not every deviation from the rating protocols of the AMA Guides requires the ALJ to conclude that the DIME physician's rating has been overcome as a matter of law. Rather, deviation from the AMA Guides constitutes evidence that the ALJ may consider in determining whether the DIME physician's rating has been overcome. *Wilson v. Industrial Claim Appeals Office,* 81 P.3d 1117 (Colo. App. 2003); *Adams v. Manpower, supra*. Moreover, a mere difference of opinion between physicians does not necessarily rise to the level of clear and convincing evidence. *See Gonzales v. Browning Ferris Industries of Colorado*, W.C. No. 4-350-36 (ICAO March 22, 2000).

Dr. Castrejon assigned a 7% impairment of the upper extremity for loss of range of motion and a 4% impairment for loss of function due to loss of strength. These combined for the upper extremity impairment rating of 11%, which, if converted per table 3, would result in a 7% whole person impairment rating, prior to apportionment. These calculations resulted in a lower impairment rating than the 19% upper extremity rating provided by Dr. McKenna bases on his range of motion shoulder measurements performed on May 28, 2013.

Respondents argued that Dr. Castrejon erred in finding the Claimant's ongoing right shoulder issues were work related and submitted that the impairment rating for the Claimant's right upper extremity was incorrect. This was based largely on the report and testimony of Dr. D'Angelo. She opined that Dr. Castrejon erred in providing an impairment rating at all. She indicated Dr. Castrejon failed to take into account the MRI findings, and the interval amount of time it would take to develop those findings. However, to the extent that he provided an impairment rating, Dr. D'Angelo testified that he calculated it correctly per the AMA Guides based on the range of motion shoulder measurements that he obtained. With respect to the causation issue, the Respondents offered the contrary opinion of Dr. D'Angelo, but did not establish that the opinion of Dr. Castrejon was in error. The Respondents failed to overcome Dr. Castrejon's finding of a causal relationship between the Claimant's January 12, 2013 injury and the impairment rating that he provided.

At the hearing and in the post-hearing briefs, the Claimant did not take issue with the substantive impairment rating provided by Castrejon of an 11% upper extremity rating (that would convert to a 7% whole person rating, if converted) prior to apportionment. Rather, the Claimant argued that apportionment was not appropriate in

this case. At issue was a 10% apportionment for a distal clavical resection that occurred as a result of the Claimant's 2002 work injury. This would implicate C.R.S. § 8-42-104(5)(a).

Apportionment of Medical Impairment for a Prior Work-Related Condition or Injury

In this case C.R.S. § 8-42-104(5) provides statutory authority for apportioning permanent medical impairment. As the parties arguments rest on interpretation and application of the statute, some history of the statutory scheme is helpful. After the 1991 amendment that implemented medical impairment determinations for PPD benefit awards, apportionment of those benefits was governed by C.R.S. § 8-42-104(2), which continued to refer to apportionment of "disability." Pursuant to *Askew v. Industrial Claim Appeals Office,* 927 P.2d 1333 (Colo. 1996), apportionment of medical impairment was governed by a two-step analysis. Respondents first had to show that a prior condition was disabling at the time of the instant work injury. If Respondents met that first step, the second step in the Askew test was whether the prior impairment "has been sufficiently identified, treated, or evaluated to be rated as a contributing factor in the subsequent disability" and whether there was evidence of a reduced capacity to meet the demands of life's activities. The Supreme Court noted that a dormant or asymptomatic condition cannot be adequately evaluated, and thus rejected any apportionment of such a condition as "arbitrary," quoting provisions from the AMA Guides instructing an evaluator not to attempt apportionment in the absence of information to measure prior impairment accurately.

For injuries from July 1, 1991 to July 1, 1999, "apportionment" had to be distinguished from the normal "causation" determinations that were part of the DIME ratings. *Public Service Co. of Colorado v. Industrial Claim Appeals Office,* 40 P.3d 68 (Colo. App. 2001); *Qual-Med, Inc. v. Industrial Claim Appeals Office,* 961 P.2d 590 (Colo. App. 1998); *Cudo v. Blue Mountain Energy Inc.,* W.C. No. 4-375-278 (Industrial Claim Appeals Office, October 29, 1999). The distinction between "causation" and "apportionment" was drawn in *Johnson v. Christian Living Campus,* W.C. No. 4-354-266 (ICAO, October 5, 1999). Johnson explained that determination of whether an entire component of impairment is due to the industrial injury was a causation determination. Assessing the contribution of occupational factors to a particular aspect of the impairment was an apportionment determination.

Effective July 1, 1999, subsection (2) of C.R.S. § 8-42-104 was renumbered as (2)(a) and applied only to permanent total disability benefits. A new subsection (2)(b) provided, "When benefits are awarded pursuant to section 8-42-107, an award of benefits for an injury shall exclude any previous impairment to the same body part." This amendment rendered irrelevant the previous two-step apportionment analysis under Askew, supra. The existence of previous "disability" was irrelevant. The sole issue was whether claimant had "previous impairment to the same body part." This purely medical determination was part and parcel of the DIME determination of impairment for the work injury. *Martinez v. Industrial Claim Appeals Office,* 176 P.3d 826 (Colo. App. 2007).

Then, effective July 1, 2008, C.R.S. § 8-42-104, was extensively amended. Subsection (2) was repealed in its entirety. Subsection (5)(a) was added to provide for apportionment of previous awards or settlements of medical impairment ratings from a previous work injury. Subsection (5)(b) was added and provided for apportionment when an employee has a nonwork-related previous permanent medical impairment to the same body part that has been identified, treated, and, at the time of the subsequent compensable injury, is independently disabling. In this case, reference to the facts shows that the Claimant had previously suffered both a non-work related injury and a work-related injury. However, Dr. Castrejon only apportioned the impairment rating with respect to a procedure/specific injury he associated with the 2002 work injury.

Additionally, the Division of Workers' Compensation has adopted WCRP 12 to implement the statutory provisions for impairment rating determinations. WCRP 12-3(B) in pertinent part provides:

> For claims with a date of injury on or after July 1, 2008, the Physician may provide an opinion on apportionment for any preexisting work related or non work-related permanent impairment to the same body part using the AMA Guides, 3rd Edition, Revised, where medical records or other objective evidence substantiate a preexisting impairment. Any such apportionment shall be made by subtracting from the injured worker's impairment the preexisting impairment as it existed at the time of the subsequent injury or occupational disease. The Physician shall explain in their written report the basis of any apportionment. If there is insufficient information to measure the change accurately, the Physician shall not apportion. If the Physician apportions based on a prior non work-related impairment, the Physician must provide an opinion as to whether the previous medical impairment was identified, treated and independently disabling at the time of the work-related injury that is being rated. Identified and treated in this context requires facts reflecting that a medical provider previously noted and provided some level of treatment for the non work-related impairment.
>
> > (1) The effect of the Physician's apportionment determination is limited to the provisions in section 8-42-104. When filing an admission an insurer shall provide documentation reflecting compliance with section 8-42-104.

The Claimant posits, as a matter of law**,** apportionment was not authorized under C.R.S. § 8-42-104(5)(a). The Claimant asserts that the plain language of C.R.S. § 8-42-104(5)(a) precludes apportionment in this case. Although WRCP 12-3(B) would allow for the opinion provided by Dr. Castrejon, the statute limits application of WRCP 12-3(B) by its very terms.

C.R.S. §8-42-104(5)(a) provides:

> In cases of permanent medical impairment, the employee's award or settlement shall be reduced:
>
> When an employee has suffered more than one permanent medical impairment to the same body part and has received an award or settlement under the 'Workers' Compensation Act of Colorado' or a similar act from another state. The permanent medical impairment rating applicable to the previous injury to the same body part, established by award or settlement, shall be deducted from the permanent medical impairment rating for the subsequent injury to the same body part.

It is the Claimant's position that, even if Respondents could provide medical support for apportionment of claimant's prior work-related injury, apportionment is not authorized because Respondents cannot meet the second part of the statutory test, which requires for apportionment of a prior medical impairment that the Claimant has received an award or settlement for the previous injury to the same body part.

When interpreting statutes a court should give words and phrases in a statue their plain and ordinary meanings. This is true because the object of statutory construction is to give effect to the legislative intent of the statute, and the best indicator of legislative intent is contained in the language of the act. Forced and subtle interpretations should be avoided. *Jones v. Industrial Claim Appeals Office,* 87 P.3d 259 (Colo. App. 2004); *Spracklin v. Industrial Claim Appeals Office,* 66 P.3d 176 (Colo. App. 2002). Further, statutes addressing the same subject matter should be construed together, and an interpretation that renders one clause meaningless should be avoided. *USF Distribution Services, Inc., v. Industrial Claim Appeals Office,* 111 P.3d 529 (Colo. App. 2005). When the legislature speaks with exactitude, we must construe the statute to mean that the inclusion or specification of a particular set of conditions necessarily excludes others. *Lunsford v. W. States Life Ins.,* 908 P.2d 79, 84 (Colo.1995). Finally, we note that when it chooses to legislate in a particular area, the General Assembly is presumed to be aware of existing case law precedent. *Pierson v. Black Canyon Aggregates, Inc.,* 48 P.3d 1215, 1219 (Colo.2002).

The statute in question is two sentences long. Both sentences make reference to "award or settlement." In the first sentence, the statute requires proof that a Claimant "*received an award or settlement* under the 'Workers' Compensation Act of Colorado' or a similar act from another state." The second sentence permits apportionment "applicable to the previous injury to the same body part, *established by award or settlement*…." It is abundantly clear from the plain language of the statute, repeated for further clarity, that apportionment is not authorized in the absence of proof of this element.

In considering the issue of apportionment, Dr. Castrejon noted the Claimant sustained a prior work related injury to the same body part which he opines, "would

have been eligible for 10% impairment of upper extremity based upon distal clavical resection. After apportioning 10%, Dr. Castrejon opined a 1% upper extremity (and, if converted, a 1% whole person) impairment rating remains.

The ALJ specifically found that no evidence was presented, in testimony at hearing, deposition testimony, or in the voluminous exhibits admitted into evidence, that the Claimant was compensated by award or settlement for previous injury to the same body part. Rather, Dr. Castrejon merely opined that the Claimant would have been entitled to a 10% scheduled impairment rating for that body part.

Under the plain language of C.R.S. § 8-42-104(5)(a), apportionment is not warranted in this case because Respondents failed to establish that the Claimant received an award or settlement for her prior work related injury. Because the Respondents failed to establish that the Claimant was compensated by award or settlement, the Claimant is entitled as a matter of law to permanent partial medical impairment benefits based on the 11% scheduled rating (which, if converted would equate to a 7% whole person impairment rating) as provided by the DIME physician for the January 12, 2013 work injury, without apportionment to reduce that rating.

Disability Compensation Based on Scheduled Injury vs. Whole Person Impairment

The claimant bears the burden of establishing functional impairment beyond the arm at the shoulder and the consequent right to permanent partial disability benefits under§ 8-42-107(8)(c), C.R.S., by a preponderance of the evidence. *Maestas v. American Furniture Warehouse,* W.C. No. 4- 662-3 69 (June 5, 2007); *Johnson-Wood v. City of Colorado Springs,* W. C. No. 4-536-198 (ICAO June 20, 2005).

The question of whether a claimant sustained a "loss of an arm at the shoulder" within the meaning of § 8-42-107(2)(a), C.R.S. or a whole person medical impairment compensable under § 8-42-107(8)(c), C.R.S. is one of fact for determination by the ALJ. In resolving this question, the ALJ must determine the situs of the claimant's "functional impairment," and the site of the functional impairment is not necessarily the site of the injury itself. *Langton v. Rocky Mountain Health Care Corp.,* 937 P.2d 883 (Colo. App. 1996); *Strauch v. PSL Swedish Healthcare System,* 917 P.2d 366 (Colo. App. 1996); *Warthen v. Industrial Claim Appeals Office,* 100 P.3d 581 (Colo. App. 2004).

There is no requirement that functional impairment take any particular form in order to be compensable under § 8-42-107(8)(c), C.R.S. Evidence of pain and discomfort which interferes with the claimant's ability to use a portion of the body may be considered impairment for this purpose. Aligaze *v. Colorado Cab Co. / Veolio Transportation*; W.C. No. 4-705-940 (ICAO April 29, 2009); *Chacon v. Nichols Aluminum Golden, Inc.,* W.C. No. 4-521-005 (ICAO November 29, 2004); *Guillotte v. Pinnacle Glass Company*, W.C. No. 4-443-878 (ICAO November 20, 2001), aff'd., *Pinnacle Glass Co. v. Industrial Claim Appeals Office*, (Colo. App. No. 01CA2386, August 22, 2002) (not selected for publication). The courts have held that damage to structures of the "shoulders" may or may not reflect a "functional impairment"

enumerated on the schedule of disabilities. *See Walker v. Jim Fouco Motor Company,* supra*; Strauch v. PSL Swedish Healthcare System,* supra, *Langton v. Rocky Mountain Health Care Corp.,* supra*; Price v. United Airlines,* W.C. No. 4-441-206 (ICAO January 28, 2002); *Johnson-Wood v. City of Colorado Springs,* supra. Pain that causes physical limitations, such as the ability to engage in actions requiring overhead movement has been determined to be a proper basis for a finding of functional impairment justifying a whole person rating. *Martinez v. Pueblo County Sheriff's Office,* W.C. No. 4-806-129 (ICAO December 7, 2011).

In this case, the Claimant's testimony, substantiated by the medical records and opinions of Drs. McKenna, Durbin, Castrejon and Hatzidakis, establishes that the Claimant is entitled to a whole person medical impairment compensable under § 8-42-107(8)(c), C.R.S., because he has suffered a functional impairment to a part of the body that is not contained on the schedule. The Claimant has proven by a preponderance of the evidence that the situs of his functional impairment extends beyond the arm at the shoulder. The Claimant testified credibly that as a result of this right shoulder injury he continues to suffer functional impairments that limit use of his arm overhead or extended out to the side, due to pain occurring in his shoulder. The Claimant was also provided permanent lifting restrictions by Dr. McKenna of: no use of the right upper extremity above the shoulder level, and no lifting, pushing, pulling greater than 50 pounds. The Claimant testified credibly that he can continue to perform his current work duties, but only if he limits overhead use of his right upper extremity.

Based on the testimony and the medical records, the situs of the Claimant's functional impairment is to his right shoulder, including credible and documented continuing complaints of pain and discomfort which were impact his functioning. As the Claimant's functional impairment is contained off the schedule of injuries, the 7% whole person rating (converted from the 11% scheduled upper extremity rating) is the correct impairment rating.

Medical Maintenance Treatment after MMI

Respondents are liable for medical treatment reasonably necessary to cure or relieve the employee from the effects of the injury. The need for medical treatment may extend beyond the point of maximum medical improvement where Claimant presents substantial evidence that future medical treatment will be reasonably necessary to relieve the effects of the injury or to prevent further deterioration of his condition. *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988); *Stollmeyer v. Industrial Claim Appeals Office,* 916 P.2d 609 (Colo. App. 1995). The evidence must establish a causal connection with reasonable probability, but it need not establish it with reasonable medical certainty. *Ringsby Truck Lines, Inc. v. Industrial Commission*, 30 Colo. App. 224, 491 P.2d 106 (Colo. App. 1971); *Industrial Commission v. Royal Indemnity Co.,* 124 Colo. 210, 236 P.2d 2993. Medical evidence is not required to establish causation and lay testimony alone, if credited, may constitute substantial evidence to support an ALJ's determination regarding causation. *Industrial Commission*

of Colorado v. Jones, 688 P.2d 1116 (Colo. 1984); *Apache Corp. v. Industrial Commission of Colorado, 717 P.2d 1000 (Colo. App. 1986).*

An award for *Grover* medical benefits is neither contingent upon a finding that a specific course of treatment has been recommended nor a finding that claimant is actually receiving medical treatment. *Holly Nursing Care Center v. Industrial Claim Appeals Office,* 992 P.2d 701 (Colo. App. 1999). The claimant must prove entitlement to *Grover* medical benefits by a preponderance of the evidence. *Lerner v. Wal-Mart Stores, Inc.,* 865 P.2d 915 (Colo. App. 1993). An award of *Grover* medical benefits should be general in nature. *Hanna v. Print Expediters Inc.,* 77 P.3d 863 (Colo. App. 2003).

The Claimant was placed at MMI on June 4, 2013, 2013 by Dr. McKenna made no recommendation for maintenance medical care. Dr. Castrejon also noted that no maintenance care was recommended by Dr. McKenna. Dr. Castrejon himself did not make any specific recommendation for maintenance care either, but he did state that, "based upon the Claimant's medical condition, it is reasonable for the claimant to retain access to surgical intervention should he experience a significant change in his condition that is found to be directly related to the industrial condition." At the time that the Claimant saw Dr. D'Angelo for evaluation on July 23, 2014, she noted that her measurements for range of motion were similar to those of Dr. Castrejon. Thus, the Claimant's condition was not deteriorating. Moreover, he continued to work at his job with his brother's company performing the same work that he did at the time of MMI.

The Claimant failed to prove entitlement to medical maintenance care by a preponderance of the evidence as the Claimant did not establish that future medical treatment will be reasonably necessary to relieve the effects of the injury or to prevent further deterioration of his condition.

ORDER

Based on the foregoing Findings of Fact and Conclusions of Law, it is therefore ordered that:

1. The Claimant's request for medical benefits consisting of right shoulder arthroscopic biopsies/cultures, rotator cuff repair, longhead biceps tenodesis, subacromial decompression with possible distal clavical resection and open pectoralis major transfer recommended by Dr. Hatzidakis is not reasonably necessary to cure and relieve the effects of his January 12, 2013 work injury and this claim for medical benefits is denied and dismissed.

2. The Respondents failed to prove, by clear and convincing evidence, that DIME physician Miguel Castrejon, M.D. erred in finding that the Claimant's right shoulder condition, for which he provided an impairment rating, was causally related to the Claimant's January 12, 2013 work injury.

3. The Claimant failed to prove, by clear and convincing evidence, that DIME physician Miguel Castrejon, M.D. erred in his MMI determination. The Claimant reached MMI on June 4, 2013.

4. The Claimant's impairment rating is not subject to apportionment pursuant to C.R.S. § 8-42-104(5)(a).

5. The Claimant proved, by a preponderance of the evidence, that he suffered a functional impairment contained off the schedule of injuries set forth at Section 8-42-107(2), C.R.S. and is entitled to permanent partial disability benefits based upon a whole person conversion of the upper extremity rating. The Claimant is entitled to a 7% whole person impairment rating.

6. Respondents shall file an amended Final Admission of Liability reflecting a whole person impairment rating of 7% in accordance with Dr. Castrejon's impairment rating report and shall pay permanent partial disability benefits based on the 7% whole person impairment rating.

7. The Claimant failed to prove, by a preponderance of the evidence, that future medical benefits are reasonably necessary to relieve the effects of his injury or prevent deterioration of his condition. The claim for medical benefits is denied and dismissed.

8. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

9. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. (as amended, SB09-070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: July 23, 2015

Kimberly A. Allegretti
Administrative Law Judge
Office of Administrative Courts
1525 Sherman Street, 4th Floor
Denver, CO 80203

ISSUES

1. Whether the claimant's need for treatment to her low back is related to her admitted industrial injury of January 15, 2013; and,

2. If so, is the recommendation of an epidural steroid injection reasonable and necessary to treat that low back condition?

FINDINGS OF FACT

1. The claimant sustained an admitted work injury on January 15, 2013. On that date, the claimant worked as a paraprofessional for the respondent-employer. While walking at work, the claimant tripped and fell walking on an uneven sidewalk in icy conditions. The claimant has treated continuously since January 15, 2013.

2. Dr. Olson treated the claimant for multiple injuries as a result of this incident, including placing the claimant in a CAM boot to help resolve the issue the claimant was having with her ankle.

3. The claimant suffers from scoliosis that pre-exists her work related injury.

4. The claimant has treated for back pain on numerous occasions prior to January 15, 2013 injury, both with chiropractic care and osteopathic care.

5. The claimant began to have back pain as a result of her altered gait form the use of the CAM boot.

6. The claimant informed Dr. Olson of her pain and the claimant was sent to Dr. Sparr for further treatment. Specifically, Dr. Olson requested that the claimant receive trigger point injections and an epidural injection.

7. The claimant received the trigger point injections but did not receive the epidural injection.

8. The respondents denied the epidural injection requested by Dr. Olson.

9. Dr. Olson testified by deposition that he believes that the claimant should still undergo the epidural injection in an attempt to relieve the symptoms that she is having as a result of the use of the CAM boot. Dr. Olson testified that he believes that the claimant suffered an exacerbation of her low back condition as a result of the use of the CAM boot and that further treatment is necessary. Dr. Olson also agreed that the claimant's back pain, if it were from the altered gait should have resolved by now.

10. Dr. Olson conceded the claimant's low back problems "certainly could be" related to her preexisting low back complaint, since she has been out of the CAM walker for a long time yet continues to have low back complaints. He expected once she was out of the CAM walker, a normal gait would follow and problems would have resolved.

11. Mark Paz, M.D. preformed an independent medical examination of the claimant. Dr. Paz does not believe that the claimant's back condition is related to the use of the CAM boot. Dr. Paz believes that the claimant's condition would have gotten better after she discontinued the use of the CAM boot.

12. Dr. Paz opined that the claimant has an "established history of chronic low back pain . . . documented in the medical record prior to the January 15, 2013 date of injury." The Southern Colorado Family Medicine record from February 27, 2012, documents that treatment for the claimant's low back had been "ongoing for years." The claimant had a history of scoliosis with low back pain since she was a teenager, according to the records. The claimant provided a "direct history" during her evaluation with Dr. Paz that "she had no back or low back symptoms prior to the date of injury." The history she provided to Dr. Paz was not consistent with an aggravation of a preexisting condition.

13. Dr. Paz opined, based on a reasonable degree of medical probability, it is "not medically probable that the CAM walker aggravated or accelerated the preexisting back condition of scoliosis in the lumbar spine." The "natural history of a "flare" of chronic back discomfort . . . during use of the CAM walker is that the back condition would improve after the CAM boot is no longer used." In the claimant's case, she reported the symptoms further worsened after the CAM walker was used, which is inconsistent with a history where the CAM boot would have worsened the low back complaints.

14. The claimant has a degenerative disk disease according to Dr. Paz. It is not medically probable that the degenerative disease is related to the work injury. It is

not medically probable to Dr. Paz that the scoliosis or degenerative disk disease was aggravated or accelerated by the January 15, 2013 work injury according to Dr. Paz.

15. The ALJ finds Dr. Paz's opinions are credible and more persuasive than medical opinions to the contrary.

16. The ALJ finds that the claimant has failed to establish that it is more likely than not that her low back condition is causally related to her admitted industrial injury of January 15, 2013.

CONCLUSIONS OF LAW

1. The claimant must prove that she is a covered employee who suffered an injury arising out of and in the course of employment. Section 8-41-301(1), C.R.S.; *see, Faulkner v. Industrial Claim Appeals Office*, 12 P.3d 844 (Colo. App. 2000); *City of Boulder v. Streeb*, 706 P.2d 786 (Colo. 1985); *Pacesetter Corp. v. Collett*, 33 P.3d 1230 (Colo.App. 2001).

2. The claimant must prove that an injury directly and proximately caused the condition for which benefits are sought. *Wal-Mart Stores, Inc. v. Industrial Claim Appeals Office*, 989 P.2d 251 (Colo. App. 1999); *Snyder v. Industrial Claim Appeals Office*, 942 P.2d 1337 (Colo. App. 1997), *cert. denied* September 15, 1997.

3. The claimant must prove entitlement to benefits by a preponderance of the evidence. The facts in a workers' compensation case are not interpreted liberally in favor of either claimant or respondents. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979).

4. Claimant has the burden to prove his entitlement to medical benefits by a preponderance of the evidence. §8-43-201, C.R.S. Respondents are only liable for the medical treatment that is reasonable and necessary to cure and relieve the work-related injury. §8-42-101(1)(a), C.R.S. Even after an admission of liability is filed, respondents retain the right to dispute the relatedness of the need for continuing treatment. This principle recognizes that the mere admission that an injury occurred cannot be construed as a concession that all subsequent conditions and treatments were caused by the admitted injury. *HLJ Management Group, Inc. v. Kim*, 804 P.2d 250 (Colo. App. 1990); *Snyder v. ICAO*, 942 P.2d 1337 (Colo. App. 1997).

5. In accordance with § 8-43-215, C.R.S., this decision contains specific Findings of Fact, Conclusions of Law and an Order. In rendering this decision, the ALJ has made credibility determinations, drawn plausible inferences from the record, and resolved essential conflicts in the evidence. *See Davison v. Industrial Claim Appeals Office*, 84 P.3d 1023 (Colo. 2004). This decision does not specifically address every item contained in the record; instead, incredible or implausible testimony or unpersuasive arguable inferences have been implicitly rejected. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000).

6. In determining credibility, the ALJ should consider the witness' manner and demeanor on the stand, means of knowledge, strength of memory, opportunity for observation, consistency or inconsistency of testimony and actions, reasonableness or unreasonableness of testimony and actions, the probability or improbability of testimony and actions, the motives of the witness, whether the testimony has been contradicted by other witnesses or evidence, and any bias, prejudice or interest in the outcome of the case. *Colorado Jury Instructions, Civil*, 3:16.

7. The preponderance of persuasive evidence demonstrates that the claimant failed to prove that her January 15, 2013 injury, including treatment for that injury, directly and proximately caused a low back condition for which medical benefits are sought.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The claimant's claim for medical benefits for her low back condition is denied and dismissed.

2. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

3. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATE: July 22, 2015

/s/ original signed by:
Donald E. Walsh
Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Dr Ste 230
Colorado Springs, CO 80906

ISSUES

1. Whether the respondents proved by clear and convincing evidence that the Division independent medical examiner's determination regarding Maximum Medical Improvement (MMI) was incorrect and that the claimant was appropriately placed at MMI on June 12, 2014?

2. Whether the claimant proved by a preponderance of the evidence that she is entitled to further medical benefits including the treatment recommended by the DIME physician and Dr. Paul Stanton's recommendation for a lumbar fusion surgery?

FINDINGS OF FACT

1. The claimant was a general manager for the respondent-employer for 14 years at 4 different locations. She was employed at the respondent-employer for 16 years prior to being terminated on August 1, 2013.

2. The claimant injured her back on December 12, 2012 while working at the respondent-employer.

3. On December 12, 2012, the claimant lifted a keg of beer at the respondent-employer's and had immediate onset of low back pain. The claimant told another manager on duty, Pam Stebbenne, that she had injured her back. The claimant did not fill out an incident report because she thought that her back would feel better. The claimant was hoping that it wasn't anything serious.

4. The claimant's back initially felt better a couple weeks later. However, the claimant's pain gradually got more intense between the end of February and beginning of March 2013. On March 24, 2013, the claimant went to the emergency department at Penrose Hospital for the pain in her back.

5. The claimant was eventually evaluated by Dr. Paul Stanton on March 28, 2013. Dr. Stanton ordered an MRI which showed a disk herniation at L5-S1 on the right with mild compression of the S1 nerve root. The MRI also showed moderate degenerative disk disease at L4-L5.

6. Dr. Stanton recommended physical therapy. However, the claimant was unable to complete physical therapy because she was having difficulty walking.

7. Because the claimant was unable to participate in physical therapy and she continued to experience right sciatic and low back pain, Dr. Stanton recommended an L5-S1 discectomy.

8. On April 29, 2013, Dr. Stanton performed an L5-S1 discectomy on the claimant.

9. On May 6, 2013, the claimant returned to Dr. Stanton for a post-surgery follow-up. The claimant reported having new leg and foot pain since having the surgery. During that visit the claimant also told Dr. Stanton that she was uneasy about returning to work because she is a "hands on" manager. Dr. Stanton referred the claimant to physical therapy and wrote an off work note for May 6, 2013 through May 20, 2013.

10. On May 20, 2013, Dr. Stanton allowed the claimant to return to work with restrictions that included "no bending, lifting over 10-20 LBS, no twisting. Return 4 hours a day for the first two weeks then increase to 6 hours for two weeks then full time."

11. On June 11, 2013, Dr. Stanton released the claimant to a full days work with maximum lifting of 10-20 LBS, no prolonged sitting, no prolonged standing, and no repeated bending or twisting.

12. On July 9, 2013, the claimant returned to Dr. Stanton reporting that she is having trouble following her restrictions at work and an escalation in her pain. She also reported having some plantar fasciitis pain on the left side. Dr. Stanton noted that he believed the claimant "did not have an adequate chance to recover. She may have returned to work too early without having fully rehabbed her musculature. . . Ultimately, she may require significant strengthening before returning to work as she may have inflamed her current situation by returning to work at too high a level too soon."

13. On September 12, 2013, Dr. Stanton stated:

> At this point, it seems the patient has had a difficult course. She sustained an injury while at work lifting a heavy keg in December. She ultimately presented to my office with significant nerve pain. She was taken to surgery for discectomy and her symptoms were relieved. Her employer apparently had demanded she return to work. When she did, she was working extremely long hours with a significant amount of heavy lifting and twisting, despite her recent surgery. Eventually she was terminated for poor work performance. It seems clear that her injury was definitely sustained at work. I do not feel she had adequate time to

> recover before returning to work with such a heavy work load. Now I think she is sustaining dynamic foraminal stenosis where her L5-S1 disc is just not competent to maintain her foraminal dimensions and when she is in a standing position she has some recurrence of symptoms on the right side. . . I will see her back in 2 weeks for recheck. If at that time she is not markedly improved or still has recurrent symptoms, we discussed the possibility of reconstructing her L5-S1 segment for permanent resolution of her disc disease. This would also fare better for her obtaining meaningful employment in the future.

14. The respondent-insurer authorized the claimant to see Dr. Stanton for one visit on November 5, 2013. During that visit, Dr. Stanton noted:

> [T]he patient continues to have dynamic stenosis of her L5-S1 segment, which is causing persistent leg pain in the right lower extremity. The fact that her symptoms are relieved when she is supine suggests that this is dynamic in nature and the quality of her disc material is not competent enough to withstand her body weight when she is upright. . . At this point, I would recommend she undergo an L5-S1 epidural injections, as well as bilateral L5-S1 facet injections to see if we can quiet both her leg and back pain. . . I suspect that her symptoms would be short-term in nature as I feel that problem is mainly a structure one and not an inflammatory one. Ultimately, if she had some good results from her epidural and facet injections, she would be a candidate for reconstruction of her L5-S1 segment, which would stabilize her foraminal dimensions, alleviate her leg pain, as well as relieve her facet and ultimately muscular mediated back pain. Apparently, the patient was only approved for one visit today so I will need to see her back on a p.r.n. basis. Should she require further care, I will be glad to continue her treatment.

15. On November 12, 2013, the claimant filed an application for hearing to address medical benefits, reasonable and necessary, authorized provider, temporary total disability benefits, temporary partial disability benefits, and right of selection.

16. On January 20, 2014, the claimant saw Dr. Randall Jones. He recommended more physical therapy, referred the claimant back to Dr. Stanton, referred to pain management with Dr. Jenks for an EMG of right lower extremity, referral to Dr. David Hopkins, clinical psychologist, and if needed, Mr. Beaver for biofeedback, and a repeat MRI.

17. On January 2, 2014, Dr. Fall performed an Independent Medical Examination on the claimant. During that examination, the claimant noted that she currently experiences pain in her lower back. She noted that the pain in her right lower back is a constant aching and weakness, which goes down to her right gluteal area,

hamstring, and lateral hip. She also noted difficulty sleeping. Driving and sitting causes pain in her right calf. She noted that the pain does not go down to the hip as much as it did before the surgery. She also told Dr. Fall that she began experiencing bladder urgency and incontinence around November 2013. The claimant told Dr. Fall that sometimes her foot feels “lazy” and she does not always have control of her bowels.

18. A hearing was held on March 4, 2014. On April 3, 2014, 2014, ALJ Stuber Ordered the respondents to pay for the April 29, 2013 surgery by Dr. Stanton; and for the respondents to pay for reasonably necessary medical treatment by authorized providers, including Dr. Stanton, Dr. Jenks, and Dr. Hopkins.

19. On April 17, 2014, Dr. Albert Hattem examined the claimant. Dr. Hattem scheduled the claimant for a lumbar spine MRI with gadolinium to rule out recurrent disk. He noted that the claimant should return to clinic in one month for likely case closure if the MRI is unrevealing.

20. On April 24, 2014, the claimant underwent an MRI of her lumbar spine with and without contrast. The MRI revealed “Right hemilaminectomy L5-S1 with enhancing granulation tissue surrounding the thecal sac at the site of the surgery without recurrent herniation of stenosis. Mild buldge and endplate spur L4-L5 without significant stenosis.”

21. On June 12, 2014, Dr. Hattem placed the claimant at maximum medical improvement (“MMI”) and gave her a 19% whole person impairment rating. Dr. Hattem informed the claimant that the MRI looked good demonstrating only postsurgical changes without evidence of recurrent disk. He indicated that Dr. Stanton did not schedule a return appointment with the claimant and that the claimant was not a candidate for additional surgery.

22. However, the claimant testified she was not able to schedule a return appointment with Dr. Stanton because the respondent-insurer hadn’t paid the claimant’s medical bills from Dr. Stanton, which was ordered by ALJ Stuber.

23. On July 23, 2014, Dr. Edwin Healey performed an Independent Medical Evaluation of the claimant. Dr. Healey indicated that the claimant’s current diagnosis related to her December 12, 2012, worker’s compensation injury was “1. Acute L5-S1 subligamentous disc herniation with associated radiculitis, status post L5-S1 discectomy, with residual chronic low back and right leg pain. 2. Urinary frequency and urgency; rule out urinary sphincter dyssynergia.”

24. Dr. Healey opined that the claimant is not at MMI. At the time of Dr. Healey's examination, he opined that the claimant needed to undergo another surgical opinion by a surgeon. However, subsequent to Dr. Healey's examination, the claimant was examined by Dr. Stanton and he recommended surgery.

25. Dr. Healey concurred the with 19% whole person impairment rating assessed by Dr. Hattem. Dr. Healey noted that there appeared to be some granulation tissue around the L5-S1 surgical site on the MRI report. Dr. Healey recommended that the claimant undergo a selective L5-S1 epidural steroid injection. Dr. Healey also recommended

> lumbar paraspinal muscle trigger point injection on one occasion with local anesthetic and cortisone. If this does not relieve the pain, then I would recommend L4-L5, L5-S1 facet blocks, if they relieve her pain medical branch blocks and if she gets 80% relief of medial branch blocks then the primary pain generator may be her L4-L5, L5-S1 facets because the lumbar MRI indicates there is arthrosis at these levels. If receives an 80 percent reduction of her pain with medial branch blocks she would be a candidate for radiofrequency neurotomies at the symptomatic levels. [The claimant] is receiving some relief of her pain with gabapentin and I would recommend that it be restarted.

26. On November 7, 2014, Dr. Kenneth Finn performed a Division Independent Medical Examination ("DIME"). Dr. Finn found that the claimant was not at MMI. Dr. Finn indicated that the epidural fibrosis noted on postoperative imaging could be the cause of her pain. Dr. Finn recommended that the claimant be under the care of a physician that can manage her pain and spasms. He recommended that she undergo spinal injections to address the potential nerve irritation based on the scar tissue. In addition, Dr. Finn recommended a spine strengthening and stabilization exercise program and an electrodiagnostic study.

27. On December 23, 2014, the claimant returned to Dr. Stanton for an examination. Dr. Stanton noted that:

> At this point, I think that [the claimant's] symptoms are mainly dynamic in nature. She had a significant disc herniation with loss of disc space material, and the remainder of her disc is not competent to hold up her body weight. This would explain the increase in symptoms when she is upright and improve her symptoms when she is lying supine. She said she has had a recent MRI and will drop it off at the office and I can review if after she had delivered it. . . She may eventually require reconstruction of the L5-S1 segment, but I would like to review her MRI in detail after it is delivered.

28. On February 5, 2015, Dr. Fall performed a follow up independent medical examination for the respondents. Dr. Fall indicated that the claimant:

> reported pain that radiated from the mid lower back through the hip and buttock down the right leg, lower back weakness with feeling of instability, sleep interruption and bladder urgency. [The claimant] reported loss of control of bladder beginning November of 2013. . . [The claimant] describes her back feels unstable, like a clunkiness.

29. Dr. Fall opined that "it is highly unlikely that there is any additional active medical treatment that would lead to any substantial change in [The claimant's] condition.

30. On February 17, 2015, the claimant returned to Dr. Stanton for examination and review of her April 2014 MRI. Dr. Stanton noted that

> At this point, I think [the claimant] will ultimately need a reconstruction of her L5-S1 segment. She has symptoms which are very positional in nature when she is standing upright. She has an increase symptoms when she lays down and she feels better. This indicates that her disc is not competent to hold her body weight when standing. This may be due to her L4-5 segment but I still think that her primary area of disease is L5-S1. Ultimately, if she is able to proceed with surgery I would want an updated MRI of her lumbar spine prior to surgery to reevaluate her L4-5 segment.

31. On February 17, 2015, Dr. Stanton reviewed the claimant's MRI films of her lumbar spine that were taken on April 24, 2014. The MRI demonstrated:

> disc disease at L5-S1 with loss of disc space height, a broad based annular bulge with small annular tear. There is evidence of right sided hemilaminotomy. There is moderate to severe foraminal stenosis, worse on the right side due to facet hypertrophy and loss of disc space height. At L4-5 there are end plate changes with loss of disc space height and a shallow broad based disc herniation causing mild to moderate foraminal stenosis. There is a small amount of foraminal extension of the disc into L4-5 disc space on the right.

32. On March 3, 2015, Dr. Stanton sent a referral for an MRI to the respondent-insurer.

33. On May 14, 2015, a post-hearing deposition of Dr. Paul Stanton was taken. Dr. Stanton was qualified as an expert in the field of spine surgery without objection.

34. Dr. Stanton testified that he performed a microscopic discectomy on the claimant on April 29, 2013.

35. Dr. Stanton opined that the claimant did not recover from the discectomy surgery in regards to strength. He opined that the claimant has dynamic foraminal stenosis where the L5-S1 disc is not competent to maintain her foraminal dimensions.

36. Dr. Stanton opined that:

> [T]he disc is like a shock absorber in between the vertebral bodies. When you stand upright, that shock absorber is exposed to more load. The shock absorber at the disc is responsible for holding open the nerve root window to allow safe passage for the nerve out of the spine. If the disc is incompetent, in other words, will not hold up body weight, when you stand upright and your full body weight is on the disc, it will squat down and lose height, closing the nerve window and pinching the nerve root.
>
> When you're lying down on your back, there's no gravity on that disc, so the stenosis or tightness is resolved and patients usually feel better.

37. Dr. Stanton testified that he recommended the claimant undergo epidural facet injections to see if those help her leg and back pain. Dr. Stanton testified the facet injections would be both therapeutic and diagnostic. He testified that he was hoping the injections would improve the claimant's back and leg pain in the short term. However, Dr. Stanton further explained that if her dynamic stenosis was severe enough, the epidural injection would not provide a full relief. He explained that if the injections provided relief, he would recommend a fusion stabilization surgery to restore the disc height and provide permanent opening for the nerve roots. He testified that to his knowledge, those injections were denied by the respondents.

38. Dr. Stanton testified that the next time he examined the claimant was in February 17, 2015. He testified that during this visit he reviewed the actual films from the claimant's MRI which was performed on April 24, 2014. Dr. Stanton testified that he recommended a reconstruction of the L5-S1 segment, but he wanted to see the L4-L5 segment on a new MRI. He explained that he wanted to see if the L4-L5 segment needed surgery.

39. Dr. Stanton testified that he did not make a referral for back surgery because he ordered the MRI and it was denied. He testified that the next step would be to obtain an updated MRI of the lumbar spine to assess the L4-L5 disc health. He

further testified that at a minimum, the claimant would need a reconstruction of the L5-S1 segment and he would base the treatment of the L4-L5 segment off the current MRI.

40. Dr. Stanton testified that the back surgery that he recommended is likely to improve the claimant's condition.

41. Dr. Stanton testified that it is his opinion, based on a reasonable degree of medical certainty, the back surgery that he recommended is reasonable and necessary to treat the claimant's symptoms for her industrial injury.

42. Dr. Stanton testified that the surgery that he recommended is directly related to the claimant's industrial injury.

43. Dr. Stanton testified that in his opinion, the claimant never reached maximum medical improvement.

44. The ALJ finds that the analyses and opinions of Dr. Healy, Dr. Finn and Dr. Stanton are credible and more persuasive than medical analyses and opinions to the contrary.

45. The ALJ finds that the respondents have failed to establish that Dr. Finn clearly erred in finding the claimant was not at MMI.

46. The ALJ finds that the claimant has established that it is more likely than not that the claimant requires further treatment to cure and relieve her from the effects of her industrial injury, as recommended by Dr. Finn and Dr. Stanton.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" (Act) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. § 8-40-102 (1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by preponderance of the evidence. §8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark,* 197 Colo. 306, 592, P .2d 792 (1979); *People v. M.A.,* 104 P .3d 273, 275 (Colo. App. 2004). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. §8-43-201, C.R.S. A workers' compensation case is decided on its merits. §8-43-201, C.R.S.

2. The Judge's factual findings concern only evidence that is dispositive of the issues involved; the Judge has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *See Magnetic Engineering, Inc. v. ICAO,* 5 P .3d 385, 389 (Colo. App. 2000).

3. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2007).

4. The respondents bear the burden of overcoming the DIME physician's opinions as to MMI by clear and convincing evidence.

5. Section 8-42-107(8)(c), C.R.S. 2006, provides that the DIME physician's findings of maximum medical improvement is binding unless overcome by clear and convincing evidence.

6. "Clear and convincing" evidence is stronger than a preponderance, is unmistakable and is free from serious or substantial doubt. *Martinez v. Triangle Sheet Metal, Inc.* (W.C. 4-595-741, ICAO October 8, 2008), citing *Dilco v. Koltnow*, 613 P 2.d 318 (1980). A mere difference of medical opinions is insufficient. *Medina-Weber v. Denver Public Schools* (W.C. 4-782-625, ICAO May 24, 2010).

7. In order to overcome the DIME report, there must be evidence which proves that it is highly probable that the DIME physician's opinions are incorrect. *Metro Moving & Storage Co. v. Gussert*, 914 P. 2d 411 (Colo. App. 1995).

8. The question whether a party has overcome the DIME by clear and convincing evidence is one of fact for the ALJ's determination. *Metro Moving and Storage Co. v. Gussert*, 914 P. 2d 411(Colo. App. 1995).

9. The decisions of a DIME physician are to be given presumptive effect when provided by the statute. *Cordova v. Industrial Claim Appeals Office*, 55 P. 3d 186 (Colo. App. 2002).

10. While the respondents provided evidence demonstrating a difference in opinion between the DIME physician, Dr. Stanton, Dr. Healey, and their retained independent medical examiner, Dr. Fall, regarding whether the claimant's back injury is

at maximum medical improvement, they did not present clear and convincing evidence that the DIME physician's opinion was incorrect when he demonstrated the claimant's back injury requires additional treatment.

11. The ALJ concludes that the analyses and opinions of Dr. Healy, Dr. Finn, and Dr. Stanton are credible and more persuasive than medical analyses and opinions to the contrary.

12. The ALJ concludes that the respondents have failed to prove by clear and convincing evidence that the DIME physician's findings that the claimant is not at MMI was incorrect and warrants reversal.

13. For a compensable injury, an employer and its insurance company must provide all medical benefits which are reasonably necessary to cure and relieve the injury. C.R.S. 8-42-101 (2010). The respondents are liable for reasonable and necessary medical treatment by a physician to whom a claimant has been referred by an authorized treating provider. *Rogers v. Industrial Commission*, 746 P.2d 565 (Colo. App. 1987). Whether such a referral was made in the "normal progression of authorized medical care" is a question of fact for the administrative law judge. *Cabela v. Industrial Claim Appeals Office*, 198 P.3d 1277 (Colo. App. 2008).

14. The injured worker has the burden of proof, by a preponderance of the evidence, of establishing the entitlement to benefits. C.R.S. § 8-43-201; See *City of Boulder v. Streeb*, 706 P. 2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals Office,* 12 P. 3d 844 (Colo. App. 2000); *Lutz v. Indus. Claim Appeals Office*, 24 P.3d 29 (Colo. App. 2000). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). *People v. M.A.*, 104 P. 3d 273 (Colo. App. 2004). "Preponderance" means "the existence of a contested fact is more probable than its nonexistence." *Indus. Claim Appeals Office v. Jones*, 688 P.2d 1116 (Colo. 1984).

15. The claimant has established by preponderance of the evidence that the MRI and back surgery recommended by Dr. Stanton is reasonable, necessary and related to treat the claimant's back injury.

ORDER

It is therefore ordered that:

1. The respondents' request to overcome the DIME opinion that the claimant is not at MMI is denied and dismissed.

2. The claimant is not at MMI.

3. The respondent-insurer shall pay for the claimant's medical care to cure and relieve the claimant from the effects of her industrial injury as recommended by Dr. Finn and Dr. Stanton, including authorization for spinal surgery as recommended by Dr. Stanton.

4. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

5. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATE: July 6, 2015

/s/ original signed by:
Donald E. Walsh
Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Drive, Suite 230
Colorado Springs, CO 80906

ISSUES

The issues determined herein are as follows:

1. Whether the respondents may reopen the claim due to overpayments and are entitled to an order holding that the claimant must repay the overpayments;

2. Whether the claimant may reopen the claim on the issue of average weekly wage due to mistake or error;

3. If the claimant is allowed to reopen the claim on the issue of average weekly wage, then whether his admitted average weekly wage of $796.50 is correct;

4. Whether the permanent partial disability rating given by the authorized treating physician, Dr. Bradley, is correct; and,

5. Whether the permanent partial disability rating for the left thumb should be converted to a rating for the left hand or the left upper extremity?

FINDINGS OF FACT

1. On May 7, 2013, the claimant was working for the respondent-employer as a rigger. He was cutting a zip tie off of a cable when the knife slipped, lacerating his left thumb.

2. The respondent-insurer admitted to temporary total disability (TTD) benefits for May 8, 2013 through March 18, 2014. Benefits were admitted and paid at a weekly compensation rate of $531.03, which was based on an average weekly wage (AWW) of $796.50 as determined by the respondent-insurer.

3. The claimant reached MMI on March 18, 2014 however; he continued to receive TTD benefits until July 7, 2014.

4. On July 7, 2014, the respondents filed a Final Admission of Liability (FAL). The FAL terminated TTD benefits due to the placement of the claimant at maximum medical improvement (MMI) as of March 18, 2014 by his authorized treating physician

(ATP), Dr. Bradley. The respondent-insurer admitted to the 20% scheduled permanent partial disability (PPD) rating for the left thumb. This had a value of $1,868.86 [.20 x 35 weeks x $266.98]. The respondent-insurer claimed a $8,420.62 overpayment resulting from TTD benefits paid past the MMI date. After offsetting the PPD award against the overpayment, the resulting overpayment was $6,551.76.

5. The claimant filed an Application for Hearing (AFH) on August 7, 2014, endorsing the issues of disfigurement, PPD benefits, post-MMI medical benefits, and conversion of the PPD rating for the thumb to the equivalent rating for the upper extremity or the hand below the wrist.

6. A hearing was set to occur on November 20, 2014 at 1:30 p.m. in Pueblo.

7. On October 14, 2014, the respondents filed an amended FAL in response to a letter from the Division of Workers' Compensation.

8. The claimant filed an AFH on November 13, 2014, endorsing the issue of "Respondents did not have jurisdiction to file a FAL because it was filed beyond 30 days from the first FAL so penalties should begin August 6 2014 and ongoing." The claimant did not set a hearing date.

9. On November 19, 2014, the claimant cancelled the hearing that was set for his August 7, 2014 AFH.

10. The respondents filed an AFH on December 10, 2014 on the issue of overpayments.

11. On December 16, 2014, the claimant filed a Response to the AFH (RAH), endorsing the issues of AWW, petition to reopen the claim, disfigurement, "worsening of condition claimant no longer at MMI," conversion of the PPD rating, and overpayments.

12. At the outset of the hearing the claimant indicated that the issue of worsening of condition claimant no longer at MMI was no longer an issue for hearing.

13. The ALJ finds that the circumstances surrounding the claimant's employment do not fit squarely under the statutory formula for calculating an employee's AWW. Thus, the respondent-insurer was not obligated to follow the normal procedure in determining AWW. The ALJ finds that it is appropriate to calculate the claimant's AWW using an alternative manner that would fairly determine his AWW based on the facts presented.

14. Once the respondent-insurer admitted for a specific AWW in the final admission of liability dated October 14, 2014 the claimant was obligated to object within 30 days and file an application for hearing on the issue of AWW if he believed the admitted AWW was in error. Having failed to do so the ALJ is now without jurisdiction to address the issue of AWW as it is closed. The claimant's assertion that the respondent-insurer was mistaken in their calculations is not the kind of mistake for which the issue of AWW can be reopened.

15. On March 17, 2015, the claimant underwent an Independent Medical Examination (IME) with Douglas Scott, M.D. Dr. Scott examined the claimant's ability to use his left thumb IP joint.

16. Dr. Scott opined that the active IP joint range of motion measured at the FCE was not valid.

17. Dr. Bradley adopted the measurements from the FCE, which led him to assign a 20% scheduled PPD rating.

18. The ALJ finds that Dr. Bradley's assessment of the claimant's permanent partial disability rating is credible and persuasive. The ALJ finds that Dr. Bradley's 20% PPD rating for the thumb, which was based on the FCE measurements, was correct.

19. The value of the 20% rating is $1,868.86 [.20 x 35 weeks x $266.98].

20. The ALJ finds that the claimant was overpaid benefits in the amount of $8,420.62, prior to taking into account PPD benefits owed.

21. The amount of the overpayment ($8,420.62), after offsetting the value of the 20% PPD rating ($1,868.86), is $6,551.76. As found below the claimant is entitled to a payment of $2,000.00 for his disfigurement. Thus, reducing the overpayment to $4,551.76.

22. At the IME, Dr. Scott also evaluated the claimant's ability to use his left hand and left upper extremity to address his claim that the functional situs of his impairment was located at his left hand or left upper extremity.

23. The claimant told Dr. Scott that he had resumed his rock climbing hobby. Dr. Scott found this to be important because rock climbing requires a significant amount of bilateral hand, finger, and upper extremity strength and coordination. As a result, Dr. Scott doubted that the claimant could participate in rock climbing if he had any significant hand or upper extremity dysfunction or impairment.

24. The claimant testified at the hearing that he used his left hand in rock climbing because he thought it would be good therapy for his thumb. He described using his index through pinky fingers to grab some rock holds and using his entire hand to grab other holds.

25. Additionally, Dr. Scott reviewed surveillance footage, dated February 18th, 19th, and 20th, 2015, of a person whom he confirmed to be the same person that he examined on March 17, 2015. The claimant testified multiple times that he was the person depicted in the various scenes in the surveillance footage that were shown at the hearing.

26. Dr. Scott observed that the surveillance footage showed the claimant using his left hand without any signs of dysfunction. Among other activities, the claimant used his left hand to grasp a wrench, lift a propane tank, hold a propane torch, and use tools to work on coin mechanisms.

27. The claimant testified that he chooses to do some activities with his left hand, even though he could also do them with his right hand.

28. Dr. Scott opined that the video demonstrated the claimant using his left hand and left upper extremity without limitation or functional restriction. As a result, Dr. Scott persuasively opined that the functional situs of impairment is limited to the left thumb and that the left hand and left upper extremity are not impaired.

29. The ALJ finds that Dr. Scott's opinion on this issue is credible and persuasive. The ALJ finds that the functional situs of the claimant's impairment is limited to his left thumb and that his left hand and left upper extremity are not impaired. As a result, the ALJ finds that the scheduled PPD rating for the left thumb should not be converted to the equivalent PPD rating for either the left hand and or the left upper extremity.

30. The ALJ finds that as a result of his May 7, 2013 work injury, the claimant has a visible disfigurement to the body consisting of a surgical scar on the inside portion of the left thumb that is approximately two and one-half inches in length and one-eighth of an inch in width with a jagged appearance and being discolored when compared to the surrounding tissue. The left thumb's outer surface has an unusually smooth appearance with a slightly smaller appearance when compared to the opposite thumb. The left thumb also appears to have a permanent fixation when compared to the opposite thumb. The claimant has sustained a serious permanent disfigurement to areas of the body normally exposed to public view, which entitles the claimant to

additional compensation. Section 8-42-108 (1), C.R.S. The ALJ finds that the claimant is entitled to $2,000.00 for his disfigurement.

31. The ALJ finds that the respondents have established that it is more likely than not that the claim should be reopened to recover an overpayment.

32. The ALJ finds that the respondents have established that it is more likely than not that the claimant was overpaid in the amount of $4,551.76, after reducing the overpayment by PPD and disfigurement wards, and that they are entitled to recover that amount.

33. The ALJ finds that the respondents have failed to establish that it is more likely than not that the claimant's thumb should be rated at 5%.

34. The ALJ finds that the claimant has failed to establish that it is more likely than not the claim should be reopened on the issue of AWW.

35. The ALJ finds that the claimant has failed to establish that it is more likely than not the situs of the claimant's disability extends beyond the thumb.

CONCLUSIONS OF LAW

1. Pursuant to C.R.S. §8-43-203(2)(b)(II)(A), a claim is automatically closed as to the issues addressed in the FAL if the claimant does not timely object and request a hearing on any disputed issues that are ripe for hearing. These issues may not be litigated further unless they are reopened pursuant to C.R.S. §8-43-303. *Leewaye v. Indus. Claim Appeals Office*, 178 P.3d 1254, 1256-57 (Colo. App. 2007).

2. The ALJ finds that, by filing the December 10, 2014 AFH on the issue of overpayments, the respondents implicitly petitioned to reopen the claim; additionally, the issue of reopening was endorsed by the claimant and thus addressing reopening of the claim to address overpayments is appropriate.

3. In pertinent part, an overpayment is defined as "money received by a claimant that exceeds the amount that should have been paid, or which the claimant was not entitled to receive." C.R.S. §8-40-201(15.5).

4. The respondents have the burden of proof on the issue of overpayments. *See* C.R.S. §8-43-303(4) (the party attempting to reopen an issue or claim has the burden of proof on the issue sought to be reopened).

5. Once the respondents have made a prima facie showing that a claimant received overpayments, it is mandatory that a claim be reopened only as to overpayments and that the claimant must repay the overpayment. C.R.S. §8-43-303(1), (2).

6. The ALJ finds that the respondents have made a prima facie showing that the claimant reached MMI on March 18, 2014 and that he continued to receive TTD benefits until July 7, 2014.

7. The ALJ finds that the payment of benefits after March 18, 2014 was an overpayment because TTD benefits should have terminated with the claimant's placement at MMI on that date. *See* C.R.S. §8-42-105(3)(a). The resulting overpayment amount is $8,420.62.

8. As found, the PPD award is worth $1,868.86. When offset against the $8,420.62 overpayment, the remaining amount of the overpayment is $6,551.76. When further reduced by the disfigurement award of $2,000.00 the resulting overpayment is $4,551.76.

9. As found, the correct amount of the overpayment is actually $4,551.76.

10. The ALJ finds that the respondents are entitled to seek repayment of the overpayment from the claimant and that the claimant is required to repay the overpayment.

11. The ALJ finds that the issue of AWW is closed because the claimant did not endorse it as a disputed issue in either his August 7, 2014 or November 13, 2014 AFH. Therefore, his petition to reopen this issue is appropriate.

12. The claimant indicated at the hearing that he was petitioning to reopen the claim on the issue of AWW because the respondents allegedly calculated it incorrectly.

13. At the hearing, the respondents objected to proceeding on reopening the issue of AWW, arguing that the claimant had waived his right to challenge it by not endorsing it as a disputed issue in either his August 7, 2014 or November 13, 2014 AFH.

14. The Industrial Claims Appeals Office (the "Panel") has held that a claimant's failure to apply for a hearing on the issue of AWW does not constitute a waiver of his right to challenge it. It also does not constitute a waiver of his right to

reopen the claim later on the basis of error or mistake. *See Casias v. Interstate Brands Corp. & ACE Am. Ins. Co.*, W.C. No. 4-740-818-02 (I.C.A.O. Mar. 25, 2013).

15. However, the instances in which a claimant has been allowed to reopen his claim on the issue of AWW based on an error or mistake are factually distinguishable from the instant case. For example, the *Casias* claim involved both a Social Security offset and the loss of the claimant's health insurance, both of which affected the calculation of her AWW. The ALJ found that the failure to include the cost of continuing her insurance constituted a mutual error or mistake, both of fact and of law. This was because neither party's counsel previously was aware that the claimant had insurance through the employer and subsequently lost it. The Panel upheld reopening the issue of AWW because the respondents were *statutorily required* to augment the claimant's AWW to include the cost of continuing her insurance.

16. In contrast, in the instant case, there is no error or mistake of fact. Neither party has recently discovered previously unknown information, like in *Casias*. Claimant's wage records were exchanged in 2013 and 2014.

17. Moreover, in the instant case, there is no error or mistake of law. The claimant has not presented any evidence that he had health insurance through the employer, and subsequently lost it, which would statutorily require his AWW to be augmented. Further, the respondents have not argued the applicability of any statutory offsets that would require the claimant's AWW to be adjusted. *See, e.g., Renz v. Larimer County Sch. Dist. Poudre R-1*, 924 P.2d 1177, 1181 (Colo. App. 1996).

18. The ALJ has not found any cases indicating that a disagreement between the parties on how a claimant's AWW should be calculated, when it does not involve an adjustment due to an offset or the loss of health insurance, qualifies as an error or mistake of either law or fact.

19. The ALJ finds that the method by which the respondents calculated the AWW was not a mistake of law or fact justifying reopening the issue of AWW.

20. The ALJ finds that the issue of PPD benefits remains open. This is because the claimant timely explicitly endorsed it as a disputed issue in his August 7, 2014 AFH.

21. This claim involves a PPD rating for a scheduled extremity injury. Therefore, neither party was required to apply for a Division Independent Medical Examination ("DIME") to challenge Dr. Bradley's 20% scheduled PPD rating for the thumb. As a result, the ALJ has jurisdiction to resolve disputes over the rating. *See*

McCormick v. Exempla Healthcare, W.C. No. 4-594-683 at 4 (I.C.A.O. Jan. 27, 2006); *Whiteside v. Smith*, 67 P.3d 1240, 1246 (Colo. 2003).

22. As found, Dr. Bradley's 20% PPD rating for the thumb, which was based on the FCE measurements, was correct. The appropriate scheduled PPD rating for the thumb is 20%.

23. When a claimant's injury is enumerated in the statutory schedule of injuries, the claimant is limited to PPD benefits as specified on the schedule. C.R.S. §8-42-107(1)(a), (2). In this context, the term "injury" refers to the situs of the functional impairment. *Walker v. Jim Fuoco Motor Co.*, 942 P.2d 1390, 1391 (Colo. App. 1997). The term "situs of the functional impairment" means the part of the body that sustained the ultimate loss of function and became disabled or impaired. This is not necessarily the location where the injury actually occurred.

24. As found, the functional situs of the claimant's impairment is limited to his left thumb, and his left hand and left upper extremity are not impaired. As a result, the ALJ finds that the scheduled PPD rating for the left thumb should not be converted to the equivalent PPD rating for either the left hand and or the left upper extremity.

25. The ALJ concludes that the claimant has sustained a serious permanent disfigurement to areas of the body normally exposed to public view, which entitles the claimant to additional compensation. Section 8-42-108 (1), C.R.S. The ALJ finds that the claimant is entitled to $2,000.00 for his disfigurement. The respondent-insurer shall be given credit for any amount previously paid for disfigurement in connection with this claim.

26. The ALJ concludes that the respondents have established by a preponderance of the evidence that the claim should be reopened to recover an overpayment.

27. The ALJ concludes that the respondents have established by a preponderance of the evidence that the claimant was overpaid in the amount of $4,551.76, after reducing the overpayment by PPD and disfigurement wards, and that they are entitled to recover that amount.

28. The ALJ concludes that the respondents have failed to establish by a preponderance of the evidence that the claimant's thumb should be rated at 5%.

29. The ALJ concludes that the claimant has failed to establish by a preponderance of the evidence that the claim should be reopened on the issue of AWW.

30. The ALJ concludes that the claimant has failed to establish by a preponderance of the evidence that the situs of the claimant's disability extends beyond the thumb.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The claim is reopened to address the issue of overpayments.

2. The respondents are entitled to payment from the claimant of an overpayment in the amount of $4,551.76.

3. The respondents request to change the admitted PPD rating is denied and dismissed.

4. The claimant's request to reopen the claim on the basis of mistake or error in the admitted AWW is denied and dismissed.

5. The claimant's request to change the scheduled impairment rating is denied and dismissed.

6. All matters not determined herein, and not closed by operation of law, are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATE: July 31, 2015

/s/ original signed by:
Donald E. Walsh
Administrative Law Judge
Office of Administrative Courts
2864 S. Circle, Suite 810
Colorado Springs, CO 80906

ISSUES

Although the Insurer has admitted liability for the claim, the parties framed the issue for hearing as "compensability of the Claimant's left hip injury." Thus, this decision determines whether Claimant's fall on August 26, 2013, while in the course and scope of her employment, caused an injury to Claimant's left hip, or aggravated a pre-existing condition. If the left hip injury is a compensable component of Claimant's claim, the remaining issue is whether Claimant is entitled to medical benefits to treat her left hip, including whether the total hip replacement performed by Dr. John Xenos was reasonable, necessary and related to the claim.

FINDINGS OF FACT

1. The Claimant is 58 years old and has worked for the Employer for 27 years as an account representative.

2. On August 26, 2013, Claimant was running late for a sales call at Parker Adventist Hospital. She was carrying a briefcase, a laptop, and an iPad along with several phone books.

3. While rushing to catch the elevator, Claimant reached for the elevator button, apparently tripped and fell onto her left side. After falling, she gathered her items and went to her appointment.

4. About an hour later, Claimant began noticing neck pain, so she called her manager, Tom Egan, to report the accident. She then returned to Parker Adventist Hospital to report the accident to the building manager. The building manager informed Claimant that she could go to the emergency room, but that she would have to pay for it herself. The Claimant decided against seeking treatment in the emergency room.

5. Following the accident, the Claimant had bruises on her left side from her knee to her hip.

6. Shortly after the accident, the Claimant took two weeks off from work and went on a previously scheduled vacation to visit her sister's family in Loveland. While in Loveland, Claimant testified that she engaged in little activity.

7. When the Claimant returned to work after her vacation, she performed administrative tasks in the office for two days. The Claimant began making sales calls again, and she noticed increased pain in her back and hip. She told Egan about her symptoms. He referred Claimant to HealthOne Occupational Medicine and Rehabilitation.

8. On September 11, 2013, Dr. Elizabeth Bisgard evaluated the Claimant at HealthOne. Claimant reported that on August 26, 2013, she fell and landed primarily on her knees and elbow with most of the impact on her left side. She initially noticed neck pain and limited range of motion in her neck. The Claimant reported that she had pain in her left hip since the fall and had gotten worse particularly when getting in and out of her car. The Claimant told Dr. Bisgard about the left hip labral tear she had surgically repaired in 2010. Claimant reported no residual symptoms in her left hip before the fall on August 26, 2013.

9. Dr. Bisgard diagnosed Claimant with a cervical strain and left hip contusion. Dr. Bisgard imposed work restrictions of no lifting, carrying, pushing or pulling over 5 pounds.

10. Claimant's x-rays revealed no fractures but did show degenerative changes in both of her hips.

11. The Claimant began missing work on September 16, 2013 and has not returned to work since that date. The Insurer filed a general admission on September 26, 2013 admitting for medical benefits and temporary total disability.

12. The Claimant had a labral tear in her left hip prior to the work injury. Dr. John Xenos performed a surgical repair of the tear in 2010. She recovered fully following the surgery and returned to her normal activities.

13. Claimant returned to Dr. Xenos on September 18, 2013 for treatment of her left hip. She was concerned about a re-tear of her labrum and told Dr. Xenos she did feel like the workers' compensation doctors were looking enough at her hip. Claimant did not have a referral to Dr. Xenos at that time.

14. Dr. Bisgard's physician's assistant, Thanh Chau, evaluated the Claimant on September 25, 2013. Mr. Chau documented Claimant's reports of a catching sensation in her left hip, as well as pain with walking and weight bearing.

15. On September 26, 2013, the Respondents filed a General Admission of Liability admitting for reasonable and necessary medical benefits for Claimant's back, neck and left hip, as well as temporary total disability benefits.

16. Claimant had a MRI on October 1, 2013, which showed a possible small labral tear and osteoarthritis in the left hip.

17. On October 4, 2013, Claimant saw Mr. Chau. Mr. Chau went over the MRI findings with the Claimant and referred her to Dr. Xenos for further evaluation of her hip.

18. Claimant returned to Dr. Xenos on October 8, 2013. He discussed non-surgical and surgical options with the Claimant regarding the MRI results. Claimant elected to undergo a total left hip arthroplasty and scheduled it for December 9, 2013.

19. On October 22, 2013, Claimant saw Dr. Bisgard. Dr. Bisgard noted that what she initially believed to be a soft tissue injury to the left hip is now more substantial. Dr. Bisgard stated that Claimant had been working full time and full duty until her fall at work after which she has rapidly deteriorated. Dr. Bisgard opined that the fall permanently aggravated Claimant's pre-existing degenerative joint disease in the left hip.

20. The Claimant testified that she had pain in her left hip from the day of the accident. Dr. Bisgard testified that the Claimant gave a consistent history of pain in the left hip from the day of the accident and ongoing.

21. Dr. Bisgard testified that she was familiar with Dr. Xenos and considered him an accomplished hip surgeon. She agreed with the referral to Dr. Xenos.

22. The Claimant had left hip surgery to repair a labral tear in 2010, but had returned to her regular physical activities without any hip symptoms. These activities included skiing, bowling, dancing, biking, power walking and golf. She engaged in these activities with no left hip symptoms up to the September 26, 2013 fall.

23. The Insurer denied the total hip arthroplasty as unrelated to this claim, but the Claimant proceeded with the surgery on December 9, 2013, under her personal medical insurance.

24. Following the surgery the Claimant's hip symptoms subsided and she and continued to recover from her injuries.

25. The Claimant had physical therapy for her hip beginning on January 7, 2014. A physical therapy record indicated that Claimant fell down some stairs and fractured her pelvis approximately two years earlier. The Claimant admitted that she fell down some stairs in September 2011, but she did not fracture her pelvis and her symptoms subsided within a short period of time. There are no other medical records suggesting Claimant sustained a fractured pelvis.

26. The Claimant continued to treat with Dr. Bisgard until Dr. Bisgard left the HealthOne practice in September 2014.

27. Dr. Barton Goldman took over Claimant's care. The history Claimant gave to Dr. Goldman was consistent with the history she provided to Dr. Bisgard. Dr. Goldman stated in his September 25, 2014 report that the Claimant had made a fairly good recovery from the hip replacement surgery. Dr. Goldman stated that the Claimant had pre-existing osteoarthritis in her left hip which was aggravated by the August 26, 2013 fall.

28. Dr. Bisgard testified that while the Claimant did have pre-existing osteoarthritis in her left hip, it was completely asymptomatic prior to the fall. It was clear to Dr. Bisgard that the Claimant fell on her left side because she still had bruising on her left side when Dr. Bisgard first saw her about 16 days after the accident. She stated that the cause of the bruising was the direct impact on her left side.

29. Dr. Bisgard based her causation opinion on several factors. The MRI showed that the hip was injured. There was a temporal relationship between the hip pain and the trauma in that the Claimant told her she had hip pain from the day of the accident and had no problems with her hip immediately before the accident. Dr. Bisgard could find no intervening factors which would have caused the hip injury or would have made it worse following the fall.

30. Dr. Bisgard stated that it is common for people to have arthritic conditions which have no symptoms until a trauma causes inflammation which causes the previously asymptomatic condition to become symptomatic and disabling.

31. Dr. Bisgard explained that a fall on the left hip can drive the femoral head into the hip socket and cause the pre-existing hip condition to become symptomatic. She testified that this is what happened with the Claimant and that there was no other reasonable explanation for the cause of the Claimant's left hip symptoms. Dr. Bisgard opined that symptoms can progress and may not be immediately apparent on the date of the injury.

32. Dr. Bisgard discounted a physical therapy report that stated the Claimant fell on her right side and rolled onto her left. She based this on the fact that there were no bruises on the right side and that there would have been no bruising on her left side if she had fallen on the right and then rolled to her left. She also testified that the surgery performed by Dr. Xenos appeared to be successful and she deferred to Dr. Xenos on the need for the surgery.

33. On February 19, 2014, Dr. Timothy O'Brien performed an independent medical examination (IME) at the Respondents' request. Dr. O'Brien opined that Claimant sustained only minor injuries on August 26, 2013 because she continued to work after her fall, and because she did not seek medical treatment right away.

34. Dr. O'Brien believes that Claimant suffered only a minor hip contusion when she fell on August 26, 2013. He stated that the minor contusion did not result in an aggravation or acceleration of underlying pre-existing osteoarthritis to the extent that the total hip arthroplasty is indicated. Dr. O'Brien indicated that Dr. Xenos' representation to the contrary is inaccurate.

35. Dr. O'Brien opined in his report that Claimant's candidacy for a left total hip arthroplasty was established based on radiographs which demonstrated joint space narrowing. These radiographic findings take years to become evident. According to Dr. O'Brien, Claimant was a candidate for a left total hip arthroplasty long before to Dr. Xenos' radiographs which were taken on September 18, 2013.

36. Ultimately, Dr. O'Brien opined that Claimant's need for a total left hip arthroplasty was not causally related to the August 26, 2013 work injury. Dr. O'Brien went on to opine that Claimant proceeded with a left hip total arthroplasty to treat her personal health issues and her long-standing pre-existing osteoarthritis in her left hip.

Dr. O'Brien opined that Claimant did not become more of a candidate for left or right total hip arthroplasty as a result of the work injury.

37. Dr. O'Brien completed a supplemental report dated April 16, 2014, after reviewing additional medical records. He stated that his medical opinion had not changed since the February 19, 2014 IME report.

38. Dr. O'Brien further opined that Claimant had a long-standing pre-existing chondromalacia of the acetabulum and left hip joint and this was due to congenital dysplasia of the left hip. Claimant's femoral head was "out of round" thus Claimant's left hip was biomechanically altered from the time of her birth. This pre-existing condition relentlessly progressed between the 2010 surgical intervention and the work injury that occurred on August 26, 2013. Dr. O'Brien indicated that joint space narrowing does not occur acutely as the result of a fall on the outside of the left hip that produced a bruise and a minor contusion, but rather these changes of cartilage thinning and joint space narrowing takes years to become evident. Dr. O'Brien stated that Claimant was a candidate for a total hip arthroplasty on August 25, 2013, one day before her alleged fall on August 26, 2013, and she did not become more of a candidate for a total hip arthroplasty because of her minor fall on August 26, 2013.

39. Dr. Mark Paz performed an IME at the request of Respondents on October 31, 2014. Dr. Paz examined the Claimant and reviewed medical records. In his report, Dr. Paz indicated that he agreed with Dr. O'Brien's opinion that Claimant's left hip surgery was not the result of the fall on August 26, 2013, and that her left hip condition is not work-related. Dr. Paz stated in his report that the mechanism of injury based on the history provided by Claimant was inconsistent with the mechanism of injury documented in Dr. Bisgard's initial evaluation on September 11, 2013.

40. Dr. Paz testified at hearing consistent with his report. Dr. Paz also testified that he listened to the audio recording of the Claimant's IME after the IME and prior to the hearing. Dr. Paz testified that Claimant indicated she developed pain in her hip approximately 2-3 days after the incident on August 26, 2013. Dr. Paz believed the 2-3 day delay in onset of pain was significant. Dr. Paz testified this would not be indicative of an acute traumatic injury to Claimant's left hip.

41. Dr. Paz testified that the initial diagnosis was a contusion and that a worsening of symptoms in the left hip region is inconsistent with a contusion. Dr. Paz stated that left groin pain and restricted motion of the left hip joint are expected clinical findings associated with symptomatic osteoarthritis of the hip. Dr. Paz opined that the findings reported by Dr. Bisgard in the absence of groin pain and restrictive movement of the left hip are clinically inconsistent with an acute traumatic event which caused bruising of the left hip and left lateral thigh.

42. The opinions of Dr. Paz fail to consider that Dr. Bisgard explained that she made a working diagnosis of "left hip contusion." Dr. Bisgard candidly explained that she did not believe she needed to perform left hip range of motion testing on the Claimant during the initial visit because she believed Claimant suffered only a

contusion. She testified that in hindsight she should have done a more thorough examination of Claimant's left hip. After Claimant's symptoms worsened, it became apparent to Dr. Bisgard that Claimant's injury to her left hip was more severe than initially thought.

43. Dr. Paz testified that Claimant's left hip MRI did not reveal a hematoma, which Dr. Paz indicated would be blood accumulating deep and around the hip joint. Dr. Paz testified that the bruising on Claimant's lateral hip was more superficial and progressed down Claimant's hip due to gravity. Dr. Paz testified the bruising Claimant had is more consistent with a soft tissue injury and not an acute traumatic injury to Claimant's left hip joint.

44. Dr. Paz testified that it was not medically probable that Claimant's fall aggravated her pre-existing condition to produce the need for treatment.

45. Dr. Paz's opinions seem to hinge on his credibility evaluation of the Claimant. As such, his opinions are not persuasive. The ALJ finds that Claimant consistently reported the mechanism of injury to various treatment providers. Further, the ALJ places little significance on any alleged delayed pain onset. Dr. Bisgard credibly testified that pain symptoms can evolve and progress with the passage of time especially as activities change.

46. Dr. Bisgard disagreed with the opinions of Dr. O'Brien on causation. She testified that visible bruising 16 days after the fall does not suggest a minor injury, and that Dr. O'Brien's apparent reliance on a "history of bilateral pelvic and hip pain" was misplaced, as the Claimant fully recovered from the prior hip injury and was without symptoms and was not getting treatment before she fell.

47. Dr. Bisgard also disagreed with Dr. Paz's opinions. Dr. Paz heavily relied on what he believed was inconsistent reporting by the Claimant concerning the injury and its effects. Dr. Bisgard said that the history from the Claimant that the pain began on the day of the accident was given to her just 16 days after the injury. Dr. Paz did not see the Claimant until 14 months after the accident. Dr. Bisgard believes, and the ALJ agrees, that the history given right after the accident is more reliable. She also said that the worst pain would not necessarily occur right after the injury and in the case of arthritis; it could get more painful over time as the condition was now made symptomatic, and worsened.

48. The ALJ finds the opinions of Dr. Bisgard and Dr. Goldman to be credible and persuasive. As treating physicians, they had a more extensive relationship with the Claimant and were better able to judge her credibility. Dr. Bisgard took Claimant's history sooner after the accident than did the Respondents' IME doctors. Their opinions regarding causation, particularly the opinion of Dr. Bisgard, are more persuasive than the IME opinions of Drs. O'Brien and Paz.

49. Claimant suffered an aggravation of the pre-existing left hip osteoarthritis when she fell on August 26, 2013, and that the hip replacement surgery was reasonable, necessary and related to her workers' compensation claim.

CONCLUSIONS OF LAW

Based on the evidence presented, the Judge makes the following conclusions of law:

General

1. The purpose of the Workers' Compensation Act of Colorado (Act), § 8-40-101, *et seq.*, C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. Except as specifically noted below, the Claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the Claimant nor in favor of the rights of respondents. Section 8-43-201, C.R.S.

2. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005).

3. The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

Compensability - Causation

4. The Claimant must prove causation to a reasonable probability. Circumstantial evidence, including lay testimony alone, may be sufficient to prove causation. However, where expert testimony is presented on the issue of causation it is for the ALJ to determine the weight and credibility to be assigned such evidence. *Rockwell International v. Turnbull,* 802 P.2d 1182 (Colo. App. 1990). Ultimately, the question of whether the Claimant met the burden of proof to establish the requisite causal connection is one of fact for determination by the ALJ. *City of Boulder v. Streeb*, 706 P.2d 786 (Colo. 1985); *Faulkner v. Industrial Claim Appeals Office,* 12 P.3d 844 (Colo. App. 2000).

5. The Claimant has met her burden of proof. Claimant's pre-existing left hip condition was aggravated when she fell on August 23, 2013. The fall necessitated medical treatment including the left hip arthroplasty. Although Claimant had pre-existing osteoarthritis in her left hip, she had been symptom free for approximately three years. The ALJ is not persuaded by Dr. O'Brien's opinions that Claimant's hip required medical treatment prior to the fall on August 23, 2013. Dr. O'Brien based his opinions on imaging but he failed to consider her clinical presentation or lack thereof for the three-year period between her labral repair surgery and the work injury. Claimant did not have physical symptoms that would have required surgery until after she fell at work.

The ALJ is also not persuaded by Dr. Paz's opinions. Dr. Paz focused on Dr. Bisgard's initial diagnosis of "contusion" and ignored the fact that Dr. Bisgard admittedly erred in diagnosing only a contusion. Dr. Paz also focused on lack of restricted movement in Claimant's hip joint at her first evaluation with Dr. Bisgard; however, Dr. Bisgard admitted that she should have evaluated the Claimant's hip more thoroughly at that visit. Claimant went to Dr. Xenos and complained that HealthOne practitioners were not paying attention to her hip. Further, the ALJ disagrees with Dr. Paz's evaluation of Claimant's credibility. Claimant provided consistent reports of the mechanism of injury to her providers, and any deviation from her reports was minor.

Dr. Bisgard's opinions concerning the history of this claim and causal relatedness of Claimant's left hip condition to the work incident are more persuasive than those of Drs. O'Brien and Paz. Dr. Bisgard credibly explained that a fall on the left hip can drive the femoral head into the hip socket and cause the pre-existing hip condition to become symptomatic. She testified that this is what happened with the Claimant and that there was no other reasonable explanation for the cause of the onset of Claimant's left hip symptoms. Dr. Bisgard opined that symptoms can progress and may not be immediately apparent on the date of the injury.

Medical Benefits

6. Every employer must furnish to employees such treatment "as may reasonably be needed at the time of the injury or occupational disease and thereafter during the disability to cure and relieve the employee from the effects of the injury." Section 8-42-101(1)(a), C.R.S. *See also Snyder v. Industrial Claim Appeals Office*, 942 P.2d 1337 (Colo. App. 1997). It is Claimant's burden to prove a causal connection between the industrial injury and the need for specific medical treatment. *See City of Durango v. Dunagan*, 939 P.2d 496 (Colo. App. 1997).

7. Claimant has proven that the total left hip arthroplasty was reasonable, necessary and related to her work injury. As found, Dr. O'Brien felt the need for a total hip arthroplasty was present in the Claimant regardless of the fall at work. In addition, Dr. Xenos felt the procedure was reasonable and necessary, and Dr. Bisgard deferred to the opinions of Dr. Xenos regarding the need for a left hip arthroplasty. No persuasive opinions were offered to the contrary. Because the Claimant has proven that her pre-existing left hip osteoarthritis was aggravated by the fall at work, the ALJ concludes that the surgery was related to the work injury.

ORDER

It is therefore ordered that:

1. Claimant sustained an aggravation of her pre-existing left hip condition when she fell at work on August 23, 2013. Respondents have already admitted liability for the injury, which shall now include the left hip.

2. Claimant is entitled to medical treatment for the left hip.

3. Respondents are liable for the total left hip arthroplasty Claimant underwent on December 9, 2013.

4. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

1. Whether Claimant has established by a preponderance of the evidence that he suffered compensable injuries during the course and scope of his employment with Employer on January 17, 2014.

2. Whether Claimant has demonstrated by a preponderance of the evidence that he is entitled to receive reasonable and necessary medical benefits to cure or relieve the effects of his industrial injuries.

3. Whether Claimant has proven by a preponderance of the evidence that he is entitled to receive Temporary Total Disability (TTD) benefits for the period January 17, 2014, excluding the period from September 30, 2014 through January 26, 2015, until terminated by statute.

4. Whether Respondents have established by a preponderance of the evidence that Claimant is precluded from receiving TTD benefits because he was responsible for his termination from employment under §8-42-105(4) C.R.S and §8-42-103(1)(g) C.R.S. (collectively "termination statutes").

5. A determination of Claimant's Average Weekly Wage (AWW).

FINDINGS OF FACT

1. Claimant worked for Employer as an Electrician. He drove his personal vehicle to jobsites to perform electrical duties. Claimant testified that he transported necessary supplies and equipment in his truck. He noted that he sometimes used his truck during the course of the day to travel between jobsites and purchase materials from The Home Depot.

2. Dakota Carter worked for Employer as an Apprentice Electrician. During early to mid-January 2014 his car was not working so he received rides to jobsites from co-employee Harold Holland. On January 5, 2014 Mr. Holland was involved in an incident at the Precision job site located at 7076 South Alton Way in the Denver Metropolitan area. Because of the incident, Mr. Holland was prohibited from working at the Precision location and Mr. Carter did not have transportation to the site. Mr. Carter explained that he procured rides to the site from friends and family but missed 2-3 days of work during early to mid-January 2014 because of his inability to get to the job location.

3. On the evening of January 14, 2014 Mr. Carter contacted Claimant through text message to confirm a possible ride to the Precision jobsite. Claimant responded that he could give Mr. Carter a ride to the location but sent a text message to

owner of Employer Ron Burek stating "so I'm picking up Dakota in the morning. Am I supposed to take him with me." Mr. Burek responded to Claimant that "He [Dakota] just texted me. If you want he can go with you." Claimant then told Mr. Carter that he had just gotten off the phone with Mr. Burek and confirmed that he would be driving Mr. Carter to work. Claimant and Mr. Carter then exchanged text messages about the pickup location.

4. Claimant's commute from his home to the Precision jobsite required him to drive the following route: I-70 to I-25 Southbound, I-25 to Arapahoe Road, Arapahoe Road Westbound to Yosemite and South on Yosemite to the jobsite located on Alton Way. To pick up Mr. Carter Claimant deviated from his typical route by exiting I-25 on Santa Fe to pick up Mr. Carter at Broadway and Tufts. Claimant drove Mr. Carter to and from the Precision jobsite on January 15-16, 2014. He also drove with Mr. Carter to The Home Depot and at least one other jobsite on January 15-16, 2014.

5. On January 17, 2014 Claimant was traveling to pick up Mr. Carter but was involved in a motor vehicle accident at approximately 6:30 a.m. Claimant was rear-ended while heading Southbound on Santa Fe at the intersection of Santa Fe and Oxford. Claimant suffered numerous injuries including head trauma, fractured hips, a lumbar strain, PTSD and a cervical strain. He initially received medical treatment at a hospital but then obtained care through Concentra Medical Centers. Concentra physicians prohibited Claimant from working because of his injuries.

6. Mr. Carter testified that Employer was not involved in the driving arrangement he had made with Claimant. He explained that Mr. Burek did not care how he got himself to the jobsite. In fact, Mr. Carter remarked that Mr. Burek did not even care whether he made it to work because his job was simply as an apprentice assisting Claimant. If he did not make it to work Claimant was responsible for completing his job duties without help.

7. Mr. Carter commented that, after Mr. Holland was prohibited from working on the Precision jobsite, Claimant offered to give him a ride to and from work for $15.00 per day. He paid Claimant $15.00 for the first two days of transportation but never received a ride on the third day because Claimant was involved in a motor vehicle accident prior to picking him up for work..

8. Mr. Burek testified that Employer has a policy of not compensating employees for driving their personal vehicles to work in the morning and home in the evening. He noted that the policy has been consistently enforced for the previous 16 years. Mr. Burek explained that no employee has ever included "travel time" in his job description on a time sheet. He emphasized that he has never been involved in how employees get to and from work and has never reimbursed employees for gas, travel or associated expenses for getting to and from jobsites.

9. Mr. Burek explained that he sometimes communicated with employees via text messaging to confirm jobsite addresses. The text message he sent to Claimant on January 14, 2014 simply meant that Claimant could take Mr. Carter to work if he

wanted. He explained that Mr. Carter was working as an apprentice/assistant to Claimant at the time. Mr. Carter was learning the trade and otherwise helping at the jobsite. Mr. Burek remarked that he had enough employees on his jobsites and would not have incurred a detriment if Mr. Carter had not been able to make it to work during the week of January 14, 2014. He denied any involvement in the financial arrangement between Claimant and Mr. Carter regarding transportation to and from work.

10. Claimant maintained that in a telephone conversation Mr. Burek directed him to give Mr. Carter a ride to and from the Precision jobsite. He remarked that Mr. Burek reimbursed him for the deviation from his normal travel route to the jobsite when he picked up Mr. Carter. However, in a recorded statement to Insurer Claimant did not assert that Mr. Burek ordered him to transport Mr. Carter to and from the Precision jobsite. Claimant also acknowledged that he was not reimbursed by Employer to transport Mr. Carter to and from work.

11. Claimant has failed to demonstrate that it is more probably true than not that he suffered compensable industrial injuries during the course and scope of his employment with Employer on January 17, 2014. Applying the *Madden* factors, he has failed to establish an exception to the "traveling to or from work rule" because his travel was not considered the performance of services arising out of and in the course of employment. Initially, Claimant was injured in a motor vehicle accident while on his way to pick up Mr. Carter to transport him to the Precision jobsite. The travel thus did not occur during working hours and was not on Employer's premises. Although Claimant asserted that he was directed by Mr. Burek to transport Claimant to and from the Precision jobsite on January 17, 2014, the record reveals that the transportation agreement existed solely between Claimant and Mr. Carter. Mr. Carter noted that he paid Claimant $15.00 for the first two days of transportation to the Precision location but never received a ride on the third day because Claimant was involved in a motor vehicle accident. Mr. Burek credibly noted that he has never been involved in how employees get to and from work and has never reimbursed employees for gas, travel or associated expenses for getting to and from jobsites.

12. The critical inquiry is whether travel was contemplated by Claimant's employment contract and constituted a substantial part of his service to Employer. The record reveals that Claimant's travel was not contemplated by the employment contract. Specifically, Employer did not require Claimant to use his automobile in order to work. Claimant's vehicle was not used to perform job duties and thus did not confer a benefit to Employer beyond his mere arrival at work. Claimant's job was to perform electrician duties at a designated jobsite. Claimant explained that he sometimes used his truck during the course of the day to travel between jobsites and purchase materials from The Home Depot. However, Mr. Burek testified that Employer has a policy of not compensating employees for driving their personal vehicles to work in the morning and home in the evening. He noted that the policy has been consistently enforced for the previous 16 years. Mr. Burek explained that no employee has ever included "travel time" in his job description on a time sheet.

13. The credible evidence reveals that Claimant's contract of employment did not require him to transport his personal vehicle to Employer's job locations during the work day. Claimant merely had to get to the jobsite in order to work for the day. Although Claimant may have chosen to use his truck to travel to jobsites and make trips to The Home Depot, the record reveals that Employer did not receive a benefit beyond Claimant's mere arrival at work. Claimant's decision to give Mr. Carter a ride to work on January 17, 2014 was not at Employer's express or implied request and conferred no benefit to Employer. Because Claimant's injuries occurred prior to his arrival at the jobsite and picking up Mr. Carter was not contemplated by the employment contract, he has failed to establish that "special circumstances" exist justifying an exception to the "traveling to or from work" rule. A review of the *Madden* factors thus reveals that Claimant has failed to demonstrate a nexus between his injuries and his employment for Employer. Accordingly, Claimant's claim for Workers' Compensation benefits is denied and dismissed.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" (Act) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. §8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. §8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979); *People v. M.A.*, 104 P.3d 273, 275 (Colo. App. 2004). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. §8-43-201, C.R.S. A Workers' Compensation case is decided on its merits. §8-43-201, C.R.S.

2. The Judge's factual findings concern only evidence that is dispositive of the issues involved; the Judge has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *See Magnetic Engineering, Inc. v. ICAO,* 5 P.3d 385, 389 (Colo. App. 2000).

3. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2007).

4. To establish a compensable injury an employee must prove by a preponderance of the evidence that his injury arose out of the course and scope of employment with his employer. §8-41-301(1)(b), C.R.S. (2006); *see City of Boulder v. Streeb*, 706 P.2d 786, 791 (Colo. 1985). An injury occurs "in the course of" employment when a claimant demonstrates that the injury occurred within the time and place limits of

his employment and during an activity that had some connection with his work-related functions. *Triad Painting Co. v. Blair*, 812 P.2d 638, 641 (Colo. 1991). The "arise out of" requirement is narrower and requires a claimant to show a causal connection between the employment and injury such that the injury has its origins in the employee's work-related functions and is sufficiently related to those functions to be considered part of the employment contract. *Id.* at 641-62.

5. Generally, injuries sustained by employees while they are traveling to or from work are not compensable because such travel is not considered the performance of services arising out of and in the course of employment. *Madden v. Mountain West Fabricators*, 977 P.2d 861, 863 (Colo. 1999). However, injuries incurred while traveling are compensable if "special circumstances" exist that demonstrate a nexus between the injuries and the employment. *Id.* at 864. In ascertaining whether "special circumstances" exist the following factors should be considered:

- Whether travel occurred during working hours;
- Whether travel occurred on or off the employer's premises;
- Whether travel was contemplated by the employment contract; and
- Whether obligations or conditions of employment created a "zone of special danger" out of which the injury arose.

Id. In considering whether travel is contemplated by the employment contract the critical inquiry is whether travel is a substantial part of service to the employer. *See id.* at 865.

6. "Special circumstances" may be found where the employment contract contemplates the employee's travel or the employer delineates the employee's travel for special treatment as an inducement. *See Staff Administrators Inc. v. Reynolds,* 977 P.2d 866, 868 (Colo. 1999). "Special circumstances" may also exist when the employee engages in travel with the express or implied consent of the employer and the employer receives a special benefit from the travel in addition to the employee's mere arrival at work. *See National Health Laboratories v. Industrial Claim Appeals Office,* 844 P.2d 1259, 1260 (Colo. App. 1992). The essence of the travel status exception is that when the employer requires the claimant to travel beyond a fixed location to perform his job duties the risks of the travel become the risks of the employment. *Breidenbach v. Black Diamond, Inc.,* W.C. No. 4-761-479 (ICAP, Dec. 30, 2009).

7. In considering whether travel was contemplated by the employment contract, case law reflects that the exception applies when a claimant is required by an employer to come to work in an automobile that is then used to perform job duties. The vehicle confers a benefit to the employer beyond the employee's mere arrival at work. *See Whale Communications v. Osborn,* 759 P.2d 848 (Colo. App. 1988). As explained in 1 A. Larson, *Workmen's Compensation Law*, §17.50 (1985), "[t]he rationale for this exception is that the travel becomes a part of the job since it is a service to the employer to convey to the premises a major piece of equipment devoted to the employer's purposes. Such a requirement causes the job duties to extend beyond the

workplace and makes the vehicle a mandatory part of the work environment." *See In Re Rieks,* W.C. No. 4-921-644 (ICAP, Aug. 12, 2014) (where employer required the claimant to come to work in an automobile to attend appointments and meet with customers, transport of car was contemplated by the employment contract and the claimant's motor vehicle accident on the way to work occurred in the course of and arose out of his employment); *Norman v. Law Offices of Frank Moya,* W.C. No. 4-919-557 ICAP, Apr. 23, 2014) (where attorney was required to use car to travel from work to courthouse and was injured in motor vehicle accident while she was driving to her first court appearance of the day, injuries were compensable because travel was contemplated by employment contract and conferred benefit to employer beyond mere arrival at work); *Lopez v. Labor Ready,* W.C. 4-538-791 (ICAP, Sept. 26, 2003) (where the claimant's job required her to spend large parts of her day in her personal vehicle and she was injured in a motor vehicle accident while driving home for lunch, claim was compensable because it conferred a benefit to the employer beyond the claimant's mere arrival at work). In contrast to the preceding case law, Claimant's use of his vehicle was not contemplated by the employment contract and did not confer a benefit to Employer. He was only required to travel to the jobsite to perform his duties as an Electrician.

8. As found, Claimant has failed to demonstrate by a preponderance of the evidence that he suffered compensable industrial injuries during the course and scope of his employment with Employer on January 17, 2014. Applying the *Madden* factors, he has failed to establish an exception to the "traveling to or from work rule" because his travel was not considered the performance of services arising out of and in the course of employment. Initially, Claimant was injured in a motor vehicle accident while on his way to pick up Mr. Carter to transport him to the Precision jobsite. The travel thus did not occur during working hours and was not on Employer's premises. Although Claimant asserted that he was directed by Mr. Burek to transport Claimant to and from the Precision jobsite on January 17, 2014, the record reveals that the transportation agreement existed solely between Claimant and Mr. Carter. Mr. Carter noted that he paid Claimant $15.00 for the first two days of transportation to the Precision location but never received a ride on the third day because Claimant was involved in a motor vehicle accident. Mr. Burek credibly noted that he has never been involved in how employees get to and from work and has never reimbursed employees for gas, travel or associated expenses for getting to and from jobsites.

9. As found, the critical inquiry is whether travel was contemplated by Claimant's employment contract and constituted a substantial part of his service to Employer. The record reveals that Claimant's travel was not contemplated by the employment contract. Specifically, Employer did not require Claimant to use his automobile in order to work. Claimant's vehicle was not used to perform job duties and thus did not confer a benefit to Employer beyond his mere arrival at work. Claimant's job was to perform electrician duties at a designated jobsite. Claimant explained that he sometimes used his truck during the course of the day to travel between jobsites and purchase materials from The Home Depot. However, Mr. Burek testified that Employer has a policy of not compensating employees for driving their personal vehicles to work in the morning and home in the evening. He noted that the policy has been consistently

enforced for the previous 16 years. Mr. Burek explained that no employee has ever included "travel time" in his job description on a time sheet.

10. As found, the credible evidence reveals that Claimant's contract of employment did not require him to transport his personal vehicle to Employer's job locations during the work day. Claimant merely had to get to the jobsite in order to work for the day. Although Claimant may have chosen to use his truck to travel to jobsites and make trips to The Home Depot, the record reveals that Employer did not receive a benefit beyond Claimant's mere arrival at work. Claimant's decision to give Mr. Carter a ride to work on January 17, 2014 was not at Employer's express or implied request and conferred no benefit to Employer. Because Claimant's injuries occurred prior to his arrival at the jobsite and picking up Mr. Carter was not contemplated by the employment contract, he has failed to establish that "special circumstances" exist justifying an exception to the "traveling to or from work" rule. A review of the *Madden* factors thus reveals that Claimant has failed to demonstrate a nexus between his injuries and his employment for Employer. Accordingly, Claimant's claim for Workers' Compensation benefits is denied and dismissed. *See In Re Hall,* W.C. No. 4-689-120 (ICAP, Nov. 7, 2007).(where the claimant had a motor vehicle accident while driving to transport inmates to work in exchange for payment from the inmates and the employer was not involved in the agreement, the claimant's activities were not contemplated by the employment contract).

ORDER

Based upon the preceding findings of fact and conclusions of law, the Judge enters the following order:

Claimant's request for Workers' Compensation benefits is denied and dismissed.

If you are a party dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. *For statutory reference, see section 8-43-301(2), C.R.S. (as amended, SB09-070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a form for a petition to review at http://www.colorado.gov/dpa/oac/forms-WC.htm.*

DATED: July 24, 2015.

ISSUES

- Whether Insurer properly denied prior authorization of chiropractic treatment recommended by Dr. Miguel Castrejon as not being reasonable and necessary and related to the Claimant's March 26, 2015 admitted work related injury?

- Whether Insurer properly denied prior authorization for a SI joint injection as recommended by Dr. Miguel Castrejon as not being reasonable and necessary and related to the Claimant's March 26, 2015 admitted work related injury?

FINDINGS OF FACT

Based upon the evidence presented at hearing, the Judge enters the following findings of fact:

1. Claimant was employed as a carpenter by Employer for approximately six to seven months prior to his admitted work related injury of March 26, 2014. On March 26, 2014, Claimant had been lifting concrete forms throughout the day when he experienced pain involving his lower back and lower extremities.

2. Respondents filed a General Admission of Liability (GAL) on April 18, 2014 admitting for medical only. Respondents have not filed further GALs.

3. On August 27, 2014, Claimant applied for a hearing endorsing the following issues: Medical Benefits, Average Weekly Wage (AWW), Temporary Total Disability (TTD), and Penalties. This hearing application addressed the issue of TTD on an ongoing basis, and stated that "Respondents failed to object to 20 day letter dated June 4, 2104 for Claimant to see Dr. Timothy Hall for authorized treating provider (ATP). Respondents refused to pay for treatment with Dr. Timothy Hall." Also addressed was "Penalties for failure to pay benefits when due pursuant to C.R.S. 8-43-304." On October 10, 2104, an Order was entered approving the parties' September 30, 2014 Stipulation. In the Stipulation, the parties agreed that Dr. Miguel Castrejon would be Claimant's ATP; that Respondent would pay Dr. Hall $450.00; that Dr. Hall would have no further involvement with the case; and that Claimant would withdraw his penalty issue up to the date the Stipulation was approved. This Stipulation resolved the issues contained in Claimant's August 27, 2014 Application for Hearing except for AWW and TTD.

4. On January 7, 2014, a Judge approved the parties' December 22, 2014 Stipulation which addressed the remaining issues of AWW and TTD. The parties

stipulated that Claimant's AWW was $1,055.85. The parties also stipulated that the issue of TTD from March 27, 2014 to December 16, 2014 should be resolved by Respondents paying Claimant $25,000.

5. Respondents stated in the Stipulation that they agreed to file an amended GAL admitting to "the stipulated AWW and would admit therein to temporary total disability benefits." To date, although Claimant has continued to receive TTD, Respondents have yet to file the amended GAL based upon the Order of January 7, 2015.

6. On March 26, 2014 Claimant received medical care at Memorial Hospital Emergency Room. The Memorial Emergency Room records reflect that Claimant reported doing heavy lifting when he felt a pop in his low back and had pain in his legs to approximately his knees bilaterally. These records also state that Claimant was incontinent of stool on one occasion and that the Claimant underwent an MRI to rule out cauda equina syndrome.

7. On March 31, 2014, Claimant was seen again in the Memorial Hospital Emergency Room complaining of severe back pain for which medication was provided. The examining physician noted that the MRI revealed disc degeneration as well as some protrusion without nerve impingement.

8. On April 2, 2014 Claimant was seen again for back pain at Memorial Hospital. This report discussed the MRI which revealed a bulging disc but no cauda equina syndrome. The examining physician noted Claimant required outpatient follow-up and pain management.

9. On April 14, 2014, Claimant was evaluated by Dr. Timothy Sandell at Pikes Peak Physical Medicine. Claimant reported the same history he had provided to the emergency room doctors of lifting concrete forms and feeling pain in his low back and down his legs. Dr. Sandell stated Claimant exhibited extensive pain behaviors in the examination and that he was unable to note any neurological abnormalities. Dr. Sandell recommended another MRI and prescribed Claimant a Medrol Dosepak. On May 8, 2014, May 12, 2014, and May 22, 2014, Dr. Sandell's physician's assistant, Daniel Haecker saw Claimant. On June 10, 2014, Mr. Haecker indicated that Claimant had undergone a right L5-S1 epidural steroid injection with no benefit on May 27, 2105 Electrodiagnostic testing was recommended at that time.

10. On July 14, 2014, Dr. Sandell completed electrodiagnostic testing which indicated no evidence of lumbar nerve irritation or lumbar radiculopathy.

11. On July 30, 2014, Dr. Sandell's P.A evaluated Claimant, noting Claimant had undergone a right L5-S1 steroid injection and a right L4-S5 facet joint injection with no benefit. He noted that Claimant had undergone two physical therapy visits, and had been prescribed Gabapentin with no benefit. The P.A. stated, "I discussed this patient's case extensively with Dr. Sandell. At this point, we really have nothing further to offer this patient. No further office visits will be scheduled. Since he had increased pain with physical therapy, I advised him that it would be reasonable to hold

off on physical therapy for now. We recommend reevaluation by another pain medicine office, or else an independent medical evaluation."

12. On August 25, 2015, Dr. Timothy Hall evaluated Claimant. Dr. Hall noted in his report that a lumbar MRI revealed L4-5 facet arthropathy and narrowing of the spinal canal. Dr. Hall also noted at L5-S1 a small cluster of disc protrusion with posterior annular fissure and mild facet joint arthropathy. Dr. Hall recommended proceeding with a right SI joint injection at that time. But, this recommendation was made by Dr. Hall on August 25, 2014, just two days before Claimant filed his application for hearing, Claimant has not received the SI joint injection.

13. On October 10, 2014 ALJ Donald E. Walsh granted the parties' Stipulated Motion. In this Stipulation, as noted above, Respondents and Claimant agreed that Dr. Miguel Castrejon be designated as the Claimant's ATP.

14. On October 15, 2014, Claimant saw Dr. Castrejon for the first time. Dr. Castrejon noted that Claimant had not been under the care of any physician since last seeing Dr. Sandell's office on July 30, 2014 and that Claimant was not taking any medication at that time. Dr. Castrejon noted that the mechanism of injury consisted of lifting concrete forms, subsequent to which Claimant reported onset of back and right leg pain. Dr. Castrejon stated that these symptoms had remained consistent throughout the record and history review. Dr. Castrejon noted that Dr. Sandell had performed spinal injections, epidural and facet, but that they failed to benefit Claimant. He noted that these injections were medically reasonable based upon the MRI findings in conjunction with physical presentation. Dr. Castrejon recognized that Dr. Sandell performed electrodiagnostic testing after Claimant failed to improve, and that testing failed to reveal evidence of central or peripheral lesion.

15. Dr. Castrejon noted that Dr. Sandell did not consider sacroiliac or piriformis mediated pain as possible diagnoses, nor did he consider chemical radiculitis on the basis of the fissure that was seen on MRI. Dr. Castrejon noted that Claimant discussed these possibilities with Dr. Hall, who ultimately recommended proceeding with right SI joint injection. Dr. Castrejon noted many pain behaviors with some findings that were considered to be positive for Waddell's. Nevertheless, Dr. Sandell found that testing for Waddell's in the Latin population is not conclusive given cultural differences that exist between the Latin culture compared to other cultures. He testified that Claimant's behavior was normal within his population. Dr. Castrejon indicated positive examination findings that he found were reproducible involving the right SI joint piriformis. On October 15, 2014 Dr. Castrejon diagnosed Claimant as follows:

- Lumbar musculoligamentous strain/sprain with primarily right SI joint involvement.

- Right lower limb radiculities with no electrodiagnostic evidence of lumbar radiculopahty, consider related to piriformis syndrome vs discogneric.

- MRI evidence of posterior disc protrusion at L5-S1with posterior annular fissure and facet joint arthoropy.

- Right lower limb swelling likely secondary to disuse, with element of neuropathic pain not likely related to complex regional pain syndrome.

- Reactive depression and anxiety.

16. Dr. Castrejon initiated a trial of Cymbalta and Neurontin. He also prescribed a combination of chiropractic and physical therapy, with emphasis on treating the presumed sacroiliac and piriformis conditions. Dr. Castrejon discontinued Claimant's use of crutches and provided him with a cane for assisted ambulation. Dr. Castrejon found Claimant was not at maximum medical improvement (MMI) and considered Claimant temporary totally disabled at that time.

17. On March 26, 2014, and May 13, 2014, Claimant underwent MRI's of his lumbar spine. Dr. Castrejon noted the following regarding the May 13, 2014 MRI:

- it revealed a retrolisthesis at L5-S1, which would imply an inconsistent stacking of the two lower vertebrae, which could suggest instability;

- it identified a small mid-portion tear of the disc that creates instability to the disc, produces pain, andallows the internal contents of the disc to excrete onto the nerve root causing chemical radiculitis. Chemical radiculitis leads to lower limb pain. It can also lead to lower limb numbness and to findings described by the patient as burning pain or even sensation of weakness, if there is enough involvement of the nerve root.; and

- It showed facet joint changes at L4-5 and L5-S1.

18. Dr. Castrejon also noted the indication of a small protrusion in the May 13, 2014 MRI which was also apparent on the March 26, 2014 MRI. Dr. Castrejon noted that it was "medically reasonable based upon the MRI findings in conjunction with the physical presentation" for Dr. Sandell to have proceeded with the epidural and facet injections.

19. Dr. Castrejon testified the MRIs showed Claimant was neurologically intact and did not require other testing at that time. Dr. Castrejon felt that Claimant had received very limited conservative care, and planned to provide chiropractic/physical therapy directed to the SI joint in keeping with the *Guidelines*, and then move toward an SI joint injection, if needed.

20. On October 15, 2014, Dr. Castrejon made consistent, positive, reproducible findings of SI joint dysfunction when examining Claimant. These included pelvic obliquity which implies that there is an unlevel the pelvis; and reproducible joint pain with various maneuvers, including Gaenslen's maneuvers, a SI joint compression maneuver, and a Patrick's maneuver. Dr. Castrejon was aware of other doctors' notes notes indicating difficulty examining Claimant, but Dr. Castrejon had no such

difficulties and was able to rule out facet-loading pain which would be indicative of malingering. All of his findings were consistent with an SI-mediated problem.

21. Dr. Castrejon's November 17, 2014 report stated that Claimant was deriving benefit with chiropractic in terms of mild decrease in pain, and increase in strength, balance and overall function.

22. Dr. Castrejon stated Claimant's last chiropractic appointment was on December 1, 2014. He compared Claimant during treatment as moving better, he seemed in better spirits, and he was actually able to do more, of what I needed him to do, during the examination. After the chiropractic treatment was denied, "he looked like he had digressed, and was looking more the way he did the first time I saw him, where, he was keeping the weight off that leg, using the cane much more, having difficulty getting off -- on the examination table -- was not even sitting anymore. All he could do was stand."

23. On December 11, 2014, Dr. Castrejon formally made the request for the SI joint injection. Dr. Castrejon stated that he made this request "after the patient indicated that, as a result of that flare up, he needed some form of pain control." Dr. Castrejon explained the majority of Claimant's reproducible pain remained in the SI area and he needed to provide a diagnostic and therapeutic injection, and ensure that that actually was the etiology of his problem.

24. Claimant received Respondents denial for chiropractic care on December 12, 2014, and denial for SI joint injection on January 22, 2015. The Claimant was not seen for Respondents' independent medical examination (IME) with Dr. Raschbacher until February 23, 2015. Dr. Raschbacher saw Claimant one time for forty minutes according the audio recording of that date.

25. Dr. Raschbacher indicated in his February 23, 2015 report that he believed that Claimant reached MMI on April 14, 2014. His report states "Given that presentation, one could also reasonably make a case, medically, that 04/14/14 would be a reasonable MMI date given his presentation at that time with what were apparently florid pain behaviors."

26. Dr. Raschbacher stated that within three weeks of the date of the accident, Claimant should not have been entitled to any medical treatment whatsoever. "I think that 4/14/14 would be a reasonable MMI date because of his presentation, and I guess retrospectively you can say that that's been borne out by the imaging tests and his reported response to treatment."

27. Dr. Raschbacher does not believe that Claimant's MRIs s how anything significant: only age related degeneration which would not explain his presentation.

28. Dr. Raschbacher's findings are summarized as follows:

- Claimant was evaluated by physical medicine specialist, Dr. Sandell, who felt he had nothing further to offer. Multiple possible diagnoses were mentioned. More recently, Claimant has come under Dr. Castrejon's care, and he opines that an SI injection on the right side would be appropriate.

- Differential diagnoses include malingering or symptomatic right SI joint dysfunction. SI joint dysfunction or pain would certainly not explain the presentation, which is, with respect to subjective complaints, far out of proportion to the paucity of objective findings. Even if the SI joint were symptomatic, it would not be medically likely that he would present as he does.
- I think that with the presentation exhibited by Mr. Lucero, that there is reasonable likelihood that his primary diagnosis is malingering.

29. Dr. Raschbacher's February 23, 2015 report does not address Dr. Castrejon's recommendation of chiropractic care or Claimant's positive response to same.

30. Dr. Raschbacher makes mention of chiropractic care in his hearing testimony. He recommended against further chiropractic care because Claimant did not have a consistent presentation of SI joint findings from the outset. He further opined, "I think it unlikely that any type of care is going to change his subjective reports and change his presentation."

31. Dr. Raschbacher testified that he recommends SI joint injections "when there is clear evidence of an SI joint dysfunction that has been consistent, and -- basically if I feel that's the correct diagnosis and time [and] conservative care, occasionally chiropractic whatever you're treating it with hasn't resolved it, then it's a reasonable thing to consider for persistent SI joint dysfunction."

32. He testified that he would expect to see medical evidence from the outset that a claimant had consistent localizing tenderness at that joint. He would also expect other diagnoses to not appear to be likely. Facet joint, disc, et cetera. He would not expect florid pain behaviors.

33. Dr. Raschbacher testified that to a reasonable degree of medical certainty he does not believe that Claimant requires SI joint injections.

34. Dr. Castrejon and Dr. Raschbacher disagree on several issues. Dr. Castrejon disagrees with Dr. Raschbacher that Claimant reached MMI on April 14, 2014. Dr. Castrejon states, "at the time that he is indicating that Claimant would have been at MMI, there was still no diagnosis or etiology, etiology to explain his symptoms, nor his presentation, and the guidelines are clear, in stating that we need to determine -- do whatever is needed --to determine what the actual diagnosis is." Claimant had not been adequately diagnosed, he was still very functionally limited, and he had consistent, reproducible findings on examination.

35. Dr. Castrejon also disagrees with Dr. Raschbacher regarding the mechanism of injury. Dr. Raschbacher states "the lifting injury is not one that is particularly likely to cause SI joint injury or dysfunction." Dr. Castrejon concluded otherwise: "this gentleman was performing heavy lifting and at one point, when he had the pain, severe pain, he was actually unable to continue to do the lifting. In my opinion, the lifting and rotational movements, that he was performing, are consistent with the mechanism of injury for an SI condition." Dr. Castrejon's opinion was based in

part on an article written by Dr. Cohen from Johns Hopkins which identifies “all of the different mechanisms that can lead to an SI problem including myofascial pain, including lifting, including lifting and rotation . . . direct impacts onto the hip or the side.”

36. Dr. Castrejon addresses each reason Dr. Raschbacher states that a claimant would require an SI joint injection. Dr. Raschbacher states that “You’d expect that from the outset they would have had localizing tenderness at that joint. You would expect it to be consistent. Dr. Castrejon noted that in 20% of people the SI joint condition is not found until the patient has undergone an entire workup for other issues. Dr. Castrejon was critical of Dr. Raschbacher’s exanination of Claimant’s SI joint, his failure to perform a Gaenslen's maneuver, his failure to look for pelvic obliquity, his failure to do a Patrick's maneuver, and his failure to do SI joint-stressing or evaluate the gluteus medius or maximus.

37. Dr. Raschbacher testified that he did not perform a Gaenslen’s maneuver, a Patrick’s maneuver, or SI joint stressing and that he did not look for obliquity. Dr. Raschbacher said that his evaluation of the gluteus medius or maximus was just watching the Claimant’s gait but acknowledged he does not specifically mention this issue in his report.

38. Dr. Raschbacher opined, “You would also expect other diagnoses to not appear to be likely. Facet joint, disc, et cetera.” Dr. Castrejon disagrees, stating: “People, who have complicated spines, postsurgical spine and even non-surgical spines, will have two or three different diagnoses going on at the same time. And that's the purpose of sometimes doing these selective nerve root blocks or spinal injections, is to weed out which are -- which is actually the overwhelming factor.

39. Dr. Raschbacher states Claimant should not have the SI joint injection due to his “florid pain behaviors.” However, Dr. Castrejon explained that he did not observe such behavior. Rather, he observed consistent pain behaviors, “and they're not any more than I would expect in somebody of the Latin culture.”

40. Dr. Castrejon believes Claimant needs the SI joint injection that he recommended by testifying because he has multiple issues, multiple issues primarily because of the length of time that he has remained in pain, and really limited treatment. Dr. Castrejon noted that while Claimant has undergone some diagnostic testing, his care has been fragmented. He also explained that caused altered spinal and gait mechanics. Further Claimant has developed chronic pain. He recommended physical therapy and good psychological care.

41. Dr. Castrejon addressed that even though prior injections were not successful, he believes the SI joint injection would be different because it targets a different area and could provide diagnostic and therapeutic relief.

42. Dr. Raschbacher has commented why Claimant would not need chiropractic care. Dr. Raschbacher says that Claimant would not need chiropractic care because “Well, I think that going way back to the beginning now, he would have had consistent presentation with for example SI joint findings from the outset.” Dr. Castrejon disagreed, noting, “Chiropractic isn't just used for an SI problem. He has a

chronic lumbar-straining injury that is affecting the sacroiliac joint. So, chiropractic most likely was providing benefit not only to the SI but, also, to the other substantial structures of the spine."

43. Dr. Raschbacher stated another reason Claimant would not need chiropractic care was that Claimant "didn't appear to have localizing SI joint findings at the beginning, and certainly he wouldn't be likely medically to develop SI joint dysfunction later on." Dr. Castrejon disagreed, noting: "usually an SI problem, if it isn't immediate, it will be produced as time goes on, especially in the case of this gentleman, with the altered mechanics that he has in terms of his body movements and activity."

44. Dr. Raschbacher opined, "[Claimant] doesn't require further chiropractic care, and I think it is unlikely that any type of care is going to change his subjective reports and change his presentation." Dr. Castrejon disagreed, expressing frustration over what he perceived as Dr. Raschbacher's bias:

> Well, I disagree, because it appears to me, with all respect, that Dr. Raschbacher has already placed this gentleman into the malingering category, and no matter what question we ask of Dr. Raschbacher, he is going to use that as his support for denying, or not authorizing or not recommending, any ongoing care for [Claimant].

45. Dr. Castrejon opines to a reasonable degree of medical probability that he believes that Claimant requires continuing chiropractic care.

46. Dr. Raschbacher, and Respondents have indicated that Claimant's positive Waddell findings, which would have been 2 out of 5 or 3 out of 5 positive findings by Dr. Castrejon and 5 out of 5 by Dr. Raschbacher are indications that Claimant does not require further chiropractic care or the SI joint injections. Dr. Castrejon has addressed this issue. Dr. Castrejon's report of October 15, 2014, he states "On examination today, there are many pain behaviors with some findings that would be considered positive for Waddell's. Nevertheless, I have found that the testing for Waddell's in the Latin population is not entirely conclusive given the cultural differences that exist."

47. Dr. Castrejon also addresses the issue of Dr. Raschbacher's primary diagnosis of Claimant as malingering. Dr. Castrejon disagrees with this finding, noting consistency in Claimant's pain diagrams, he did not misuse medications, he underwent spinal injections without sedation, he followed every recommendation in his treatment plan, and his examinations have been consistent.

48. Respondents have stated throughout their cross examination of Dr. Castrejon on May 28, 2015 that "Dr. Sandell indicated that no further care was necessary." The ALJ finds that statement to be inaccurate. Dr. Sandell's office has provided a record of July 30, 2014 which states, "I [PA Hacker] discussed this patient's case extensively with Dr. Sandell. At this point, we really have nothing further to offer this patient. No further office visits will be scheduled. Since he had increased pain with physical therapy I advised him that it would be reasonable for him to hold off on

any further physical therapy for now. We recommend reevaluation by another pain medicine office or else an independent medical evaluation." The clear recommendation on July 30, 2014 is a "reevaluation by another pain medicine office."

49. It appears Dr Sandell's office left open the issue that another pain medicine office, not their own, could identify treatment that is being put on hold "for now." Based on this recommendation, Claimant saw Dr. Timothy Hall on August 25, 2014, before Respondents agreed that Dr. Miguel Castrejon would be the ATP in this case. Dr. Hall's August 25, 2014 report indicates objective, significant changes that were reproducible and supported that an industrial injury occurred. Dr. Hall recommended an SI joint injection, and planned a right SI joint injection for diagnostic purposes. Claimant followed up with Dr. Castrejon on October 15, 2014, with a noted SI joint dysfunction and a recommendation of an SI joint injection. Respondents' argument that Dr. Sandell recommended no further treatment is incorrect because he recommended treatment by "another pain management office." The follow up to another pain management office occurred when Claimant sought treatment from Dr. Hall. Dr. Hall's diagnosis supports the need for an SI joint injection and chiropractic treatment.

50. On April 4, 2014, Claimant testified at hearing that he received benefit from chiropractic care until Insurer cancelled the visits for chiropractic care. He noted that it helped his body, it allowed him to walk, and to move better. He testified that one month after he stopped chiropractic he hed more difficulty with range of motion.

51. Claimant testified that he wishes to have the SI joint injection because it was recommended by Dr. Castrejon and he trusts Dr. Castrejon and feels that the SI joint injection would be helpful.

52. Dr. Castrejon believes the Claimant should be entitled to additional chiropractic care and the SI joint injection that has been denied by the Respondents. In his opinion, Claimant has multiple issues primarily because of the length of time that he has remained in pain with only a limited amount of conservative care. This has caused him to develop chronic pain and chronic alterations of his biomechanics.

53. Dr. Castrejon is the agreed upon ATP in this case. He has seen Claimant numerous times since October 15, 2014. He also exhibited a credible and persuasive explanation of Claimant's presentation. The ALJI finds the opinions of Dr. Castrejon to be more persuasive and credible than those of Dr. Rashbacher.

54. Dr. Raschbacher saw the Claimant one time on February 23, 2015 for forty minutes. This was after Respondents' denied chiropractic care and the SI joint injection as not being reasonable and necessary. Dr. Raschbacher made a finding that the Claimant reached MMI on April 14, 2014 only three weeks after the date of his accident which the ALJ does not find to be credible. Dr. Raschbacher did not complete a full examination of Claimant in regard to identifying a SI dysfunction indicating that he was unable to do so. Dr. Raschbacher indicated that he did not do the sufficient testing to determine whether an SI joint injection was reasonable and necessary.

55. Dr. Raschbacher did not mention the chiropractic recommendation in his February 23, 2015 report, and addressed it in his testimony in a limited fashion. Dr.

Raschbacher's main diagnosis of the Claimant is malingering. However, he goes on to say "With respect to differential diagnosis, these include malingering or symptomatic right SI joint dysfunction." Dr. Raschbacher goes on to say, however, that "Even if the SI joint were actually symptomatic, it would not be medically likely that he would present as he does." Dr. Raschbacher states that he was unable to perform the testing necessary to determine an SI dysfunction although the ATP was able to do so. Dr. Raschbacher states that because his opinion is that the Claimant is a malingerer that he is not entitled to the denied medical treatment. The ALJ is not persuaded by Dr. Raschbacher's opinions.

56. Respondents' position is based on the report of Dr. Raschbacher, that the treatment is not reasonable and necessary. As stated, the ALJ is not persuaded by the opinions of Dr. Raschbacher. The ALJ is persuaded by the opinions of Dr. Castrejon, and by Claimant's testimony that he is not malingering and that he had not reached MMI as of April 14, 2014 as Dr. Raschbacher stated. Based on this, the ALJ finds that the opinions of Dr. Raschbacher are not persuasive. To the contrary, the ALJ finds the opinions of Dr. Castrejon to be credible and persuasive.

57. Further, the ALJ finds that Claimant, who the ALJ finds credible, has proven the reasonableness and necessity of continued chiropractic treatment and the SI joint injection. The ALJ further finds find that Respondents have not met their burden of proving otherwise.

58. Claimant's description of the injury and his physical complaints have been consistent throughout his medical records and his testimony is persuasive and credible.

59. Dr. Castrejon's opinions have been persuasive and credible in terms of the reasonableness and necessity of the Claimant's need for chiropractic care and the SI joint injection.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the Judge draws the following conclusions of law:

The purpose of the Workers' Compensation Act of Colorado is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. § 8-40-102(1), C.R.S. A claimant in a workers' compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. § 8-43-201, C.R.S. A preponderance of the evidence is that leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. § 8-43-201, C.R.S. A workers' compensation case is decided on its merits. § 8-43-201, C.R.S.

The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as

unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and action; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 57 P.2d 1205 (Colo. 1936); CJI, Civil 3:16 (2006).

In deciding whether a party to a workers' compensation dispute has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Kroupa v. Industrial Claim Appeals Office*, 53 P3d 1192, 1197 (Colo. App. 2002).

Claimant has the burden of proving that requested medical treatment is reasonable, necessary and related to a work injury. Specifically, C.R.S. § 8-42-101(1)(a) provides the following directive on this issue: "Every employer shall furnish such medical [treatment]. . . as may reasonably be needed at the time of the injury or occupational disease and thereafter during the disability to cure and relieve the employee from the effects of the injury."

Preponderance of the evidence means as follows: "Proof by a preponderance of the evidence requires the proponent to establish that the existence of a 'contested fact is more probable than its nonexistence." *Jimenez-Chavez v. Cargill Meat*, W.C. No. 4-704-536 (October 2008); *see Page v. Clark*, 592 P.2d 792 (Colo. 1979).

Pursuant to W.C.R.P 16-10, Respondents bear the burden of proof and must demonstrate by a preponderance of the evidence that a claimant's medical treatment is not reasonably necessary to cure or relieve the effects of the work injury. *Salisbury v. Prowers County School District*, W.C. No. 4-702-144 (June 5, 2012) (respondents have burden pursuant C.R.S § 8-43-201(1), to prove treatment is not reasonable, necessary or related).

The question of whether a particular medical treatment is reasonable and necessary is one of fact for determination by the ALJ. *Kroupa v. Industrial Claim Appeals Office*, supra; *Wal-Mart Stores, Inc. v. Industrial Claims Office*, 989 P.2d 251 (Colo. App. 1999). The claimant bears the burden of proof to establish the right to specific medical benefits. *HLJ Management Group, Inc. v. Kim*, 804 P.2d 250 (Colo. App. 1990). Factual determinations related to this issue must be supported by substantial evidence in the record. C.R.S. Section 8-43-301(8) Substantial evidence is that quantum of probative evidence which a rational fact finder would accept as adequate to support a conclusion without regard to the existence of conflicting evidence. *Metro Moving and Storage Co. v. Gussert*, 914 P.2d 411, 415 (Colo. App. 1995).

ATP Dr. Castrejon has been highly persuasive and credible in his opinions that the Claimant requires chiropractic care and the SI joint injection. The Claimant made

positive steps in regard to strength, range of motion and function with the limited chiropractic treatment that he had. His pain was better, he was able to walk and ambulate better and he was in better spirits while he was having the chiropractic treatment. After the chiropractic treatment was denied the Claimant regressed in all of these areas. Therefore, I am convinced that the chiropractic treatment is both reasonable and necessary. I am also persuaded that an SI joint dysfunction has been identified for the Claimant by Dr. Castrejon and was identified long ago. I am also persuaded that the SI joint injection is necessary for both diagnostic and therapeutic reasons as explained by Dr. Castrejon.

Claimant has proven by a preponderance of the evidence that he is entitled to receive both the recommended chiropractic treatment and the SI joint injection as reasonably necessary to cure or relieve the Claimant from the effects of the admitted work injury.

Respondents have failed to prove by a preponderance of the evidence that the recommended chiropractic treatment and SI joint injection are unreasonable and unnecessary in relation to the admitted work injury.

Respondents are liable for authorized medical treatment that is reasonable and necessary to cure and relieve the effects of an industrial injury. C.R.S. 8-42-101(1)(a), *Colorado Comp. Ins. Auth. v. Nofio*, 886 P.2d 714, 716 (Colo. 1994).

ORDER

Based upon the foregoing findings of fact and conclusions of law, the Judge enters the following order:

1. Claimant's claim for further chiropractic care as recommended by Dr. Castrejon is GRANTED. Insurer shall provide such care.

2. Claimant's claim for SI joint injections as recommended by Dr. Castrejon is GRANTED. Insurer shall provide such care.

3. Issues not expressly decided herein are reserved to the parties for future determination.

4. If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) that you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) that you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: July 27, 2015

/s/ Kimberly Turnbow
Kimberly B. Turnbow
Administrative Law Judge
Office of Administrative Courts
1525 Sherman St., 4th Floor
Denver, CO 80203

STIPULATIONS

1. To the extent that Claimant's alleged back injuries are found to be related to the Claimant's April 22, 2014 work injury, the parties stipulate and agree that the Claimant's average weekly wage (AWW) is $736.71 with a corresponding TTD rate of $491.14.

ISSUES

The issues for determination are:

1. Whether the Claimant has proven, by a preponderance of the evidence, that he sustained an injury to his low back on April 22, 2014.

2. If the Claimant's low back claim is compensable, whether the Claimant has proven, by a preponderance of the evidence, that he is entitled to medical treatment to cure and relieve him from the effects of the April 22, 2014 injury.

3. If the Claimant's low back claim is compensable, whether Claimant proved, by a preponderance of the evidence, that he is entitled to temporary total disability benefits from May 7, 2014 through June 3, 2014.

FINDINGS OF FACT

1. The Claimant worked for Employer as a stocking clerk. In this position, his duties including loading and unloading product from skids to the freezer shelves and to frequently lift between 2 and 30 pounds, bend frequently, and twist frequently. Claimant further testified that this was the position he was working on April 22, 2014. The Claimant's testimony was credible and is found and is found as fact.

2. Claimant was working his shift on April 22, 2014 and was performing the duties of lifting items and placing them on the freezer shelves. Approximately an hour prior to the end of Claimant's shift, Claimant was had placed a package on the freezer shelve and was in the process of bending to pick up more product from the skid. As Claimant bent, he felt and immediate pain in his back that radiated into his legs. Claimant testified that his hands were empty at the time of the injury. The Claimant's testimony regarding his mechanism of injury was credible, not contested, generally consistent with the medical records, and is found as fact.

3. Claimant testified that he had a prior injury in his low back the year before on approximately August 10, 2013 for which he had filed a Workers' Compensation claim. Claimant testified that the previous injury had resolved with physical therapy after approximately 2 months of treatment. Claimant also testified following the previous injury, he did not have medical restrictions and was working at full duty prior to April 22, 2014. The Claimant's testimony regarding his prior low back injury and its resolution was credible and supported by the medical records at Claimant's Exhibits 19 – 23, and is found as fact.

4. Claimant immediately informed Grocery Manager, Austin Icke of what had happened and explained that he was in pain. Mr. Icke asked if Claimant wanted to report the injury as a work accident. Claimant testified that, at that time, he did not want to file a report because he believed that his symptoms would resolve shortly and Claimant returned to finish the remainder of his shift.

5. As Claimant continued his shift, his pain did not resolve and Claimant left his shift approximately 30 minutes early due to his pain. Following his shift, Claimant sought treatment at Kaiser Permanente. Claimant testified he was informed by providers at Kaiser Permanente that because the injury was work related, Claimant would not be able to continue to received medical treatment through that facility should his symptoms continue.

6. Claimant contacted Mr. Icke again and informed Mr. Icke that he wanted to report the injury as a Workers' Compensation Claim and seek medical treatment through a Workers' Compensation doctor.

7. The Claimant's testimony regarding the reporting of his injury to his supervisor is credible, not contested, and is found as fact.

8. Claimant was then sent to Union Medical, PC on April 23, 2014 where he was evaluated by Dr. Paz and Erin Lay, PA C/F. Claimant was given medical restrictions that limited him from lifting more than 10 lbs., carrying more than 10 lbs., and pushing/pulling more than 10 lbs. Based on this evaluation, Dr. Paz opined that his objective findings were consistent with a work related mechanism of injury. Claimant continued to treat with Union Medical, PC until May 7, 2014 and continued to remain on medical restrictions. The Claimant was provided modified light duty at work while he was in physical therapy recommended by Dr. Paz.

9. Respondents filed a Notice of Contest on May 6, 2014 and Claimant was no longer able to continue treating through the Workers' Compensation providers. Claimant attempted to return to work on May 7, 2014 but was sent home because he remained on restricted duty but his claim had been denied. Claimant was not allowed to return to work until he could provide a release to full duty from a medical provider.

10. Claimant continued to follow up with providers at Kaiser Permanente and remained on restrictions. Claimant testified that during that time, he experienced an

aggravation while completing yard work but that the aggravation ultimately improved. On June 2, 2014, Claimant was approved to return to full duty starting on June 3, 2014.

11. Between May 7, 2014 and June 3, 2014, Claimant was not paid wage loss benefits due to the claim being denied.

12. Claimant testified that he returned to full duty as of June 3, 2014 and has continued working since that time. Claimant continues to experience low back pain and symptoms but has not returned to a medical provider for treatment due to the financial expense of doing so.

CONCLUSIONS OF LAW

Generally

The purpose of the Workers' Compensation Act of Colorado (Act), C.R.S §§ 8-40-101, *et seq*., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. C.R.S. § 8-40-102(1). The Claimant shoulders the burden of proving entitlement benefits by a preponderance of the evidence. C.R.S. § 8-43-201. Respondent bears the burden of establishing any affirmative defenses. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The fact in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the Claimant nor in favor of the rights of the respondents and a workers' compensation claim shall be decided on its merits. C.R.S. § 8-43-201 (2008).

The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo.App. 2000).

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness whether the testimony has been contradicted; and bias, prejudice, or interest. See, *Prudential Insurance Co v. Cline,* 98 Colo. 275, 57 p.2d 1205 (1936); *Bodensieck v. Industrial Claim Appeals Office*, 138 P.3d 684 (Colo. App. 2008; *Kroupa v. Industrial Claim Appeals Office*, 53 P.3d 1192 (Colo. App. 2002).

Compensability

Whether a compensable injury has been sustained is a question of fact to be determined by the ALJ. *Eller v. Industrial Claim Appeals Office*, 224 P.3d 397 (Colo. App. Div. 5 2009). The Claimant's right to compensation initially hinges upon a determination that "at the time of the injury, the employee is performing service arising

out of and in the course of the employee's employment." C.R.S. § 8-41-301(1)(b). The "arising out of" test is one of causation which requires that the injury have its origins in an employee's work-related functions. There is no presumption than an injury which occurs in the course of employment arises out of the employment. *Finn v. Industrial Commission,* 165 Colo. 106, 437 P.2d 542 (1968). The evidence must establish the causal connection with reasonable probability, but it need not establish it with reasonable medical certainty. *Ringsby Truck Lines, Inc. v. Industrial Commission*, 30 Colo. App. 224, 491 P.2d 106 (Colo. App. 1971); *Industrial Commission v. Royal Indemnity Co.,* 124 Colo. 210, 236 P.2d 2993. A causal connection may be established by circumstantial evidence and expert medical testimony is not necessarily required. *Industrial Commission of Colorado v. Jones*, 688 P.2d 1116 (Colo. 1984); *Industrial Commission v. Royal Indemnity Co.,* 124 Colo. 210, 236 P.2d 293 (1951).

Compensable injuries are those which require medical treatment or cause disability. *H & H Warehouse v. Vicory,* 805 P.2d 1167 (Colo. App. 1990). All results flowing proximately and naturally from an industrial injury are compensable. *See Standard Metals Corp. v. Ball,* 172 Colo. 510, 474 P.2d 622 (1970). In order to prove causation, it is not necessary to establish that the industrial injury was the sole cause of the need for treatment. Rather, it is sufficient if the injury is a "significant" cause of the need for treatment in the sense that there is a direct relationship between the precipitating event and the need for treatment. A preexisting condition does not disqualify a claimant from receiving workers' compensation benefits. Rather, where the industrial injury aggravates, accelerates, or combines with a preexisting disease or infirmity to produce the need for treatment, the treatment is a compensable consequence of the industrial injury. *Joslins Dry Goods Co. v. Industrial Claim Appeals Office,* 21 P.3d 866 (Colo. App. 2001); *H and H Warehouse v. Vicory,* supra; *Seifried v. Industrial Commission,* 736 P.2d 1262 (Colo. App. 1986). However, where an industrial injury merely causes the discovery of the underlying disease to happen sooner, but does not accelerate the need for the surgery for the underlying disease, treatment for the preexisting condition is not compensable. *Robinson v. Youth Track*, 4-649-298 (ICAO May 15, 2007).

The mechanism of injury described by the Claimant during testimony at the hearing, which is consistent with his description to medical providers, is not contested and, per Dr. Paz, it is a mechanism of injury that is consistent with the physical findings on examination. The injury was significant enough to require work restrictions that caused the Employer to advise the Claimant he could not return to work until he was cleared by a doctor. The injury occurred during Claimant's work shift while he was performing activities that are a specific part of his job duties.

Based upon the Claimant's uncontroverted and supported testimony and the medical records confirming the Claimant's physical condition, it is found that the Claimant suffered a compensable injury.

Medical Benefits – Reasonable, Necessary and Causally Related

Respondents are liable for medical treatment reasonably necessary to cure or relieve the employee from the effects of the injury. Section 8-42-101 C.R.S. However, the right to workers' compensation benefits, including medical benefits, arises only when an injured employee establishes by a preponderance of the evidence that the need for medical treatment was proximately caused by an injury arising out of and in the course of employment. § 8-41-301(1)(c), C.R.S.; *Faulkner v, Industrial. Claim Appeals Office*, 12 P.3d 844, 846 (Colo. App. 2000). The evidence musty establish the causal connection with reasonable probability, but it need not establish it with reasonable medical certainty. *Ringsby Truck Lines, Inc. v. Industrial Commission*, 30 Colo. App. 224, 491 P.2d 106 (Colo. App. 1971): *Industrial Commission v. Royal Indemnity Co.,* 124 Colo. 210, 236 P.2d 2993. Medical evidence is not required to establish causation and lay testimony alone, if credited, may constitute substantial evidence to support an ALJ's determination regarding causation. *Industrial Commission of Colorado*, 717 P.2d 1000 (Colo. App. 1986).

Here, Claimant testified credibly that he was working his regular duties on April 22, 2014 when experienced an injury to his low back. Though Claimant had previously been treated for symptoms related to his low back the year before, Claimant credibly testified, and the medical evidence supports, that Claimant had not been on medical restrictions prior to April 22, 2014 and that his previous symptoms resolved after approximately 2 months with physical therapy. Though Claimant was not holding anything in his hands at the time of the injury, his injury and the medical records are consistent with the mechanism of injury of bending and twisting. The Claimant has established that he is entitled to further evaluation of his lower back condition to determine if he requires additional medical treatment to cure and relieve the Claimant from the effects of the injury in accordance with the Act.

Temporary Disability Benefits

To prove entitlement to TTD benefits, Claimant must prove that the industrial injury caused a disability lasting more than three work shifts, that he left work as a result of the disability, and that the disability resulted in an actual wage loss. *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995); *City of Colorado Springs v. Industrial Claim Appeals Office,* 954 P.2d 637 (Colo. App. 1997). § 8-42-103(1)(a), C.R.S., requires the claimant to establish a causal connection between a work-related injury and a subsequent wage loss in order to obtain TTD benefits. *PDM Molding, Inc. v. Stanberg, supra*. The term disability, connotes two elements: (1) Medical incapacity evidenced by loss or restriction of bodily function; and (2) Impairment of wage earning capacity as demonstrated by claimant's inability to resume his prior work. *Culver v. Ace Electric*, 971 P.2d 641 (Colo. 1999). The impairment of earning capacity element of disability may be evidenced by a complete inability to work, or by restrictions which impair the claimant's ability effectively and properly to perform his regular employment. *Ortiz v. Charles J. Murphy & Co.*, 964 P.2d 595 (Colo. App. 1998). If the period of disability lasts longer than two weeks from the day the injured employee leaves work as the result

of the injury, disability indemnity shall be recoverable from the day the injured employee leaves work. § 8-42-103(1)(b), C.R.S. TTD benefits ordinarily continue until one of the occurrences listed in § 8-42-105(3), C.R.S.; *City of Colorado Springs v. Industrial Claim Appeals Office, supra*, namely:

- The employee reaches maximum medical improvement;
- The employee returns to regular or modified employment;
- The attending physician gives the employee a written release to return to regular employment; or
- the attending physician gives the employee a written release to return to modified employment, such employment is offered to the employee in writing, and the employee fails to begin such employment.

The existence of disability presents a question of fact for the ALJ. There is no requirement that the claimant produce evidence of medical restrictions imposed by an ATP, or by any other physician. Rather, lay evidence alone may be sufficient to establish disability. *Lymburn v. Symbios Logic,* 952 P.2d 831 (Colo. App. 1997).

Here, the Claimant suffered a work injury on April 22, 2014. However, the Claimant did not miss work until May 7, 2014. Claimant credibility testified, and the employer records support, that Claimant was not allowed to return to work from May 7, 2014 through June 3, 2014 because of the medical restrictions imposed upon him by his providers. These restrictions resulted in Claimant being unable to perform his regular employment and the restrictions were a direct result of the injury that Claimant sustained while bending and twisting his shift on April 22, 2014.

The total work time missed lasted longer than two weeks and therefore the Claimant is entitled to temporary total disability benefits from the day he left work. The Claimant is entitled to TTD benefits from May 7, 2014 through June 2, 2014 when, by his own testimony, he was released by his physician to return to work and he did, in fact, return to work on June 3, 2014.

ORDER

It is therefore ordered that:

1. The Claimant's suffered a compensable injury on April 22, 2014.

2. The Claimant is entitled to medical benefits to treat his low back and associated symptoms which are causally related to the April 22, 2014 work injury and the Respondent is responsible for payment for such treatment in accordance with the Medical Fee Schedule and the Act.

3. The Claimant is entitled to temporary total disability benefits at the stipulated TTD rate of $491.14 per week, from the time period of May 7, 2014 through June 3, 2014.

4. All compensation not paid when due shall bear interest at the rate of 8% per annum.

5. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1523 Sherman Street, 4th Floor, Denver, Colorado 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on the certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. NON-INSURED and

Non-Insured and Insurer/Respondents.

Hearing in the above-captioned matter was held before Edwin L. Felter, Jr., Administrative Law Judge (ALJ), on May 14, 2015, in Denver, Colorado. The hearing was digitally recorded (reference: 6/14/15, Courtroom 3, beginning at 8:30 AM, and ending at 12:00 PM).

Claimant's Exhibits 1 through 13 were admitted into evidence, without objection, Non-Insured Employer's Exhibits A through F were admitted into evidence, without objection. Respondent OSF/Pinnacol's Exhibits A through F were admitted into evidence, without objection.

At the conclusion of the hearing, the ALJ deferred ruling on the case for 15 working days to allow the parties to discuss and consider settlement. On June 5, 2015, the Claimant filed a "Status Report," indicating that the parties were continuing to engage in settlement negotiations. On June 12, 2015, the Claimant filed a subsequent "Status Report," indicating that a settlement had **not** been reached, and submitting Claimant's Exhibit 14, which reflects a Medicaid lien of $14, 832.28 by the Colorado Department of Health Care Policy and Financing against the Claimant's workers' compensation medical benefits, pursuant to § 25.5-4-301, C.R.S.

The matter was considered submitted for decision on June 12, 2015, however, due to the untimely final illness and passing of the ALJ's wife, the decision has been delayed until this time.

ISSUES

The issues to be determined by this decision concern whether or not the Employer was and "employer," as defined by the Workers' Compensation Act (hereinafter the "Act"); whether the Claimant was an "employee," as defined by the Act; whether OSF was the Claimant's statutory employer on the date of injury; whether the Employer failed to insure its liability for workers' compensation and is, therefore, subject to a 50% penalty on indemnity benefits; whether Respondent OSF/Pinnacol should be dismissed from the case; whether the Claimant suffered a compensable injury to his left hand on April 17, 2014. If compensable, the additional issues concern medical benefits, average weekly wage (AWW); temporary total disability (TTD) benefits from April 17, 2014 and continuing; and, daily penalties against the Employer for failure to timely admit or contest from May 12, 2014 (21 days after the Employer had notice of more than 3 days disability) through February 9, 2015, the date that the Respondent Employer filed a Response to Application for Hearing, which took a position on the claim, a total 274 days, both dates inclusive.

FINDINGS OF FACT

Based on the evidence presented at hearing, the ALJ makes the following Findings of Fact:

Stipulations and Findings

1. At the commencement of the hearing, the parties stipulated, and the ALJ finds, that the Employer was a sole proprietor and was not insured for workers' compensation.

2. The parties further stipulated, and the ALJ finds, that the Employer was not under contract or performing any work for OSF, which was insured by Pinnacol Assurance, and that OSF and its insurance carrier, were not proper parties.

The Injury

3. On April 17, 2014, the Claimant was working as a helper (go-fer) for the Employer when he was cutting a piece of flooring and his left hand got caught in the table saw, thus, mangling the left hand. The Employer was contemporaneously aware of the injury, and the Claimant was immediately transported to Denver Health, where emergency surgery occurred by Kyros Ipaktchi, M.D., and his assistant Christopher Lyons, M.D., hand fellow.

4. Dr. Ipaktchi's pre-operative diagnosis was:

> (1) table saw injury to left hand with zone 2 distal to PIP joint segmental defect and new complete transaction to dorsal skin with bone and soft tissue loss; (2) transaction, near complete, from volar to dorsal skin with a dorsal cortical rim still standing on the long finger in a zone 2 middle phalanx level; and, (3) amputation of the ring finger to the DIP joint with avulsion of soft tissues into the distal pulp.

5. Dr. Ipaktchi's post-operative diagnosis was:

> (1) mangling hand injury to the left hand by a table saw, coming from volar through to the dorsal side with complete amputation of the ring finger through the DIP joint with avulsion of soft tissues into the distal pulp; (2) near complete transection of the middle phalanx level of the long finger with transaction of all flexor tendons as well as radial and ulnar-sided digital artery and nerve as well as segmental bone and skin and soft tissue as well as neurovascular and tendinous subtenon loss; and, (3) index finger oblique table saw injury into the distal phalanx with avulsion of the ulnar-sided neurovascular bundles from the distal phalangeal level at the bifurcation of the vessels.

6. The ALJ observation of the Claimant's left hand illustrated a severely mangled and disfigured left hand.

7. The Claimant was discharged from Denver Health on April 21, 2014. Subsequently, in a follow up at Denver Health on August 19, 2014, Dr. Ipatchi assessed: "near amputation of left index finger, long finger, ring finger with

revasularization of the long finger and completion amputation of the index finger and ring finger…." Dr. Ipaktchi, at Claimant's request, gave him a note allowing a return to "light duty" work, however, no light duty work has been offered by the Employer and the Claimant cannot return to full duty work.

Medical Benefits

8. The Employer did not designate any specific medical provider. Moreover, the Employer facilitated the Claimant's emergency transport to Denver Health and, thus, acquiesced in treatment by Denver Health. The evidence supports the fact, and the ALJ finds that all medical care and treatment for the Claimant's work-related left hand injury was authorized, within the chain of authorized referrals, causally related to the April 17, 2014 injury, and reasonably necessary to cure and relieve the effects of that injury.

Average Weekly Wage (AWW)

9. It was the Claimant's undisputed testimony that the contract of hire with the Employer contemplated full-time, 40-hour a week work at $18 an hour. This hourly rate is corroborated by the testimony of Justin Soderberg, a principal with the Respondent Employer. Therefore, the ALJ hereby finds that the Claimant's AWW is $720. 2/3rds of the AWW, penalized by 50% for failure to insure, equals a TTD benefit of $720 per week, or $102.86 per day, pursuant to Industrial Claim Appeals office approved method of calculating aggregate days of disability.

Temporary Total Disability Benefits

10. The Claimant has not been able to return to regular work since the date of injury nor has he been offered modified work, as permitted by Dr. Ipaktchi's light duty release in August 2014. As of the present time, the Claimant has not been released to return to work without restrictions; he has not actually worked and earned wages; and, he has not been declared to be at maximum medical improvement (MMI). He has been sustaining a 100% temporary wage loss since the date of injury. Consequently, the Claimant has been temporarily and totally disabled from April 18, 2014 through the present time and continuing the present time. The period from April 18, 2014 through the hearing date, May 14, 2015, both dates inclusive, equals a total of 396 days. Aggregate TTD benefits, for this period, penalized 50% for failure to insure, equal $40,732.56.

Daily Penalties for Employer's Failure to Timely Admit or Contest

11. Daily penalties against the Employer for failure to timely admit or contest are from May 12, 2014 (21 days after the Employer had notice of more than 3 days disability) through February 9, 2015, the date that the Respondent Employer filed a

Response to Application for Hearing which took a position on the claim, a total 274 days, both dates inclusive. In light of the stipulations and findings herein above that the Employer was a sole proprietor and was not insured for workers' compensation and that the Employer was not under contract or performing any work for OSF, which was insured by Pinnacol Assurance, and that OSF and its insurance carrier, were not proper parties, the ALJ finds no mitigation to excuse or mitigate the non-insured Employer's obligation to timely admit or contest liability. Therefore, the ALJ finds that an appropriate daily penalty equals the daily TTD rate of $102.86 per day. Therefore, aggregate daily penalties for failure to timely admit or contest for 274 days, equal $28, 183.64.

Ultimate Findings

12. The Claimant's testimony was, essentially, undisputed, straight-forward, and credible. There was no persuasive testimony to the contrary.

13. The ALJ makes a rational choice, between any conflicting testimony and evidence, to accept the Claimant's testimony and reject evidence to the contrary.

14. OSF/Pinnacol were not proper parties to this case because OSF (an insured entity) was not the statutory employer of the Employer herein.

15. The Claimant was an "employee" of the Employer herein on the date of injury, and the "Employer was an 'employer,' as defined by the Act.

16. On April 17, 2014, the Claimant sustained a serious mangling, compensable injury to his left hand, and the injury arose out of the course and scope of his employment for the non-insured Employer herein and was not intentionally self-inflicted.

17. The Employer was contemporaneously aware of the injury and arranged for the emergency transport of the Claimant to Denver Health. The Employer made no specific medical referrals. All referrals emanated from Denver Health and were, therefore, within the authorized chain of referrals, Therefore, all of the Claimant's medical care and treatment for the left hand injury was authorized, causally related to the April 17, 2014 compensable injury, and reasonably necessary to cure and relieve the effects thereof.

18. The Claimant's AWW is $720, thus yielding a 50% penalized TTD rate of $720 per week.

19. The Claimant has been temporarily and totally disabled since April 17, 2014 and continuing.

20. The Employer's failed to timely admit or contest from May 12, 2014 (21 days after the Employer had notice of more than 3 days disability) through February 9, 2015, the date that the Respondent Employer filed a Response to Application for Hearing which took a position on the claim, a total 274 days, both dates inclusive. In light of the stipulations and findings herein above that the Employer was a sole proprietor and was not insured for workers' compensation and that the Employer was not under contract or performing any work for OSF, which was insured by Pinnacol Assurance, and that OSF and its insurance carrier, were not proper parties, the ALJ finds no mitigation to excuse or mitigate the non-insured Employer's obligation to timely admit or contest liability. The Employer did not have any reasonably debatable defense to non-insured liability. Therefore, the ALJ finds that an appropriate daily penalty equals the daily TTD rate of $102.86 per day. Therefore, aggregate daily penalties for failure to timely admit or contest for 274 days, equal $28,183.64.

21. The Claimant has sustained his burden of proof, by preponderant evidence, on all issues.

.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

Credibility

a. In deciding whether an injured worker has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Bodensleck v. Indus. Claim Appeals Office,* 183 P.3d 684 (Colo. App. 2008);*Kroupa v. Indus. Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002); *Rockwell International v. Turnbull,* 802 P.2d 1182, 1183 (Colo. App. 1990); *Penasquitos Village, Inc. v. NLRB*, 565 F.2d 1074 (9th Cir. 1977). The ALJ determines the credibility of the witnesses. A*renas v. Indus. Claim Appeals Office*, 8 P.3d 558 (Colo. App. 2000). The weight and credibility to be assigned evidence is a matter within the discretion of the ALJ. *Cordova v. Indus. Claim Appeals Office*, 55 P.3d 186 (Colo. App. 2002); *Youngs v. Indus. Claim Appeals Office,* 297 P.3d 964, **2012 COA 85.** The same principles concerning credibility determinations that apply to lay witnesses apply to expert witnesses as well. *See Burnham v. Grant,* 24 Colo. App. 131, 134 P. 254 (1913); *also see Heinicke v. Indus. Claim Appeals Office,* 197 P.3d 220 (Colo. App. 2008). The fact finder should consider, among other things, the consistency or inconsistency of a witness' testimony and/or actions; the reasonableness or unreasonableness (probability or improbability) of a witness' testimony and/or actions (this includes whether or not the expert opinions are adequately founded upon appropriate research); the motives of a witness; whether the testimony has been contradicted; and, bias, prejudice or interest. *See Prudential Ins. Co. v. Cline,* 98 Colo.

275, 57 P. 2d 1205 (1936); CJI, Civil, 3:16 (2005). The fact finder should consider an expert witness' special knowledge, training, experience or research (or lack thereof). *See Young v. Burke,* 139 Colo. 305, 338 P. 2d 284 (1959). The ALJ has broad discretion to determine the admissibility and/or weight of evidence based on an expert's knowledge, skill, experience, training and education. *See* S 8-43-210, C.R.S; *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P.2d 501 (Colo. App. 1995). *Also see, Annotation, Comment: Credibility of Witness Giving Un-contradicted Testimony as Matter for Court or Jury,* 62 ALR 2d 1179, maintaining that the fact finder is not free to disregard un-contradicted testimony. As found, the Claimant's testimony was, essentially, undisputed, straight-forward, and credible. There was no persuasive testimony to the contrary.

Substantial Evidence

b. An ALJ's factual findings must be supported by substantial evidence in the record. *Paint Connection Plus v. Indus. Claim Appeals Office,* 240 P.3d 429 (Colo. App. 2010); *Leewaye v. Indus. Claim Appeals Office,* 178 P.3d 1254 (Colo. App. 2007); *Brownson-Rausin v. Indus. Claim Appeals Office,* 131 P.3d 1172 (Colo. App. 2005). *Also see Martinez v. Indus. Claim Appeals Office,* 176 P.3d 826 (Colo. App. 2007). Substantial evidence is "that quantum of probative evidence which a rational fact-finder would accept as adequate to support a conclusion, without regard to the existence of conflicting evidence." *Metro Moving & Storage Co.v. Gussert,* 914 P.2d 411 (Colo. App. 1995). Reasonable probability exists if a proposition is supported by **substantial evidence** which would warrant a reasonable belief in the existence of facts supporting a particular finding. *See F.R. Orr Construction v. Rinta,* 717 P.2d 965 (Colo. App. 1985). It is the sole province of the fact finder to weigh the evidence and resolve contradictions in the evidence. See *Pacesetter Corp. v. Collett,* 33 P. 3d 1230 (Colo. App. 2001). An ALJ's resolution on questions of fact must be upheld if supported by substantial evidence and plausible inferences drawn from the record. *Eller v. Indus. Claim Appeals Office,* 224 P.3d 397, 399-400 (Colo. App. 2009). As found, the ALJ made a rational choice, between any conflicting testimony and evidence, to accept the Claimant's testimony and reject evidence to the contrary.

Non-Insurance and Employee Status

c. Section 8-43-408 (1), C.R.S., provides a 50% penalty of indemnity benefits for failure of an employer to insure its liability for workers compensation. As found, the Employer herein failed to insure its liability for workers' compensation and is, therefore, subject to a 50% increase in all indemnity benefits.

d. As found, the Claimant performed work for hire for the Employer herein and he was an "employee" within the definition of § 8-40-202, C.R.S., at the time of the compensable injury.

Compensability

e. In order for an injury to be compensable under the Workers' Compensation Act, it must "arise out of" and "occur within the course and scope" of the employment. *Price v. Indus. Claim Appeals Office,* 919 P.2d 207, 210, 210 (Colo. 1996). There is no presumption that an injury arises out of employment when an unexplained injury occurs during the course of employment. *Finn v. Indus. Comm'n,* 165 Colo. 106, 108-09, 4437 P.2d 542 (1968). Proof of causation is a threshold requirement that an injured employee must establish by a preponderance of the evidence before any benefits are awarded. § 8-41-301 (1) (c), C.R.S. *See Faulkner v. Indus. Claim Appeals Office,* 24 P.3d 844 (Colo. App. 2000)*; Eller v. Indus. Claim Appeals Office*, 224 P.3d 397, 399 (Colo. App. 2009); *Cabela v. Indus. Claim Appeals Office,* 198 P.3d 1277, 1279 (Colo. App. 2008). The question of causation is generally one of fact for the determination by the ALJ. *Faulkner* at 846; *Eller* at 399-400. As found, the Claimant sustained a compensable injury to his left hand on April 17, 2014, and this injury arose out of the course and scope of his employment.

Medical

f. Because this matter is compensable, the non-insured Respondent is liable for medical treatment which is reasonably necessary to cure or relieve the effects of an industrial injury. § 8-42-101(1) (a), C.R.S; *Snyder v. Indus. Claim Appeals Office,* 942 P.2d 1337 (Colo. App. 1997). Pursuant to § 8-43-404 (5) (a) (I) (A), C.R.S., the employer is required to furnish an injured worker a list of at least two physicians or two corporate medical providers, in the first instance. An employer's right of first selection of a medical provider is triggered when the employer has knowledge of the accompanying facts connecting the injury to the employment. *Jones v. Adolph Coors Co.,* 689 P. 2d 681 (Colo. App. 1984). An employer must tender medical treatment forthwith on notice of an injury or its right of first selection passes to the injured worker. *Rogers v. Indus. Claim Appeals Office,* 746 P.2d 565 (Colo. App. 1987). As found, the Employer was contemporaneously aware of the injury and arranged for the emergency transport of the Claimant to Denver Health. The Employer made no specific medical referrals. Therefore, all of the Claimant's medical care and treatment for the left hand injury was authorized, causally related to the April 17, 2014 compensable injury, and reasonably necessary to cure and relieve the effects thereof.

g. To be authorized, all referrals must remain within the chain of authorized referrals in the normal progression of authorized treatment. *See Mason Jar Restaurant v. Indus. Claim Appeals Office,* 862 P. 2d 1026 (Colo. App. 1993); *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P. 2d 501 (Colo. App. 1995); *City of Durango v. Dunagan,* 939 P.2d 496 (Colo. App. 1997). As found, all referrals emanated from Denver health, The Claimant's first selection of a medical provider, and were, therefore, within the authorized chain of referrals.

h. To be a compensable benefit, medical care and treatment must be causally related to an industrial injury or occupational disease. *Dependable Cleaners v. Vasquez,* 883 P. 2d 583 (Colo. App. 1994). As found, Claimant's medical treatment is causally related to the left hand, mangling injury of April 17, 2014. Also, medical treatment must be reasonably necessary to cure and relieve the effects of the industrial occupational disease. § 8-42-101 (1) (a), C.R.S. *Morey Mercantile v. Flynt,* 97 Colo. 163, 47 P. 2d 864 (1935); *Sims v. Indus. Claim Appeals Office,* 797 P.2d 777 (Colo. App. 1990). As found, the Claimant's medical care and treatment was and is reasonably necessary to cure and relieve the effects of the April 17, 2014 compensable injury.

Average Weekly Wage (AWW)

i. An AWW calculation is designed to compensate for **total** temporary wage loss. *Pizza Hut v. Indus. Claim Appeals Office,* 18 P. 3d 867 (Colo. App. 2001). *See* § 8-42-102, C.R.S. As found, the Claimant's AWW is $720 which, ordinarily, would yield an insured TTD benefit of 2/3rds of $720, however, penalized by 50% for failure to insure the weekly TTD benefit is $720 per week, or $102.86 per day.

Penalized Temporary Disability Benefits

j. To establish entitlement to temporary disability benefits, the Claimant must prove that the industrial injury has caused a "disability," and that he has suffered a wage loss that, "to some degree," is the result of the industrial disability. § 8-42-103(1), C.R.S; *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). Disability from employment is established when the injured employee is unable to perform the usual job effectively or properly. *Jefferson Co. Schools v. Headrick*, 734 P.2d 659 (Colo. App.1986). This is true because the employee's restrictions presumably impair his opportunity to obtain employment at pre-injury wage levels. *Kiernan v. Roadway Package System*, W.C. No. 4-443-973 (ICAO, December 18, 2000). . There is no statutory requirement that a claimant must present medical opinion evidence from of an attending physician to establish her physical disability. See *Lymburn v. Symbois Logic*, 952 P.2d 831 (Colo. App. 1997). Rather, the Claimant's testimony alone is sufficient to establish a temporary "disability." *Id*. Once the prerequisites for TTD are met (*e.g.,* no release to return to full duty, MMI has not been reached, a temporary wage loss is occurring, modified employment is not made available, and there is no actual return to work), TTD benefits are designed to compensate for a 100% temporary wage loss. *See Eastman Kodak Co. v. Industrial Commission,* 725 P. 2d 107 (Colo. App. 1986); *City of Aurora v. Dortch,* 799 P. 2d 461 (Colo. App. 1990). As found, the Claimant has not been able to return to regular work since the date of injury nor has he been offered modified work, as permitted by Dr. Ipaktchi's light duty release in August 2014. As of the present time, the Claimant has not been released to return to work without restrictions; he has not actually worked and earned wages; and, he has not been declared to be at maximum medical improvement (MMI). He has been sustaining a 100% temporary wage loss since the date of injury. Consequently, the Claimant has

been temporarily and totally disabled from April 18, 2014 through the present time and continuing the present time. The period from April 18, 2014 through the hearing date, May 14, 2015, both dates inclusive, equals a total of 396 days. Aggregate TTD benefits, for this period, penalized 50% for failure to insure, equal $40,732.56.

Daily Penalty for Failure to Timely Admit or Contest

k. Section 8-43-203 (2) (a), C.R.S., provides for a daily penalty of one day's compensation for each day's failure to timely admit or contest, up to 365 days, 50% payable to the Subsequent Injury Fund and 50% payable to the Claimant. As found, the Employer's failed to timely admit or contest from May 12, 2014 (21 days after the Employer had notice of more than 3 days disability) through February 9, 2015, the date that the Respondent Employer filed a Response to Application for Hearing which took a position on the claim, a total 274 days, both dates inclusive. In light of the stipulations and findings herein above that the Employer was a sole proprietor and was not insured for workers' compensation and that the Employer was not under contract or performing any work for OSF, which was insured by Pinnacol Assurance, and that OSF and its insurance carrier, were not proper parties, the ALJ finds no mitigation to excuse or mitigate the non-insured Employer's obligation to timely admit or contest liability. As found, the Employer lacked any reasonably debatable defense to non-insured employer liability. Therefore, the ALJ finds that an appropriate daily penalty equals the daily TTD rate of $102.86 per day. Therefore, aggregate daily penalties for failure to timely admit or contest for 274 days, equal $28,183.64.

Burden of Proof

l. The injured worker has the burden of proof, by a preponderance of the evidence, of establishing the compensability of an industrial injury and entitlement to benefits. §§ 8-43-201 and 8-43-210, C.R.S. *See City of Boulder v. Streeb,* 706 P. 2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals Office,* 12 P. 3d 844 (Colo. App. 2000); *Lutz v. Indus. Claim Appeals Office,* 24 P.3d 29 (Colo. App. 2000). *Kieckhafer v. Indus. Claim Appeals.Office*, 284 P.3d 202, 205 (Colo. App. 2012). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark,* 197 Colo. 306, 592 P. 2d 792 (1979). *People v. M.A.,* 104 P. 3d 273 (Colo. App. 2004); *Hoster v. Weld County Bi-Products, Inc.,* W.C. No. 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. *Also see Ortiz v. Principi,* 274 F.3d 1361 (D.C. Cir. 2001). "Preponderance" means "the existence of a contested fact is more probable than its

nonexistence." *Indus. Claim Appeals Office v. Jones*, 688 P.2d 1116 (Colo. 1984). As found, the Claimant has sustained his burden, by preponderant evidence, on all issues.

ORDER

IT IS, THEREFORE, ORDERED THAT:

A. Respondents OSF Investments, LLC, and their insurance carrier, Pinnacol Assurance, are hereby dismissed as parties, with prejudice.

B. The Respondent Non-Insured Employer, sole proprietor, shall pay all of the costs of medical care and treatment for the Claimant's compensable left hand injury, subject to the Division of Workers' Compensation Medical Fee Schedule.

C. The Respondent Non-Insured Employer shall pay the Claimant temporary total disability benefits at the rate of $720.00 per week, or $102.86 per day, from April 18, 2014 through May 14, 2015, both dates inclusive (penalized 50% for failure to insure) in the aggregate subtotal amount of $40,732.56, which is payable retroactively and forthwith. From May 15, 2015 and continuing until cessation of temporary indemnity benefits is warranted by law, the Non-Insured Employer shall continue to pay the Claimant $720 per week in temporary total disability benefits.

D. For failing to timely admit or contest, Respondent Non-Insured Employer shall pay daily penalty benefits at the rate of $102.86 per day. For the penalty period from May 12, 2014 through February 9, 2015, both dates inclusive, a total of 274 days, the Non-Insured Respondent shall pay aggregate daily penalties the daily TTD rate of $102.86 per day, in the aggregate amount of $28,183.64., 50%, or $14,091.82, is payable to the Claimant and $14,091.82 is payable to the Subsequent Injury Fund, Division of Workers Compensation. The grand total of indemnity benefits due as of May 14, 2015, equal $68, 916.20. The exact amount of the cost of medical benefits is as of the present time not ascertainable other the Medicaid lien of $14, 82.28, placed on medical benefits by the Colorado Department of Health Care Policy and Financing. Consequently, the grand total of presently ascertainable indemnity and medical benefits equals $83,748.48.

E. The Non-Insured Respondent Employer shall pay the Claimant statutory interest at the rate of eight percent (8%) per annum on all amounts of indemnity benefits due and not paid when due.

F. Any and all issues not determined herein are reserved for future decision.

G. In lieu of payment of the above compensation and benefits to the Claimant, the Respondent property Owner shall:

a. Deposit the sum of $ 83,748.48 with the Division of Workers' Compensation, as trustee, to secure the payment of all unpaid compensation and benefits awarded. The check shall be payable to: Division of Workers' Compensation/Trustee. The check shall be mailed to the Division of Workers' Compensation, P.O. Box 300009, Denver, Colorado 80203-0009, Attention: Sue Sobolik/Trustee; or

b. File a bond in the sum of $ 100,000.00 with the Division of Workers' Compensation within ten (10) days of the date of this order:
(1) Signed by two or more responsible sureties who have received prior approval of the Division of Workers' Compensation; or
(2) Issued by a surety company authorized to do business in Colorado.
The bond shall guarantee payment of the compensation and benefits awarded.

IT IS FURTHER ORDERED: That the on-insured Respondent Employer shall notify the Division of Workers' Compensation of payments made pursuant to this order.

IT IS FURTHER ORDERED: That the filing of any appeal, including a petition to review, shall not relieve the Non-Insured Respondent Employer of the obligation to pay the designated sum to the trustee or to file the bond. §8-43-408(2), C.R.S.

DATED this_____day of July 2015.

_____
EDWIN L. FELTER, JR.
Administrative Law Judge

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts,**1525 Sherman Street, 4th Floor, Denver, CO 80203.** You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on the certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) that you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) that you mailed it to the above address for the Denver Office of Administrative Courts. **For statutory reference, *see* § 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, *see* Rule 26, OACRP. You may access a form for a petition to review at** *http://www.colorado.gov/dpa/oac/forms-WC.htm*.

CERTIFICATE OF SERVICE

I hereby certify that I have sent true and correct copies of the foregoing **Full Findings of Fact, Conclusions of Law and Order** on this_____day of July 2015, electronically in PDF format, addressed to:

OFFICE OF ADMINISTRATIVE COURTS
STATE OF COLORADO

W.C. No. 4-951-860-03

FULL FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

IN THE MATTER OF THE WORKERS' COMPENSATION CLAIM OF:

Claimant,

v.

Employer,

and

Insurer / Respondents.

Hearing in the above-captioned matter was held before Edwin L. Felter, Jr., Administrative Law Judge (ALJ), on June 17, 2015, in Denver, Colorado. The hearing was digitally recorded (reference: 6/17/15, Courtroom 3, beginning at 8:30 AM, and ending at 12:00 PM). Fayha Suleman served as the official Arabic/English Interpreter.

Claimant's Exhibits 1 through 42 were admitted into evidence, without objection. Claimant's Exhibit 43 was withdrawn. Respondents' Exhibits A through M were admitted into evidence, without objection.

At the conclusion of the hearing, the ALJ ruled from the bench and referred preparation of a proposed decision to counsel for the Claimant. The proposed decision was filed, electronically, on June 24, 2015. On the same date, the Respondents filed objections requesting more findings including the dates of chiropractic treatment from king Chiropractic and Sean Lloyd, M.D. (an FMLA physician); and, more detailed findings concerning the basis why Kristin Mason, M.D., was designated as the designated medical provider, as detailed in the bench ruling but not included in the proposed decision. After a consideration of the proposed decision and the objections thereto, the ALJ has modified the proposal and hereby issues the following decision.

ISSUES

The issues to be determined by the decision concern compensability; if compensable, whether the right to select an authorized treating physician (ATP) passed to the Claimant when Carlos Cebrian, M.D., denied medical treatment for a non-medical reasons, thus, making the Claimant's selection of Kristin D. Mason, M.D. as the new ATP WHEN THE Respondents knew of Dr. Cebrian's opinion and offered no further medical treatment to the Claimant; also, whether the medical treatment rendered by Dr. Mason is reasonably necessary and causally related to the Claimant's injury of September 11, 2013; average weekly wage (AWW); and temporary total disability (TTD) benefits from September 11, 2013 and continuing. The Claimant withdrew the issue of temporary partial disability (TPD) benefits from September 11, 2013 and continuing. The Respondents raised the affirmative defense of "responsibility for termination."

The Claimant bears the burden of proof, by a preponderance of the evidence, on the issues of compensability, ATP, reasonably necessary, AWW, and TTD benefits. The Respondents bear the burden of proof, by a preponderance of the evidence, for the affirmative defense of "responsibility for termination."

FINDINGS OF FACT

Based on the evidence presented at hearing, the ALJ makes the following Findings of Fact:

Preliminary Findings

1. According to the Claimant, he worked for the Employer since March 14, 2011, and he speaks Arabic as his primary language.

2. The parties stipulated, and the ALJ finds, that if the claim is found compensable, the Claimant's AWW is $662.92.

3. The Respondents made a judicial admission that there was a compensable injury on September 11, 2013.

The Injury

4. On September 11, 2013, the Claimant was working at the Employer's plant as a Loin Tail Boner.

5. On September 10, 2013, the Claimant was feeling well with no previous problems or injuries in the low back, buttocks, or legs prior to the incident of September 11, 2013.

6. According to the Claimant, the following events occurred on September 11, 2013. He started work at 5:30 AM and he suffered an injury to his low back when his supervisor asked him to lift a box of meat weighing approximately forty (40) pounds. The Claimant lifted the box of meat, as directed by his supervisor, and as he twisted he felt a pain in his low back. He reported the injury immediately to his supervisor who escorted the Claimant to the Employer's clinic for treatment.

7. At hearing, the Respondents stipulated to the fact that the Claimant suffered a work-related injury on September 11, 2013, and the ALJ so finds.

Medical Treatment at the Employer's Clinic

8. The Claimant received treatment from the Employer's clinic from September 11, 2013 through May 13, 2014.

9. Dr. Cebrian testified at hearing that he holds the position of Onsite Medical Director for the Occupational Health Department, at the Employer's medical clinic, where the Claimant was treated for his low back injury until May 13, 2014.

10. Dr. Cebrian stated that the only treatment provided to the Claimant from September 11, 2013 to May 13, 2014, was ice, stretches, and home exercise education.

11. Kristin Mason, M.D., credibly testified at hearing that the care that the Claimant received at the Employer's clinic from September 11, 2013 to May 13, 2014, was a "passive kind of palliative type care."

12. On October 22, 2013, Dr. Cebrian ordered x-rays of the Claimant's low back.

13. On December 17, 2013, Dr. Cebrian placed the Claimant at maximum medical improvement (MMI).

The Claimant

14. According to the Claimant, from December 17, 2013 to February 26, 2014, his symptoms were getting worse, consisting of pain every day in the low back, buttock, and legs, which he related to the September 11, 2013 incident.

15. On February 26, 2014, the Claimant returned to the Employer's clinic for additional treatment for his low back pain.

16. On February 26, 2014, the Claimant filled out a new Employee Statement of Injury form, with a date of injury of February 20, 2014. According to the Claimant, February 20, 2014, is the date that his low back pain **worsened to a point where he determined the need to return to the Employer's medical clinic** for treatment. He testified, unequivocally, that February 20, 2014, was not a new injury date.

17. On March 17, 2014, **Dr. Cebrian released the Claimant from care, stating the opinion that there was no work related incident that occurred.**

18. On March 17, 2014, the Claimant still had back pain and it was getting worse.

19. According to the Claimant, from March 17, 2014 to May 7, 2014, his low back, buttock and leg symptoms were in the same painful condition, consisting of pain every day in the low back, buttock, and legs, which he related to the September 11, 2013 incident.

20. On May 7, 2014, because his pain in the low back, buttock, and legs was getting worse, the Claimant returned to Dr. Cebrian for treatment.

21. On May 7, 2014, the Claimant was asked to fill out another Employee Statement of Injury form. On the May 7, 2014 form, however, the Claimant testified that he did not fill in the date of entry or time of injury fields, despite the form listing a date of injury of May 7, 2014.

22. **On May 13, 2014, Dr. Cebrian released the Claimant from care for the third time and referred the Claimant to a chiropractor outside the Worker's Compensation system (as a non-work related proposition).**

<u>King Chiropractic</u>

23. According to Respondents' Exhibit F (bates 163-172), the Claimant was seen at King Chiropractic on April 4, 2014 for intake; May 9, 2014, for an adjustment and x-ray; and, May 21, 2014 for an adjustment.

24. The Claimant provided undisputed testimony that on May 19, 2014, he asked his supervisor multiple times for a break so that he could seek medical treatment for his low back pain at the Employer's medical clinic, however, the Claimant was not allowed to leave his post. After lunch, he asked again for a break to see the nurse at the Employer's medical clinic. He then proceeded to the Employer's medical clinic and requested medical treatment for his low back pain. His supervisor told the Employer's clinic not to treat the Claimant because the Employer had a note from a doctor (Dr. Cebrian) stating that the Claimant's injury is not work related. The Claimant then sought

out a union representative, who advised him to document the May 19, 2014 incident. The Claimant then documented the incident.

25. On May 19, 2014, the Claimant's Employer denied him treatment for his low back pain.

26. The fact that from September 11, 2013 to May 13, 2014, the only treatment the Claimant received consisted of ice packs, heat pads, and massage that he performed on himself is reiterated.

27. The Claimant's testimony and the medical records from the Employer's medical clinic support, that from September 11, 2013 to May 13, 2014, the Claimant worked full-duty without any medically-imposed restrictions by his ATP, Dr. Cebrian.

28. According to the Claimant, the Employee Statement of Injury forms, completed on September 11, 2013, February 26, 2014, and May 7, 2014, all relate to the injury that occurred on September 11, 2013.

Family Medical Leave Act (FMLA) Referral to Sean Lloyd, M.D.

29. The Claimant's first visit with Dr. Lloyd was on May 30, 2014, on a FMLA referral (Respondents' Exhibit J, bates 179-206). He saw Dr. Lloyd again on June 3, 2014 for an office visit and an FMLA Report (Respondents' Exhibit J, bates 201-204). He next saw Dr. Lloyd on November 21, 2014 for an FMLA office visit (Respondents' Exhibit J, bates 179-200).

Dr. Cebrian's Final Release and Referral to Physician Outside Workers Compensation System.

30. Dr. Cebrian's December 8, 2014 medical report states, "[h]e is released from care. **He was told to follow-up with his primary care physician outside of the workers' compensation system[,]"** with a MMI date of December 10, 2013.

31. In addition, the Claimant testified that the descriptions of what he was doing at the time the injury occurred, listed on the Employee Statement of Injury forms, *i.e*. "I am carrying back of meat" and "I am carrying box of meat," references the September 11, 2013 incident.

32. The Claimant stated that he communicated to the Employer's medical clinic in English each time he was evaluated.

Selection of Kristin Mason, M.D. as the ATP

33. Dr. Cebrian refused to treat the Claimant's medical condition as a work-related condition as of May 13, 2014, and ultimately referred the Claimant to a private chiropractor, thus, severing his role as the workers' compensation ATP.

34. After Dr. Cebrian's refusal to treat for non-medical reasons, Dr. Mason was the first qualified physician selected to be the Claimant's ATP. She is fully Level 2 accredited. King Chiropractic, and Dr. Lloyd, from Aurora South Medical Center do not qualify as validly selected referrals to be ATPs. King Chiropractic is only an ancillary provider, much like physical therapy, and cannot be considered an ATP for workers' compensation purposes.

35. Additionally, the Claimant was referred to Dr Lloyd of Aurora South Medical Center in regard to his FMLA claim, and not his work-related injury, and Dr. Lloyd is therefore not an appropriate ATP for workers' compensation purposes. Therefore, as of June 5, 2014, Dr. Mason became the Claimant's validly selected ATP for workers' compensation purposes.

Dr. Mason's Treatment and Opinions

36. The Claimant was evaluated and treated by Kristin Mason, M.D., from June 5, 2014 and thereafter, under his private health insurance.

37. According to Dr. Mason, on June 5, 2014, the Claimant complained of low back pain and pain down his right leg, which is consistent with the symptoms the Claimant reported and are documented in the Employer's medical clinic Daily Visit Log.

38. When Dr. Mason treated the Claimant, he reported that his low back and right leg pain complaints were attributed to his September 11, 2014 work-related injury. Dr. Mason also stated that the Claimant never reported any other injury or injury date.

39. On July 3, 2014, Dr. Mason ordered an MRI (magnetic resonance imaging) and x-rays including flexion/extension views of the Claimant's low back to determine if there was a structural reason for his pain.

40. Dr. Mason was of the opinion that "the MRI showed central disc bulges at L4-5 and L5-S1 impinging on the bilateral L5 and S1 nerve roots."

41. Dr. Mason initially treated the Claimant with physical therapy (PT). When the PT failed to resolve the Claimant's symptoms, she ordered imaging. After the imaging, Dr. Mason ordered right-sided epidural steroid injections.

42. Dr. Mason attributed the MRI findings to the Claimant's September 11, 2013 work-related injury. The basis for her opinion is that the Claimant reported no previous history of injuries or back pain prior to lifting something heavy at work.

According to Dr. Mason, a lifting injury is a common mechanism for a disc injury, the Claimant reported persistent similar symptoms since the time of onset of his pain, and the disc bulges were identified as the pain generator when he got over 50% benefit from the epidural injections. Therefore, it made sense that the abnormality on the MRI was caused or exacerbated by the lifting injury. Based on the thoroughness of Dr. Mason's exam and treatment of the Claimant, the ALJ finds her opinions far more persuasive, credible and compelling than any opinions to the contrary.

43. On August 13, 2014, the Claimant received right L4-5 and L5-S1 transforaminal epidural steroid injections by Nicholas Olsen, D.O., on referral from Dr. Mason, which resulted in a greater than 50% decrease in pain in his low back and right leg pain.

44. Dr. Mason's diagnosis of the Claimant is discogenic back pain with some right-sided L5-S1 radicular pain.

45. Dr. Mason's opinion, within a reasonable degree of medical probability, is that the Claimant's condition of discogenic back and right-sided L5-S1 radicular pain was aggravated and accelerated by the work related incident on September 11, 2013, and the ALJ so finds.

46. In Dr. Mason's opinion, the Claimant's condition is causally related to the September 11, 2013 work-related incident for the following reasons: (1) the Claimant provided a straightforward report that he lifted something heavy at work; (2) the Claimant had pain since that time; (3) the Employer medical clinic records demonstrate a continuous and chronic period of time the Claimant continued to have similar complaints following the lifting injury that were voiced to the Employer. Dr. Cebrian refused to continue to treat the Claimant's medical condition as a work-related condition as of May 13, 2014, and referred the Claimant to a private chiropractor. In denying to further treat the Claimant for his condition on the grounds that it is not work-related, Dr. Cebrian severed his role as the ATP; and, (4) the Claimant's complaints were similar to the complaints he presented to Dr. Mason. For those reasons, Dr. Mason concluded the Claimant's complaints were all due to the same injury. The ALJ finds her opinion, in this regard highly persuasive and credible.

47. According to Dr. Mason, the Claimant was not at MMI prior to June 5, 2014, because he continued to be symptomatic and he was not actively treated prior to that date.

48. According to Dr. Mason, all of the medical treatment that the Claimant received from September 11, 2013 through October 23, 2014 was reasonable, necessary and causally related to the September 11, 2013 work-related injury.

49. Dr. Mason is of the opinion that the Claimant reached MMI on October 23, 2014.

Temporary Disability Claim

50. The Claimant continued to work for the Employer at full wages and until November 18, 2014, when he was terminated.

Ultimate Findings

51. The ALJ finds the Claimant's testimony credible and un-impeached. Further, the ALJ finds the opinions of Dr. Cebrian lacking in credibility, and the opinions of Dr. Mason far more credible and persuasive because of her specific expertise, thorough treatment of the Claimant's medical case, and because she was treating the Claimant under his health insurance before being designated as the ATP at the conclusion on the June 17, 2015 hearing, thus, she did not have "a dog in the fight," which makes her opinion more objective and disinterested.

52. The ALJ makes a rational choice, between conflicting medical opinions, to accept the opinions of Dr. Mason, and to reject the opinions of Dr. Cebrian and any other opinions to the contrary.

53. Dr. Cebrian made a referral to a chiropractor under the mistaken belief that the Claimant's condition was not work-related. At that point, the right of the Claimant to select a qualified ATP came into being. Because a chiropractor provides ancillary services, the chiropractor cannot serve as an ATP on any continuing basis. Also, as found herein above, evaluations and treatments by Dr. Llloyd at Aurora South Medical Center were for FMLA purposes and did not constitute a valid selection of a workers' compensation ATP. Therefore, the Claimant's first selection of a workers' compensation ATP was Dr. Mason. All of the referrals from Dr. Mason, including the steroid injections by Dr. Olsen, were authorized and within the authorized chain of referrals.

54. All of the medical care and treatment for the Claimant's aggravated and accelerated back injuries of September 11, 2013 was and is causally related thereto and reasonably necessary to cure and relieve the effects thereof.

55. The Claimant has proven, by a preponderance of the evidence that he sustained compensable injuries as herein above described in course and scope of his employment on September 11, 2013.

56. As found herein above, the Claimant continued to work for the Employer at full wages and until November 18, 2014, when he was terminated, which was beyond Dr. Mason's MMI date. Therefore, there is no proof of temporary disability.

57. The Claimant has proven, by preponderant evidence that Dr. Cebrian, under the mistaken belief that the Claimant's condition was not work-related, refused to treat the Claimant's condition as work-related after May 13, 2014 for non-medical reasons, the Respondents were aware of this, and the Claimant made a valid first selection of a qualified ATP by selecting Dr. Mason as of June 5, 2014. All of Dr. Mason's referrals were authorized and within the authorized chain of referrals.

58. All of the medical care and treatment for the Claimant's injuries of September 11, 2013 is causally related thereto and reasonably necessary to cure and relieve the effects thereof.

59. The Claimant continued to work for the Employer at full wages until November 18, 2014, when he was terminated. Dr. Mason, the ATP, declared him to be at MMI, effective October 23, 2014. Therefore, the Claimant failed to prove entitlement to temporary disability benefits.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

Credibility

a. In deciding whether an injured worker has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Bodensleck v. Indus. Claim Appeals Office,* 183 P.3d 684 (Colo. App. 2008);*Kroupa v. Indus. Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002); *Rockwell International v. Turnbull,* 802 P.2d 1182, 1183 (Colo. App. 1990); *Penasquitos Village, Inc. v. NLRB*, 565 F.2d 1074 (9th Cir. 1977). The ALJ determines the credibility of the witnesses. A*renas v. Indus. Claim Appeals Office*, 8 P.3d 558 (Colo. App. 2000). The weight and credibility to be assigned evidence is a matter within the discretion of the ALJ. *Cordova v. Indus. Claim Appeals Office*, 55 P.3d 186 (Colo. App. 2002); *Youngs v. Indus. Claim Appeals Office,* 297 P.3d 964, **2012 COA 85.** The same principles concerning credibility determinations that apply to lay witnesses apply to expert witnesses as well. *See Burnham v. Grant,* 24 Colo. App. 131, 134 P. 254 (1913); *also see Heinicke v. Indus. Claim Appeals Office,* 197 P.3d 220 (Colo. App. 2008). The fact finder should consider, among other things, the consistency or inconsistency of a witness' testimony and/or actions; the reasonableness or unreasonableness (probability or improbability) of a witness' testimony and/or actions

(this includes whether or not the expert opinions are adequately founded upon appropriate research); the motives of a witness; whether the testimony has been contradicted; and, bias, prejudice or interest. *See Prudential Ins. Co. v. Cline,* 98 Colo. 275, 57 P. 2d 1205 (1936); CJI, Civil, 3:16 (2005). The fact finder should consider an expert witness' special knowledge, training, experience or research (or lack thereof). *See Young v. Burke,* 139 Colo. 305, 338 P. 2d 284 (1959). The ALJ has broad discretion to determine the admissibility and/or weight of evidence based on an expert's knowledge, skill, experience, training and education. *See* S 8-43-210, C.R.S; *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P.2d 501 (Colo. App. 1995). As found, the Claimant's testimony was credible and un-impeached. Further, as found, the opinions of Dr. Cebrian were lacking in credibility, and the opinions of Dr. Mason were far more credible and persuasive because of her specific expertise, thorough treatment of the Claimant's medical case, and because she was treating the Claimant under his health insurance before being designated as the ATP at the conclusion on the June 17, 2015 hearing, thus, she did not have "a dog in the fight", which makes her opinion more objective and disinterested.

Substantial Evidence

b. An ALJ's factual findings must be supported by substantial evidence in the record. *Paint Connection Plus v. Indus. Claim Appeals Office,* 240 P.3d 429 (Colo. App. 2010); *Leewaye v. Indus. Claim Appeals Office,* 178 P.3d 1254 (Colo. App. 2007); *Brownson-Rausin v. Indus. Claim Appeals Office,* 131 P.3d 1172 (Colo. App. 2005). *Also see Martinez v. Indus. Claim Appeals Office,* 176 P.3d 826 (Colo. App. 2007). Substantial evidence is "that quantum of probative evidence which a rational fact-finder would accept as adequate to support a conclusion, without regard to the existence of conflicting evidence." *Metro Moving & Storage Co.v. Gussert,* 914 P.2d 411 (Colo. App. 1995). Reasonable probability exists if a proposition is supported by **substantial evidence** which would warrant a reasonable belief in the existence of facts supporting a particular finding. *See F.R. Orr Construction v. Rinta,* 717 P.2d 965 (Colo. App. 1985). It is the sole province of the fact finder to weigh the evidence and resolve contradictions in the evidence. See *Pacesetter Corp. v. Collett,* 33 P. 3d 1230 (Colo. App. 2001). An ALJ's resolution on questions of fact must be upheld if supported by substantial evidence and plausible inferences drawn from the record. *Eller v. Indus. Claim Appeals Office,* 224 P.3d 397, 399-400 (Colo. App. 2009). As found, the ALJ made a rational choice, between conflicting medical opinions, to accept the opinions of Dr. Mason, and to reject the opinions of Dr. Cebrian and any other opinions to the contrary.

Refusal of Dr. Cebrian to Treat for Non-Medical Reasons/Selection of Dr. Mason as ATP

c. If the physician selected refuses to treat for non-medical reasons, and the insurer fails to appoint a willing ATP after notice of the refusal to treat, the right of *selection passes to the injured worker. Weinmeister v. Cobe Cardiovascular, Inc., W.C.*

No. 4-657-812 [Industrial Claim Appeals Office (ICAO), July 10, 2006]. Also see Lutz v. Industrial Claim Appeals Office, 24 P.3d 29 (Colo. App. 2000); Ruybal v. University Health Sciences Center, 768 P.2d 1259 (Colo. App. 1988). As found, Dr. Cebrian, under the mistaken belief that the Claimant's condition was not work-related, refused to treat the Claimant's condition as work-related after May 13, 2014 for non-medical reasons, the Respondents were aware of this, and the Claimant made a valid first selection of a qualified ATP by selecting Dr. Mason as of June 5, 2014.

d. To be authorized, all referrals must remain within the chain of authorized referrals in the normal progression of authorized treatment. *See Mason Jar Restaurant v. Indus. Claim Appeals Office,* 862 P. 2d 1026 (Colo. App. 1993); *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P. 2d 501 (Colo. App. 1995); *City of Durango v. Dunagan,* 939 P.2d 496 (Colo. App. 1997). When an ATP refers an injured worker to his personal physician, under the mistaken belief that the claim was not compensable, the referral was nonetheless within the chain of authorized referrals and, thus, subsequent treatment was authorized. *See Cabela v. Indus. Claim Appeals Office,* 198 P.3d 1277 (Colo. App. 2008). As found, Dr. Cebrian, under the mistaken belief that the Claimant's condition was not work-related, refused to treat the Claimant's condition as work-related after May 13, 2014 for non-medical reasons and referred him to a chiropractor. As further found, the Claimant made a valid first selection of a qualified ATP by selecting Dr. Mason on June 5, 2014. All referrals by Dr. Mason have been within the authorized chain of referrals.

Medical Treatment

e. To be a compensable benefit, medical care and treatment must be causally related to an industrial injury or occupational disease. *Dependable Cleaners v. Vasquez,* 883 P. 2d 583 (Colo. App. 1994). As found, Claimant's medical treatment is causally related to the aggravation of his back condition on September 11, 2013. Also, medical treatment must be reasonably necessary to cure and relieve the effects of the industrial occupational disease. § 8-42-101 (1) (a), C.R.S. *Morey Mercantile v. Flynt,* 97 Colo. 163, 47 P. 2d 864 (1935); *Sims v. Indus. Claim Appeals Office,* 797 P.2d 777 (Colo. App. 1990). As found, the Claimant's medical care and treatment was and is reasonably necessary to cure and relieve the effects of his injury.

Temporary Disability

f. To establish entitlement to temporary disability benefits, a claimant must prove that the industrial injury has caused a "disability," and that he has suffered a wage loss that, "to some degree," is the result of the industrial disability. § 8-42-103(1), C.R.S; *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). As found, the Claimant continued to work for the Employer at full wages until November 18, 2014, when he was terminated. Dr. Mason, the ATP, declared him to be at MMI, effective

October 23, 2014. Therefore, the Claimant failed to prove entitlement to temporary disability benefits. Therefore, the Respondents' "responsibility for termination" defense is moot.

Burden of Proof

g. The injured worker has the burden of proof, by a preponderance of the evidence, of establishing the compensability of an industrial injury and entitlement to benefits. §§ 8-43-201 and 8-43-210, C.R.S. *See City of Boulder v. Streeb,* 706 P. 2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals Office,* 12 P. 3d 844 (Colo. App. 2000); *Lutz v. Indus. Claim Appeals Office,* 24 P.3d 29 (Colo. App. 2000). *Kieckhafer v. Indus. Claim Appeals.Office*, 284 P.3d 202, 205 (Colo. App. 2012). Also, the burden of proof is generally placed on the party asserting the affirmative of a proposition. *Cowin & Co. v. Medina,* 860 P.2d 535 (Colo. App. 1992). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark,* 197 Colo. 306, 592 P. 2d 792 (1979). *People v. M.A.,* 104 P. 3d 273 (Colo. App. 2004); *Hoster v. Weld County Bi-Products, Inc.,* W.C. No. 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. *Also see Ortiz v. Principi,* 274 F.3d 1361 (D.C. Cir. 2001). "Preponderance" means "the existence of a contested fact is more probable than its nonexistence." *Indus. Claim Appeals Office v. Jones*, 688 P.2d 1116 (Colo. 1984). As found, the Claimant has sustained his burden of proof with respect to all issues with the exception of "temporary disability benefits through the date of MMI. Consequently, the Respondents issue of "responsibility for termination" is moot.

ORDER

IT IS, THEREFORE, ORDERED THAT:

A. On September 11, 2013, the Claimant sustained compensable low back injuries.

B. Dr. Cebrian is no longer the Claimant's authorized treating physician.

Kristin Mason, M.D., became the Claimant's authorized treating physician on June 5, 2014, and the Respondents are liable for the costs of her work-related treatment, subject to the Division of Workers' Compensation Medical Fee Schedule. The Claimant reached MMI on October 23, 2014.

C. The Respondents shall pay costs of all medical care and treatment, including post maximum medical improvement maintenance care provided or ordered by Dr. Mason and her referrals from June 5, 2014, 2014 and continuing, subject to the Division of Workers' Compensation Medical Fee Schedule

D. Any and all claims for temporary disability are hereby denied and dismissed.

E. Any and all issues not determined herein, including permanent disability, are reserved for future decision.

DATED this_____day of July 2015.

_____
EDWIN L. FELTER, JR.
Administrative Law Judge

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts,**1525 Sherman Street, 4th Floor, Denver, CO 80203.** You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on the certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) that you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) that you mailed it to the above address for the Denver Office of Administrative Courts. **For statutory reference, *see* § 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, *see* Rule 26, OACRP. You may access a form for a petition to review at** *http://www.colorado.gov/dpa/oac/forms-WC.htm*.

CERTIFICATE OF SERVICE

I hereby certify that I have sent true and correct copies of the foregoing **Full Findings of Fact, Conclusions of Law and Order** on this_____day of July 2015, electronically in PDF format, addressed to:

Division of Workers' Compensation
cdle_wcoac_orders@state.co.us

ISSUES

- Whether claimant has proven by a preponderance of the evidence that she sustained a compensable injury arising out of and in the course of her employment with employer?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that the medical treatment she received was reasonable and necessary to cure and relieve claimant from the effects of the work injury?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that she is entitled to an award of temporary total disability ("TTD") benefits?

- The parties stipulated prior to the hearing that if the claim is compensable, claimant's average weekly wage ("AWW") is $1,454.79.

- Whether respondents have proven by a preponderance of the evidence that claimant's benefits should be reduced pursuant to an injurious practice?

- Whether respondents have proven by a preponderance of the evidence that claimant's benefits should be terminated based on an intervening accident?

FINDINGS OF FACT

1. Claimant was employed with employer as a package car driver. Claimant testified at hearing that on May 14, 2014 she was lifting a box when she developed pain in her leg. Claimant was initially seen following her injury by Mr. Fox, a physician's assistant with Cottonwood Holistic Family Health on May 27, 2014. Claimant reported to Mr. Fox that she had pulled her hamstring in 2013 and felt she had injured her leg again using an inversion table. Claimant reported pain in her left inferior gluteal region for about 4-5 weeks. Claimant reported a gradual onset of pain and denied any acute trauma. Claimant also reported pain in her left low back region.

2. Claimant returned to Mr. Fox on May 29, 2014 and reported a lot of pain and tightness in her left calf after working. Mr. Fox noted that claimant's symptoms

were more consistent with left sided sciatic and recommended diagnostic studies of the lumbar spine.

3. Claimant underwent a magnetic resonance image ("MRI") of the lumbar spine on May 31, 2014. The MRI showed moderate sized posterior and left lateral disc extrusions at L4-L5 and L5-S1 with significant foraminal compromise at both levels on the left.

4. Claimant was evaluated by Dr. Weber on June 5, 2014. Claimant reported that she was lifting several 100 boxes on May 5, 2014 when she got hemorrhoids and self treated. Claimant reported she also developed left leg pain about 3 weeks ago and had an MRI that showed disc extrusions at the L4-5 and L5-S1 levels. Dr. Weber referred claimant for physical therapy. Claimant testified she went to Dr. Weber because when she reported her injury she was informed by Mr. Masse that she should go to the physician who performed her Department of Transportation ("DOT") physical.

5. Claimant was subsequently referred by employer to Dr. Jernigan for treatment. Claimant was examined by Dr. Jernigan on June 6, 2014. Dr. Jernigan noted claimant reported developing leg pain on May 14 while working heavily moving 70 pound packages. Claimant reported her symptoms got worse over the ensuing days. Dr. Jernigan recommended work restrictions that limited claimant to no more than 20 pounds. Dr. Jernigan noted that claimant's work was very heavy and noted she reported problems with hemorrhoids after heavy lifting on May 2, 2014 and following that incident she continued to lift upwards of 70 pounds. Dr. Jernigan referred claimant to Spine Colorado for additional treatment and recommended prednisone and physical therapy.

6. Claimant returned to Dr. Jernigan on June 16, 2014 and reported her pain level was unchanged with the prednisone. Dr. Jernigan again recommended a referral to Spine Colorado. Claimant continued to treat conservatively with Dr. Jernigan. Dr. Jernigan opined in his medical records that claimant's condition was related to her work activities with employer.

7. Claimant was examined by Dr. McLaughlin with Animas Spine on July 2, 2014. Dr. McLaughlin noted claimant's accident history that she developed left gluteal and calf pain at work on May 14, 2014 that progressively got worse. Dr. McLaughlin further noted claimant's work history of having to left up to seventy pounds. On physical examination, Dr. McLaughlin noted that claimant had four out of five EHL weakness on the left compared to the right. Dr. McLaughlin diagnosed claimant with left lower extremity radiculopathy secondary to disc extrusion at L4-5 and L5-S1 and

recommended claimant repeat her course of oral steroids. Dr. McLauglin also recommended transforaminal injections.

8. Dr. McLaughlin noted that while claimant did not recall a deciding mechanism of injury for her pain, he still felt her condition was a work related injury given the work that she performed.

9. Claimant returned to Dr. Jernigan on July 15, 2014 with continued complaints of significant pain. Dr. Jernigan noted that claimant was unable to lay down due to severe pain and reported claimant was very depressed due to the constant pain.

10. Claimant testified she took a vacation that had been previously planned in mid-July 2014. Claimant's vacation included driving to Virginia and North Carolina. Claimant continued to complain of significant pain on her vacation and was seen at the emergency room ("ER") at Howard County General Hospital in Columbia, Maryland on July 31, 2014 with complaints of left sided sciatica pain that increased a couple of hours ago. Claimant was given medications and released. Claimant returned to the ER at Mary Washington Hospital in Fredricksburg, Virginia on August 1, 2014 with additional complaints of back pain. Claimant was again given medications and released. Claimant testified at hearing that during the vacation her husband was driving and she was in the back seat. Claimant testified she had a sudden increase in back pain after she shifted her body weight which resulted in her treatment at the ER on August 1, 2014.

11. Claimant was again treated at Beach Medical Care on August 6, 2014 with complaints of low back pain. Claimant noted she was under care of a work injury that developed on May 14, 2014 and had received treatment on July 31 and August 1 during the course of her trip. Claimant was again evaluated and released.

12. Claimant returned to Dr. Jernigan on August 12, 2014. Dr. Jernigan noted that Dr. McLaughlin was recommending an injection, which he agreed with. Dr. Jernigan took claimant off of work completely.

13. Claimant was examined by Mr. Baumchen, the physician's assistant for Dr. Youssef with Spine Colorado on August 19, 2014. Mr. Baumchen examined claimant and recommended she undergo a surgical evaluation.

14. Claimant eventually underwent the transforaminal epidural steroid injection recommended by Dr. McLaughlin on August 21, 2014.

15. Claimant was next evaluated by Dr. Youssef on August 27, 2014. Claimant reported to Dr. Youssef that she had a gradual onset of symptoms that got

particularly worse every time she went to work. Dr. Youssef noted that claimant was not able to walk on her heels because of obvious foot drop and weakness in her EHL and ankle dorsiflexion. Dr. Youssef further noted decreased sensation in the L5 and S1 distribution on the left compared to the right. Dr. Youssef diagnosed claimant with contiguous L4-5 and L5-S1 left sided herniated nucleus pulposus with left sided radiculopathy and neurologic deficit which was failing nonoperative treatment. Dr. Youssef recommended surgery including an L4-5 and L5-S1 microdiscectomy on the left with medial facetectomy and foraminotomy at L4-5 and L5-S1 on the left.

16. Claimant returned to Dr. Jernigan on September 2, 2014. Claimant reported continued complaints of pain radiating into her left lower extremity. Claimant reported relief following the epidural steroid injection including a decrease in her pain from 8 to 2 making her much more comfortable in general. Dr. Jernigan kept claimant off of work and noted that he agreed with Dr. Youssef's surgery recommendation.

17. Claimant returned to Dr. McLaughlin on September 5, 2014. Dr. McLaughlin noted that claimant reported a near 100 percent relief of her calf pain following the injection, but continued to complain of pain in her left gluteal and hip area with weakness in her left toe. Dr. McLaughlin noted that claimant's symptoms were returning and noted that he could provide her with a repeat injection for pain relief until her scheduled September 18, 2014 surgery.

18. Claimant eventually underwent the left sided L4-L5 microdiscectomy with medial facetectomy and foraminotomy at L4-L5 on the left along with left sided L5-S1 microdisectomy with medial facetectomy on the left at L5-S1 under the auspices of Dr. Youssef on September 18, 2014.

19. Claimant followed up with Mr. Hamlin, a physician's assistant, on October 3, 2014. Mr. Hamlin noted that claimant was two weeks post-op and was doing well. Mr. Hamlin noted that claimant's pain was manageable and claimant had been weaning off the medications. Claimant was instructed to begin physical therapy.

20. Claimant continued to treat with Dr. Jernigan following her surgery. Dr. Jernigan kept claimant off of work and noted claimant was undergoing physical therapy.

21. Claimant underwent an independent medical examination ("IME") with Dr. Rauzzino on December 6, 2014. Dr. Rauzzino reviewed claimant's medical records, obtained a history from claimant and performed a physical examination in connection with his IME. Dr. Rauzzino noted the initial accident history claimant presented to Dr. Fox involving a pulled hamstring and the use of an inversion table. Dr. Rauzzino noted that he reviewed a phone conversation from Mr. Evans and a representative of insurer in which Mr. Evans indicated he had lent the inversion table to claimant's husband and

he believed claimant had used the inversion table on one occasion and it had apparently made her symptoms worse. Dr. Rauzzino noted that claimant had reported that she had recently begun jogging before her symptoms developed and she initially thought her symptoms may have been related to running. Claimant reported that she ran 2-3 times per week and had increased her mileage up to about 6 miles. Dr. Rauzzino also noted claimant's need for emergency medical treatment during her trip to the East Coast.

22. Dr. Rauzzino opined in his report that claimant's condition was not related to her work with employer. Dr. Rauzzino indicated in his report that his opinion was based specifically on the report by Mr. Fox of May 27, 2014 where claimant described a history of pain in her left inferior gluteal region for four to five weeks, which would have put the injury outside the reported accident date of May 14, 2014. Dr. Rauzzino also noted that claimant failed to describe any specific trauma and developed as a gradual onset of symptoms. Dr. Rauzzino also noted that the report made no mention of an onset of symptoms related to her work with employer. Dr. Rauzzino noted that the first mention that claimant's injury was work related occurred after her MRI revealed two herniated disks in her lumbar spine. Dr. Rauzzino further opined that the road trip in July 2014 significantly aggravated her low back condition. Dr. Rauzzino opined that the surgery claimant underwent was reasonable, but was not related to any injury at work on May 14, 2014.

23. Dr. Rauzzino testified in this case consistent with his medical report. Dr. Rauzzino noted in his testimony that claimant's running would be an activity that would specifically lead to compression of her disk. Dr. Rauzzino further testified that the inversion table aggravated claimant's pain, based on her report of injury. Dr. Rauzzino testified that claimant's physical examination after her cross country road trip was significantly worse than it was prior to her road trip, with diminished sensation in her leg and foot.

24. Dr. McLaughlin testified at hearing in this matter. Dr. McLaughlin testified he treated claimant with respect to her back injury. Dr. McLaughlin testified when he examined claimant on July 2, 2014 claimant presented with pain radiating into her left hamstring and calf. Dr. McLaughlin testified he diagnosed claimant with 2 herniated discs. Dr. McLaughlin testified it was his opinion that the cause of claimant's 2 lumbar herniated discs was due to her repetitive bending, lifting, twisting and turning related to her work with employer. Dr. McLaughlin testified that it was his opinion that the use of the inversion table would not be a cause of the herniated discs in claimant's back. Dr. McLaughlin noted that prior to claimant's trip to the East Coast, he had documented weakness in claimant's left foot during the July 2, 2014 evaluation. The ALJ finds the testimony of Dr. McLaughlin to be credible and persuasive.

25. Dr. Jernigan testified at hearing in this matter. Dr. Jernigan noted in the course of his testimony the medical care he provided for claimant in relation to her lumbar spine issues. Dr. Jernigan testified he took claimant off of work completely as of July 15, 2014. Dr. Jernigan opined at hearing that claimant's back condition was related to the lifting she performed for employer. Dr. Jernigan further testified that he was aware of claimant's trip to the East Coast and the trip did not violate the work restrictions he had provided to claimant in relation to her back condition.

26. Mr. Van Iderstine testified at hearing in this matter. Mr. Van Iderstine testified that he performed a job analysis of claimant's position with employer. Mr. Van Iderstine testified claimant worked in a heavy to very heavy job. Mr. Van Iderstine's testimony is not credited with determining whether claimant's condition was related to her work with employer and was of limited assistance in reaching the conclusions regarding whether claimant's injury was compensable.

27. Claimant testified at hearing in this case regarding her work with employer. Claimant testified she would drive a truck and perform approximately 100 stops per day. Claimant testified the average package she delivers weighs approximately 45 pounds. Claimant testified her lifting of the packages requires her to squat and reach and twist the package to maneuver it to her "power zone" to lift. Claimant testified that the heavier packages she will slide to the back of the truck, and then use a dolly to deliver the package.

28. Claimant testified that she began to experience symptoms on May 14, 2014 (a Wednesday) and her symptoms gradually got work from there. Claimant denied having any sudden sharp pain with lifting and denied any specific incident. Claimant testified that pain began as a pain in her left hamstring and lower buttocks area and the pain got worse over the next week. Claimant testified she did not originally correlate her symptoms to a back injury and though she had a pulled hamstring. Claimant testified her symptoms increased and she was in significant pain as of July 14, 2014 and could not get to work. Claimant testified that during this time she was not sleeping beyond 2 hours per night. Claimant testified Dr. Jernigan increased her work restrictions and she has not returned to work in any capacity since July 15, 2014. Claimant testified that the weakness in her toe began in late June 2014 and continued to progress until four days prior to her transforaminal epidural steroid injection. The ALJ finds the testimony of claimant to be credible and persuasive in this regard.

29. Mr. Blaine, claimant's supervisor, testified at hearing in this matter. Mr. Blaine testified that claimant accurately testified about safe lifting methods required by employer. Mr. Blaine testified that the purpose of the safe lifting methods is to reduce injuries. Mr. Blaine testified he was familiar with claimant's route which consists of approximately 100 stops and roughly 200 to 300 packages. Mr. Blaine testified

claimant's average weight per package would be approximately 25 pounds. Mr. Blaine testified the work environment claimant is employed in is fast paced. The ALJ finds the testimony of Mr. Blaine to be credible.

30. The ALJ ultimately credits the opinions expressed by Dr. Jernigan and Dr. McLaughlin regarding the cause of claimant's condition over the contrary opinions expressed by Dr. Rauzzino. The ALJ further credits claimant's testimony regarding the onset of her symptoms in this regard. The ALJ notes that claimant's symptoms originally manifested themselves in her hamstring and gluteal area. The ALJ finds the opinions expressed by Dr. Jernigan and Dr. McLaughlin appear to coincide with one another and are supported by the medical records entered into evidence.

31. The ALJ, in crediting the testimony of claimant and the opinions expressed by Dr. Jernigan and Dr. McLaughlin, finds that claimant has proven that it is more likely than not that she sustained a compensable injury arising out of and in the course of her employment with employer.

32. The ALJ credits the testimony and opinions of Dr. Jernigan and Dr. McLaughlin, along with the corresponding medical records, and finds that claimant has proven that it is more likely than not that her medical treatment, including the surgery performed by Dr. Youssef, was reasonable and necessary to cure and relieve the claimant from the effects of her work injury.

33. The ALJ credits claimant's testimony that she has not worked in any capacity since July 15, 2014 and credits the medical records from Dr. Jernigan that took her off of work completely and determines that claimant has shown that it is more likely than not that she is entitled to an award of TTD benefits commencing July 15, 2014 and continuing until terminated by law. Respondents reserve the right to take any allowed statutory offsets against the award for TTD benefits.

34. The ALJ finds respondents have failed to establish that claimant suffered an intervening injury or engaged in an injurious practice by taking the road trip to the East Coast. The ALJ credits Dr. Jernigan's testimony that the road trip would not have exceeded the work restrictions he had established in reaching this conclusion. The ALJ further credits the testimony of Dr. McLaughlin who noted claimant was experiencing weakness in the lower extremity prior to her trip to the East Coast.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. Section 8-40-

102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. Section 8-43-201, C.R.S., 2006. A Workers' Compensation case is decided on its merits. Section 8-43-201, *supra*.

2. The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and action; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2006).

3. A compensable industrial accident is one that results in an injury requiring medical treatment or causing disability. The existence of a preexisting medical condition does not preclude the employee from suffering a compensable injury where the industrial aggravation is the proximate cause of the disability or need for treatment. *See H & H Warehouse v. Vicory*, 805 P.2d 1167 (Colo. App. 1990); *see also Subsequent Injury Fund v. Thompson*, 793 P.2d 576 (Colo. App. 1990). A work related injury is compensable if it "aggravates accelerates or combines with "a preexisting disease or infirmity to produce disability or need for treatment. *See H & H Warehouse v. Vicory, supra.*

4. As found, claimant has established by a preponderance of the evidence that she suffered a compensable work injury on May 14, 2014 resulting in the need for medical treatment. As found, the testimony of claimant regarding the onset of her symptoms along with the testimony and opinions expressed by Dr. McLaughlin and Dr. Jernigan are found to be credible and persuasive on this issue.

5. Respondents are liable for authorized medical treatment reasonably necessary to cure and relieve an employee from the effects of a work related injury. Section 8-42-101, C.R.S.; *see Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990). Pursuant to Section 8-43-404(5), C.R.S., Respondents are afforded the right, in the first instance, to select a physician to treat the industrial injury. Once respondents have exercised their right to select the treating physician, claimant may not

change physicians without first obtaining permission from the insurer or an ALJ. *See Gianetto Oil Co. v. Industrial Claim Appeals Office*, 931 P.2d 570 (Colo. App. 1996).

6. As found, the ALJ credits the medical opinions of Dr. Jernigan and finds that claimant has proven by a preponderance of the evidence that the medical treatment she received from the medical providers was reasonable and necessary to cure and relieve claimant from the effects of the industrial injury.

7. To prove entitlement to temporary total disability (TTD) benefits, claimant must prove that the industrial injury caused a disability lasting more than three work shifts, that he left work as a result of the disability, and that the disability resulted in an actual wage loss. *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). Section 8-42-103(1)(a), *supra*, requires claimant to establish a causal connection between a work-related injury and a subsequent wage loss in order to obtain TTD benefits. *PDM Molding, Inc. v. Stanberg, supra*. The term disability, connotes two elements: (1) Medical incapacity evidenced by loss or restriction of bodily function; and (2) Impairment of wage earning capacity as demonstrated by claimant's inability to resume his prior work. *Culver v. Ace Electric*, 971 P.2d 641 (Colo. 1999). There is no statutory requirement that claimant establish physical disability through a medical opinion of an attending physician; claimant's testimony alone may be sufficient to establish a temporary disability. *Lymburn v. Symbios Logic*, 952 P.2d 831 (Colo. App. 1997). The impairment of earning capacity element of disability may be evidenced by a complete inability to work, or by restrictions which impair the claimant's ability effectively and properly to perform his regular employment. *Ortiz v. Charles J. Murphy & Co.*, 964 P.2d 595 (Colo.App. 1998).

8. As found, claimant has proven by a preponderance of the evidence that his injury resulted in work restrictions set forth by Dr. Jernigan that limited claimant's ability to earn wages. As found, claimant has established that he is entitled to TTD benefits as a result of her work injury beginning July 15, 2014 and continuing until terminated by law.

9. Section 8-43-404(3), C.R.S. provides in pertinent part that if "any employee persists in any unsanitary or injurious practice which tends to imperil or retard recovery or refuses to submit to such medical or surgical treatment or vocational evaluation as is reasonably essential to promote recovery, the director shall have the discretion to reduce or suspend the compensation of any such injured employee."

10. As found, the ALJ credits the testimony of Dr. McLaughlin and claimant's testimony at hearing, and finds that respondents have failed to establish that claimant taking a vacation in July after her work injury that involved an injurious practice under Section 8-43-404(3), C.R.S.

11. The doctrine of intervening injury concerns the effect of a separate injury, which occurs while the claimant is receiving medical and disability benefits for a compensable injury effectively holds that respondents are not liable for injuries which occur subsequent to a compensable injury, and are not a "natural result" of the compensable injury. *Post Printing and Publishing Co. v. Erickson,* 94 Colo. 382, 30 P.2d 327 (1934). Respondents are only liable for subsequent injuries which "flow proximately and naturally" from the compensable injury. *Standard Metals Corp. v. Ball,* 172 Colo. 510, 474 P.2d 622 (1970).

12. As found, respondents have failed to prove by a preponderance of the evidence that claimant suffered an intervening injury that would sever their liability for claimant's medical treatment by taking the vacation in mid-July 2014. As found, the testimony of Dr. McLaughlin that claimant had weakness in her left lower extremity as documented by his examination of claimant prior to the trip is found to be credible and persuasive on this point. As found, claimant was complaining of increased pain prior to the trip and the trip did not result in an intervening injury that would sever their liability in this case.

ORDER

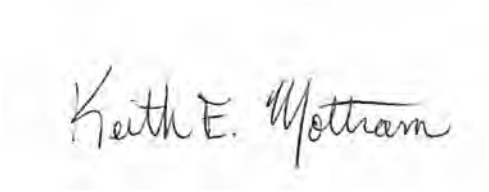
It is therefore ordered that:

The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: July 21, 2015



_____

Keith E. Mottram
Administrative Law Judge
Office of Administrative Courts
222 S. 6th Street, Suite 414
Grand Junction, Colorado 81501

ISSUES

1. Whether KM has demonstrated by a preponderance of the evidence that she was the common law spouse of Decedent and is thus entitled to receive death benefits as the dependent widow of Decedent pursuant to §8-41-501(1)(a), C.R.S.

2. Whether AP is entitled to receive death benefits as a wholly dependent minor child of Decedent pursuant to §8-41-501(1)(b)-(c), C.R.S.

3. Whether Claimants are financially responsible for Decedent's Oregon child support lien.

STIPULATIONS

The parties agreed to the following:

1. Decedent earned an Average Weekly Wage (AWW) of $500.00;

2. AP is the wholly dependent minor child of Decedent;

3. AP's date of birth is July 7, 1997;

4. Decedent's date of death was July 18, 2014.

FINDINGS OF FACT

1. On July 15, 2014 Decedent began working for Employer as an Installation Technician. On July 17, 2014 Decedent fell from a ladder during the course and scope of his employment. He suffered multiple traumatic head and internal organ injuries. Decedent underwent emergency surgery upon his arrival at Denver Health Medical Center. However, on July 18, 2014 he died as a result of his industrial injuries.

2. At the time of Decedent's death, a child-support lien from the State of Oregon shows he was responsible for a monthly payment of $158.00 or $35.05 per week for AP. The lien also reflects an arrears amount of $1,835.32. The lien utilizes Decedent's Social Security number as to the person responsible for payment. The Oregon administrative order specifies that it applies only to Decedent.

3. KM testified that she had known Decedent for over 20 years. They worked together and were friends. KM was married to another individual at the time but the marriage ended in approximately 2001.

4. In approximately 2010 KM and Decedent reconnected through social media. Approximately one year later they began to communicate through text messaging. Decedent explained to KM that he had left his wife and was moving from Oregon to Colorado to begin a new life. KM remarked that Decedent filed divorce papers in approximately February 2012 but did not know when the divorce became final.

5. Decedent moved into a trailer in his parents' driveway when he arrived in Colorado. KM remained in Oregon but spoke frequently with Decedent on the telephone. KM flew to Colorado in November 2011 to visit Decedent. In January 2012 she moved to Colorado and resided with Decedent in his trailer.

6. KM testified that she and Decedent did not care about the "piece of paper" or marriage license. Nevertheless, Decedent wanted to buy KM an engagement ring. The couple planned to marry in Ireland and take a vacation around the event. KM summarized that the couple intended to purchase an engagement ring, apply for a marriage license and have a formal marriage ceremony in Ireland.

7. KM and Decedent lived together from January 2012 until Decedent's death in July 2014. They purchased furniture and a television using Decedent's credit card. At times each of them was unemployed but supported by the other. For approximately 10 months prior to Decedent's death he was unemployed and KM paid the bills because she was working. Nevertheless, KM acknowledged that the couple never filed joint federal or state tax returns and Decedent listed himself on his 2012 return as "single."

8. KM and Decedent pooled their income into a single bank account owned by Decedent. KM's name was not on the account and she did not have access to the account. KM had a credit card on Decedent's credit card account and could charge to the account. She explained that she was unable to obtain an account at Decedent's credit union because she had a poor credit history from a previous bankruptcy.

9. In July 2012 Decedent bought a home. KM explained that Decedent had used money from the sale of a home in his prior divorce proceedings as a down payment. KM was not listed on the mortgage for the house nor as an owner on the deed. Similarly, Decedent bought a car used by KM. Only Decedent was named on the car loan and the car was only registered in his name. When Decedent died KM had to leave the home and the car was repossessed.

10. Decedent identified KM as his emergency contact for Employer. He listed KM as his "fiancée" and noted that he was "single." On his application for health insurance through Employer Decedent noted that he was "single" although "common law" was an option on the form.

11. KM testified that she considered herself married to Decedent when she moved into the Colorado trailer with him in January 2012. However, Decedent was still married to another woman and thus could not legally marry KM. KM explained that

Decedent and his ex-wife did not file divorce documents until February 2012 and she did not know when the divorce became final.

12. Because KM was listed as an emergency contact she was notified and went to Denver Health Medical Center after Decedent's July 17, 2014 industrial injury. Decedent's parents, brother, sister, aunt, uncle and nephew were also at the hospital. KM explained that the entire family made the decision to remove Decedent from life support. Decedent's mother Linda Poland confirmed that the family collectively made the decision to remove Decedent from life support. Ms. Poland commented that KM was considered part of the family but was not considered "married" to Decedent. Ms. Poland remarked that KM signed the do not resuscitate order because the family knew that she was planning to marry Decedent.

13. Ms. Poland testified that Decedent and KM did everything together and she knew them as boyfriend and girlfriend. Decedent told Ms. Poland that he planned to marry KM at some time in the future when they were more financially stable. Decedent did not tell her that he considered himself married to KM. Decedent referred to KM as his fiancée and planned to purchase an engagement ring when he was financially able. Ms. Poland did not refer to KM as her daughter-in-law.

14. Jean Barringer was Decedent's aunt. Ms. Barringer testified that she was close to Decedent and KM. She described them as a close couple who "acted married." Decedent told her that he planned to buy KM a ring but he did not want to do anything until he purchased the ring. Ms. Barringer was aware of their plans to apply for a marriage license and marry in Ireland.

15. Carl Dyess testified on behalf of AP. Mr. Dyess is Decedent's former father-in-law and AP's maternal grandfather. He initiated the proceedings to act as a conservator for AP concerning Decedent's estate. As conservator Mr. Dyess' duties involved maximizing the return of the estate for AP. The estate was liquidated through a Colorado attorney.

16. After Decedent's death Mr. Dyess was introduced to KM. KM identified herself as Decedent's girlfriend or fiancée. Mr. Dyess knew KM and Decedent were living together at the time of Decedent's death but did not know them to be husband and wife. He was not aware of their intentions to marry in the future but KM mentioned that Decedent had planned to buy her an engagement ring. Mr. Dyess confirmed that KM had not made any claim on Decedent's estate.

17. KM has failed to demonstrate that it is more probably true than not that she was the common law spouse of Decedent and is thus not entitled to receive death benefits as the dependent widow of Decedent pursuant to §8-41-501(1)(a), C.R.S. Although KM and Decedent lived together from January 2012 until Decedent's death in July 2014, the record reveals that there was no general understanding or reputation among persons in the community that KM and Decedent held themselves out as husband and wife. Instead, Decedent intended to purchase an engagement ring for KM. The couple then planned to apply for a marriage license and have a formal

marriage ceremony in Ireland. Although the record reveals a future intent to marry, the indicia of a common law marriage were not present at the time of Decedent's death on July 18, 2014.

18. Decedent and KM never filed joint federal or state tax returns and Decedent listed himself as "single" on his 2012 return. In July 2012 Decedent bought a home. KM explained that Decedent had used money from the sale of a home in his prior divorce proceedings as a down payment. KM was not listed on the mortgage for the house nor as an owner on the deed. Similarly, Decedent bought a car used by KM. Only Decedent was named on the car loan and the vehicle was registered solely in his name. Decedent identified KM as his emergency contact for Employer but listed her as his "fiancée" and noted that he was "single." Moreover, on his application for health insurance through Employer Decedent noted that he was "single" although "common law" was an option on the form.

19. Decedent told his mother Ms. Poland that he planned to marry KM at some time in the future when they were more financially stable. Decedent did not tell her that he considered himself married to KM. Decedent referred to KM as his fiancée and planned to purchase an engagement ring when he was financially able. Ms. Poland did not refer to KM as her daughter-in-law. Although Ms. Barringer described Decedent and KM as a close couple who "acted married," Decedent told her that he planned to buy KM a ring in the future. Finally, KM identified herself to Mr. Dyess as Decedent's girlfriend or fiancée. He was not aware of their intentions to marry in the future but KM mentioned that Decedent had planned to buy her an engagement ring. Accordingly, the bulk of the persuasive evidence reflects Decedent and KM had a future plan to marry but did not generally hold themselves out to the community as husband and wife.

20. At the time of Decedent's death, a child-support lien from the State of Oregon shows he was responsible for a monthly payment of $158.00 or $35.05 per week for AP. The lien also reflects an arrears amount of $1,835.32. The lien utilizes Decedent's Social Security number as to the person responsible for payment. The Oregon administrative order specifies that it applies only to Decedent. Accordingly, the Oregon child support lien is discharged as to benefits payable to AP.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" (Act) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. §8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. §8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979); *People v. M.A.*, 104 P.3d 273, 275 (Colo. App. 2004). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. §8-43-201, C.R.S. A Workers' Compensation case is decided on its merits. §8-43-201, C.R.S.

2. The Judge's factual findings concern only evidence that is dispositive of the issues involved; the Judge has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *See Magnetic Engineering, Inc. v. ICAO,* 5 P.3d 385, 389 (Colo. App. 2000).

3. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2007).

Dependents

4. Pursuant to §8-42-114, C.R.S. death benefits are payable to dependents of a decedent in the amount of two-thirds of the AWW subject to the applicable minimum amount of $218.86. If there are wholly dependent persons at the time of the employee's death, they are entitled to weekly compensation equal to two-thirds of the decedent's AWW. §8-42-115(1)(b), C.R.S.

5. Section 8-41-501(1), C.R.S. designates classes of persons who are presumed to be wholly dependent on a decedent. Section 8-41-501(1)(a) provides that a widow or widower is wholly dependent "unless it is shown that she or he was voluntarily separated and living apart from the spouse at the time of the injury or death or was not dependent in whole or in part on the deceased for support." The statutory presumption of spousal dependency can thus only be rebutted by demonstrating that the surviving spouse was voluntarily separated and living apart from the decedent or was not dependent upon the decedent for any support. *See Exeter Drilling v. Industrial Claim Appeals Office,* 801 P.2d 20, 21 (Colo. App. 1990); *Michalski v. Industrial Claim Appeals Office,* 781 P.2d 183, 184-85 (Colo. App. 1989).

6. Section 8-41-501, C.R.S. presumes that a decedent's minor children under the age of 18 years are wholly dependent on the decedent. Pursuant to §8-41-501(1)(c), C.R.S. minor children of a decedent who are over 18 years of age and under 21 years of age who are engaged in courses of study as full-time students at accredited schools are also wholly dependent on the decedent. Section 8-42-121, C.R.S. grants discretion to the Director to apportion death benefits among the beneficiaries in the manner the Director deems just and equitable. Because the undersigned ALJ acts on behalf of the Director in determining appropriate apportionment after a hearing, the ALJ is afforded the same power to apportion the benefits.

Common Law Marriage

7. Proof of a common law marriage requires a party to establish mutual agreement of the parties to be husband and wife followed by a mutual and open assumption of the marriage relationship. *People v. Lucero,* 747 P.2d 660, 663 (Colo.

1987); *In Re Marquez*, W.C. No. 4-425-155 (ICAP, Apr. 5, 2001). The agreement must be manifested by conduct that provides evidence of the parties' mutual understanding. *Lucero,* 660 P.2d at 663. The court in *Lucero* noted that the "two factors that most clearly show an intention to be married are cohabitation and a general understanding or reputation among persons in the community in which the couple lives that the parties hold themselves out as husband and wife." *Id.* at 665. The court also listed a number of other "behaviors" that may be considered including the maintenance of joint bank accounts, joint ownership of property, use of the man's surname by the woman and the filing of joint tax returns. *Id.* Disclosures to relatives regarding marital status may also be relevant because it may be reasonably inferred that marriage would be disclosed to certain family members. *In re Emenyonu,* W.C. 4-391-071 (ICAP, Mar. 12, 2001); *see Whitenhill v. Kaiser Permanente,* 940 P.2d 1129 (Colo. App. 1997). Furthermore, a promise to marry in the future is not consistent with a current marital relationship. *In re Emenyonu,* W.C. 4-391-071 (ICAP, Mar. 12, 2001). Ultimately, "there is no single form that any such evidence must take" and the ultimate determination "turns on issues of facts and credibility, which are properly within the trial court's discretion." *Lucero,* 660 P.2d at 665; *see In re Custody of Nugent,* 955 P.2d 584 (Colo. App. 1997).

8. As found, KM has failed to demonstrate by a preponderance of the evidence that she was the common law spouse of Decedent and is thus not entitled to receive death benefits as the dependent widow of Decedent pursuant to §8-41-501(1)(a), C.R.S. Although KM and Decedent lived together from January 2012 until Decedent's death in July 2014, the record reveals that there was no general understanding or reputation among persons in the community that KM and Decedent held themselves out as husband and wife. Instead, Decedent intended to purchase an engagement ring for KM. The couple then planned to apply for a marriage license and have a formal marriage ceremony in Ireland. Although the record reveals a future intent to marry, the indicia of a common law marriage were not present at the time of Decedent's death on July 18, 2014.

9. As found, Decedent and KM never filed joint federal or state tax returns and Decedent listed himself as "single" on his 2012 return. In July 2012 Decedent bought a home. KM explained that Decedent had used money from the sale of a home in his prior divorce proceedings as a down payment. KM was not listed on the mortgage for the house nor as an owner on the deed. Similarly, Decedent bought a car used by KM. Only Decedent was named on the car loan and the vehicle was registered solely in his name. Decedent identified KM as his emergency contact for Employer but listed her as his "fiancée" and noted that he was "single." Moreover, on his application for health insurance through Employer Decedent noted that he was "single" although "common law" was an option on the form.

10. As found, Decedent told his mother Ms. Poland that he planned to marry KM at some time in the future when they were more financially stable. Decedent did not tell her that he considered himself married to KM. Decedent referred to KM as his fiancée and planned to purchase an engagement ring when he was financially able. Ms. Poland did not refer to KM as her daughter-in-law. Although Ms. Barringer described Decedent and KM as a close couple who "acted married," Decedent told her

that he planned to buy KM a ring in the future. Finally, KM identified herself to Mr. Dyess as Decedent's girlfriend or fiancée. He was not aware of their intentions to marry in the future but KM mentioned that Decedent had planned to buy her an engagement ring. Accordingly, the bulk of the persuasive evidence reflects Decedent and KM had a future plan to marry but did not generally hold themselves out to the community as husband and wife.

Oregon Child Support Lien

11. Death benefits are entirely separate and independent from compensation benefits paid to the injured employee. *Hoffman v. Hoffman*, 872 P.2d 1367 (Colo.App. 1994); *Richards v. Richards & Richards*, 664 P.2d 254 (Colo.App. 1983). The legal distinction of death benefits as separate from an injured worker's compensation benefits is called the "rule of independence." *City of Loveland Police Department v. Industrial Claim Appeals Office*, 141 P.3d 943 (Colo. 2006); *Metro Glass & Glazing, Inc. v. Orona*, 868 P.2d 1178 (Colo.App. 1994). A child support lien applies only to benefits payable to the specific injured worker. *See* §8-43-204 (4), C.R.S.

12. As found, at the time of Decedent's death, a child-support lien from the State of Oregon shows he was responsible for a monthly payment of $158.00 or $35.05 per week for AP. The lien also reflects an arrears amount of $1,835.32. The lien utilizes Decedent's Social Security number as to the person responsible for payment. The Oregon administrative order specifies that it applies only to Decedent. Accordingly, the Oregon child support lien is discharged as to benefits payable to AP.

ORDER

Based upon the preceding findings of fact and conclusions of law, the Judge enters the following order:

1. KM's request for death benefits as the dependent widow of Decedent is denied and dismissed.

2. AP is the wholly dependent minor child of Decedent and is thus entitled to receive death benefits pursuant to statute.

3. The Oregon child support lien is discharged as to benefits payable to AP.

If you are a party dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. *For statutory reference, see section 8-43-301(2), C.R.S. (as amended, SB09-*

070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a form for a petition to review at http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

Whether the claimant has established by a preponderance of the evidence that on or about July 23, 2014 she sustained a compensable industrial injury arising out of and in the course of her employment with the respondent-employer.

FINDINGS OF FACT

1. The claimant is a 44-year-old woman with a July 15, 1970 date of birth. The claimant was hired by the respondent-employer on April 27, 2011 to work as a customer service manager.

2. The claimant's medical history is significant for chronic right knee problems with a patellar dislocation injury approximately ten years ago and second injury to the right knee approximately five years prior to the incident in question. On the date of the incident, the claimant was utilizing an open patella right knee brace, as was her practice when "her knee was bothering her".

3. On July 23, 2014, the claimant slipped on some water near the self-scan registers and fell. The claimant has given varying descriptions of the July 23, 2014 accident. On July 28, 2014, the claimant described the incident to Physician Assistant Steven Quackenbush as occurring when she stepped into water with her left foot, her right knee twisted inwards and she heard a "pop" with instant pain and swelling. The claimant reported she did not fall down. She denied any hip or back pain associated with the incident.

4. At hearing, and in her discovery responses, the claimant described the incident as occurring when she slipped in water and fell hard hitting the left knee on the ground. The claimant testified she immediately experienced "excruciating pain." According to the claimant, she remained on the ground for up to a minute after the fall and required the assistance of another associate to stand up. The claimant testified she was then helped to the service desk, in extreme pain.

5. The incident was witnessed and captured on in-store security video. Review of the video shows that on July 23, 2014, at approximately 5:55 p.m., the

claimant entered the self-check-out area wearing a brace on her right knee. At 5:55:52 p.m., the claimant turns from the cashier and slips. The claimant catches herself with the left upper extremity. From the video evidence, it does appear that the claimant's left knee made contact with the floor. Immediately after slipping, at 5:55:53 p.m., the claimant very quickly returns to full upright position, with no evidence of injury. The claimant then bends at the waist to exam the floor. At 5:55:58 p.m., the cashier hands the claimant a roll of paper towels. At 5:56 p.m., the claimant begins wiping up the spill with paper towels, using first her left and then her right lower extremities to mop the spill. At 5:56:39 p.m., the claimant is seen to leave the area, unassisted, with no evidence of a limp and no pain behaviors.

6. The claimant completed her work shift on July 23, 2014. The claimant reported the incident on July 23, 2014. Although she described being in excruciating pain immediately following the slip, the claimant did not request medical treatment.

7. On July 26, 2014, the claimant reported an accident and requested medical treatment. The claimant testified that on July 26, 2014, she was in extreme pain and her right knee had swollen to the same size as her thigh.

8. The claimant selected CCOM as the provider designated to treat her injuries. That facility was closed on July 26, 2014. The claimant proceeded to Canyon City Urgent Care where she gave a history of falling on her left knee and her right knee giving out and twisting out. The claimant also reported a history of "right knee pain". On physical exam, the knees were symmetrical and without obvious joint angulation. The right knee was reportedly "slightly swollen". X-rays were taken and read as normal. The treating physician assessed a "strain of the right knee" and referred the claimant to the workers' compensation provider.

9. On July 28, 2014, P.A. Steven Quackenbush evaluated the claimant. On that date, the claimant indicated her average pain related to the incident was at a level 2/10. On physical exam, the claimant did not have any pain with palpation of the spine, right hip, upper leg, foot, or ankle. P.A. Quackenbush described a "mild effusion" without discoloration, increased warmth or redness of the right knee.

10. The claimant returned to CCOM on July 31, 2014, complaining of "severe" and "constant" pain in her right knee. On physical exam, P.A. Quackenbush noted the claimant did not appear to have a contusion, with no discoloration or increased warmth of the right knee. The claimant had full active extension and flexion of the right knee without popping, locking or crepitus. P.A. Quackenbush released the

claimant to return to work, with restrictions. Due to the claimant's subjective pain complaints, P.A. Quackenbush referred the claimant for an MRI of the right knee.

11. The respondent-employer offered the claimant a modified position within the physician-imposed restrictions. The claimant accepted the modified position.

12. MRI of the right knee was performed on August 7, 2014. The right knee MRI was read as normal.

13. Physician Assistant Thomas Shepard evaluated the claimant on August 8, 2014. The claimant was reporting pain at a level 9.9/10. P.A. Shepard noted the normal MRI findings and opined the claimant's pain seemed disproportionate. Despite the normal MRI and the "disproportionate findings", P.A. Shepard ordered physical therapy.

14. The claimant returned to CCOM on August 28, 2014, reporting no improvement from any treatment. On physical exam, the claimant was ambulating without an obvious antalgic gait. There was no obvious swelling, increased warmth, or increased redness of the right knee. The claimant had full active extension and flexion without popping, locking or crepitus. Due to "persistent severe pain in the right knee", "not responding to therapy", P.A. Quackenbush referred the claimant to Dr. Keith Minihane for a surgical consult.

15. Dr. Minihane evaluated the claimant on September 8, 2014. The claimant was again complaining of pain at a level 10/10. Dr. Minihane opined the MRI was consistent with a "soft tissue contusion", although the claimant does not report falling on to the right knee. Dr. Minihane performed a right knee intra-articular injection, which the claimant testified increased her 10/10 pain sevenfold.

16. By September 12, 2014, the claimant was reporting aching, pins and needles, burning, stabbing and "other" pain at a level 11+/10 in her entire right leg. The claimant described the pain as "excruciating". On physical exam, the claimant had "very good" flexion of the right knee to about 135 degrees and full extension. The movements were without pain. The right knee joint did not show "the slightest swelling and there was no tenderness". Dr. Nanes opined the MRI was "quite unremarkable" and the claimant's knee exam was "very benign." He opined the claimant's complaints were "inconsistent with her physical exam".

17. The claimant continued to complain of pain at a level 10+/10, without objective evidence of injury. The claimant demonstrated excessive pain complaints, including grimacing and crying with pain. Dr. Nanes questioned whether there was

"self-limiting going on." Nonetheless, on November 4, 2014, Dr. Nanes restricted the claimant from all work activity "because of her severe pain". Dr. Nanes credibly testified there was no objective evidence to support restricting the claimant's work activities on November 4, 2014.

18. On November 20, 2014, the claimant presented to Dr. Nanes, accompanied by her husband. On that date, the claimant was again complaining of knee pain at a level 10+/10, grimacing and crying with pain. On physical exam, there was no joint redness and no swelling.

19. On November 25, 2014, Dr. Wallace Larson performed an IME at the respondent-insurer's request. The claimant presented to Dr. Larson complaining of pain exceeding level 10/10. On physical exam, the claimant reported decreased sensibility and tingling over the entire right leg and a glove stocking distribution as far proximal as the upper thigh. The claimant reported an inability to sense sharp dull sensation in the same area through her entire leg. On motor testing, she demonstrated very minimal strength of the quadriceps, hamstring, tibialis anterior, extensor halluces longus, extensor digitorum, or gastrocsoleous muscle groups. Dr. Larson credibly testified the claimant's motor testing and strength on physical exam was inconsistent with even the ability to ambulate. The claimant reported extreme tenderness to palpation of the right knee, even to very light touch in an area from 10 cm above the knee to 10 cm below the knee in a relatively global distribution.

20. Dr. Larson noted the claimant demonstrated "a very large amount of pain behavior." There were no skin or trophic changes. The claimant demonstrated cogwheel type of giving way on muscle testing of the upper and lower leg. She demonstrated minimal motor ability, but had no atrophy to either visualization or to direct measurements of the thighs. Dr. Larson opined the claimant had much greater right knee motion on casual exam than she did on direct exam. There was no joint effusion. Dr. Larson was unable to test ligamentous integrity of the right knee because the claimant reported extreme pain to even light touch and would not allow her knee to straighten on direct exam.

21. Dr. Larson opined the claimant has a very large amount of nonphysiologic findings. Her reported symptoms are not supported by any objective findings. There was a very high degree index of symptom magnification or malingering. He advised against knee arthroscopy "in the strongest possible terms." He further opined, the claimant's symptoms cannot be explained by the presence of a medial synovial plica. A medial synovial plica would not result in the symptoms the claimant describes.

22. Dr. Larson credibly opined it is medically probable the claimant's reported symptoms are unrelated to structural injury. Dr. Larson credibly opined the claimant does not have a work-related diagnosis of any specific injury to the right knee. Dr. Larson credibly opined the claimant has not had any objective evidence of injury. Dr. Larson credibly opined the claimant had no objective findings to support an injury. Dr. Larson credibly testified that based on his review of the records and his examination of the claimant, the claimant's most medically probable diagnosis is malingering.

23. Dr. Nanes reviewed Dr. Larson's IME report. Dr. Nanes credibly testified that based on his review of the report, he "completely agrees" with Dr. Larson's opinions and assessment. Dr. Nanes credibly testified that the claimant has given "an inconsistent history as well as an inconsistent physical exam".

24. On February 5, 2015, the claimant presented to Dr. Jennifer Fitzpatrick, as a self-referral. The claimant reported right knee pain with dysesthesia throughout the entire right leg in a stocking glove distribution. The claimant also reported changes in skin color of the right leg. She also reported hip and back pain. On physical exam, there was no knee effusion, no erythema and no ecchymosis. In contrast to Dr. Larson's findings six weeks prior, knee extension and flexion were full and symmetric to 110 degrees. Dr. Fitzpatrick opined the claimant's symptoms were "difficult to interpret" and may be representative of a reflex sympathetic dystrophy type syndrome. Given the claimant's report of hip and back pain, she recommended x-ray and MRI of the lumbar spine. There was no recommendation for treatment of the claimant's right knee symptoms. Dr. Fitzpatrick opined, "At this point, it is difficult for me to link her fall reported in July to her current symptoms."

25. The claimant's care was transferred to Dr. Jorge Klajnbart based on Dr. Nanes' refusal to treat for nonmedical reasons. Dr. Klajnbart evaluated the claimant on February 15, 2015. On that date, the claimant was reporting right knee pain, but no hip or back pain. The claimant did report numbness of the right foot. She denied any kind of mechanical symptoms to include locking, catching and giving way or buckling. Dr. Klajnbart noted the claimant was wearing an orthotic which was "quite tight." He opined, "It is somewhat incongruent to my physical exam as she has acute response to include grimacing and closing her eyes to light touch when she is able to wear her brace quite tightly around her knee." On physical exam, the claimant had full range of knee motion. There were no skin or hair changes indicative of complex regional pain syndrome. Dr. Klajnbart opined that neither the MRI nor the physical examination demonstrated any acute pathology from the alleged injury. He opined the claimant was not a surgical candidate and should be immediately returned to work.

26. Six days later, on February 19, 2015, the claimant returned to Dr. Fitzpatrick with ongoing complaints of hip and back pain, but no complaints of knee pain. Dr. Fitzpatrick did not recommend any treatment for the claimant's right knee. Instead she recommended evaluation by a spine doctor for possible injection of L5-S1 nerve impingement versus other intervention. Dr. Larson credibly testified that the claimant's right hip and low back complaints are not related to the July 23, 2014 slip and treatment for those complaints should be outside the workers' compensation system.

27. The ALJ credits the testimony of authorized provider, Dr. Richard Nanes, and independent examiner, Dr. Wallace Larson, that the claimant's reported symptoms are not supported by any objective findings.

28. The ALJ finds insufficient evidence to establish that it is more likely than not that the claimant suffered an injury arising out of and in the course of her employment with the respondent-employer on July 23, 2014.

CONCLUSIONS OF LAW

1. According to C.R.S. § 8-43-201, "a claimant in a workers' compensation claim shall have the burden of proving entitlement to benefits by a preponderance of the evidence; the facts in a workers' compensation case shall not be interpreted liberally in favor of either the rights of the injured worker or the rights of the employer, and a workers' compensation case shall be decided on its merits." *Also see Qual-Med, Inc. v. Indus. Claim Appeals Off.,* 961 P.2d 590, 592 (Colo. App. 1998) ("The Claimant has the burden of proving an entitlement to benefits by a preponderance of the evidence."); *Lerner v. Wal-Mart Stores, Inc.,* 865 P.2d 915, 918 (Colo. App. 1993) ("The burden is on the claimant to prove his entitlement to benefits by a preponderance of the evidence.").

2. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark,* 197 Colo. 306, 592 P.2d 792 (1979); *People v. M.A.,*104 P.3d 273, 275 (Colo. App. 2004).

3. For an injury to be compensable under the Workers' Compensation Act, it must "arise out of" and "occur within the course and scope" of the employment. *Price v. Indus. Claim Appeals Off.,* 919 P.2d 207, 210, 210 (Colo. 1996); *Schepker v. Daewoo North*, W.C. No. 4-528-434 (ICAO April 22, 2003). An injury "arises out of" employment when the origins of the injury are sufficiently related to the conditions and circumstances under which the employee usually performs his or her job functions as part of the

employee's services to the employer. *See Schepker, supra.* "In the course of" employment refers to the time, place, and circumstances of the injury. *Id.* There is no presumption that an injury arises out of employment when an unexplained injury occurs during the course of employment. *Finn v. Indus. Comm'n,* 165 Colo. 106, 108-09, 4437 P.2d 542 (1968).

4. Proof of causation is a threshold requirement that an injured employee must establish by a preponderance of the evidence before any benefits are awarded. § 8-41-301 (1)(c) C.R.S.*; Faulkner v. Indus. Claim Appeals Off.,* 12 P.3d 844, 846 (Colo. App. 2000). The question of causation is generally one of fact for the determination by the ALJ. *Faulkner,* 12 P.3d at 846.

5. In deciding whether claimant has met his burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Kroupa v. Indus. Claim Appeals Off.*, 53 P.3d 1192, 1197 (Colo. App. 2002).

6. When considering credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005).

7. The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000).

8. Colorado's Workers' Compensation Act creates a distinction between the terms "accident" and "injury". The term "accident" refers to an "unexpected, unusual, or undesigned occurrence." *See* §8-40-201(1), C.R.S. In contrast, an "injury" refers to the physical trauma caused by the accident. In other words, an "accident" is the cause and an "injury" is the result. *City of Boulder v. Payne,* 426 P.2 194 (1967). No benefits flow to the victim of an industrial accident unless the accident results in a compensable "injury."

9. A compensable injury is one which requires medical treatment or causes a disability. It is well established that it is the claimant's initial burden to prove a compensable injury. *City of Boulder v. Payne, supra; Rockwell International v. Turnbull*, 802 P.2d 1182 (Colo. App. 1990). The determination of whether the claimant proved an injury which required medical treatment or resulted in disability is one of fact for the ALJ. *F.R. Orr Construction v. Rinta*, 717 P.2d 965 (Colo. App. 1985). Moreover, the ALJ's findings may be based on reasonable inferences from circumstantial evidence. *Ackerman v. Hilton's Mechanical Men, Inc.*, 914 P.2d 524 (Colo. App. 1996).

10. It is the claimant's burden to prove a causal connection between her employment and the resulting condition for which medical treatment and indemnity benefits are sought. Section 8-43-201, C.R.S.; *Ramsdell v, Horn*, 781 P.2d 150 (Colo. App. 1989); *Faulkner v. Industrial Claim Appeals Office*, 12 P.3d 844 (Colo. App. 2000). The determination of whether the claimant sustained that burden of proof is factual in nature. The claimant bears the burden of proof, by a preponderance of the evidence, to establish that an injury arising out of and in the course of the employment was the cause of the disability and need for treatment. The question of whether the claimant has met the burden is one of fact for the ALJ. *Faulkner v. Industrial Claim Appeals Office*, *supra.*

11. It is the claimant's burden to prove by a preponderance of the evidence that there is a direct causal relationship between her employment and her injuries. An ALJ might reasonably conclude the evidence is so conflicting and unreliable that the claimant has failed to meet the burden of proof with respect to causation. *Cordova v. Industrial Claim Appeals Office*, 55 P.3d 186, 191 (Colo. App. 2002) (weight to be accorded evidence on question of causation is issue of fact for ALJ). *See also, In the Matter of the Claim of Tammy Manzanares, Claimant*, W. C. Nos. 4-517-883 and 4-614-430, 2005 WL 1031384 (Colo. Ind. Cl. App. Off. Apr. 25, 2005).

12. The facts in a workers' compensation case are not interpreted liberally in favor of either claimant or respondents. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979).

13. In the instant claim, there was clearly a slip accident on July 23, 2014, as documented by in-store security video. Despite extensive medical treatment, including diagnostics and surgical referral, no medical provider has identified any objective evidence of an injury requiring medical treatment or resulting in disability.

14. The ALJ concludes that the opinions and analysis of Dr. Larson and Dr. Nanes is credible and persuasive and the ALJ concludes that the claimant has failed to establish by a preponderance of the evidence that she sustained a compensable injury arising out of and in the course of her employment with the respondent-employer on July 23, 2014.

ORDER

It is therefore ordered that:

The claimant's claim for benefits under the Workers' Compensation Act of Colorado is denied and dismissed.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATE: July 17, 2015

/s/ original signed by:
Donald E. Walsh
Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Dr Ste 230
Colorado Springs, CO 80906

ISSUES

The issues for determination at the hearing were:

1. Whether the Claimant proved, by a preponderance of the evidence, that he suffered a compensable injury in the course and scope of his employment on December 18, 2013.

2. If the Claimant's claim is compensable, whether the Claimant proved that medical treatment he received was authorized, causally related and reasonably necessary to cure and relieve the effects of the December 18, 2013 industrial injury.

3. If the Claimant's claim is compensable, whether the Claimant proved, by a preponderance of the evidence, that he is entitled to temporary total disability indemnity benefits from March 17, 2014 ongoing.

4. If the Claimant is entitled to temporary total disability indemnity benefits, whether the Respondents proved that there are applicable offsets.

5. If the Claimant's claim is compensable, determination of the Claimant's average weekly wage ("AWW").

6. If the Claimant's claim is compensable, whether the Respondents proved, by a preponderance of the evidence, that the Claimant is subject to penalty for failure to timely report his injury.

FINDINGS OF FACT

1. The Claimant testified at the hearing that he had back pain in the past but he had no prior diagnosis of a hernia. He testified that he attributes his current back condition to his work during a heavy work load due to the holiday season. The Claimant testified that, during mid-December of 2013, he was lifting lots of kegs and that is when he started to notice pain. There are no medical records in evidence showing that the Claimant sought treatment in December of 2013. The Claimant placed the date of injury on December 18, 2013 but indicated that he returned to work on December 19, 2013 (Respondents' Exhibit D, p. 11). The Claimant testified that he continued to work for the Employer at the same job duties with no modifications.

2. The Claimant calculated his average weekly wage, including overtime and a health insurance benefit as $1,246.40 (Respondents' Exhibit D, p. 11). Respondents attached wage records from March 15, 2013 through March 14, 2014, the year period

before the Claimant ceased working on March 26, 2014. The Claimant's gross earnings were $61,931.64. $61,931.64 divided by 52 weeks equals $1,190.99 per week. It is not known if this gross earnings amount includes the health insurance benefit, but it is presumed to include the overtime. The health insurance benefit amount was not separately listed by the Claimant in his Worker's Claim for Compensation.

3. The Claimant testified that at some time in December, 2013, he had trouble getting out of bed so he saw Dr. Theiss and complained of back pain but did not state when it happened or that it was work-related because at that time the Claimant wasn't certain that it happened at work the week he was lifting the kegs before Christmas. On cross-examination, the Claimant later testified that he told Dr. Theiss that it was work-related in January of 2014. There is no medical record in evidence to support the Claimant's testimony that he saw Dr. Theiss in December of 2013 complaining of back pain, nor is this medical record discussed in the IME report of Dr. McCranie.

4. The earliest medical record in evidence is from January 23, 2014.[1] The Claimant saw Dr. Thomas D. Mino at Firestone Family and Occupational Medicine complaining of "left calf pain for 6 days." The Claimant reported that he left calf pain was constant since the onset 6 days ago when he woke up. The Claimant reported that could not recall any injury whatsoever. The Claimant described the pain "like a cramp that just won't go away." The pain was described as starting near the posterior knee and radiating towards the Achilles. Dr. Mino noted the Claimant walked without a limp and had full range of motion on the left knee and ankle. The calf was described as "supple" but the Claimant reported tenderness to palpation, medial more than lateral (Respondents' Exhibit M, pp. 78-83). Dr. Mino ordered an ultrasound as the Claimant is diabetic, "to exclude DVT" and noted that if the ultrasound were negative, the Claimant would be treated with heat and compression and over the counter analgesics (Respondents' Exhibit M, p. 78). The ultrasound was normal with no findings of deep vein thrombosis or superficial thromophlebitis (Respondents' Exhibit M, p. 76).

5. The Claimant returned to Firestone Family and Occupational Medicine and saw Dr. Ruth Vanderkooi on January 28, 2014 with continued left leg complaints. The Claimant reported that it hurts behind the knee/calf down to the lateral ankle area and the pain could be 10/10 at times, worse if he is standing and putting weight on it and better if he is lying down. The Claimant was now walking with an antalgic gait. Dr. Vanderkooi noted that the Claimant's pain was unusual with an unclear etiology. She opined that it is possible that it is a referred pain from a lumbar process, but the Claimant declined an MRI due to cost (Respondents' Exhibit M, pp. 71-73).

6. On March 3, 2014 the Claimant saw Dr. Megan Eliassen at the Firestone Family and Occupational Medicine Clinic. She noted that the Claimant reported that he was having more leg pain. He had thought it was going away, but then about 10 days before the appointment the pain came back. The pain is described "like a leg cramp that

[1] There are references to some earlier medical records of the Claimant in the IME report of Dr. McCranie dated April 28, 2015, but no earlier medical records were offered or admitted into evidence in this claim.

won't go away in back of L calf, radiates down to ankle and up to hip." Ice and heat do not help and nothing the chiropractor did changed the pain. The Claimant stated that he is not sure what made the pain better a few weeks ago and not sure what made it worse the previous Saturday. The Claimant offered that maybe the pain was worse because he has to lift heavy things and go up and down stairs at work. The Claimant reported that there was "no trauma /injury that he knows of." The Claimant continued to decline an MRI due to cost (Respondents' Exhibit M, pp. 65-70).

7. On March 17, 2014, the Claimant saw Dr. Nicholee Theiss for a follow up appointment for his diabetes condition. Dr. Theiss notes that the Claimant has chronic diabetes mellitus that is poorly controlled. On this visit, the Claimant also reported low back pain with left-sided radiculopathy. The Claimant reported to Dr. Theiss that he has had the low back pain with leg pain since Christmas and that he had been seen at the Exempla primary care clinic in Firestone. Dr. Theiss noted that the Claimant reported he took Soma and Percocet for the pain and it helped initially, but in the last week the pain has been severe again. Dr. Theiss noted the Claimant had limited range of motion. Dr. Theiss noted that a Medrol Dosepak was provided for the short-term for relieve from acute symptoms. Dr. Theiss indicated that the records from the Exempla clinic would be ordered for review (Respondents' Exhibit G, pp. 32-34).

8. In March 2014, the Claimant testified that he slipped and fell in the restaurant bringing in kegs and he stated that he reported to Greg Miller that he fell down the stairs bringing up kegs. The Claimant testified that he saw Dr. Theiss and reported that he fell on the stairs with kegs. The Claimant testified that he filled out a report with Greg Miller in March 2014 about the fall on the stairs. The Claimant testified that Mr. Miller asked the Claimant if he wanted to see one of their doctors and the Claimant testified that he said, "No, I'm fine" because he was already injured by then. The Claimant testified that he did not fill out a Worker's Claim for Compensation for the March 2014 incident. He testified that there was no reason, he just didn't do it.

9. On March 21, 2014, the Claimant underwent an MRI of the lumbar spine without contrast. The MRI findings included (1) mild disc bulge with moderate sized, broad, left foraminal disc protrusion at L5-S1 which abuts and displaces the left L5 nerve root in the neural foramen and results in moderate left neural foraminal narrowing; (2) mild bilateral neural foraminal narrowing at L4-5, left greater than right; (3) minimal disc bulges in the other intervertebral disc levels in the lumbar spine; and (4) mild facet arthropathy throughout the lumbar spine with no marrow edema or spondylolisthesis (Respondents' Exhibit L, pp. 62-63).

10. The Claimant testified that he stopped working as of March 26, 2014.

11. On March 26, 2014, the Claimant presented to the emergency department at Good Samaritan Medical Center with left lower extremity pain. The Claimant stated that "the pain started in his left leg about 3 months ago" and the pain has gotten worse and now includes low back pain. The Claimant brought a copy of the MRI he had done the previous Friday on DVD. The Claimant denied any new trauma or fall. The pain

medication he was given previously was no longer controlling his pain (Respondents' Exhibit K, p. 52). PA-C Christine Andrea Zakar noted that the Claimant reported "his symptoms initially began in January and have been intermittent up until recently, and now they are persistent." The Claimant's pain was localized to the left posterior let to the lateral aspect of his ankle with no right lower extremity symptoms. The Claimant rated his pain at 10/10 for the leg pain and 4 to 5 / 10 for the back pain (Respondents' Exhibit K, pp. 55-56). The Claimant was also seen by Dr. Kara Beasley who assessed the Claimant with a left L5-S1 disk protrusion and she recommended conservative treatment with physical therapy. The Claimant received an epidural steroid injection, which reduced the Claimant's pain by 50%, and oral pain medication. On discharge, the Claimant was provided a 10 lb. lifting restriction, was referred for physical therapy, and was to follow up with Dr. Beasley in 2-3 weeks. The Claimant was discharged on March 28, 2013 (Respondents' Exhibit K, p. 60).

12. On March 31, 2014, the Claimant saw Dr. Theiss for the purpose of completion of disability paperwork. Dr. Theiss noted that since the last visit on March 17th, the Claimant noted a very slight improvement with the steroid burst, but then his pain became so severe he had to go to the Emergency room. Dr. Theiss assessed a herniated L5-S1 disc which is impinging on the left L5 nerve root with lumbar disc degeneration of L4-5, as well as osteoarthritis throughout his lumbar spine with persistent radiculopathy symptoms into the leg. Dr. Theiss noted that the Claimant would start physical therapy and follow up with Dr. Beasley. Dr. Theiss also completed the disability claim form (Respondent's Exhibit G, pp. 29-31). On the disability claim form, Dr. Theiss noted that he first treated the Claimant on March 17, 2014. He noted that the Claimant "cannot bend, twist, pull, push, or crawl" until cleared by his neurosurgeon. The treatment planned included, "epidural injections, PT, MRI, neurosurgical evaluation, muscle relaxers, anti-inflammatories and narcotic pain relievers (Respondents' Exhibit J, p. 45).

13. On April 14, 2014, the Claimant saw Dr. Kara Beasley for follow up. She noted that the Claimant reported that the ESI on March 27, 2014 "significantly helped his leg pain and the back pain resolved completely." The Claimant also reported that the twice-weekly PT was helping. Dr. Beasley discussed the Claimant's MRI with him and treatment options. At that visit, the Claimant opted to try another injection and continue with PT in an attempt to avoid surgical intervention (Respondents' Exhibit E, p. 18).

14. On May 20, 2014, the Claimant underwent a left L5 transforaminal epidural steroid injection performed by Dr. Greg Arends (Respondents' Exhibit I, p. 39).

15. On June 5, 2014, the Claimant saw Dr. Theiss for follow up regarding his back pain. Dr. Theiss noted the Claimant has undergone three epidural injections on referral from Dr. Kara Beasley. Dr. Theiss noted that the Claimant reported some relief but that the Claimant has not been able to return to work yet. The Claimant was provided with refills for the Oxycodone prescription for pain (Respondents' Exhibit G, pp. 27-28).

16. On June 27, 2013, the Claimant was seen in Dr. Beasley's office by PA-C Christine Zakar. She noted that the Claimant has had 3 epidural steroid injections, the last one on 5/20/2014. The Claimant reported that his leg pain was improved compared to the previous month. Continued conservative care was recommended with a possible referral for another ESI if the pain intensifies, with the understanding that the number of injections be limited to 3-4 per year (Respondents' Exhibit E, p. 12).

17. The Claimant's attorney completed a Worker's Claim for Compensation for the alleged December 18, 2013 injury dated August 4, 2014 stating that the Claimant injured his lower back while "lifting kegs and boxes of wine & spirits upstairs downstairs" (Respondent's Exhibit D, p. 11). On the form, the Claimant does not state that he reported this injury to anyone, but just wrote "NA" in that box. On the form, the Claimant also reports that he had no initial treatment.

18. Respondents filed a Notice of Contest on September 9, 2014 (Respondents' Exhibit B).

19. Dr. Kathy McCranie saw the Claimant for an independent medical examination (IME) and prepared a report dated April 28, 2015. The Claimant reported a five-year history of low back pain to Dr. McCranie. He reported that on December 18, 2013, he was performing his regular job duties of lifting case of wine and kegs up and down stairs and ramps and he noted more pain than usual in his back over the course of that week. The Claimant told Dr. McCranie that he thinks he mentioned this to his employers but he did not file a work injury claim or seek medical care at that time. The Claimant told Dr. McCranie that on December 25 or December 26, he noted a muscle cramp in his left leg. He did not seek medical treatment for this until approximately January 13, 2014 when he was seen at Firestone Exempla Clinic (Respondent's Exhibit A, p. 1). The Claimant reported that he then saw several doctors, including Dr. Theiss, Dr. Beasley and Dr. Arends and he received epidural steroid injections, underwent physical therapy twice a week for three months and was referred to a chiropractor, Dr. Johnson, who he saw twice a month for about 12 sessions of adjustments and electrical stimulation. The Claimant told Dr. McCranie that he did not report a work injury until March of 2014 when he had a separate injury where he slipped and fell and landed on his back. The Claimant stated that he did not seek any medical treatment with respect to this new injury (Respondents' Exhibit A, p. 2). Dr. McCranie provided a thorough review of the Claimant's medical records both prior to his alleged December 2013 injury and since then (Respondents' Exhibit A, pp. 2-5). Dr. McCranie assessed the Claimant with (1) left-sided low back and lower extremity pain; and (2) left-sided lumbar disk protrusion, L5-S1. After taking the Claimant's history and reviewing the medical records, Dr. McCranie opined that she "do[es] not think it is medically probable that the patient had any type of industrial accident." She went on to opine that the Claimant's report of injury is inconsistent with the medical records, having been seen by a doctor on December 22, 2013 and reporting no back pain. Further, Dr. McCranie notes that the reports of calf pain start on January 23, 2014 and, at that time, the Claimant stated that the onset was 6 days prior to the doctor visit. Dr. McCranie notes that, in the medical records, the Claimant cannot recall any injury or trauma and that it is not until March of

2014 that the Claimant mentioned to one of his doctors that he lifted heavy items at work. Ultimately, Dr. McCranie opined that she did not find "any medically probable causal relationship between the onset of the patient's lumbar disc herniation and his work activities of December 18, 2013" (Respondents' Exhibit A, p. 7).

20. When questioned on cross-examination why the Claimant waited until August to fill out a claim, the Claimant testified that at first the pain subsided, but then it got worse again. The Claimant also testified that between March and August, he was on short-term disability and he received about $2,300.00 per month, but that ended at the beginning of August. The Claimant testified that now he is on long-term disability but that is only $1,500.00 per month.

21. The Claimant testified that he was aware of posters around the workplace about reporting injuries but he had never read them or paid attention to them since he hadn't needed to report anything. He testified that he did keep telling Greg Miller that his back was hurting more and more.

22. Greg Miller testified at the hearing that he is the Transportation Manager for the Employer. He managed 78 drivers and is also responsible for the initial filings for all Workers' Compensation claims. He testified that at orientation, all employees are advised about reporting work injuries and there are big posters at the workplace that provide information on work injuries and advise to report injuries to Greg Miller. Mr. Miller testified that when an employee reports an injury to him, they are provided and are to complete the Sedgwick forms. The employee then picks a medical provider as different ones are available all over town. Then, Mr. Miller sends in the Sedgwick forms.

23. Mr. Miller testified credibly that the Claimant never reported an injury in December 2013 to him. Mr. Miller testified that he did not know the Claimant had a work injury and if he had known, he would have had the Claimant fill out the Workers' Compensation paperwork. Mr. Miller likewise testified that he was never advised that the Claimant had a fall in March of 2014. Mr. Miller testified that he was only made aware that the Claimant was off work on short term disability after the fact.

24. On the issue of reporting alleged injuries occurring on either December 18, 2013 or in March of 2014, the testimony of Mr. Miller is found to be more credible and persuasive than that of the Claimant. The Claimant's testimony about reporting back and leg pain due to work injuries is not credible and the medical records do not support acute injuries during these time frames. Moreover, no paperwork was completed and there is no written record of the Claimant having reported work injuries to Mr. Miller.

CONCLUSIONS OF LAW

Generally

The purpose of the Workers' Compensation Act of Colorado (Act), C.R.S. §8-40-101, *et seq.*, is to assure the quick and efficient delivery of disability and medical

benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. C.R.S. §8-40-102(1). The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. C.R.S. §8-43-201. Respondent bears the burden of establishing any affirmative defenses. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of respondents and a workers' compensation claim shall be decided on its merits. C.R.S. §8-43-201 (2008).

The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. See *Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); *Bodensieck v. Industrial Claim Appeals Office*, 183 P.3d 684 (Colo. App. 2008); *Kroupa v. Industrial Claim Appeals Office*, 53 P.3d 1192 (Colo. App. 2002).

Compensability

A claimant's right to compensation initially hinges upon a determination that the claimant suffered a disability that was proximately caused by an injury arising out of and within the course and scope of employment. C.R.S. §8-41-301. Whether a compensable injury has been sustained is a question of fact to be determined by the ALJ. *Eller v. Industrial Claim Appeals Office*, 224 P.3d 397 (Colo. App. 2009). It is the burden of the claimant to establish causation by a preponderance of the evidence. *Faulkner v. Indus. Claim Appeals Office,* 12 P.3d 844, 846 (Colo. App. 2000). There is no presumption than an injury which occurs in the course of employment arises out of the employment. *Finn v. Industrial Commission,* 165 Colo. 106, 437 P.2d 542 (1968). The evidence must establish the causal connection with reasonable probability, but it need not establish it with reasonable medical certainty. *Ringsby Truck Lines, Inc. v. Industrial Commission*, 30 Colo. App. 224, 491 P.2d 106 (Colo. App. 1971); *Industrial Commission v. Royal Indemnity Co.,* 124 Colo. 210, 236 P.2d 2993. Medical evidence is not required to establish causation and lay testimony alone, if credited, may constitute substantial evidence to support an ALJ's determination regarding causation. *Industrial Commission of Colorado v. Jones*, 688 P.2d 1116 (Colo. 1984); *Apache Corp. v. Industrial Commission of Colorado, 717 P.2d 1000 (Colo. App. 1986).* The weight and credibility to be assigned expert testimony on the issue of causation is a matter within the

discretion of the ALJ. *Cordova v. Industrial Claim Appeals Office,* 55 P.3d 186 (Colo. App. 2002).

In order to prove causation, it is not necessary to establish that the industrial injury was the sole cause of the need for treatment. Rather, it is sufficient if the injury is a "significant" cause of the need for treatment in the sense that there is a direct relationship between the precipitating event and the need for treatment. A preexisting condition does not disqualify a claimant from receiving workers' compensation benefits. Rather, where the industrial injury aggravates, accelerates, or combines with a preexisting disease or infirmity to produce the need for treatment, the treatment is a compensable consequence of the industrial injury. *Joslins Dry Goods Co. v. Industrial Claim Appeals Office,* 21 P.3d 866 (Colo. App. 2001); *H and H Warehouse v. Vicory,* 805 P.2d 1167 (Colo. App. 1990); *Seifried v. Industrial Commission,* 736 P.2d 1262 (Colo. App. 1986). However, where an industrial injury merely causes the discovery of the underlying disease to happen sooner, but does not accelerate the need for the surgery for the underlying disease, treatment for the preexisting condition is not compensable. *Robinson v. Youth Track*, 4-649-298 (ICAO May 15, 2007).

Ultimately, the evidence does not support Claimant's allegation that he sustained a work injury on December 18, 2013. The Claimant continued to work through March of 2014. He testified that he stopped working as of March 26, 2014. Prior to this, he worked at his regular job with no modifications. He even testified that he had a fall down stairs at work in March of 2014 prior to the date he stopped working. He missed no days from work until the day he presented to the emergency room on March 26, 2014. The Claimant's supervisor testified credibly and persuasively that the Claimant never reported a December 2013 work injury or a March 2014 fall at work to him. There is no paperwork filed with the Employer to initiate a Workers' Compensation claim and receive medical treatment until the Claimant filed his Worker's Claim for Compensation on August 4, 2014. The Claimant's supervisor also testified that he was not even aware that the Claimant was off work on disability leave until after the fact.

Dr. Kathy McCranie saw the Claimant for an independent medical examination (IME) and prepared a report dated April 28, 2015. The Claimant reported a five-year history of low back pain to Dr. McCranie. He reported that on December 18, 2013, he was performing his regular job duties of lifting case of wine and kegs up and down stairs and ramps and he noted more pain than usual in his back over the course of that week. The Claimant told Dr. McCranie that he thinks he mentioned this to his employers but he did not file a work injury claim or seek medical care at that time. The Claimant told Dr. McCranie that on December 25 or December 26, he noted a muscle cramp in his left leg. He did not seek medical treatment for this until approximately January 13, 2014 when he was seen at Firestone Exempla Clinic. The Claimant also told Dr. McCranie that he did not report a work injury until March of 2014 when he had a separate injury where he slipped and fell and landed on his back. The Claimant stated that he did not seek any medical treatment with respect to this new injury. After a thorough review of the medical records and a physical examination, Dr. McCranie assessed the Claimant with (1) left-sided low back and lower extremity pain; and (2) left-sided lumbar disk

protrusion, L5-S1. However, after taking the Claimant's history and reviewing the medical records, Dr. McCranie opined that she "do[es] not think it is medically probable that the patient had any type of industrial accident." She went on to opine that the Claimant's report of injury is inconsistent with the medical records, having been seen by a doctor on December 22, 2013 and reporting no back pain. Further, Dr. McCranie notes that the reports of calf pain start on January 23, 2014 and, at that time, the Claimant stated that the onset was 6 days prior to the doctor visit. Dr. McCranie notes that, in the medical records, the Claimant cannot recall any injury or trauma and that it is not until March of 2014 that the Claimant mentioned to one of his doctors that he lifted heavy items at work. Ultimately, Dr. McCranie opined that she did not find "any medically probable causal relationship between the onset of the patient's lumbar disc herniation and his work activities of December 18, 2013."

The credible and persuasive evidence does not support an injury occurring at work. The Claimant's testimony regarding the mechanism of injury and the facts surrounding an incident occurring at work on December 18, 2013 is at odds with the testimony of Mr. Miller, his supervisor, the documentary evidence and the medical records. The Claimant had a preexisting low back condition. However, the Claimant testified that this pain was different. Yet, with respect to the medical records, there were multiple confusing reports by the Claimant to his various doctors regarding the onset of his symptoms. Moreover, the Claimant continued to perform his physically demanding job for approximately three months following his alleged date of injury. Overall, there is considerable doubt whether the Claimant was actually injured in the manner he has described.

This doubt is not resolved by the Claimant's testimony at the hearing that he also suffered a slip and fall work injury on stairs in March of 2014 while carrying kegs and cases of wine and spirits. While the Claimant testified that he did report this injury, there is no record of this and the testimony of his supervisor is more credible that the Claimant did not report a March 2014 injury. Then, with respect to this March 2014 injury, the Claimant never filed a Worker's Claim for Compensation.

By March 26, 2014, the Claimant has leg pain that is so severe, he goes to the emergency department and he never returns to work. Instead, he files paperwork for short-term disability. However, even at this point, he does not file any paperwork to initiate a Workers' Compensation claim.

The credible and persuasive evidence demonstrates that it is more likely than not that the Claimant was treating a non-work related low back problem. The credible and persuasive evidence shows that it is more likely than not he was missing work for a non-work related low back problem. From that point forward, the Claimant remained in treatment and on restrictions for his low back. Given the circumstances, including the inconsistent statements made by the Claimant regarding the onset of pain, the contrasting and more persuasive testimony of Mr. Miller on the lack of any report of work injury, and the opinion of Dr. Kathy McCranie, the ALJ determines that the Claimant has failed to meet his burden of proof to establish that he sustained a work

injury and his need for treatment is related to his employment or any work-related injury. As such, the Claimant's claim for compensation is denied and dismissed.

Remaining Issues

The Claimant failed to prove that his December 18, 2013 claim is compensable. Therefore, the remaining issues regarding medical benefits and temporary disability benefits are moot.

ORDER

It is, therefore, ordered that:

1. The Claimant has failed to sustain his burden of proving by a preponderance of the evidence that he suffered a compensable injury resulting from work activities on December 18, 2013.

2. The Claimant's claim for benefits under the Workers' Compensation Act of Colorado is denied and dismissed.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, Colorado, 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. (as amended, SB09-070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: July 27, 2015

Kimberly A. Allegretti
Administrative Law Judge
Office of Administrative Courts
1525 Sherman Street, 4th Floor
Denver, Colorado, 80203

ISSUES

Issues raised for consideration were compensability of an August 16, 2014 right shoulder injury and if compensable entitlement to medical benefits including authorized provider and reasonably necessary care. Specifically, Claimant sought an Order requiring respondents to provide physical and massage therapy.

STIPULTION

The parties' stipulated that in the event of a finding of compensability, the authorized treating facility was Centura Centers for Occupational Medicine (CCOM). The parties stipulation regarding identity of the authorized provided is approved.

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. Claimant is employed as a registered nurse (RN) for Employer at their Belmont Lodge Health Care facility.

2. On August 16, 2014 Claimant was "called in" to work due to staff shortages. Upon her arrival at work, she assumed her normal duties of taking care of elderly patients residing in the facility. Claimant asserts that at around 7:00 PM, two hours after arriving, she was walking down a hallway in the facility when the plastic covering of an overhead light fixture fell and struck her on her right shoulder.

3. Claimant testified that she cried out "ouch" and felt immediate pain in her right shoulder area.

4. An unidentified patient, a co-worker (Barbara Miller), and the interim Director of Nursing for Employer (Janet Green) responded to the area of the incident. Ms. Green testified she was approximately fifteen to twenty feet away in another patient's room when she heard a "clang" in the hallway, like something had fallen.

5. Ms. Green testified that she did not see the actual incident. Instead, Ms. Green testified that as she backed out of the patient's room she was in to look into the hallway, she observed the broken light cover on the floor. According to Ms. Green, there were several 3-4 inch pieces of broken plastic on the floor and multiple smaller pieces in the vicinity. Ms. Green also testified that Claimant did not exclaim "ouch", i.e. Claimant did

not cry out from the hallway. Ms. Miller did not testify.

6. Claimant testified that Ms. Green instructed her to retrieve a broom and dustpan from the maintenance closet and clean the broken plastic from the floor. Claimant testified that she complied despite being in pain. Per Claimant's testimony, she used her left arm as it caused her pain to use her right arm.

7. Ms. Green challenges Claimant's recollection, testifying that she did not require Claimant to clean the mess up. Rather, Ms. Green testified that she observed a resident of the facility approach the area and begin to bend over to pick the broken plastic up from the floor. For safety reasons, Ms Green stopped the resident from attempting to clean up the broken cover after which she noticed that Claimant had already retrieved a broom and dust pan and was cleaning up the area using both arms without apparent pain.

8. Ms. Green testified that Claimant did not report that the light cover had struck her on the shoulder at the time and Claimant testified that she did not show Ms. Green any injury.

9. Claimant testified that she attempted to continue her duties over the next twenty minutes, but was unable secondary to pain. She reportedly returned to the nursing station and requested to Ms. Green that she be able to seek immediate medical treatment for her injured shoulder.

10. Ms. Green agreed that Claimant reported that the cover hit her on the shoulder approximately twenty minutes after the incident occurred. At that time, Ms Green testified that she took Claimant's report as a claim for an on the job injury and repeatedly told her to stop working. Specifically, Ms. Green testified that she told the Claimant to stop using her arms if she was claiming an injury to her shoulder. According to Ms. Green, Claimant refused to stop working during which time she observed Claimant reach out and over her head with both arms to retrieve files for charting without limitation or obvious pain.

11. Claimant testified that after she reported her injury, Ms. Green was exasperated and threw the on the job injury incident paperwork at her. According to Claimant, Ms. Green demanded that she complete it immediately or sign a refusal. Ms. Green disputes this, testifying instead that Claimant refused to stop working when instructed to do so. According to Ms. Green, she heard a visitor to the facility ask claimant if she was hit by the light cover and if so that she would be a witness for claimant. Ms. Green claimed to be out of eye-sight, but within earshot of the visitor's comment. Ms. Green testified that within seconds of this alleged interaction between the visitor and Claimant, Claimant came to her asking to make a report of injury and to seek medical treatment. According to Ms. Green's testimony the interaction between Claimant and this visitor put her "on alert" to a likely workers compensation situation.

12. After some confusion on where to report for treatment initially, Claimant reported

to the emergency room (ER) at St. Mary Corwin Medical Center where she was eventually evaluated by Dr. Sara Kruger-Johnson at 12:03 AM on August. Prior to her seeing Dr. Kruger-Johnson, Claimant was triaged by Kathleen Bujanda, RN who documented the following history of injury at 10:24 (2224) PM: "pt states she was ambulating down hallway at work and the covering of the overhead light fell striking her on the r. shoulder . . ."

13. At midnight (0000) Tabatha Wills, RN completed an initial emergency department (ED) Assessment which the undersigned ALJ finds included a visual inspection of the right shoulder after which RN Wills documented "redness noted to shoulder."

14. During her encounter with Claimant, Dr. Kruger-Johnson took a verbal history regarding the mechanism of injury which is documented in her report as: "was walking through a hallway at work when a light fixture fell from the ceiling striking her in the right shoulder." Dr. Kruger-Johnson also completed a physical examination (P.E.) of the extremities the results of which yielded the following documentation from Dr. Kruger-Johnson: "Patient has tenderness about the posterior joint line of the right shoulder. There is some mild erythema and tenderness to palpation over the a.c. joint. Patient has full range of motion with abduction and adduction with some discomfort with full arm extension and internal rotation."

15. On August 19, 2014, Claimant went to CCOM where she was evaluated by PA-C Steven Byrne at which time she complained of having a sore, aching shoulder which was made worse by lifting. PA Byrne assessed "contusion" of the right shoulder noting that the "objective findings are consistent with the history of a work-related etiology." PA Byrne prescribed Bio Freeze and Ibuprofen and imposed restrictions on Claimant's activities tightening a fifteen pound lifting limitation to ten pounds.

16. Claimant returned to CCOM on August 25, 2014 where she saw Dr. Paul Merchant. During this encounter, Claimant reported continued pain of 8/10 associated with decreased right arm range of motion (ROM). Physical examination revealed tenderness to palpation over the AC joint, along the infraspinatus and deltoid as well as limited right shoulder ROM. Dr. Merchant referred Claimant for four weeks of physical and massage therapy. He also modified Claimant's restrictions reducing her lifting capacity to five pounds. Working diagnosis remained contusion of the right shoulder.

17. Claimant was unable to immediately begin her physical or massage therapy due to scheduling issues, but she had scheduled an initial evaluation for September 3, 2015. On September 2, 2014, she again returned to CCOM with no change in diagnosis or treatment plan by Dr. Merchant. He recommended she remain in a sling.

18. On September 3, 2014, Claimant went for her initial evaluation at the Institute for Total Rehab in Pueblo, CO. The physical therapist noted she displayed signs and symptoms of a shoulder contusion. She was given a treatment schedule of two times per week for a minimum four weeks.

19. Claimant was unable to begin continue physical therapy and initiate massage therapy treatment or return to CCOM due to Respondents' decision to contest the claim.

20. At respondents' request, claimant was seen by Dr. Eric Ridings on November 17, 2014 for an Independent Medical Examination (IME). Respondents submitted Dr. Ridings report as evidence at hearing. Dr. Ridings did not testify. The ALJ has reviewed the report of Dr. Ridings submitted by Respondents at hearing and finds it incomplete. Although Respondents contend that the report provides that Dr. Ridings was of the opinion, assuming claimant was struck by the plastic light cover, she suffered a contusion injury which requires no additional treatment; the ALJ finds no such opinions are contained in the report submitted by Respondents given its incomplete nature. For purposes of this Order the ALJ accepts Respondents assertion that Dr. Ridings opined that Claimant's right shoulder contusion requires no additional treatment, including PT and massage therapy because "her marked (and likely self-limited) loss of range of motion at the right shoulder is inconsistent with being struck by a plastic light cover in the anterior shoulder, which [he] would not expect to have any effect on the movement of her arm given her essentially normal x-rays. The ALJ is not convinced, finding the contrary opinions and recommendations of Dr. Merchant more persuasive than those of Dr. Ridings.

21. Based upon the content of RN Bujanda, RN Wills and Dr. Kruger-Johnson's records, the ALJ finds that Claimant has consistently reported that the cover of the light fixture fell from the ceiling striking her on the right shoulder. Moreover, the ALJ finds the visual inspection of RN Wills and the physical examination of Dr. Kruger-Johnson to contain objective findings (redness and warmth) consistent with being struck on the shoulder by a falling object. The ALJ finds it more probable than not that Claimant's described mechanism of injury is the cause of her shoulder pain and limited ROM and that the care required for her shoulder condition is reasonably necessary to cure or relieve Claimant from the ongoing effects/symptoms caused by this injury. Consequently, the ALJ finds that Claimant has proven, by a preponderance of the evidence, that she suffered a compensable right shoulder injury entitling her to medical benefits, including physical and massage therapy as recommended by Dr. Merchant.

22. Claimant's testimony is credible and persuasive.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

General Legal Principals

A. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to Employers, without the necessity of any litigation. Section 8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving

entitlement to benefits by a preponderance of the evidence. Section 8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the Employer. Section 8-43-201, C.R.S. A Workers' Compensation case is decided on its merits. Section 8-43-201, C.R.S.

B. In accordance with § 8-43-215, C.R.S., this decision contains specific Findings of Fact, Conclusions of Law and an Order. In rendering this decision, the ALJ has made credibility determinations, drawn plausible inferences from the record, and resolved essential conflicts in the evidence. *See Davison v. Industrial Claim Appeals Office*, *84 P.3d 1023 (Colo. 2004).* This decision does not specifically address every item contained in the record; instead, incredible or implausible testimony or unpersuasive arguable inferences have been implicitly rejected. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office, 5 P.3d 385 (Colo. App. 2000).*

C. In determining credibility, the ALJ should consider the witness' manner and demeanor on the stand, means of knowledge, strength of memory, opportunity for observation, consistency or inconsistency of testimony and actions, reasonableness or unreasonableness of testimony and actions, the probability or improbability of testimony and actions, the motives of the witness, whether the testimony has been contradicted by other witnesses or evidence, and any bias, prejudice or interest in the outcome of the case. *Colorado Jury Instructions, Civil*, 3:16. Here, there are some inconsistencies in the testimony of Claimant and Ms. Green. Nonetheless, the ALJ finds many of those inconsistencies immaterial to the threshold issue concerning compensability and resolves the remaining inconsistencies in favor of Claimant to find that her account of the injury and the events thereafter are credible and supported by the record evidence. Consequently, the ALJ concludes that Claimant's testimony concerning the cause of his alleged injury is reliable and persuasive.

Compensability

D. Under the Workers' Compensation Act, an employee is entitled to compensation where the injury is proximately caused by an injury or occupational disease arising out of and in the course of the employee's employment. *Section 8-41-301(1), C.R.S.; Horodyskyj v. Karanian* 32 P.3d 470 (Colo. 2001). The phrases "arising out of "and "in the course of" are not synonymous and a claimant must meet <u>both</u> requirements. *Younger v. City and* County of Denver, 810 P.2d 647, 649 (Colo. 1991); *In re Question Submitted by U.S. Court of Appeals,* 759 P.2d 17, 20 (Colo. 1988). The latter requirement refers to the time, place, and circumstances under which a work-related injury occurs. *Popovich v. Irlando,* 811 P.2d 379, 381 (Colo. 1991). Thus, an injury occurs "in the course of" employment when it takes place within the time and place limits of the employment relationship and during an activity connected with the employee's job-related functions. *In re Question Submitted by U.S. Court of Appeals,*

supra; Deterts v. Times Publ'g Co., 38 Colo.App. 48, 51, 552 P.2d 1033, 1036 (1976). Here there is little question that Claimant produced sufficient evidence to support a conclusion that her symptoms occurred in the scope of employment. Rather, based Ms. Green's testimony and Respondents' assertion regarding the content of Dr. Ridings' report, the ALJ concludes that the question for determination is whether Claimant's injuries and consequently, her need for treatment arise out of her employment.

E. The term "arises out of" refers to the origin or cause of an injury. *Deterts v.Times Publ'g Co. supra.* There must be a causal connection between the injury and the work conditions for the injury to arise out of the employment. *Younger v. City and County of Denver, supra.* An injury "arises out of" employment when it has its origin in an employee's work-related functions and is sufficiently related to those functions to be considered part of the employee's employment contract. *Popovich v. Irlando supra.* As noted above, it is the Claimant's burden to prove by a preponderance of the evidence that there is a direct causal relationship between employment and the alleged injuries. Section 8-43-201, C.R.S. 2013.

F. The determination of whether there is a sufficient "nexus" or causal relationship between Claimant's employment and the injury is one of fact which the ALJ must determine based on the totality of the circumstances. *In Re Question Submitted by the United States Court of Appeals,* 759 P.2d 17 (Colo. 1988); *Moorhead Machinery & Boiler Co. v. Del Valle,* 934 P.2d 861 (Colo. App. 1996). While it is true, under *F.R. Orr Construction v. Rinta*, 717 P.2d 965 (Colo. App. 1985); *Parra v. Ideal Concrete,* W.C. No. 3-963-659 and 4-179-455 (April 8, 1988)*; Barba v. RE1J School District,* W.C. No. 3-038-941 (June 28, 1991); *Hoffman v. Climax Molybdenum Company,* W.C. No. 3-850-024 (December 14, 1989), that an incident which merely elicits pain symptoms without a causal connection to industrial activities does not compel a finding that the claim is compensable, the totality of the persuasive evidence presented establishes that a light cover fell from its mooring onto Claimant's right shoulder while she was engaged in her routine duties as a nurse for Employer. As a consequence Claimant reported that she sustained an injury to her shoulder. As found, the persuasive evidence, including the visual inspection of RN Wills and the physical examination of Dr. Kruger-Johnson, hours after the asserted injury, supports Claimant's assertion. Consequently, the ALJ concludes that a logical causal connection between the Claimant's complaints and her work-related duties exists in this case. The claim is compensable.

Medical Benefits

G. Once a claimant has established a compensable work injury, the claimant is entitled to a general award of medical benefits and respondent's are liable to provide all reasonable and necessary medical care to cure and relieve the effects of the work injury. *Section 8-42-101, C.R.S*.; *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988); *Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo.App. 1990). The question of whether the need for treatment is causally related to an industrial injury is one of fact. *Walmart Stores, Inc. v. Industrial Claims Office,* 989 P.2d 521 (Colo. App.

1999). Where the relatedness, reasonableness, or necessity of medical treatment is disputed, Claimant has the burden to prove that the disputed treatment is causally related to the injury, and reasonably necessary to cure or relieve the effects of the injury. *Ciesiolka v. Allright Colorado, Inc*., W.C. No. 4-117-758 (ICAO April 7, 2003).

H. Based upon the medical records submitted, including the visual observations of RN Wills and the objective findings of Dr. Kruger-Johnson on physical examination, the ALJ credits the opinions/recommendations of Dr. Merchant to conclude that additional treatment in the form of physical and massage therapy is reasonable and necessary to cure and relieve Claimant of the ongoing effects of her compensable right shoulder injury.

ORDER

It is therefore ordered that:

1. Claimant's August 16, 2014 shoulder injury is deemed compensable and Respondents shall pay for all medical expenses to cure and relieve claimant from the effects the effects of this injury, including but not limited to, additional physical therapy and massage therapy as requested by Dr. Merchant.

2. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: July 28, 2015

Colorado Springs, CO 80906

ISSUES

- Whether claimant has proven by a preponderance of the evidence that he sustained a compensable injury arising out of and in the course and scope of his employment with employer?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that the medical treatment he received was reasonable and necessary to cure and relieve the claimant from the effects of the industrial injury?

- The parties stipulated prior to the hearing that Western Medical Associates and Work Partners are designated providers for claimant's work injury.

- The issue of whether claimant failed to timely report his injury in writing to employer was held in abeyance by the parties at the hearing.

FINDINGS OF FACT

1. Claimant was employed with employer as a manager. Claimant testified that on May 22, 2014 he was working on getting the swamp coolers for employer functioning and took an extension ladder and set it up along the building to access the swamp coolers. While working on the ground next to a large overhead door, the wind blew the extension ladder over and the extension ladder struck claimant on the back.

2. Claimant presented the testimony of Mr. Halmark at the hearing. Mr. Halmark was a customer of employer and witnessed the ladder get blown over and strike claimant. Mr. Halmark testified he went over to claimant after he was struck by the ladder and lifted his shirt where he saw substantial red marks and abrasions on claimant's back.

3. Claimant testified he experienced muscle soreness but didn't think he would need medical care initially. Claimant testified he didn't seek medical treatment until June 27, 2014 when he sought treatment with Western Medical Associates and was treated by Ms. Saunders, a nurse practitioner. Claimant reported to Ms. Saunders that he had pain between his shoulder blades and spine on his left side for the previous

2 weeks. Ms. Saunders recommended trigger point injections into the medial side of the scapulis along the 5th to 6th rib.

4. Claimant testified at hearing that he told Ms. Saunders that he was hit by a ladder at work but told her he didn't want to file a workers' compensation claim.

5. Claimant was seen by Dr. Moore on July 6, 2014 on referral from Ms. Saunders. Dr. Moore noted claimant reported he had no obvious injury. Dr. Moore performed manipulations.

6. Claimant was evaluated by Ms. Twardowski, a nurse on July 15, 2014 with complaints of left shoulder pain that he reported felt like a sapasm with severe pains. Claimant reported to Ms. Twardowski that he had left shoulder pain for the last month. Claimant reported that he had a ladder fall on him 1 ½ months ago, but there was no pain at that time. Claimant reported he felt like hi shoulder is cramped and at time he has sharp and stabbing pain. Examination revealed cervical and thoracic motion was restricted. Claimant was provided a prescription for Celebrex.

7. Claimant was examined by Dr. Twardowksi (not to be confused with nurse Twardowski) on August 5, 2014. Dr. Twardowski reported that claimant had left shoulder pain down the back of his arm to his 5th finger, but noted his neck and back pain felt much better. Dr. Twardowski also noted claimant had tenderness at the left first rib and left 4th rib laterally with motion restricted in his cervical and upper thoracic spine. Claimant was diagnosed with neck pain with some radiculopathy and cervicalgia.

8. Claimant was referred for physical therapy and was evaluated by Mr. Olsson with Olsson Physical Therapy on August 13, 2014. Claimant reported to Mr. Olsson that he had been having problems since the beginning of June and didn't know how it started, but did have a ladder fall on his back. Claimant reported intiiatlly he didn't have any problems after the ladder fell on him, but some time after that he started having pain in his left shoulder blade and rib cage area. Claimant reported that the pain was consistent but fluctuated in intensity. Claimant was diagnosed with a left intercostal and rhomboid strain.

9. Claimant eventually reported his injury to employer in writing as a workers' compensation claim on or about August 14, 2014 by filling out a workers' claim for compensation. Claimant testified he spoke to the controller for employer approximately one week before he filled out the form and reported the injury verbally. Claimant was referred to Dr. Winnefeld with Western Medical Associates for treatment.

10. Claimant was evaluated by Dr. Winnefeld on August 14, 2014. Claimant reported to Dr. Winnefeld that he had pain in his shoulder that began after a ladder at

work hit him on the back. Dr. Winnefeld provided claimant with work restrictions of no lifting over 20 pounds. Claimant returned to Mr. Olsson on August 18, 2014. Claimant reported to Mr. Olsson that he had been on prednisone and it had made a big change with less pain than he had experienced in the previous 2 months.

11. Claimant testified he was referred by Dr. Winnefeld to the emergency room ("ER") at some point due to complaints of severe chest pain. Claimant testified he underwent tests in the ER and had asked that insurer pay for the ER visit related to his severe chest pain. The records from this ER visit were not entered into evidence and the ALJ determines that respondents are not responsible for the cost of the ER visit.

12. Claimant was eventually referred for a magnetic resonance image ("MRI") of the left shoulder by Dr. Winnefeld on August 25, 2014. The MRI was essentially normal with only some minor spurring inferiorly from the tip of the acromion being noted. Claimant had a falling out with Dr. Winnefeld after the MRI and his care was transferred to Dr. Heil.

13. Claimant was examined by Dr. Heil on September 5, 2014 as a referral from Dr. Winnefeld. Claimant reported to Dr. Heil the incident of being struck by the ladder and the development of pain. Dr. Heil noted that he believed claimant likely injured his neck when he was hit in the back by the ladder. Dr. Heil noted that claimant had reported pain down the back of his arm, which could be related to a problem with the C8 nerve root. Dr. Heil performed x-rays of the cervical spine and recommended claimant undergo an MRI of the cervical spine.

14. Claimant continued to treat with various providers and was evaluated by Dr. Gustafson with Work Partners on September 25, 2014. Dr. Gustafson noted claimant's accident history of being struck by a ladder in May 2014 and had undergone a course of care since that time that included chiropractic care, acupuncture, massage, x-rays, EKG, MRI of the left shoulder without finding a cause of his pain. Dr. Gustafson noted tenderness present with palpation over rhomboids on the left side along border of scapula. Claimant reported pain with side bending of his neck to the left. Dr. Gustafson noted that no specific cause was known for claimant's pain. Dr. Gustafson also noted that there were signs of radiculopathy of the left upper extremity and recommended an electromyelogram ("EMG").

15. Claimant testified his symptoms were resolving in October 2014, but never fully abated. Claimant testified in January 2015 he contacted insurer regarding getting additional treatment. Claimant also testified he woke up in January 2015 and his hand was numb.

16. Claimant was evaluated by Dr. Richard Price on February 2, 2015. Claimant continued to complain of pain in his shoulder blade region that radiates down the ulnar aspect of the arm with numbness into the 4th and 5th digits with weakness. Dr. Price noted claimant had a significant prior injury to the left wrist and elbow with a partial left wrist fusion. Dr. Price diagnosed claimant with cervical radiculopathy and neck pain of unknown etiology. Dr. Price noted claimant's symptoms seemed to be associated with the C8 nerve root. Dr. Price recommended a cervical MRI and an EMG.

17. Claimant eventually underwent the cervical MRI on February 20, 2015. The cervical MRI revealed multilevel central canal narrowing, greatest at C3-4 and C4-5 along with degenerative retrolisthesis of C6-7 and anterolisthesis of C7-T1 with broad based disc bulges noted at multiple levels.

18. Claimant also underwent an EMG with Dr. Frazho. Dr. Frazho noted on March 5, 2015 that the EMG was abnormal with left likely C8 and possibly some component of C7 radiculopathy. Dr. Frazho recommended a referral to Dr. Clifford or Dr. Gebhard to discuss possible surgical options.

19. Respondents arranged for claimant to undergo an independent medical examination ("IME") with Dr. Lindberg on April 7, 2015. Dr. Lindberg obtained a medical history from claimant, reviewed claimant's medical records and performed a physical examination in connection with his IME. Dr. Lindberg issued a report dated April 7, 2015 that noted claimant's lack of medical treatment between his date of injury (May 22, 2014) and his first medical treatment with a chiropractor in mid June. Dr. Lindberg noted that claimant reported he never had neck pain following the incident and does not have neck pain now. Dr. Lindberg opined in his report that claimant has severe cervical diseases and had a posterior chest wall contusion form the falling ladder. Dr. Lindberg noted that claimant's medical records were silent on the issue of the falling ladder when he first started seeking medical treatment. Dr. Lindberg noted claimant was not complaining of neck pain, and therefore, he disagreed with Dr. Heil's hypothesis that claimant maybe injured his neck when he got hit by the ladder. Dr. Lindberg noted that claimant's pain in his chest wall went away in September 2014, only to return in October 2014 that started another workup. Dr. Lindberg opined that the posterior chest wall contusion (that was mislabeled as a shoulder contusion) had no effect on claimant's cervical spine and resolved. Dr. Lindberg opined that the severe degenerative changes in claimant's cervical spine had no relationship to the alleged ladder contusion. Dr. Lindberg opined that any further care to claimant's left arm, neck or shoulder would be unrelated to the May 22, 2014 work injury.

20. Dr. Lindberg testified at hearing consistent with his report. Dr. Lindberg noted that he did not question claimant having an injury when the ladder fell on him, as the accident was witnessed, but opined that the degenerative changes shown on the

MRI were not related to the incident in which the ladder fell on claimant. Dr. Lindberg testified that if the incident with the ladder had caused an injury to the cervical spine, he would expect claimant to have complained of neck pain following the incident.

21. The ALJ notes that respondents at hearing conceded that with the witness testimony provided at hearing and the testimony of Dr. Lindberg, they were not contesting necessarily that there was a compensable injury when claimant was struck by the ladder, but instead whether the current need for medical treatment, including the cervical MRI and surgical consultation referral to Dr. Clifford or Dr. Gebhard was related to the work injury.

22. The ALJ notes that Dr. Heil was indicating that claimant's injury could involve the C8 nerve root and recommending an MRI of the cervical spine in September 2014, fairly early on in claimant's treatment from his May 22, 2014 injury. The ALJ further notes that Dr. Lindberg opined that claimant's injury was originally mislabeled as a shoulder injury, which may have helped develop the confusion involving his initial treatment for this injury (along with claimant's admitted misstep in not wanting to report his injury as a workers' compensation claim, and providing an inaccurate accident history to his initial providers by telling them he didn't want this injury to be treated as a workers' compensation claim).

23. The credits the reports from Dr. Heil as more credible and persuasive than the contrary opinions expressed by Dr. Lindberg in his report and testimony and finds that claimant has demonstrated that it is more probable than not that the cervical MRI and referral for surgical consultation are reasonable medical treatment necessary to cure and relieve claimant from the effects of the May 22, 2014 injury. The ALJ notes that claimant's diagnosis of having his injury involve a radicular component related to the C8 nerve root was addressed early on in claimant's treatment with Dr. Heil. This evidence is persuasive to the ALJ that the incident with the ladder falling on claimant on May 22, 2014 aggravated, accelerated or combined with claimant's pre-existing condition to cause the need for medical treatment recommended by Dr. Heil in September 2014 and confirmed by Dr. Price and Dr. Frazho in February 2015.

24. Based on the foregoing, the ALJ determines that claimant has demonstrated that it is more likely than not that the recommended medical treatment is related to his compensable May 22, 2014 work injury.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. Section 8-40-

102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. Section 8-43-201, C.R.S., 2006. A Workers' Compensation case is decided on its merits. Section 8-43-201, *supra*.

2. The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and action; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2006).

3. A compensable industrial accident is one that results in an injury requiring medical treatment or causing disability. The existence of a preexisting medical condition does not preclude the employee from suffering a compensable injury where the industrial aggravation is the proximate cause of the disability or need for treatment. *See H & H Warehouse v. Vicory*, 805 P.2d 1167 (Colo. App. 1990); *see also Subsequent Injury Fund v. Thompson*, 793 P.2d 576 (Colo. App. 1990). A work related injury is compensable if it "aggravates accelerates or combines with" a preexisting disease or infirmity to produce disability or need for treatment. *See H & H Warehouse v. Vicory, supra.*

4. As found, claimant has proven by a preponderance that he suffered compensable injury arising out of and in the course of his employment with employer when he was struck by the ladder.

5. Respondents are liable for authorized medical treatment reasonably necessary to cure and relieve an employee from the effects of a work related injury. Section 8-42-101, C.R.S.; *see Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990).

6. As found, the claimant has proven by a preponderance of the evidence that the MRI performed in February 20, 2015 and the referral from Dr. Frazho to Dr.

Gebhard or Dr. Clifford for surgical consultation represent reasonable medical treatment that is necessary to cure and relieve the claimant from the effects of the industrial injury.

ORDER

It is therefore ordered that:

1. Respondents shall pay for the reasonable medical treatment necessary to cure and relieve claimant from the effects of the industrial injury, including but not limited to the treatment provided by the physicians authorized to treat claimant for his work injury, and the cervical MRI performed on February 20, 2015.

2. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

Grand Junction, Colorado 81501

OFFICE OF ADMINISTRATIVE COURTS
STATE OF COLORADO

W.C.No. 4-961-975-02

FULL FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

IN THE MATTER OF THE WORKERS' COMPENSATION CLAIM OF:

Claimant,

v.

Employer,

and

Insurer/Respondent(s)

Hearing in the above-captioned matter was held before Edwin L. Felter, Jr., Administrative Law Judge (ALJ) on June 18, 2015, in Denver, Colorado. The hearing was digitally recorded (reference: Courtroom 1, beginning at 8:30 AM, and ending at 10:30 AM).

Claimant's Exhibits 1-14 were admitted into evidence without objection. Respondents' Exhibits A – C where admitted into evidence without objection.

At the conclusion of the hearing, the ALJ established a post-hearing briefing schedule: The Claimant's opening brief was filed, electronically, on June 23, 2015. The Respondent's answer brief was filed on June 25, 2015. The Claimant's reply brief was filed on June 27, 2015, at which time the matter was deemed submitted for decision. The ALJ hereby issues the following decision.

ISSUES

The issues to be determined by this decision are whether Claimant sustained compensable injuries, arising out of and in the course of his employment with the Employer, on September 6, 2014; and, if so, medical and disfigurement benefits and temporary total disability benefits from September 6, 2014 and continuing.

FINDINGS OF FACT

Based upon the evidence presented at hearing and by depositions, the ALJ makes the following Findings of Fact:

Preliminary Findings

1. At the commencement of the hearing, the parties stipulated, and the ALJ finds as fact, that the Claimant's average weekly wage (AWW) was $320 per week.

2. The Claimant worked for the Employer, a temporary staffing agency, on the date of his alleged injuries.

3. At all times relevant to this case, the Claimant was assigned by his Employer to work as a materials handler for Communications Test Design, Inc., (hereinafter "CTDI"). CTDI processes and packages cable infrastructure at a warehouse facility in the Denver area.

4. While assigned to CTDI, the Claimant worked full-time (40-hours per week), Monday through Friday, with his shift usually beginning at 6:00 AM and ending at 2:30 PM. Upon CTDI's request, the Claimant worked on Saturday. The Claimant worked a Saturday shift on two separate occasions while assigned to CTDI, with the second of those two Saturdays being the date of Claimant's automobile accident and alleged injury.

The On-Premises Lunchroom

5. CTDI permitted workers, including the Claimant, to take a thirty minute lunch break during each shift. While on lunch break, the Claimant was not responsible for clocking in and out when going to and returning from lunch. Rather, thirty minutes of pay was deducted from the Claimant's wages for each shift to reflect the unpaid nature of the lunch break.

6. CTDI provides a lunchroom or break area on the premises for employees. The lunchroom is located inside of CTDI's warehouse, and it is separated from the warehouse floor by a set of doors that open and close. The lunchroom consists of tables and chairs, two refrigerators, two microwaves, and an assortment of vending machines. Employees may store their lunches in the refrigerators provided in CTDI's lunchroom. While on shorter breaks or lunch break, employees can retrieve, warm/prepare, and enjoy their meals in the lunchroom. In addition to bringing their own lunches, employees

may purchase small foodstuffs from the vending machines provided inside of CTDI's lunchroom. The vending machines contain items such as sandwiches and beverages for purchase. CTDI's lunchroom is open and accessible to employees on workdays, which are generally Monday through Friday, but includes Saturday if employees work those days. The lunchroom is for the mutual benefit of the Employer and employees.

7. According to the Employer's witnesses, CTDI's lunchroom is never locked. It is always accessible to employees while working, even on Saturdays. As testified to by all of Respondent's witnesses (Paul Kelly, Salvador Lopez Cuevas, Anthony Folks, and Maurice Edgerton), the lunchroom's doors have no locking mechanisms and are incapable of being locked.

8. In addition to offering a lunchroom, CTDI also permits a food truck to park on company property. This food truck provides hot meals for purchase to employees during lunch breaks. The food truck parks on the premises from Monday through Friday, and is not present on the Saturdays when employees work.

9. The Claimant usually purchased lunch items from the CTDI's lunchroom vending machines or from the food truck, usually eating in the lunchroom.

The Alleged Work-Related Incident

10. According to the Claimant and Christopher Rangel, a co-worker, on September 6, 2014, a Saturday, the Claimant and Rangel, took a 15-minute break. While on break, the pair went to CTDI's lunchroom because Rangel wanted to purchase an energy drink from a vending machine inside and the Claimant wanted to use the restroom located nearby. According to the Claimant and Rangel, Rangel attempted unsuccessfully to open the doors to the lunchroom. Believing that the doors to CTDI's lunchroom were locked, the Claimant and Rangel exited the warehouse to take a smoke break outside. While outdoors and smoking the duo discovered that the food truck was not on the premises that day either.

The Injury Incident

11. The Claimant allegedly believing that CTDI's lunchroom was inaccessible, and observing that the food truck was absent, chose to leave the jobsite to purchase lunch. The Claimant and several co-workers (Roberto Castillo, Paul Littlejohn, and Christopher Rangel) drove to a nearby Wendy's restaurant. The Claimant rode in the front passenger seat. During the drive to Wendy's, the Claimant and his co-workers were involved in a motor vehicle collision (MVA). Roberto Castillo, the driver, ran a red light and his vehicle was T-boned in an intersection by another automobile. The vehicle rolled several times, and ejected the Claimant onto the pavement. He was transported by ambulance to Denver Health Medical Center, where he was admitted to the Intensive Care Unit.

12. The Respondents' witnesses presented and testified more credibly than the Claimant and Rangel. The Respondents' witnesses had less interest in the outcome than the Claimant and Rangel. Indeed, to accept the Claimant's version of events, the ALJ would be required to find an unusual anomaly, without supporting evidence, that the lunchroom was mysteriously inaccessible on the day in question when there were no locking mechanisms according to all of the Respondents' witnesses. The Claimant's and Rangel's version of events makes no sense unless one would accept a "grand conspiracy theory" to lie on the part of all of the Respondents' witnesses. To do so, without any evidentiary basis, would be arbitrary and capricious on the part of the ALJ. Between conflicting sets of evidence, the ALJ makes a rational choice to accept the credible testimony of the Respondents witnesses, and to reject the ultimate testimony of the Claimant that the lunchroom was inaccessible on the Saturday in question. Indeed, the preponderance of evidence supports the proposition that the lunchroom was incapable of being locked and inaccessible on the Saturday in question. The testimony of Respondents' witnesses was more persuasive and credible than the testimony of the Claimant and Rangel because the Respondents' witnesses, among other things, were more familiar with CTDI's warehouse facility, its lunchroom, and the company's procedures relating to work scheduling as well as the availability of resources. Indeed, the temporary job service was the Claimant's employer and not CTDI, which had no monetary interest in the outcome of the Claimant's workers' compensation claim.

Medical

13. As a result of the collision, the Claimant suffered serious and significant injuries to his head, back, right elbow, arms, and hands. Specifically, his injuries included: "(1) right orbital fracture; (2) right frontal hemorrhagic contusion; (3) right subdural hematoma; (4) occipital degloving; (5) right eyebrow/forehead lacerations; (6) right optic neuropathy; and (7) right open elbow fracture." (Claimant's Exhibit 2, Pages 2-6).

14. The Claimant remained unconscious in the Intensive Care Unit at Denver Health Medical Center from September 6 - 10, 2014. During that span, on September 7, 2014, the Claimant underwent emergency surgery to repair his various injuries.

15. On September 11, 2014, the Claimant was discharged from Denver Health Medical Center. Since that time until the present, the Claimant has visited several doctors and other medical specialists who are assisting him in recuperating from his injuries. Claimant is diligently working towards his recuperative goals.

16. The Claimant suffers lingering impairments as a result of the September 6, 2014 collision. As assess by Susan E. Ladley-O'Brien, M.D., on December 11, 2014, the Claimant endured "a traumatic brain injury with residual cognitive difficulties, headache, fatigue, irritability, loss of vision in the right eye due to optic nerve trauma,

right shoulder bicipital tendinitis, and healing right elbow arthrotomy" (Claimant's Exhibit 9, p. 73).

Ultimate Findings

17. The Respondents' witnesses presented and testified more credibly than the Claimant and Rangel for the reasons specified in paragraph 12 herein above. The Respondents' witnesses had less interest in the outcome than the Claimant and Rangel. Their testimony was more consistent with reason and common sense. The Claimant and Rangel's version that the lunchroom was inaccessible on the Saturday in question is without any visible means of support. Between conflicting sets of evidence, the ALJ makes a rational choice to accept the credible testimony of the Respondents witnesses, and to reject the ultimate testimony of the Claimant that the lunchroom was inaccessible on the Saturday in question.

18. The Claimant has failed to prove, by a preponderance of the evidence, that he sustained an industrial accident resulting in multiple injuries to his body including, but not limited to, his head, back, right elbow, arms, and hands. His medical injuries are therefore not compensable in contemplation of law because he was outside the course and scope of employment, on his way to or from and off-premises lunch break, when the on-premises lunchroom was accessible. Consequently, the Claimant was not in the course and scope of his employment and the resultant injuries and disfigurement suffered as a result of the September 6, 2014 car collision are not work-related.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

Credibility

a. In deciding whether an injured worker has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." See *Kroupa v. Indus. Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002); *Penasquitos Village, Inc. v. NLRB*, 565 F.2d 1074 (9th Cir. 1977). The ALJ determines the credibility of the witnesses. *Arenas v. Indus. Claim Appeals Office*. 8 P.3d 558 (Colo. App. 2000). The weight and credibility to be assigned

evidence is a matter within the discretion of the ALJ. *Cordova v. Indus. Claim Appeals Office*. 55 P.3d 186 (Colo. App. 2002). The fact finder should consider, among other things, the consistency or inconsistency of a witness' testimony and/or actions; the reasonableness or unreasonableness (probability or improbability) of a witness' testimony and/or actions; the motives of a witness; whether the testimony has been contradicted; and, bias, prejudice or interest. See *Prudential Ins. Co. V. Cline*, 98 Colo. 275, 57 P.2d 1205 (1930); CJI, Civil, 3:16 (2005). As found, the Respondents witnesses were more credible than the Claimant and Rangel for the reasons specified in paragraph 12 herein above. As further found the testimony of Respondent's witnesses were more persuasive and credible than the testimony of Claimant's witness because, among other things, the Respondents' witnesses were more familiar with CTDI's warehouse facility, its lunchroom, and the company's procedures relating to work scheduling as well as the availability of resources, critical facts concerning the accessibility of the lunchroom on the Saturday in question.

Substantial Evidence

b. As found, between conflicting sets of evidence, the ALJ made a rational choice to accept the credible testimony of the Respondents' witnesses and to reject the testimony of the Claimant and Rangel. Beyond the testimony, Claimant tendered no substantial evidence to substantiate his assertion that CTDI's lunchroom was locked. If the Claimant offered any persuasive evidence that doors were capable of being locked, his assertion that the doors were locked on a particular day could become more probable and plausible. Lacking such evidence, the ALJ is left to decide the case based on Claimant's and Respondents' conflicting in court testimony, which weighs in favor of the doors being incapable of being locked, thus, making the lunchroom on CDTI's premises accessible on the Saturday in question.

Course and Scope of Employment

c. Off-remises lunchtime travel generally falls within the "to and from work" rule and is not compensable because the claimant was free to do what he wanted at lunchtime. *Perry v. Crawford & Co.,* 677 P.2d 416 (Colo. App. 1983). In *Perry,* the claimant went to lunch at a nearby restaurant and was struck by a car on the trip back to the employer's premises. The court determined that the absence of lunch facilities at work was not a sufficient nexus to the employment to make the claimant's injury compensable. As found, the Claimant's injuries resulting from the auto accident occurred during the drive to Wendy's when the Claimant and his co-workers were involved in a motor vehicle collision (MVA). Roberto Castillo, the driver, ran a red light and his vehicle was T-boned in an intersection by another automobile. The vehicle rolled several times, and ejected the Claimant onto the pavement. As found, the accident occurred "to and from work" to get lunch at Wendy's.

d. A narrow exception to the "to and from" rule was articulated In *City & County of Denver School Dist. No. 1 v. Indus. Comm'n*, 196 Colo. 131, 131, 581 P.2d 1162, 1162 (1978), the Supreme Court of Colorado held that an automobile accident in which school board employees were injured occurred within the scope of the employees' employment, and that the injuries were therefore subject to workers' compensation. In that case, the accident happened when the employees were driving to lunch on a day on which they were later required to be at school for a teachers' meeting. Normally, the teachers had the option of going off the school premises for lunch or eating at the school cafeteria. On the day of the accident, the school cafeteria was closed. The claimants and some of their co-employees decided to drive to a restaurant for lunch. During the trip to the restaurant, the claimants were injured. *Id*. at 132. Applying the totality of the circumstances test, the Court held that there was sufficient evidence in the record to support the finding of the Industrial Commission that claimants were acting within the scope of their employment when injured. *Id*. at 133. As found, the Claimant's testimony that the lunchroom was inaccessible on the Saturday in question was not credible and it made no sense in the context of the totality of the evidence. Indeed, the preponderance of evidence supports the proposition that the lunchroom was incapable of being locked and inaccessible on the Saturday in question. The testimony of Respondents' witnesses was more persuasive and credible than the testimony of the Claimant and Rangel because the Respondents' witnesses, among other things, were more familiar with CTDI's warehouse facility, its lunchroom, and the company's procedures relating to work scheduling as well as the availability of resources. Consequently, the lunch room at CDTI was accessible and available on the day in question, and the Claimant and his co-workers chose to go off the premises to have lunch, thus, the auto accident does **not** fall under the narrow exception enunciated in *City & County of Denver School Dist. No. 1 v. Indus. Comm'n, supra.* The Claimant's injuries resulting from the auto accident, as found, occurred when the Claimant was outside the course and scope of his employment because he was "coming from" work to have lunch at Wendy's.

Burden of Proof

e. The injured worker has the burden of proof, by a preponderance of the evidence, of establishing the compensability of an industrial injury and entitlement to benefits §§ 8-43-201 and 8-43-210, C.R.S. See *City of Boulder v. Streeb*, 706 P.2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals Office*, 12 P.3d 884 (Colo. App. 2000)*; Lutz v. Indus. Claim Appeals Office*, 24 P.3d 29 (Colo. App. 2000). *Kieckhafter v. Indus. Claim Appeals Office*, 284 P.3d 202, 205 (Colo. App. 2012). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). *People v. M.S.*, 104 P. 3d 273 (Colo. App. 200); *Hoster v. Weld County Bi-Products, Inc*. W.C. No.: 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. Also

see *Ortiz v. Principi*, 274 F.3d 1361 (D.C. Cir. 2001). Preponderance: means "the existence of a contested fact is more probable than its nonexistence." *Indus. Claim Appeals Office v. Jones*, 688 P.2d 1116 (Colo. 1984). As found, the Claimant failed to sustain his burden on the designated issues.

ORDER

IT IS, THEREFORE, ORDERED THAT:

Any and all claims for workers' compensation benefits are hereby denied and dismissed.

DATED this _____ day of July 2015.

_____

EDWIN L. FELTER, JR.
Administrative Law Judge

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on the certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) that you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) that you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see § 8-43-301(2) C.R.S. (As amended, SB 09-070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a form for a Petition to Review at http://www.coloado.gov/dpa/oac/forms-WC.htm.

CERTIFICATE OF MAILING

I hereby certify that on I have sent true and correct copies of the foregoing Full Findings of Fact, Conclusions of Law and Order on this _____ day of _____ 2015, electronically in PDF format, addressed to:

Division of Workers' Compensation
cdle_wcoac_orders@state.co.us

_____
Court Clerk

Wc.ord

ISSUES

The following issues were raised for consideration at hearing:

1. Did Claimant prove that he sustained a compensable injury within the course and scope of his employment with Employer?

2. If claimant sustained a compensable injury, did he prove by a preponderance of evidence that the ongoing medical treatment and, specifically, the request for a total hip replacement, is reasonable, necessary and causally related to the work injury?

FINDINGS OF FACT

Having considered the evidence presented at hearing, the following Findings of Fact are entered.

1. Claimant works for Employer as a store manager and had done so for three and a half years.

2. Claimant's duties include all aspects of operating the store. He is required to do paperwork, unloading of inventory, stocking, and inside and outside sales. The inventory that the store receives arrives in large plastic totes. They are supposed to weigh no more than 60 lbs but frequently the totes exceed this weight.

3. On April 8, 2014, Claimant was lifting an overweight tote and he felt a pop in the front of his right hip. Claimant dropped the tote and felt pain in his hip which was constant.

4. Claimant reported the injury to his supervisor, Martin Royer. Mr. Royer instructed Claimant to fill out an accident report, and to report the injury to the risk management and human resources departments. Claimant was directed to go to one of two clinics.

5. Claimant chose HealthOne from the list and went to that clinic where he was treated by Dr. Jeffrey Hawke.

6. Dr. Hawke diagnosed Claimant as having a strain of the right hip and ordered an x-ray. In his April 9, 2014, report, Dr. Hawke stated that the hip injury was work related. Claimant received physical therapy from HealthOne but this did not lessen the pain. After that, Dr. Hawke recommended an MRI of the hip.

7. Claimant had two MRIs. One MRI was without contrast and it did not show any injury to the hip. Dr. Hawke then ordered a MRI with contrast and it showed a labral tear. Dr. Hawke then sent Claimant to Cornerstone Orthopedic where he was seen by Dr. Thomas Mann and Dr. Thomas Eichmann. X-rays were taken which showed mild osteoarthritis in both hips and a labral tear in the right hip. A total hip replacement was recommended.

8. Insurer denied liability for the injury and denied authorization for the hip replacement. Claimant went forward with the surgery and it was paid for by his medical insurance carrier. The surgery occurred on December 15, 2014. Claimant missed five weeks from work as the result of the surgery.

9. Claimant did not have problems with either hip prior to lifting the tote at work. His hobbies have included golfing and hiking and he was able to do all of his activities at work and outside of work without hip problem prior to April 8, 2014.

10. Claimant testified that his symptoms were much better following the surgery and that he continues to improve.

11. Dr. Mann is quoted in Dr. Samuel Chan's November 6, 2014, report as saying that there were degenerative changes in the hip that were exacerbated by the work injury and that the patient may need to have a total hip arthroplasty.

12. Dr. Brooks Conforti provided treatment for Claimant. She stated in her June 18, 2014, report that the patient sustained a strain affecting the muscles of the hip and also the lumbopelvic juncture. She reiterates that Claimant suffered an on-the-job injury to his hip in her June 25, 2014, report. She treated Claimant with osteopathic manipulation and trigger point injections. While seeing Dr. Conforti, Claimant reported slipping on a ladder at work and having pain in his back as a result.

13. Dr. Mann stated in his October 21, 2014, report that Claimant had a labral tear and underlying hip arthritis. He stated that the injury "progressed the labral tear," but that the benefits of an arthroscopy would be short-lived due to the underlying arthritis. Regarding causation, he said it is "multifactorial with the aggravating work injury contributing and possibly progressing the underlying arthritis."

14. Dr. Bisgard performed an independent medical examination at the request of Claimant. She is board certified in occupational medicine and Level II accredited. Part of her education in occupational medicine included training in determining causation of an injury. She has also taught classes on causality analysis. Dr. Bisgard stated that she obtained a history from Claimant which was consistent with the history given to his medical providers.

15. Dr. Bisgard testified that the original MRI of Claimant's hip did not show a labral tear because it was not done with contrast. However, the tear was identified on a

repeat MRI which was done with contrast. She also stated that the x-ray showed that Claimant had arthritis in both of his hips. The fact that there was arthritis in both hips was significant to Dr. Bisgard because only the hip that was injured at work was symptomatic. The left hip remained asymptomatic. She stated that the injury to the right hip likely caused the labral tear and caused a cascade of pain from the labral tear that caused the arthritis to become symptomatic. Dr. Bisgard testified that when the labrum tears there is a reaction causing inflammatory cells to come in which starts a pain pathway. This is enough to cause arthritis to flare and precipitate more pain and inflammation. She said that many people have arthritis from which they suffer no symptoms until there is a trauma.

16. Dr. Bisgard credibly opined that, in Claimant's case, it was the lifting of the heavy tote, combined with lifting and twisting that caused the injury to Claimant's hip and caused the arthritis to become symptomatic. Dr. Bisgard stated that there was no record of Claimant having any right hip symptoms prior to the injury at work.

17. In determining causation, Dr. Bisgard stated that she diagnosed degenerative joint disease and a labral tear. She then looked at the onset of symptoms as it correlated with the diagnosis and to see if the described mechanism could have caused the injury. She credibly opined that it was more than 50% likely that the symptoms were related to the work injury. She stated that it was unlikely that Claimant's preexisting arthritis happened to become symptomatic independent of the injury but at the exact same time as the injury. She cited the *Medical Treatment Guidelines* (Exhibit 20.) which state that "The provider must establish a change in the patient's baseline condition and a relationship to work activities including but not limited to repetitive heavy lifting or specific injury to the hip." Dr. Bisgard opined that Claimant's injury fits within these guidelines as Claimant had a baseline condition of no pain or symptoms and then, as a result of a specific injury, his preexisting osteoarthritis became symptomatic.

18. With regard to the labral tear, Dr. Bisgard credibly opined that if the symptoms were only from the labral tear, the treatment would be to simply repair the tear, but with the underlying arthritis, now symptomatic from the injury, the best course would be to replace the hip. It was her opinion that without the incident of April 8, 2014, Claimant would probably not have needed the hip replacement. She also stated that Claimant had a very good outcome from the surgery and was back to work soon thereafter.

19. On cross examination, Dr. Bisgard confirmed that the radiologist said the labral tear was chronic, but the doctor opined that it was unclear what he meant by chronic since the MRI was taken six months after the injury. According to the doctor, it was uncertain if the radiologist meant that it was of 6 months duration or longer than that. She stated that there was no other explanation why Claimant would suddenly develop pain in his hip that never went away immediately following the episode at work, other than her conclusion that the incident caused the preexisting condition to become symptomatic and require treatment.

20. Dr. Bisgard was questioned about Dr. Conforti statement in her July 28, 2014, report that Claimant reached baseline from his slip at work. Dr. Bisgard said that Dr. Conforti was talking about Claimant's back which was injured when he slipped coming down a ladder at work. This occurred after the August 8, 2014, lifting incident. Dr. Bisgard concluded that the baseline that Dr. Conforti was referring to was Claimant's condition before the slip and not before the lifting incident, as there was no slip during the lifting incident.

21. Dr. Bisgard was directed to a sentence in the *AMA* guides that refers to other causative factors to consider in order to determine if a previous trauma was the cause of the arthritis. Dr. Bisgard credibly opined that the section is clearly speaking of arthritis being caused by trauma and not preexisting arthritis becoming symptomatic due to trauma.

22. The fact that the left hip also shows an arthritic condition was significant to Dr. Bisgard because she could do a side-by-side comparison and observe that both hips have the same condition but there were no symptoms in the left hip and there was pain in the right hip. She stated that the variable was the injury to the right hip while working for the Employer.

23. Dr. Bisgard opined credibly that she frequently sees pre-existing asymptomatic arthritis become symptomatic with trauma and that this is what occurred in Claimant's case.

24. Dr. Wallace Larson testified as an expert witness on behalf of the Respondents. He is board certified as an orthopedic surgeon. He performed an independent medical examination at the request of the Respondents.

25. Dr. Larson testified that according to the radiologist report, the labral tear was complex involving multiple tears. He opined that this meant the labral tears were degenerative in nature and caused by a deformity in the femoral head which tore at the labrum over time. He stated that complex tears are chronic in nature. He opined the mechanism of injury would not cause trauma to the hip joint and the arthritis was not caused by the lifting. He opined the total hip replacement was not work related.

26. Dr. Larson opined that Claimant's work-related injury was a muscle strain, and that he would have certainly recovered from a muscle strain. However, he was unable to explain why the pain had not gone away until after the surgery.

27. The ALJ credits Dr. Bisgard testimony as being more persuasive on the issue of the cause of Claimant's preexisting and previously asymptomatic right hip osteoarthritis becoming symptomatic. It is found that, while Claimant has arthritic conditions in both hips, the cause of the right hip becoming painful and requiring surgery was the injury which occurred at work on August 8, 2014. It is also found that the total hip replacement surgery was performed by an authorized treating

physician and that it was reasonable and necessary to cure and relieve the effects of Claimant's work-related injuries.

CONCLUSIONS OF LAW

Based on the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

1. The purpose of the Workers' Compensation Act of Colorado (Act), Sections 8-40-101, et seq., C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. Claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier of fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979) The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of respondents and a workers' compensation claim shall be decided on its merits. Section 8-43-201, C.R.S.

2. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. See *Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); *Bodensieck v. Industrial Claim Appeals O*ffice, 183 P.3d 684 (Colo. App. 2008); *Kroupa v. Industrial Claim Appeals Office*, 53 P.3d 1192 (Colo. App. 2002).

3. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-42-101, C.R.S. Proof by a preponderance of the evidence requires the proponent to establish the existence of a "contested fact is more probable than its nonexistence." *Page v. Clark*, 592 P.2d 792, 800 (Colo. 1979). Whether the claimant sustained his burden of proof is a factual question for resolution by the ALJ. *City of Durango v. Dunagan*, 939 P.2d 496 (Colo. App. 1997).

4. Respondents are liable for medical treatment reasonably necessary to cure or relieve the employee from the effects of the injury. Section 8-42-101, C.R.S.; *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988). However, the right to workers' compensation benefits, including medical benefits, arises only when an injured employee establishes by a preponderance of the evidence that the need for medical treatment was proximately caused by an injury arising out of and in the course of the employment. Section 8-41-301(1)(c), C.R.S.; *Faulkner v. Indus. Claim Appeals Office*, 12 P.3d 844, 846 (Colo.App.2000). The evidence must establish the causal connection with reasonable probability, but it need not establish it with reasonable medical certainty. *Ringsby Truck Lines, Inc. v. Industrial Commission*, 30 Colo. App. 224, 491 P.2d 106 (Colo.App. 1971); *Industrial Commission v. Royal Indemnity Co*., 124 Colo.

210, 236 P.2d 2993. Medical evidence is not required to establish causation and lay testimony alone, if credited, may constitute substantial evidence to support an ALJ's determination regarding causation. *Industrial Commission of Colorado v. Jones*, 688 P.2d 1116 (Colo. 1984); *Apache Corp. v. Industrial Commission of Colorado*, 717 P.2d 1000 (Colo. App. 1986).

5. If an industrial injury aggravates, accelerates, or combines with a preexisting condition so as to produce disability and a need for treatment, the claim is compensable. *H & H Warehouse v. Vicor*y, 805 P.2d 1167 (Colo.App. 1990). In this case, the totality of the evidence supports a conclusion that claimant suffered from a latent pre-existing osteoarthritis in the right hip which manifested after the Claimant lifted an overweight tote at work and felt a pop in his hip. Such injuries are compensable. *Subsequent Injury Fund v. Devore*, 780 P.2d 39 (Colo. App. 1989); *Seifried v. Industrial Commissi*on, 736 P.2d 1262 (Colo.App. 1986). As found, Claimant has proven by a preponderance of the evidence that he suffered a compensable aggravation of a pre-existing condition when he lifted the tote at work. This aggravation made the hip replacement necessary. All of the credible and persuasive evidence supports that the arthritis in the Claimant's hip was asymptomatic up until the lifting episode and then became symptomatic immediately thereafter.

ORDER

It is therefore ordered that:

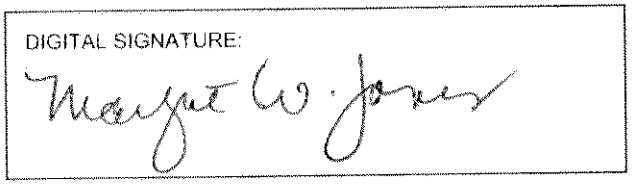
1. Claimant's April 8, 2014, hip injury, including the aggravation of his preexisting right hip arthritis, is compensable.

2. Respondents are liable for reasonably necessary and related medical treatment of the hip injury, including the total hip replacement.

All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: ___July 23, 2015_____



Margot W. Jones, Administrative Law Judge
Office of Administrative Courts
1525 Sherman St., 4th Floor
Denver, CO 80203

ISSUES

I. The issues addressed in this decision involve Claimant's entitlement to disfigurement benefits and maintenance medical treatment.

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. On May 29, 2014, Claimant sustained an admitted injury to his left elbow while employed as a recruit for the Colorado Springs Police Department. During combat training the weight of Claimant's training partner came down on his outstretched arm dislocating his left elbow.

2. Claimant was taken to the emergency room at Memorial Hospital where his elbow was reduced and splinted. Claimant subsequently sought and received medical treatment through the designated treating provider, the City Occupational Health Clinic under the direction of Dr. Miguel Castrejon and Nurse Practioner (NP) Paulette Miksch. As noted, Claimant's elbow was splinted. He was also provided Meloxicam and Norco for pain. Through the authorized chain of referrals, Claimant also received medical treatment from orthopedic specialist Dr. Christopher Jones.

3. Dr. Jones first evaluated claimant on June 6, 2014 and determined at that time that he would treat Claimant non-operatively. Dr. Jones placed Claimant into a hinged elbow brace which blocked his elbow extension at approximately 30 degrees. Claimant was scheduled for follow-up in two weeks at which time Dr. Jones anticipated increasing claimant's extension to a negative 15 degrees. Overall, Dr. Jones anticipated six weeks of splinting.

4. Claimant returned to Dr. Jones on June 23, 2014. Dr. Jones noted that Claimant was doing well with improvement in his pain, although he continued to have a "little neurapraxic pain . . . relative to the superficial radial nerve." Claimant's splinting was adjusted to a negative twenty degree extension block and he was instructed to return to the clinic in two weeks.

5. While receiving treatment from Dr. Jones, Claimant concurrently continued treatment with Dr. Castrejon and NP Miksch.

6. On June 27, 2014, NP Miksch documented that Claimant "may stop Meloxicam and start Ibuprofen 800 mg tid with food" and continue "Norco if needed." Ambien was added to Claimant's medications as he was having difficulty sleeping.

7. By July 28, 2014, due to good progress, Dr. Jones directed Claimant to return to activities as tolerated and permitted Claimant to discontinue use of the hinged brace when he was not participating in physical activity. Dr. Jones intended to "protect" Claimant in this fashion for an additional six weeks after which he would re-evaluate for potential full-release from care.

8. On August 20, 2014, Paulette Miksch documented that Claimant was permitted to judge his own physical restrictions, noting that he experienced a pain level of 1 on a scale of 10 while at rest and upwards of 6/10 with activities. Left elbow range of motion (ROM) was measured at 0-120 degrees and right elbow ROM was measured at 0-140 degrees. Left pronation and supination was painful and mildly limited. Although an MRI, which demonstrated a rupture of the lateral ulnar collateral ligament (LUCL) had been obtained by the date of this visit, Dr. Jones continued to recommend PT and strengthening as surgery was not indicated and "often" resulted in negative outcomes for injuries such as Claimant's.

9. During his August 20, 2014 appointment with NP Miksch, Claimant completed a PATIENT FOLLOW-UP VISIT questionnaire in which Claimant documented that he was currently taking Ibuprofen among other medications. Consequently, while NP Miksch ceases references regarding the need for Ibuprofen and Norco in her notes after July 11, the ALJ finds that Claimant probably continued to take Ibuprofen through his August 20 appointment with NP Miksch as documented in his Patient Follow-Up Visit questionnaire.

10. On September 8, 2014, Claimant was re-evaluated by NP Miksch who added Dermatran Cream with Tramadol for continued pain and trigger points in the elbow and biceps.

11. On September 17, 2014, Claimant returned to NP Miksch who documented continued improvement in Claimant's pain levels and ROM. During this encounter, Claimant reported a "dull ache" in the elbow, but no pain. As noted above, Dermatran with Tramadol had been added to Claimant's treatment regime on September 8, 2014, which Claimant was instructed to continue to use as directed.

12. Claimant returned to Dr. Jones on September 22, 2014. Dr. Jones' medical examination of Claimant that date showed Claimant to have full extension, full pronation and supination, and improved stability of the elbow. He documented that Claimant had "really turned the corner and is starting to feel better. [Claimant] started doing some weights. As soon as he started to do that, the pain started to subside and his strengthen [sic] is starting to improve."

13. Dr. Jones released Claimant to full duty on September 22, 2014. Although Dr. Jones did not recommend specific maintenance care he noted that "[Claimant] will return to see me only as needed."

14. On September 26, 2014, Claimant reported to NP that the Dermatran was helpful for his discomfort. Consequently, NP Miksch documented that Claimant was to "continue Dermatran Cream #6 with Tramadol to elbow and biceps" as directed.

15. On October, 21, 2014, Claimant was instructed to discontinue the Dermatran Cream with Tramadol secondary to development of a rash in the area of the left elbow, biceps and forearm. Additional medications were added to cure his rash.

16. On November 20, 2014, Dr. Castrejon placed claimant at maximum medical improvement, documenting that Claimant had full pronation and supination, no discomfort with pronation and supination, and only a very mild dull ache that did not interfere with Claimant's full duty work activities

17. Dr. Castrejon specifically stated when placing Claimant at MMI that "[m]aintenance care is not indicated." Indeed, Dr. Castrejon did not even recommend that claimant required an ongoing home exercise program. Rather, Dr. Castrejon returned Claimant to full duty without work restrictions. Nevertheless, the PATIENT FOLLOW-UP VISIT questionnaire indicates Claimant's response as "same" to question 3: What are the names of the MEDICATIONS that you are taking? As noted above, the prior Patient Follow-up Visit questionnaire completed August 20, 2014 indicated that Claimant was taking Ibuprofen. Consequently, the ALJ infers and finds from these questionnaires that Claimant, more probably than not, continued his use of Ibuprofen between August 20, 2014 and November 20, 2014 when he was placed at MMI.

18. Respondent filed a final admission of liability (FAL) on December 3, 2014 consistent with Dr. Castrejon's report of MMI in which it denied liability for any maintenance medical care per Dr. Castrejon's specific statement that maintenance care is not indicated.

19. Claimant filed an objection to the FAL and an application for hearing endorsing the issues of medical benefits, reasonably necessary, Grover meds should remain open, and disfigurement.

20. At hearing, claimant testified that he continues to experience left elbow pain for which he takes Ibuprofen from 1 to 3 times per day. He does not know if he should push continued exercise or back off due to persistent pain. Consequently, Claimant testified that he would like to return to Dr. Jones for further evaluation. Claimant testified that the pain he currently experiences "is the same as when [he] last saw Dr. Castrejon." Claimant last saw Dr. Castrejon on November 20, 2014 when he was placed at MMI during which time the ALJ finds that Claimant was using Ibuprofen for pain control. Based upon complete and careful review of the medical records, the ALJ finds support for Claimant's testimony concerning his ongoing symptoms and his

continued need to take Ibuprofen for pain/discomfort related to his admitted work injury. The medical records reveal that over the course of his treatment Claimant has been prescribed various medications, including Ibuprofen and Norco to address the pain problems attendant with his injuries. A self reported listing of Claimant's medications at the time of MMI simply indicates "same" which previously included Ibuprofen. Consequently, the ALJ finds Claimant's testimony regarding the necessity for the use of Ibuprofen to cure and relieve him of ongoing pain associated with his industrial injury credible and convincing. Without ongoing medication, the ALJ finds that Claimant's condition will likely deteriorate.

21. Claimant testified that he understood per Dr. Jones and NP Miksch that he was to return to Dr. Jones after physical therapy if he felt he had not improved. Respondents contend that neither the last record of Dr. Jones dated September 22, 2014 nor any of the reports issued by NP Miksch leading up to Claimant's placement at MMI or the MMI report of Dr. Castrejon reference any recommendation for Claimant to Dr. Jones for reevaluation. The undersigned ALJ is not persuaded. Based upon the totality of the evidence presented, the ALJ finds Respondent's interpretation of Dr. Jones' September 22, 2014 exceedingly narrow. While Dr. Jones' September 22, 2014 report does not use the terms "recommend" or "re-evaluation", it does indicate that Claimant will return to his attention only on an as needed basis. The ALJ infers and finds that Dr. Jones' use of the term "only" was not intended to preclude Claimant from returning for further assessment. Rather, the ALJ finds that the term "only" and the phase in its entirety, more probably meant that Claimant was not going to be scheduled for additional routine appointments and that he "will" return as needed. Accordingly, the ALJ credits Claimant's testimony to find that Dr. Jones, more probably than not, advised Claimant to return for further assessment if symptoms persisted. Because Claimant's symptoms have persisted despite the use of analgesics, a "re-evaluation" with Dr. Jones is warranted, i.e., it is reasonably necessary to maintain and otherwise prevent further deterioration of Claimant's condition.

22. The ALJ credits the medical records and Claimant's testimony to find that he is in need of maintenance medical treatment; including Ibuprofen and a return visit to Dr. Jones for further evaluation regarding the etiology of his ongoing pain and discomfort in order to prevent further deterioration of his condition.

23. Claimant has a visible disfigurement to the body consisting of mild swelling to the lateral portion of the left elbow when compared to the right as a consequence of his left elbow dislocation injury.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

General Legal Principals

A. The purpose of the Workers' Compensation Act of Colorado is to assure quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. *Section 8-40-102(1).* Claimant must prove entitlement to benefits by a preponderance of the evidence. The facts in a workers' compensation case are not interpreted liberally in favor of either claimant or respondents. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979).

B. In determining credibility, the ALJ should consider the witness' manner and demeanor on the stand, means of knowledge, strength of memory, opportunity for observation, consistency or inconsistency of testimony and actions, reasonableness or unreasonableness of testimony and actions, the probability or improbability of testimony and actions, the motives of the witness, whether the testimony has been contradicted by other witnesses or evidence, and any bias, prejudice or interest in the outcome of the case. *Colorado Jury Instructions, Civil*, 3:16.

C. A workers' compensation case is decided on its merits. *Section 8-43-201*. In accordance with Section 8-43-215, C.R.S., this decision contains Specific Findings of Fact, Conclusions of Law and an Order. In rendering this decision the ALJ has made credibility determinations, drawn plausible inferences from the record, and resolved essential conflicts in the evidence. See *Davison v. Industrial Claim Appeals Office*, 84 P.3d 1023 (Colo. 2004). This decision does not address every item contained in the record; instead, incredible or implausible testimony or unpersuasive arguable inferences have been implicitly rejected. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000).

Maintenance Medical Benefits

D. Claimant is entitled to ongoing medical benefits after MMI if he presents substantial evidence that future medical treatment will be reasonably necessary to relieve the claimant of the effects of the injury or prevent deterioration of the claimant's condition. *Grover v. Industrial Commission,* 759 P.2d 705 (Colo. 1988); *Stollmeyer v. Industrial Claim Appeals Office,* 916 P.2d 609 (Colo. App. 1995).

E. In *Milco Construction v. Cowan,* 860 P.2d 539 (Colo. App. 1992), the Court of Appeals established a two-step procedure for awarding ongoing medical benefits under *Grover, supra.* The Court stated that an ALJ must first determine whether there is substantial evidence in the record to show the reasonable necessity for future medical treatment. If the Claimant reaches this threshold, the Court stated that the ALJ should then enter a "general order similar to that described in Grover." Thus, while Claimant does not have to prove the need for a specific medical benefit, he must prove the probable need for some treatment after MMI due to the work injury. *Milco Construction v. Cowan*, *supra*. The question of whether the claimant met the burden of proof to

establish an entitlement to ongoing medical benefits is one of fact for determination by the ALJ. *Holly Nursing Care Center v. Industrial* Claim Appeals Office, 992 P.2d 701 (Colo. App. 1999); *Renzelman v. Falcon School District,* W. C. No. 4-508-925 (August 4, 2003).

F. Here, the ALJ concludes that Claimant has met his burden to establish his entitlement to maintenance medical treatment. Substantial persuasive evidence demonstrates that there is a need to treat Claimant's ongoing chronic pain caused by the injuries sustained in this admitted claim. The Claimant was injured in excess of one year ago and has completed a course of physical therapy. Yet, he continues to have persistent pain which he credibly testified is relieved by the use of medications previously provided. Without ongoing treatment and medications, Claimant's present condition will likely deteriorate further. Moreover, the ALJ is not persuaded by Respondent's suggestion that the return to Dr. Jones on an as needed basis constitutes a speculative statement/recommendation supporting a conclusion that Claimant is not entitled to maintenance care because there was "no way to determine whether claimant would actually require a return to Dr. Jones at the time Dr. Jones issued the September 22, 2014 medical treatment record." To the contrary, the ALJ concludes that Claimant proved such "need" to return to Dr. Jones at hearing. Claimant has proven, by a preponderance of the evidence that there is a probable need for treatment post MMI, to maintain MMI and otherwise prevent deterioration of his current condition entitling him to an order for ongoing medical benefits.

G. Claimant is entitled to ongoing medications and follow-up with his authorized treating physicians subject to Respondent's right to challenge any specifically requested future care or form of treatment based on established case law. *See for example, Hanna v. Print Expediters, Inc.* 77 P.3d 863 (Colo. App. 2003). *See Hanna v. Print Expediters Inc.,* 77 P.3d 863 (Colo. App. 2003) (a general award of future medical benefits is subject to the employer's right to contest compensability, reasonableness, or necessity).

H. In *Arkin v. Industrial Commission*, 145 Colo. 463, 358 P.2d 879 (1961), the Court held that the term "disfigurement" as used in the statute, contemplates that there be an "observable impairment of the natural person." As found in this case, Claimant has mild swelling of the lateral portion of his left elbow which the undersigned ALJ concludes constitutes a disfigurement as provided for by Section 8-42-108 (1), C.R.S.

ORDER

It is therefore ordered that:

1. Claimant is entitled to ongoing medical treatment reasonably necessary and related to his May 29, 2014 industrial injury to maintain MMI. Respondents shall pay for the attendant cost associated with Claimant's use of Ibuprofen as well as the attendant cost of reasonably necessary and related follow-up visit(s) with Dr. Jones.

2. Respondent-Employer retains the right to dispute any treatment recommended on the basis that the need for treatment is not causally related to Claimant's May 29, 2014 work injury and/or that the recommended treatment is not reasonable or necessary.

3. Claimant has sustained a serious permanent disfigurement to areas of the body normally exposed to public view, which entitles Claimant to additional compensation. Respondent-Employer shall pay Claimant $500.00 for that disfigurement. Insurer shall be given credit for any amount previously paid for disfigurement in connection with this claim.

4. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

5. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: July 23, 2015

/s/ Richard M. Lamphere

Richard M. Lamphere
Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Drive, Suite 230
Colorado Springs, CO 80906

ISSUES

1. Whether Claimant has established that she suffered a compensable injury to her left upper extremity/shoulder arising out of and in the course of her employment with Employer on September 9, 2014.

2. If the claim is compensable, whether Claimant has established that an MRI of the left shoulder as recommended by Dr. Kawasaki is reasonable, necessary, and related to Claimant's September 9, 2014 work injury.

PROCEDURAL

Claimant endorsed the issue of a neck injury in addition to the left upper extremity/shoulder injury. At the outset of hearing, Claimant withdrew the issue of a neck injury and proceeded solely on the left upper extremity/shoulder issue.

FINDINGS OF FACT

1. Claimant has worked for Employer as an Engineer Technician evaluating well permits for approximately 22 years. Her job duties involve primarily sitting at a computer desk, mousing, keyboarding, and talking on the phone. Claimant has been at her current desk/work station for approximately 18 years without significant changes.

2. Claimant testified that she has had pre-existing problems with her neck for three to four years or possibly longer. Claimant testified that she woke up one morning with some left shoulder pain and didn't really know exactly what it was from. Claimant reported that she noticed at work when she was on the job that she was in an awkward position while keying on the keyboard.

3. Claimant testified that while keying on the keyboard her left arm is above chest level, bent at the elbow, and sticking out to the left in an awkward position. Claimant testified that this is due to a wide keyboard tray and working centered on her mouse. Claimant testified that around early September of 2014 she had a lot of discomfort/pain, and limited mobility in her left arm to the point of being unable to lift it.

4. Claimant testified that other than the awkward keying at work she had not previously injured her left shoulder anytime in 2014 or before. Claimant reported she had not been treated or evaluated for any left shoulder problems or left shoulder pain since she had a tumor removed in the late 1990's.

5. Claimant reported her left shoulder pain to Employer and filled out an Employee Statement of Injury/Exposure form on September 23, 2014. For place of

accident/exposure Claimant reported, “not real sure if work related – just feeling discomfort while doing my job.” For how the injury/exposure occurred Claimant reported, “not sure – have had neck pain and back pain for the past couple of years now having pain from neck to left shoulder to arm.” For the date of injury/exposure Claimant reported, “no specific date, neck issues for past couple years now shoulder and arm since beginning of September, 2014.” *See* Exhibit H.

Prior medical treatment

6. Claimant has had neck pain for more than a couple of years. Claimant has had documented neck pain for approximately 12 years and going back to at least 2003. In 2003 Claimant also reported that she had experienced neck stiffness in the past.

7. Claimant also has had left shoulder and arm pain prior to September of 2014. Claimant has had documented left shoulder/arm pain for approximately 11 years and going back to at least 2004.

8. Two months prior to Claimant’s alleged injury, and on July 14, 2014 Samuel Clinch, M.D. evaluated Claimant. Claimant was diagnosed with bipolar disorder, borderline personality disorder, back and neck pain, poor appetite, and economic and other psychosocial and environmental problems. Claimant reported struggling with anxiety and sleep problems. Claimant reported ongoing economic concerns and bad reviews at work. Claimant also reported neck and back pain. *See* Exhibit G.

9. Approximately one year prior to her claim, and on September 9, 2013 Claimant underwent chiropractic treatment. Claimant reported neck pain and tightness that had been going on for years and that she was not sure what initially caused the pain. Claimant reported pain in her left lower neck and left upper trapezius. *See* Exhibit G.

10. A little over one year prior to her claim, and on July 2, 2013 Claimant was evaluated by Dianne Glenn, M.D. Claimant reported neck pain, *shoulder pain*, and upper back pain that was now *into her left arm*. Claimant reported that *lifting her left arm hurt and that she had numbness and tingling in her left arm* that comes and goes. *See* Exhibit G

11. On April 3, 2009 psychologist Laura Richardson evaluated Claimant. Claimant reported feeling stupid at work, missing major steps, making mistakes, and feeling that her Employer was trying to push her out. Claimant reported struggling to get her work done and getting it wrong. Claimant reported thinking of applying for long term disability because she felt she couldn’t do her job, was afraid of another bad performance review, and because she was unable to transfer jobs. Claimant also reported *numbness/tingling in her thumb and first two fingers of her left hand*. *See* Exhibit G.

12. On March 30, 2004 physician assistant (PA) Michael Borkowski evaluated Claimant. Claimant reported pain between her shoulder blades, in her neck area, and *in her upper arms*. PA Borkowski noted she had recurrent episodes of upper back pain and *paresthesias in the back of her arms*. PA Borkowski noted objectively that Claimant had severe cervical and thoracic paraspinal spasm. *See* Exhibit G.

13. On August 8, 2003 Frances Macdonald, M.D. evaluated Claimant. Claimant reported neck pain and stiffness and *numbness and tingling in the lateral aspect of her left hand to the left wrist and reported her entire left arm felt sore.* Claimant reported to Dr. MacDonald that she had stiffness in her neck in the past. Dr. MacDonald noted objectively that Claimant had full range of motion in her neck with some discomfort on rotation to the left and some discomfort on full flexion. *See* Exhibit G.

14. On June 5, 1998 Claimant underwent surgery on her left shoulder to excise a mature adipose tissue which was removed and found to be consistent with a lipoma. *See* Exhibit G.

Current claim treatment

15. On September 9, 2014 Dr. Glenn evaluated Claimant. Claimant reported pain in the left neck and arm with no history of injury but that the pain was in her arm and worse when Claimant got up. Claimant reported her arm was achy and hurt more when she moved it. Dr. Glenn noted Claimants long history of neck pain. Dr. Glenn questioned whether the pain was work related (? If related to work) and noted that Claimant worked on a computer and was having an ergonomic evaluation. *See* Exhibit G.

16. On September 24, 2014 Julie Parsons, M.D. evaluated Claimant. Claimant reported discomfort in her left arm and left side of her neck for about a month. Claimant reported her work setup was not correct and that her company was working on a new setup. Claimant reported left shoulder, upper arm, and forearm pain that was getting worse. Claimant reported pain in the left lateral neck that radiates to the left shoulder, left upper arm, and left forearm. Dr. Parsons did not place Claimant on any work restrictions and returned Claimant to full work/activity. *See* Exhibit B.

17. On October 20, 2014 Timothy Mazzola, M.D. evaluated Claimant. Claimant reported left sided shoulder and neck pain down into the left arm and into the ulnar side of the forearm with no specific injury to her shoulder. Dr. Mazzola ordered X-rays of her shoulder and C-spine. The shoulder x-rays showed normal left shoulder without joint degenerative changes and a normal acromion. The C-spine X-rays showed degenerative disc disease, mild at C4-5 and more severe at C5-6 and C6-7 before normalizing at C7-T1. *See* Exhibit C.

18. On October 27, 2014 Claimant underwent an MRI of her C-spine that was interpreted by Robert Liebold, M.D. Dr. Liebold found no acute fracture or neoplastic marrow replacement process. His impression was mild to moderate C5-C6 central stenosis with moderate to severe left foraminal stenosis, and mild to moderate C6-7 central stenosis with moderate to severe left and moderate right foraminal stenosis. *See* Exhibit F.

19. On October 29, 2014 Dr. Mazzola evaluated Claimant. Claimant reported cervical spine pain, with less arm pain but that her neck really bothering her. Dr. Mazzola reviewed the C-spine MRI with Claimant and noted it showed central stenosis with moderately severe left sided neuroforaminal stenosis at both C5-6 and C6-7. He found that Claimant indeed had significant left sided neuroforaminal stenosis at C5-6 and C6-7 levels that affected the C6 and C7 nerve roots. *See* Exhibit C.

20. On November 3, 2014 Robert Kawasaki, M.D. performed a physical medical consultation. Claimant reported no specific injury to Dr. Kawasaki and indicated that she had had problems in her neck for a few years. Claimant reported developing pain in her neck, pain in her left shoulder, and pain in her left arm and believed that her work activities caused the problems to develop. Claimant reported while working her left shoulder and arm began having increasing pain. *See* Exhibit A.

21. Dr. Kawasaki indicated Claimant's cervical pain complaints were minimal, that she had weakness in her left shoulder that appeared to be pain generated from lack of shoulder motion, and left shoulder impingement with a firm mechanical block in shoulder abduction. Dr. Kawasaki recommended further investigation of Claimant's prior shoulder tumor resection, an MRI of the left shoulder with arthrogram, and further workup of the shoulder before performing cervical epidural steroid injections. *See* Exhibit A.

22. Dr. Kawasaki opined that Claimant's main pain generator may be the left shoulder. Dr. Kawasaki opined that if Claimant's cervical pathology was causing her symptoms it would be difficult to relate it to her job. Dr. Kawasaki opined that if her shoulder pathology was causing her complaints, then a job description and ergonomic evaluation would be helpful to determine her job activities and risk factors for a cumulative trauma type of injury. *See* Exhibit A.

23. On November 7, 2014 Dr. Parsons evaluated Claimant. Claimant reported intermittent left shoulder pain and that her symptoms had improved. Dr. Parsons assessed left shoulder strain. Dr. Parsons reviewed the ergonomic evaluation that had been performed. After review, Dr. Parsons opined to a reasonable degree of medical probability that Claimant's job duties did not meet criteria for any form of cumulative trauma disorder. *See* Exhibit B.

24. On January 8, 2015 Jack Sylman performed neurodiagnostic studies. Dr. Sylman noted Claimant's history of several months of left neck pain radiating down her left arm occasionally causing tingling of digits 2 and 3. Dr. Sylman provided the

diagnosis of cervical radiculopathy and opined that Claimant had left C5 chronic radiculopathy. *See* Exhibit G.

25. Claimant has not undergone the left shoulder MRI recommended by Dr. Kawasaki as the authorization was denied by Insurer.

Ergonomic evaluations

26. On September 9, 2014 Claimant completed an Ergopoint Self-Assessment. Claimant reported moderate concern with her workstation and identified the areas she had concern with. After identifying the areas of concern Claimant was provided recommendations for reducing ergonomic risk and improving the workstation.

27. On October 2, 2014 Jess Baysinger from the State of Colorado Office of Risk Management performed an ergonomic evaluation. Ms Baysinger recommended that: Claimant get a new ergonomic chair, Claimant not turn her neck to speak with other people entering her cubicle but turn her whole body; Claimant get a different keyboard tray that doesn't have a separation between the mouse and keyboard; Claimant get a different mouse that fits her hand better; Claimant get a headset for telephone use to ease neck and shoulder tension; and that Claimant take stretching breaks twice per day. *See* Exhibit D.

28. On October 28, 2014 Marianne Pullman, R.N. performed a job site evaluation. Ms. Pullman interviewed Claimant regarding her complaints, observed Claimant performing her job, and took photographs. Ms. Pullman identified that Claimant spends 8-9 hours per day on the computer, with the majority of the time spent on mapping activities requiring heavy use of the mouse with her right hand. *See* Exhibit E.

29. Claimant reported to Ms. Pullman having had neck pain for years but noticing left shoulder and left arm pain in early September. Claimant reported feeling the pain continuously even when not working. Ms. Pullman noted Claimant tended to center herself in front of her mouse on the right of her keyboard tray due to the heavy mousing work. Ms. Pullman noted that while seated to the right, Claimant often reaches her left arm across the length of the keyboard try to meet the alpha keys. Ms. Pullman noted that led to an awkward reach to the left which Claimant reported brings immediate pain to her left arm and shoulder. Claimant's left arm, in this position, is winged out from her flank. Ms. Pullman noted Claimant exhibited awkward posture of hands and arms while working on the keyboard. Ms. Pullman made several recommendations similar to those of Ms. Baysinger. *See* Exhibit E.

Credibility

30. Claimant's testimony lacks credibility. Claimant did not report prior pain and symptoms in her left arm/shoulder that pre-date her claim and denied having any pain or symptoms following her lipoma removal surgery in 1998. The medical records

document otherwise, and document several symptoms and reports of pain in the past that are similar to those she testified began in September 2014. Claimant also testified and demonstrated that she has to reach above chest level with her elbow bent to reach her keyboard. This is not credible nor is it reasonable based on Claimant's workstation and the position of her keyboard and mouse. The position in which Claimant demonstrated typing is an extremely unreasonable way to simply reach across to a keyboard. The ergonomic evaluation does not support that the extreme awkward angle that Claimant demonstrated was necessary for her to reach her keyboard or perform her job duties.

31. Dr. Kawasaki's testimony is found credible and persuasive. Dr. Kawasaki was unable to opine that Claimant's left shoulder complaints were work related. Dr. Kawasaki reviewed the job site evaluation and opined that the only activity that implicated the left shoulder was reaching to the side for the keyboard. Dr. Kawasaki opined that would not be an injurious activity and that there was a low probability that just reaching out to the side, even frequently, would cause a shoulder injury.

32. Dr. Kawasaki reviewed medical records and noted Claimant's long history of neck pain going back to 2003. Dr. Kawasaki opined that Claimant's presentation when he saw her included very similar symptoms as far as her neck pain and pain radiating up the left upper extremity that she has had in the past.

CONCLUSIONS OF LAW

Generally

The purpose of the Workers' Compensation Act of Colorado, §§ 8-40-101, *et seq.*, C.R.S. is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. *See* § 8-40-102(1), C.R.S. The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. *See* § 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979).

Assessing weight, credibility, and sufficiency of evidence in Workers' Compensation proceeding is exclusive domain of administrative law judge. *University Park Care Center v. Industrial Claim Appeals Office*, 43 P.3d 637 (Colo. App. 2001). Even if other evidence in the record may have supported a contrary inference, it is for the ALJ to resolve conflicts in the evidence, make credibility determinations, and draw plausible inferences from the evidence. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); *Bodensieck v. Industrial Claim Appeals*

Office, 183 P.3d 684 (Colo. App. 2008). The weight and credibility to be assigned expert testimony is a matter within the discretion of the ALJ. *Cordova v. Industrial Claim Appeals Office,* 55 P.3d 186 (Colo. App. 2002). To the extent expert testimony is subject to conflicting interpretations, the ALJ may resolve the conflict by crediting part or none of the testimony. *Colorado Springs Motors, Ltd. v. Industrial Commission,* 165 Colo. 504, 441 P.2d 21 (1968).

The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

Compensability

The Claimant is required to prove by a preponderance of the evidence that the conditions for which he seeks medical treatment were proximately caused by an injury arising out of and in the course of the employment. *See* § 8-41-301(1)(c), C.R.S. The claimant must prove a causal nexus between the claimed disability and the work-related injury. *Singleton v. Kenya Corp.,* 961 P.2d 571 (Colo. App. 1998). A pre-existing disease or susceptibility to injury does not disqualify a claim if the employment aggravates, accelerates, or combines with the pre-existing disease or infirmity to produce a disability or need for medical treatment. *Duncan v. Industrial Claim Appeals Office,* 107 P.3d 999 (Colo. App. 2004); *H & H Warehouse v. Vicory,* 805 P.2d 1167 (Colo. App. 1990). However, the mere occurrence of symptoms at work does not require the ALJ to conclude that the duties of employment caused the symptoms, or that the employment aggravated or accelerated any pre-existing condition. Rather, the occurrence of symptoms at work may represent the result of or natural progression of a pre-existing condition that is unrelated to the employment. *F.R. Orr Construction v. Rinta,* 717 P.2d 965 (Colo. App. 1995); *Breeds v. North Suburban Medical Center,* WC 4-727-439 (ICAO August 10, 2010). The question of whether the claimant met the burden of proof to establish the requisite causal connection is one of fact for determination by the ALJ. *City of Boulder v. Streeb*, 706 P.2d 786 (Colo. 1985); *Faulkner v. Industrial Claim Appeals Office,* 12 P.3d 844 (Colo. App. 2000).

Claimant has failed to meet her burden to prove by a preponderance of the evidence that she suffered a left upper extremity/shoulder injury proximately caused by her employment. As found above, there was no specific injury or trauma to Claimant's left upper extremity/shoulder. Claimant woke up one morning with pain and was unsure what caused it. Although Claimant reported pain while working and believed her work to be the cause of her pain, she has presented insufficient evidence to support this argument. There is insufficient evidence of an acute injury to the left shoulder/upper extremity. There is also insufficient evidence to support a claim of occupational disease to the left shoulder/upper extremity due to Claimant's job duties. As found above, Claimant had multiple pain complaints prior to the claim related to her left shoulder, arm, fingers on her left hand, and left trapezius area that are similar to the complaints she has following this claim. Claimant's arguments are not found

persuasive. She was not performing job duties at the time of a left shoulder injury. Rather, she woke up with increased pain and the medical records show she has had on and off pain in this same area for many years.

Claimant's testimony is not credible. Claimant reported no left shoulder/left upper extremity problems or symptoms following a lipoma removal surgery in 1998. Yet, the medical records show that on the following occasions she made the following complaints:

September 9, 2013 --	pain in left lower neck and left upper trapezius
July 2, 2013 -	shoulder pain, upper back pain that went into her left arm, pain lifting left arm, numbness/tingling in left arm
April 3, 2009 -	numbness/tingling in her thumb and first two fingers of her left hand
March 30, 2004 -	pain in upper arms with parasthesias in the back of her arms
August 8, 2003 -	numbness and tingling in the lateral aspect of her left hand to the left wrist and entire left arm sore

These symptoms are similar to those Claimant complains of in this claim including her more current complaints of achiness of left arm, tingling of digits 2 and 3 on her left hand, and neck pain that radiates into her left arm. These symptoms all existed prior to this claim despite Claimant's testimony otherwise. Further, Claimant's assertion that she was required to hold her left arm above chest level at an awkward angle to use her keyboard is not credible or persuasive. Although ergonomic recommendations were made, the ergonomic evaluations in this case do not support a conclusion that she was required to wing out her arm in the extremely awkward position she demonstrated in order to reach her keyboard. Claimant's testimony is not reasonable. The pictures support that her keyboard was located close to her, and her chair had wheels to move. There would be no reason to wing out her arm in such an extreme fashion just to get to the keyboard.

The medical providers in this case have not opined that her left shoulder/upper extremity pain is work related. Dr. Kawasaki opined that there was a low probability that just reaching out to the side to reach a keyboard, even frequently, would cause a shoulder injury. Dr. Parsons, after reviewing the ergonomic evaluation opined that Claimant's left shoulder/upper extremity symptoms were not work related. Dr. Parsons did not believe that Claimant's job duties would meet criteria for any kind of cumulative trauma disorder to her left shoulder/upper extremity. Dr. Syllman and Dr. Mazzola point to Claimant's C5-6 and C6-7 problems as the cause. Dr. Glenn initially at the first visit noted it was questionable whether the symptoms were work related. With several medical providers unable to make a causal connection to Claimant's job duties and employment and with Claimant's testimony of onset of symptoms not credible or persuasive, Claimant has failed to meet her burden to show that her employment

proximately caused any injury, aggravation, or acceleration to any symptoms in her left shoulder/upper extremity.

Medical Benefits

The respondent is liable for medical treatment which is reasonably necessary to cure and relieve the effects of the industrial injury. § 8-42-101 (1)(a), C.R.S.; *Snyder v. Industrial Claim Appeals Office*, 942 P.2d 1337 (Colo. App. 1997); *Country Squire Kennels v. Tarshis*, 899 P.2d 362 (Colo. App. 1995). The claimant must prove that an injury directly and proximately caused the condition for which benefits are sought. *Wal-Mart Stores, Inc. v. Industrial Claim Appeals Office*, 989 P.2d 251 (Colo. App. 1999); *Snyder v. Industrial Claim Appeals Office*, *supra.* Where a Claimant's entitlement to benefits is disputed, the Claimant has the burden to prove a causal relationship between a work-related injury and the condition for which benefits or compensation are sought. *Id.* Proof of causation is a threshold requirement that an injured employee must establish by a preponderance of the evidence before any benefits are awarded. *Faulkner v. Indus. Claim Appeals Office*, *supra; See* § 8-41-301(1)(c), C.R.S. Whether the claimant sustained his burden of proof is generally a factual question for resolution by the ALJ. *City of Durango v. Dunagan*, 939 P.2d 496 (Colo.App. 1997).

Claimant seeks an MRI of her left shoulder as recommended by Dr. Kawasaki. Although an MRI of her left shoulder might be a reasonable step to determine if her current pain symptoms are coming from left shoulder pathology or are coming from her C5-6 and C6-7 neck pathology, Claimant has not established proof of causation or that an MRI of her left shoulder would be related to any work injury. Rather, as found above, Claimant is unable to show that any left shoulder/upper extremity symptoms are a result of an occupational injury. Claimant woke up one morning with pain per her reports, although medical records show ongoing problems throughout the years. Claimant's job duties also do not support a causal connection between her work and her symptoms of pain. Dr. Parsons opined that her symptoms were not work related and Dr. Kawasaki opined that there was a low probability that her work and reaching to her keyboard would cause shoulder problems.

Claimant argues that the Division recommends under Rule 17 that initial diagnostic procedures be considered the responsibility of the workers' compensation carrier to ensure that accurate diagnosis and treatment can be established. The Division recommendation is noted, but is a recommendation and is not mandatory nor does it require that an MRI be covered by Respondents in this case. Rather, the case law requires and places the burden on Claimant to prove a causal relationship between a work-related injury and the condition for which benefits or compensation are sought. Claimant is seeking an MRI of her left shoulder, but has failed to meet her burden to show a causal relationship or that her left shoulder complaints were caused by any work related duties. Therefore, her request for MRI is denied.

ORDER

It is therefore ordered that:

1. Claimant has failed to establish that she suffered a compensable injury to her left shoulder/upper extremity arising out of and in the course of her employment. Her claim is denied and dismissed.

2. Claimant has failed to establish that an MRI of the left shoulder as recommended by Dr. Kawasaki is reasonable, necessary, and related to a work injury. Her request for left shoulder MRI is denied.

3. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

Whether the surgery recommended by Dr. Jinkins is causally related to his September 3, 2014 work injury and medically reasonable and necessary.

FINDINGS OF FACT

1. The claimant is a 44 year old employee of the respondent-employer who injured his right knee on September 3, 2014 while coming down a flight of stairs.

2. The claimant sustained a prior work injury to his right knee on November 29, 2012 while working for the respondent-employer while working as an installer. The respondent-insurer admitted liability for this injury. The claimant received treatment for his 2012 right knee injury from Dr. Daniel Peterson and Dr. Wiley Jinkins

3. The claimant was off of work for this injury from November 30, 2012 through January 13, 2013 and then returned to work as an installer. There is conflict between the medical records of Dr. Peterson and Dr. Jinkins whether he was released to full duty or modified duty but it is apparent that the claimant was in fact working full duty after returning to work after his 2012 injury.

4. The medical records indicate that the claimant did not report much improvement in his condition with time and by April of 2013 Dr. Jinkins began a series of hyaluronic injections (Supartz). The claimant did not report any long term relief from the Supartz injections and in June of 2013 reported pain at a level of 6-7 out of 10. On June 18, 2013, Dr. Jinkins recommended one final injection and if that failed to provide him with relief then surgery, specifically an arthroscopic debridement, would need to be considered.

5. The claimant was eventually placed at maximum medical improvement on August 29, 2013 and was released to full duty to his new position. The claimant returned to work for the respondent-employer for the next year.

6. After injuring his right knee on September 3, 2014, the claimant returned to see Dr. Jinkins on September 23, 2014. At that appointment, the claimant advised Dr. Jinkins that prior to the new incident his knee was doing "so-so" and that he had not

experienced significant relief of his symptoms from the Supartz injections. He stated that he had persistent problems with his right knee from the previous injury and rated his pain level as a 5-6/10 prior to the September 3, 2014 incident. As of the date of the September 23rd exam the pain had escalated to an 8/10. Dr. Jinkins ordered an MRI of the knee and recommended a corticosteroid injection. The claimant inquired about the previously discussed arthroscopic debridement from June of 2013 but Dr. Jinkins advised that this procedure had low predictability and in some cases could actually aggravate the symptoms.

7. On September 29, 2014, Dr. Jinkins stated that there had been no great deal of change in the claimant's knee symptoms. The claimant reported pain at a level of 7/10 and Dr. Jinkins requested authorization for a specialized series of x-rays. On October 15, 2014, Dr. Jinkins requested authorization for a Fulkerson type procedure. At that time, the claimant was still reporting pain at a level of 7/10.

8. At the request of Dr. Jinkins, the claimant was examined by Dr. Derek Purcell on October 30, 2014 for a second opinion to discuss options for his knee. Dr. Purcell reviewed the claimant's records including treatment from the 2012 and 2014 injuries. Dr. Purcell discussed with the claimant various options including continued conservative care, as well as different surgical options. Dr. Purcell ultimately concluded that the Fulkerson osteotomy recommended by Dr. Jinkins would address the claimant's patellofemoral issues but would not provide the claimant long term or short term relief because of the other issues present in the claimant's knee. Dr. Purcell opined that the only surgical intervention that would be appropriate for the claimant would be a total knee arthroplasty.

9. In response to Dr. Jinkins initial request for surgery, the respondent-insurer obtained a Rule 16, records review from Dr. Mark Failinger. On October 22, 2014, Dr. Failinger concluded that a Fulkerson procedure would not solve much or even most of the claimant's pain complaints and recommended additional conservative measures and an IME. Upon receipt of Dr. Purcell's report recommending a total knee arthroplasty, Dr. Failinger completed a follow up records review on November 17, 2014. Dr. Failinger opined that assuming the claimant had completed the appropriate conservative care, then he agreed with Dr. Purcell that the total knee replacement was the more appropriate procedure given the amount of degenerative joint disease (DJD) in the claimant's tibiofemoral compartment. However, he stated it was his strong opinion that the need for the knee replacement was due to the pre-existing DJD rather than the September 3, 2014 incident.

10. Dr. Failinger subsequently completed an independent medical examination of the claimant on March 16, 2015. Dr. Failinger took a history from the claimant, conducted an examination and reviewed additional records. Dr. Failinger requested the actual x-ray or MRI films, but then opined that if the claimant's films confirmed what the written reports documented that the claimant had significant medial and lateral compartment arthritis, then it would not be reasonable to perform the patella realignment procedure being proposed by Dr. Jinkins. In his opinion, such a procedure was only reasonable where the arthritis was strictly limited to the patellafemoral joint. It was also Dr. Failinger's opinion that the recommended procedure was targeting a condition for which the claimant had been treating for 1 ½ years prior to the September 3, 2014 incident and not related to the incident.

11. On April 29, 2015, Dr. Failinger reviewed the actual MRI films of the claimant's right knee which confirmed the presence of both lateral and medial compartment arthritis. The MRI film also showed high grade loss on the central patellar region. Based upon all of these findings, Dr. Failinger re-affirmed his earlier conclusions that a patellofemoral osteotomy would not result in a good outcome for the claimant.

12. The claimant testified on his own behalf and testified that he had no difficulties working full duties after his 2012 work injury and that he could have tolerated continuing to work as an installer. The claimant testified that he approached his employer about the change in positions but that the change was not specifically related to his work-related right knee injury. The claimant further testified that he only experienced symptoms off and on after being placed at MMI for the 2012 injury and that his condition significantly worsened as a result of the September 2014 incident.

13. Dr. Jinkins testified via deposition on behalf of the claimant. Dr. Jinkins opined that the claimant had exhausted all conservative measures and that surgery was the next reasonable treatment option. However, Dr. Jinkins admitted that most of the conservative treatment to which he was referring had been performed in conjunction with the 2012 injury and that the claimant had reported a lack of improvement as a result of that treatment, he did not repeat most of what had been tried after the September 3, 2014 work injury.

14. Dr. Jinkins opined that the claimant's need for surgery was related to his industrial injury of September 3, 2014.

15. Additionally, Dr. Failinger conceded that "…If there was not significant degenerative joint disease in the tibiofemoral joint, then, a Fulkerson-type procedure is

a reasonable option." Dr. Jinkins testified that the claimant's standing view x-rays "…did not show any significant arthritis of the tibiofemoral joint." Thus, under Dr. Failinger's reasoning, the surgery recommended by Dr. Jinkins is "a reasonable option."

16. The ALJ finds Dr. Jinkins' opinions as the authorized treating orthopedic surgeon credible, persuasive, and entitled to greater weight than the contrary opinions of either Dr. Purcell or Dr. Failinger.

17. The ALJ finds that the claimant has established that it is more likely than not that the surgery proposed by Dr. Jinkins is related to the claimant's industrial injury of September 3, 2104 and that the surgery is reasonable and necessary.

CONCLUSIONS OF LAW

1. The purpose of the Workers' Compensation Act of Colorado (Act), Sections 8-40-101, C.R.S. (2007), *et seq.*, is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. In general, the claimant has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of the respondents. Section 8-43-201, C.R.S.

2. A workers' compensation case is decided on its merits. Section 8-43-201, C.R.S. The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved. The ALJ need not address every piece of evidence or every inference that might lead to conflicting conclusions. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P. 3d 385 (Colo. App. 2000).

3. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of a witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005).

4. The claimant has the burden of proof to establish the right to specific medical benefits by a preponderance of the evidence. Section 8-43-201, C.R.S.; see *Valley Tree Service v. Jimenez*, 787 P. 2d 658 (Colo. App. 1990). A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979).

5. The ALJ concludes that the claimant has established by a preponderance of the evidence that he requires the right knee surgery as recommended by Dr. Jinkins. The needed surgery is directly related to the claimant's industrial injury of September 3, 2014. The surgery is reasonably needed to cure and relieve the claimant of the effects of this September 3, 2014 injury. The respondent-insurer is liable for payment of that surgery, as well as all related follow-up treatment necessary to cure and relieve the claimant of the effects of the injury.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The respondent-insurer shall authorize and pay for the surgery as recommended by Dr. Jinkins.

2. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

3. All matters not determined herein, and not closed by operation of law, are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

The threshold issue determined by this order is compensability of an alleged December 1, 2014 hernia. The ALJ also heard testimony concerning several associated issues, including Claimant's entitlement to medical and temporary total disability (TTD) benefits, as well as a request for determination of Claimant's Average Weekly Wage (AWW).

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. Claimant was employed by Employer as a seasonal employee. He was hired on November 10, 2014 as an order picker. Claimant was to work 40 hours per week at on the "1st Shift." He reported to work between the hours of 7:30 a.m. and 4:30 p.m., Monday through Friday with a possible Saturday shift. Claimant was paid $9.25 per hour.

2. Claimant made a total of $877.00 between his date of hire and his last date of work, December 1, 2014. The ALJ finds that there are 20 days between November 11, 2014 and December 1, 2014 for a daily rate of pay equal to $43.85 based upon Claimant's total earnings of $877.00. Consequently the ALJ finds Claimant's average weekly wage (AWW) to equal $306.95. ($877.00 total wages ÷ 20 days employment = $43.85/ day × 7 days/week = $306.95).

3. As a picker, Claimant's duties included, but were not limited to, picking orders from bins at assigned shelf locations, performing cleanup activities in the work area to ensure cleanliness, organizing bins, and pulling product inventories from the rear to the front of bins for easy access. Claimant's position required the ability to lift and carry 50 lbs.

4. On December 1, 2014, at approximately 10:30 a.m., Claimant was retrieving an order from a bin on a bottom row shelf. The inventory was located on a pallet toward the back of the shelf. Consequently, Claimant bent down and moved underneath the shelf in an effort to reach the stock and bring it forward. From a semi forward flexed position with one knee on the pallet and one knee on the floor, Claimant reached forward and attempted to pull what he thought was a stack of 20-30 light bread pans forward. The stack of pans did not move. Claimant vigorously tried to pull the pans forward. Despite Claimant's efforts, the stack still did not move. Thus, Claimant lifted the top two pans to discover that they were made of heavy cast-iron. Claimant proceeded to move the inventory forward as required. As he was bent over moving the

pans, Claimant testified that he began to feel pain in his abdomen.

5. After moving the entire stack of cast-iron pans forward in piecemeal fashion, Claimant backed out from under the shelf and grabbed the metal support beam on an upper shelf to assist in pulling himself upright. As Claimant stood up, he experienced an immediate "shooting" pain in his lower abdomen and groin area. The pain improved but did not completely subside after a minute or two leading Claimant to believe he pulled a muscle in his leg.

6. Claimant testified that the pain was the worst he had ever felt. Consequently, he modified his work activities, slowing his pace of work and being cautious about the weight he lifted, for the remainder of his shift.

7. Claimant finished his shift and returned home. He was hopeful the pain would just "go away" so did not report the incident before leaving work for the evening. When he was hired, Claimant completed paperwork acknowledging that all work related injuries were to be reported immediately to his direct supervisor.

8. Upon retiring for the night, Claimant was unable to sleep because of intense shooting pains in his groin. By the morning of December 2, 2014, Claimant was in severe pain. He noticed swelling in the groin, testifying that he was "blowing up down there". Consequently, Claimant testified that he called into work before his scheduled shift and informed the shift leader that he would not be coming to work because he was "probably going to the emergency room". However, during cross examination, Claimant conceded that he did not report that he had injured himself, had a hernia, or any other condition. He stated only that he was "sick".

9. Claimant went to the Emergency Room at Memorial Hospital where he was evaluated by Dr. Tietz at 8:38 a.m. During his emergency room (ER) visit, Claimant complained of "pain in the right groin". He also reported that he "[did] a lot of heavy lifting, bending, straining". Examination revealed a freely reducible "indirect right inguinal hernia" which was documented simply as "coming on for a while." There is no indication in the ER report of the mechanism of injury described by Claimant at hearing. Claimant was instructed to follow-up with general surgery and discharged from the ER with a note for resumption of light duty work for 4 days.

10. Claimant testified that he informed his shift leader, Elaine Martinez of his restrictions that same morning, December 2, 2014. Claimant testified that he was told not to return to work by Ms. Martinez as there were no light duty positions available. Consequently, Claimant testified that Ms. Martinez informed him that she would push his "termination paperwork through."

11. Elaine Martinez, disputes the aforementioned assertions of Claimant. Ms. Martinez testified that Claimant never spoke with her on the date of his alleged injury, and did not speak to her by phone at any time on December 2, 2014. Rather, she testified that Claimant only left a voicemail indicating simply that he was "sick".

12. Claimant contacted Employer's HR Department on December 3, 2014 regarding his hernia where after he was referred to Employer's designated medical provider, Concentra Urgent Care.

13. Claimant was seen at Concentra on December 5, 2014 where he was evaluated by Physicians Assistant (PA), Kenneth Ginsburg. The history of present injury completed by PA Ginsburg provides the following account of the injury: ". . . states that he knelt down, pulled some boxes off the bottom of a pallet then stood up again without lifting anything and had a sudden onset sharp pain." PA Ginsburg noted that "there was no excessive force exerted to the inguinal canal compared to activities of daily living." PA Ginsburg noted that while it was "possible" that Claimant's work activities caused his symptoms, it was not "necessarily probable". Regarding causation, PA Ginsburg opined that Claimant's "work activities probably irritated his pre-existing inguinal canal defect." The ALJ infers from this report that Claimant likely had a pre-existing inguinal canal defect making him susceptible to the development of a full hernia in the face of strenuous pulling.

14. According to the WC M164 form signed by Dr. Randell Jones, Claimant provided the following description of the accident/injury: "I stood up and pain shot through my pelvis. Pain subsided after 1 min or two". Dr. Jones also checked the "Yes" box to question #3. "Are your objective findings consistent with history and/or work related mechanism of injury/illness".

15. Following his December 5, 2014 evaluation at Concentra, Claimant was placed on restrictions of 20 lbs. for lifting and push/pull limits of 20 lbs. Concentra listed Claimant's activity status as, "Return to modified work/activity today." Respondent did not offer Claimant modified duty. Claimant did not find alternative employment until March. Claimant is seeking Temporary Total Disability benefits from December 2, 2014, through February 4, 2015.

16. On January 9, 2015, Claimant returned to Memorial Hospital for surgery. The surgery was performed by Dr. Larry Butler, who reduced Claimant's right inguinal hernia and repaired it with mesh. Dr. Butler's post-operative instructions directed Claimant to wait until after a follow-up appointment, scheduled 7-10 days out, before returning to work. Regarding the history of injury, Dr. Butler noted as follows: "This man who was doing seasonal work noted sudden onset of groin pain last week after he was pulling from a semi-bent over position". Based upon evidence presented, the ALJ finds Dr. Butler's treatment related to Claimant's industrial injury and reasonably necessary to cure and relieve Claimant of the effects of the same.

17. Claimant was seen for an independent medical examination (IME) with Dr.

Lawrence Lesnak on April 21, 2015. Dr. Lesnak performed a causation analysis opining that there was no evidence from an anatomical perspective that the mechanism of injury (MOI) described by Claimant could cause his hernia or the treatment necessary to repair it. While congenital defects can cause hernias, Dr. Lesnak testified that the primary cause of inguinal hernias is the increased pressure on the contents of the abdominal cavity associated with forceful Valsalva maneuvers. According to Dr. Lesnak, Claimant would not have experienced a Valsalva sufficient to cause a hernia merely by pulling himself up from a squatting position and/or while pulling inventory forward from a kneeling position. Consequently, there is an absence of the movement and other necessary physiological conditions associated with Claimant's work duties to cause a hernia in this case, in Dr. Lesnak's opinion. The ALJ is not convinced for the reasons set forth in paragraph 19 below.

18. Dr. Lesnak also testified that it is important to consider the first reported history of injury provided by the patient to the first medical provider when formulating a causation opinion. In this case, Dr. Lesnak attributed the statement that right inguinal hernia had been "coming on for a while" to Claimant, testifying that this account was inconsistent with Claimant's report to him that the pain came on acutely while returning to an upright position. Consequently, Respondents suggest that Claimant has been inconsistent in his reporting of the injury. Again, the ALJ is not convinced. Based upon review of the medical record in question, the ALJ attributes the statement that the hernia had been "coming on for a while" to the author of the ER report rather than Claimant. More probably than not, the statement reflects what the provider understood was the duration of Claimant's symptoms before he sought treatment. Rather than define that time carefully, the provider in artfully documented that the hernia had been "coming on for some time" leaving interpretation of how long to the reader. As a consequence, Respondents suggest that Claimant's hernia was caused by factors other than his work duties on December 1, 2014. After careful review of the entire record, the ALJ finds that Claimant has consistently reported that his symptoms came on abruptly after pulling and lifting a stack of heavy cast iron pans and returning to an upright position rather than any indication that the hernia had been "coming on for a while". Moreover, Claimant's action in seeking treatment within hours of worsening symptoms militates against the suggestion that the hernia and accompanying symptoms had been coming on over time.

19. The ALJ has considered the totality of the evidence and finds that Dr. Lesnak's opinion that Claimant's condition was not caused, aggravated or accelerated by his work for Employer unpersuasive. While Dr. Lesnak gave no weight to Claimant's indication that the injury was from straining to move a heavy stack of pans while in a semi-bent over or kneeling position reaching to the back of the bottom bin, the ALJ finds PA Ginsburg's causation opinion that Claimant's work activities probably irritated a pre-existing inguinal canal defect more credible than Respondent's suggestion that Claimant's hernia was caused by factors other than his employment. The ALJ finds that,

more probably than not, the strenuous pulling in combination with lifting from an awkward position involved sufficient force to aggravate a small, pre-existing defect (hernia) in the inguinal canal causing it to become symptomatic which in turn prompted Claimant to seek treatment. The ALJ has considered, and hereby rejects all other evidence which is contrary to the above findings.

20. Although there are inconsistencies in the record, the ALJ resolves those inconsistencies in favor of Claimant to find that the totality of the persuasive evidence supports that he sustained a compensable hernia on December 1, 2014 as he has alleged.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

General Legal Principals

A. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to Employers, without the necessity of any litigation. Section 8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the Employer. Section 8-43-201, C.R.S. A Workers' Compensation case is decided on its merits. Section 8-43-201, C.R.S.

B. In accordance with § 8-43-215, C.R.S., this decision contains specific Findings of Fact, Conclusions of Law and an Order. In rendering this decision, the ALJ has made credibility determinations, drawn plausible inferences from the record, and resolved essential conflicts in the evidence. *See Davison v. Industrial Claim Appeals Office*, *84 P.3d 1023 (Colo. 2004).* This decision does not specifically address every item contained in the record; instead, incredible or implausible testimony or unpersuasive arguable inferences have been implicitly rejected. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office, 5 P.3d 385 (Colo. App. 2000).*

C. In determining credibility, the ALJ should consider the witness' manner and demeanor on the stand, means of knowledge, strength of memory, opportunity for observation, consistency or inconsistency of testimony and actions, reasonableness or unreasonableness of testimony and actions, the probability or improbability of testimony

and actions, the motives of the witness, whether the testimony has been contradicted by other witnesses or evidence, and any bias, prejudice or interest in the outcome of the case. *Colorado Jury Instructions, Civil*, 3:16. As found, there are some inconsistencies in the record concerning Claimant's testimony. Nonetheless, the ALJ resolves those inconsistencies in favor of Claimant to find that his account of the injury and the events thereafter are generally credible and supported by the record evidence. Consequently, the ALJ concludes that Claimant's testimony concerning the cause of his alleged injury is reliable and persuasive.

Compensability

D. Claimant has proven, by a preponderance of the evidence that he suffered a compensable hernia on December 1, 2014. Under the Workers' Compensation Act, an employee is entitled to compensation where the injury is proximately caused by an injury or occupational disease arising out of and in the course of the employee's employment. *Section 8-41-301(1), C.R.S.; Horodyskyj v. Karanian* 32 P.3d 470 (Colo. 2001). The phrases "arising out of "and "in the course of" are not synonymous and a claimant must meet both requirements. *Younger v. City and* County of Denver, 810 P.2d 647, 649 (Colo. 1991); *In re Question Submitted by U.S. Court of Appeals,* 759 P.2d 17, 20 (Colo. 1988). The latter requirement refers to the time, place, and circumstances under which a work-related injury occurs. *Popovich v. Irlando,* 811 P.2d 379, 381 (Colo. 1991). Thus, an injury occurs "in the course of" employment when it takes place within the time and place limits of the employment relationship and during an activity connected with the employee's job-related functions. *In re Question Submitted by U.S. Court of Appeals, supra; Deterts v. Times Publ'g Co.,* 38 Colo.App. 48, 51, 552 P.2d 1033, 1036 (1976). Here there is little question that Claimant produced sufficient evidence to support a conclusion that his symptoms occurred in the scope of employment. Rather, the question for determination here is whether Claimant's injuries arise out of his employment.

E. The term "arises out of" refers to the origin or cause of an injury. *Deterts v.Times Publ'g Co. supra.* There must be a causal connection between the injury and the work conditions for the injury to arise out of the employment. *Younger v. City and County of Denver, supra.* An injury "arises out of" employment when it has its origin in an employee's work-related functions and is sufficiently related to those functions to be considered part of the employee's employment contract. *Popovich v. Irlando supra.* As noted above, it is the Claimant's burden to prove by a preponderance of the evidence that there is a direct causal relationship between employment and the alleged injuries. Section 8-43-201, C.R.S. 2013.

F. The determination of whether there is a sufficient "nexus" or causal relationship between Claimant's employment and the injury is one of fact which the ALJ must determine based on the totality of the circumstances. *In Re Question Submitted by the United States Court of Appeals,* 759 P.2d 17 (Colo. 1988); *Moorhead Machinery & Boiler Co. v. Del Valle,* 934 P.2d 861 (Colo. App. 1996). While it is true, under *F.R. Orr*

Construction v. Rinta, 717 P.2d 965 (Colo. App. 1985); *Parra v. Ideal Concrete,* W.C. No. 3-963-659 and 4-179-455 (April 8, 1988)*; Barba v. RE1J School District,* W.C. No. 3-038-941 (June 28, 1991); *Hoffman v. Climax Molybdenum Company,* W.C. No. 3-850-024 (December 14, 1989), that an incident which merely elicits pain symptoms without a causal connection to industrial activities does not compel a finding that the claim is compensable, the persuasive evidence presented here establishes that Claimant engaged in physically demanding work activity which, more probably than not, aggravated a pre-existing defect (hernia) in Claimant's inguinal canal causing his symptoms and need for treatment. If an industrial injury aggravates, accelerates, or combines with a preexisting condition so as to produce disability and a need for treatment, the claim is compensable. *H & H Warehouse v. Vicory*, 805 P.2d 1167 (Colo.App. 1990). But for Claimant's obligations to his employer combined with the conditions of his employment, specifically the requirement to face product from the back of low lying shelves, necessitating his need to pull and lift from an awkward position, Claimant likely would not have aggravated his pre-existing inguinal canal defect. *See Conlon v. Dillon Companies, Inc. d/b/a King Soopers*, W.C. No. 4-835-313 (November 14, 2011); *City of Brighton v. Rodriquez*, 318 P.3d 496 (Colo. 2014). Consequently, the ALJ concludes that Claimant has established a sufficient causal connection between his injury and his work duties to support a finding that his hernia arises out of his employment. Accordingly, the injury is compensable.

Medical Benefits

G. Once a claimant has established a compensable work injury, the claimant is entitled to a general award of medical benefits and respondent's are liable to provide all reasonable and necessary medical care to cure and relieve the effects of the work injury. *Section 8-42-101, C.R.S*.; *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988); *Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo.App. 1990). The question of whether the need for treatment is causally related to an industrial injury is one of fact. *Walmart Stores, Inc. v. Industrial Claims Office,* 989 P.2d 521 (Colo. App. 1999). Where the relatedness, reasonableness, or necessity of medical treatment is disputed, Claimant has the burden to prove that the disputed treatment is causally related to the injury, and reasonably necessary to cure or relieve the effects of the injury. *Ciesiolka v. Allright Colorado, Inc*., W.C. No. 4-117-758 (ICAO April 7, 2003).

H. Based upon the medical record, including the credible opinions of PA Ginsburg, the ALJ concludes that the treatment, including Claimant's emergency room treatment and the subsequent surgery performed by Dr. Butler was related to Claimant's December 1, 2014 industrial injury. Moreover, the ALJ concludes that this treatment was reasonably necessary to cure and relieve him from the effects of the same.

Average Weekly Wage

I. The overall purpose of the average weekly wage (AWW) statute is to arrive at a fair

approximation of Claimant's wage loss and diminished earning capacity resulting from the industrial injury. *See Campbell v. IBM Corp., 867 P.2d 77 (Colo. App. 1993); National Fruit Prod. v. Crespin, 952 P.2d 1207 (Colo. App. 1997).*

Sections 8-42-102 (3) and (5) (b), C.R.S. (2013), give the ALJ discretion to determine an AWW that will fairly reflect loss of earning capacity. An AWW calculation is designed to compensate for total temporary wage loss. *Pizza Hut v. Indus. Claim Appeals Office,* 18 P. 3d 867 (Colo. App. 2001). *See* § 8-42-102, C.R.S. The best evidence of Claimant's actual wage loss and therefore a fair approximation of his diminished earning capacity comes from the wage records submitted into evidence. The ALJ adopts Respondents calculation of Claimant's AWW to find that his AWW is $306.95 as that figure represents the average weekly earnings over the entire period of Claimant's employment. The ALJ finds that this figure most closely approximates Claimant's wage loss and diminished earning capacity at the time of his December 1, 2014 compensable work related injury.

Temporary Total Disability

J. To receive temporary disability benefits, a Claimant must prove the injury caused a disability, that he/she leaves work as a consequence of the injury, and the disability is total and lasts more than three regular working days. *C.R.S. § 8-42-103(1); PDM Molding, Inc. v. Stanberg,* 898 P.2d 542 (Colo. 1995). As stated in *PDM Molding*, the term "disability" refers to the claimant's physical inability to perform regular employment. *See also McKinley v. Bronco Billy's,* 903 P.2d 1239 (Colo. App. 1995). Once the claimant has established a "disability" and a resulting wage loss, the entitlement to temporary disability benefits continues until terminated in accordance with C.R.S. § 8-42-105(3)(a)-(d).

K. C.R.S. § 8-42-105(3) provides in pertinent part: Temporary total disability benefits shall continue until the first occurrence of any one of the following:

> (a) The employee reaches maximum medical improvement;
>
> (b) The employee returns to regular or modified employment;
>
> (c) The attending physician gives the employee a written release to return to regular employment; or
>
> (d)(I) The attending physician gives the employee a written release to return to modified employment, such employment is offered to the employee in writing, and the employee fails to begin such employment.

L. From the evidence presented, the ALJ concludes that Claimant was provided with physical restrictions and released to return to work in a modified capacity following his December 2, 2014 ER visit. Moreover, the ALJ is persuaded that Respondents did not accommodate Claimant's restrictions and that Claimant returned to work for a

different employer after February 4, 2015. Thus, the ALJ concludes that Claimant experienced a wage loss lasting more than three regular work days due to his inability to perform regular work duty and Respondents unwillingness to accommodate his work restrictions. Consequently, Claimant was "disabled" within the meaning of the statute and entitled is entitled to receive temporary total disability benefits from December 2, 2014 through February 4, 2015.

ORDER

It is therefore ordered that:

1. Claimant's December 1, 2014 claim for a work related injury is compensable.

2. Respondents shall pay for all reasonable, necessary and related medical expenses to cure and relieve Claimant from the effects of his industrial injury, including but not limited to the Memorial Hospital ER visit as well as the surgery and care associated therewith as obtained through Dr. Butler.

3. Respondent shall pay the Claimant TTD benefits from December 2, 2014 through February 4, 2015, at the appropriate TTD rate associated with Claimant's average weekly wage of $306.95.

4. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

5. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

Richard M. Lamphere
Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Drive, Suite 230
Colorado Springs, CO 80906

ISSUES

- Whether claimant has proven by a preponderance of the evidence that he sustained an injury arising out of and in the course of his employment on November 7, 2014 (W.C. No. 4-970-682-01)?

- Whether claimant has proven by a preponderance of the evidence that he sustained an injury arising out of and in the course of his employment on April 6, 2015 (W.C. No. 4-979-719-01)?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that the surgery he underwent with Dr. Griggs on April 22, 2015 was reasonable medical treatment necessary to cure and relieve the claimant from the effects of the industrial injury?

- The parties stipulated at the hearing to an average weekly wage ("AWW") of $1,027.70 if the claim is compensable.

FINDINGS OF FACT

1. Claimant was employed as a Waste Water Plant Operator for employer. Claimant testified that on November 7, 2014, he was assembling a twelve inch pipe and was crossing the T section of the pipe when he slipped off the pipe and his knee got wedged between the pipe and the side of the ditch. Claimant was working with a co-worker (Mr. Early) who inquired after the incident if claimant was OK.

2. Claimant went home on November 7, 2014 (a Friday) and iced his knee. Claimant eventually sought medical treatment the next day at the emergency room ("ER") in Gunnison, Colorado.

3. Claimant reported to the ER doctor that he had injured his right knee the previous day when he fell at work. Claimant underwent x-rays of the right knee that showed tricompartmental degenerative joint disease of the right knee, most severe in the lateral compartment and associated with a moderate sized knee joint effusion. Claimant was provided medications and discharged.

4. Claimant had a prior history of treatment to his right knee, including treatment to his knee in December 2013 when he was complaining of right knee pain. Claimant initially injured his knee on August 16, 1988 when he fell 40 feet landing on his

feet. Claimant underwent surgery under the auspices of Dr. Winkler on July 3, 1989 involving an arthroscopy with removal of a medial plica and debridement of chondromalacia and synovitis. Claimant underwent a second surgical procedure on October 3, 1989 which consisted of arthroscopic removal of referormed plica in the medial compartment of his right knee and removal of 25% of the lateral meniscus. Claimant underwent a third surgical procedure, again with Dr. Winkler, on August 14, 1990 that involved additional removal of plica across the suprapatellar pouch and a partial right lateral menisectomy.

5. Claimant testified at hearing that he did not recall receiving medical treatment for his right knee between 1990 and November 2014. Claimant acknowledged that the medical records contained an x-ray of his knee from December 2007, but did not recall the circumstances that led to his getting the x-ray. Claimant testified that his right knee was not 100% but was in good shape and testified that in the autumn of 2014 he had been able to go hunting and had previously participated in activities such as coaching his children.

6. Following claimant's treatment with the ER on November 8, 2014, claimant was evaluated by Dr. Griggs, an orthopedist, on November 10, 2014. Claimant reported a history to Dr. Griggs of falling at work and feeling a pop in his knee. Claimant noted he had four prior knee surgery and had steroid injections into his knee in the past which only lasted a short time. Dr. Griggs diagnosed claimant with suspected degenerative joint disease and a lateral collateral ligament sprain of the right knee. Claimant was referred for a magnetic resonance image ("MRI") of his right knee.

7. Claimant underwent the MRI of the right knee on November 17, 2014. The MRI showed a large joint effusion with synovial osteochondromata in a posterior recess behind the knee laterally. The medial meniscus was noted to be frayed with a horizontal tear in the posterior horn. Bone bruising involving the medial proximal tibia with some osteophytic lipping was also noted. The lateral meniscus showed a tear with no meniscus interposed at the posterior joint space. The anterior cruciate ligament was noted to be torn, perhaps chronically. The radiologist noted that there was a complete tear with loss of the meniscus lateral joint space with degenerative changes in the lateral joint space and at least a grade II injury of the lateral collateral ligament. The radiologist also noted that the findings appeared to be chronic in nature except for the lateral collateral ligament.

8. Claimant returned to Dr. Griggs on November 20, 2014. Dr. Griggs agreed with the radiologist that the findings on MRI appeared to be chronic with the exception of the lateral collateral ligament. Dr. Griggs recommended physical therapy.

9. Claimant was examined by Dr. Thorson on November 20, 2014. Dr. Thorson noted claimant reported he was walking on a pipe and slipped resulting in his right knee being caught between the ditch and the pipe. Claimant reported his knee

was unstable. Dr. Thorson noted claimant would undergo physical therapy and, if he did not improve, he would likely be a surgical candidate.

10. Claimant underwent a course of physical therapy but noted in a visit with Dr. Ward on December 19, 2014 that while he thought he had been getting better, he felt like he tweaked his knee at therapy and noted his knee gives out at times with some locking and catching at other times.

11. Dr. Thorson noted on January 8, 2015 that claimant was being evaluated for surgery. Dr. Thorson noted claimant had an increased risk for cardiac complications due to coronary artery disease, but cleared claimant for surgery. The request for authorization for the surgery to be performed by Dr. Griggs was ultimately denied, however, by Insurer.

12. Claimant continued to treat with Dr. Thorson who noted claimant continued to complain for grinding and popping in the knee when she evaluated him on February 20, 2015.

13. Claimant underwent an independent medical examination ("IME") with Dr. O'Brien on March 18, 2015. Dr. O'Brien reviewed claimant's medical records, obtained a history and performed a physical examination in connection with his IME. Dr. O'Brien issued a report dated April 3, 2015 associated with his IME. Dr. O'Brien noted in his report that claimant's symptoms included weakness, locking, swelling, stabling, giving out, clicking, sharpness, throbbing and catching. Dr. O'Brien opined in the IME report that claimant's November 7, 2014 work injury resulted in a right knee strain/sprain which temporarily aggravated his pre-existing and long-standing tricompartmental degenerative joint disease of his right knee. Dr. O'Brien opined that in accordance with the natural history of healing of minor injuries such as the one claimant sustained, he had an "end of healing" regarding his right knee strain/sprain that was reached on or before the IME on March 18, 2015.

14. Dr. O'Brien testified consistent with his medical report at hearing. Dr. O'Brien agreed on cross-examination that claimant did sustain an injury on November 7, 2014 that required medical care.

15. Claimant continued to work for employer with work restrictions. Claimant testified that on April 6, 2015 he was helping co-workers hook a trailer to a truck when he stepped off the trailer tongue with his right foot, and his heel got hooked in the trailer safety chain. Claimant testified he again felt his knee pop. Claimant testified his employer had him fill out a new workers' compensation claim for the April 6, 2015 injury.

16. Claimant was evaluated by Dr. Griggs the day after the April 6, 2015 incident. Dr. Griggs noted claimant had immediate pain following the incident where he

caught his right leg on the safety chain, even though he was wearing his brace at the time of the incident.

17. Claimant subsequently underwent surgery under the auspices of Dr. Griggs on April 22, 2015. The surgery included a right arthroscopic ACL reconstruction, right arthroscopic partial lateral and medial menisectomy, and right arthroscopic lateral femoral condyle chondroplasty. The surgical report noted that claimant's medial meniscus had a small medial tear, the ACL was completely torn, the medial compartment was grade 1-2 and the patellofemoral joint was grade 1-2 as well. The lateral compartement was noted to be grade 4 mostly, but had a large lateral meniscus tear with small cartilage flaps.

18. Dr. O'Brien testified at hearing that he reviewed the MRI studies and opined that all the findings in the MRI were chronic. Dr. O'Brien testified there were no acute findings on MRI. Dr. O'Brien testified that it was his opinion that the surgery that was performed on April 22, 2015 was not related to claimant's November 7, 2014 injury nor to his April 6, 2015 injury.

19. Claimant testified at hearing that he was not in need of medical treatment for his right knee condition until the injury of November 7, 2014. The ALJ finds this testimony to be credible and persuasive. The ALJ further credits the opinions of Dr. Griggs and the radiologist that noted acute findings of a lateral collateral ligament tear and finds that claimant has demonstrated that he sustained a compensable injury arising out of his employment on November 7, 2014.

20. The ALJ credits the opinions expressed by Dr. Griggs in the medical records over the contrary opinions expressed by Dr. O'Brien in his report and testimony and finds that the surgery recommended by Dr. Griggs and performed on April 22, 2015 was reasonable and necessary to cure and relieve claimant from the effects of the November 7, 2014 work injury.

21. The ALJ notes that claimant was not under active medical care at the time of the work injury and the record is devoid of any credible evidence that claimant was in need of surgery for his pre-existing knee condition until the November 7, 2014 work injury. The ALJ therefore finds that claimant has demonstrated that it is more likely than not that the injury of November 7, 2014 resulted in acute tears to the lateral collateral ligament, aggravating his pre-existing condition and accelerating claimant's need for treatment at the ER following his injury and ultimately surgical intervention. The ALJ credits the reports from Dr. Griggs on this issue that claimant would need the surgery after his course of physical therapy failed to offer claimant relief from his symptoms as credible and persuasive.

22. The ALJ further finds that the April 6, 2015 incident at work was not a compensable injury, as no changes to claimant's underlying condition occurred during

the incident and the incident did not result in the need for additional medical treatment. Instead, the ALJ finds claimant has proven that it is more likely than not that the medical treatment, including the surgery performed on April 22, 2015 was related to claimant's November 7, 2014 work injury with employer.

23. Claimant's claim for benefits related to the April 6, 2015 work injury (W.C. No. 4-979-719-01) is therefore denied and dismissed.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. Section 8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. Section 8-43-201, C.R.S., 2006. A Workers' Compensation case is decided on its merits. Section 8-43-201, *supra*.

2. The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and action; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2006).

3. A compensable industrial accident is one that results in an injury requiring medical treatment or causing disability. The existence of a preexisting medical condition does not preclude the employee from suffering a compensable injury where the industrial aggravation is the proximate cause of the disability or need for treatment. *See H & H Warehouse v. Vicory*, 805 P.2d 1167 (Colo. App. 1990); *see also Subsequent Injury Fund v. Thompson*, 793 P.2d 576 (Colo. App. 1990). A work related injury is compensable if it "aggravates accelerates or combines with "a preexisting disease or infirmity to produce disability or need for treatment. *See H & H Warehouse v. Vicory, supra.*

4. As found, claimant has proven by a preponderance that he suffered compensable injury arising out of and in the course of his employment with employer when he slipped and fell off the pipe on November 7, 2014. As found, the testimony of claimant regarding his symptoms before and after he fell off the pipe and the opinions expressed by Dr. Griggs in his medical records are more credible and persuasive than the contrary opinions expressed by Dr. O'Brien in his report and testimony.

5. Respondents are liable for authorized medical treatment reasonably necessary to cure and relieve an employee from the effects of a work related injury. Section 8-42-101, C.R.S.; *see Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990). Pursuant to Section 8-43-404(5), C.R.S., Respondents are afforded the right, in the first instance, to select a physician to treat the industrial injury. Once respondents have exercised their right to select the treating physician, claimant may not change physicians without first obtaining permission from the insurer or an ALJ. *See Gianetto Oil Co. v. Industrial Claim Appeals Office*, 931 P.2d 570 (Colo. App. 1996).

6. As found, the medical treatment claimant received from the ER, Dr. Griggs and his referrals, including the surgery performed on April 22, 2015, are found to be reasonable medical treatment necessary to cure and relieve claimant from the effects of his work related injury.

7. As found, claimant has failed to show by a preponderance of the evidence that the incident at work on April 6, 2015 resulted in any new injury to his knee. Therefore, claimant's claim under W.C. No. 4-979-719-01 is denied and dismissed.

ORDER

It is therefore ordered that:

1. Respondents shall pay for the reasonable medical treatment necessary to cure and relieve claimant from the effects of his work injury, including but not limited to the treatment from the ER on November 8, 2014, Dr. Griggs treatment and referral for physical therapy and the surgery performed on April 22, 2015.

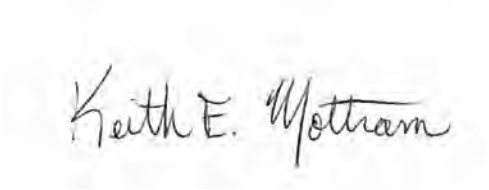
2. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

3. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the

certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: July 22, 2015



Keith E. Mottram
Administrative Law Judge
Office of Administrative Courts
222 S. 6th Street, Suite 414
Grand Junction, Colorado 81501

ISSUES

- Whether claimant has proven by a preponderance of the evidence that he sustained a compensable injury arising out of and in the course of his employment with employer?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that the medical treatment he received was reasonable and necessary to cure and relieve claimant from the effects of the industrial injury and provided by a physician authorized to treat claimant?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that he is entitled to an award of temporary total disability ("TTD") benefits from December 29, 2014 until February 23, 2015 when claimant returned to work for a different employer?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that he is entitled to temporary partial disability ("TPD") benefits beginning February 24, 2015 and continuing?

- If claimant has proven a compensable injury, whether respondents have proven by a preponderance of the evidence that claimant committed a volitional act that led to his termination of employer?

- The parties stipulated at the hearing to an average weekly wage ("AWW") of $1,601.47 that is calculated by combining claimant's earnings of $1,354.31 with Claimant's COBRA increase of $247.16.

FINDINGS OF FACT

1. Claimant was employed with employer as a Systems Operator I on December 27, 2014. Claimant testified his job duties included operating a fork lift and a front end loader. Claimant testified that through his work with employer, he would work shifts from 5:30 p.m. to 6:00 a.m.

2. Claimant testified that he was working on a drilling site in Wyoming on December 27, 2014 when at approximately 9:00 p.m., he slipped and fell on an icy ramp and landed on his right shoulder. Claimant testified he called his supervisor, Mr. Hansen and informed him that he fell. Claimant testified Mr. Hansen told him he would

tell Mr. Chambers, the direct supervisor for the area, of claimant's fall. Claimant testified he continued working and took it easy and was going to see how he felt in the morning.

3. Claimant testified that following his fall, he continued to work, but would use his left arm to lift. Claimant testified he finished his shift with employer and his shoulder was numb and throbbing.

4. Claimant testified that following his shift, he was scheduled to return to work on December 28, 2014 at 5:30 p.m., but was woken up at approximately 2:00 p.m. by Mr. Hansen and was told to pack up because he was going to another job site where he would catch a ride back to his home in Colorado. Claimant testified Mr. Hansen helped him load his belongings, including his tools and a cooler.

5. Claimant testified that while he was in the car with Mr. Hansen, he again mentioned that he hurt his shoulder. Claimant testified Mr. Hansen told him to sleep on it and that he had reported the injury to Mr. Chambers and someone would be getting back to him. Claimant testified he went to the new job site and operated a loader with his left hand. Claimant testified he was at the new job site for approximately 12-13 hours, before leaving the job site on December 29, 2014 at approximately 6:00 a.m.

6. Claimant testified he got a ride back to Colorado with Mr. Rotta and arrived at his home late in the afternoon on December 29, 2014. Claimant testified he did not receive a referral from employer to a physician between December 29, 2014 and January 2, 2015. Claimant testified that during this time, his pain began getting worse.

7. Claimant testified he was advised that he was terminated by employer on January 2, 2015. Claimant testified he then made a medical appointment with his personal physician, Dr. Smith with Roaring Fork Family Physicians.

8. Claimant was examined by Dr. Smith on January 2, 2015. Dr. Smith noted claimant reported he fell and landed on his right shoulder on December 27, 2014. Dr. Smith noted claimant had pain since his fall and documented "a little bruising down into the proximal upper arm". Claimant reported pain with overhead activity. Dr. Smith diagnosed claimant with a likely injury to the rotator cuff and provided claimant with restrictions of no lifting over 10 pounds. Claimant testified at hearing that he had not had an injury to his right shoulder before December 27, 2014.

9. Claimant testified that after his appointment with Dr. Smith, he called Axiom, a medical service provided by employer that allows the employees to call with medical questions involving work related injuries and speak to a nurse. Claimant testified he knew to call Axiom from a co-worker. Claimant testified he spoke with "Jan" at Axiom and asked her if a report had been filed. Claimant testified he was not referred to a physician by Axiom or employer after reporting the injury.

10. Claimant returned to Dr. Smith on January 14, 2015. Claimant noted continued pain in his right shoulder and Dr. Smith recommended claimant obtain a magnetic resonance image ("MRI") of his right shoulder. Claimant was referred by Dr. Smith to Dr. Adams.

11. Dr. Adams evaluated claimant on January 21, 2015 and noted claimant's accident history of slipping at work, landing on the right shoulder. Dr. Adams referred claimant for an MRI of the right shoulder.

12. Claimant returned to Dr. Smith on February 11, 2015. Dr. Smith noted that it was evident that claimant had a torn rotator cuff, but that insurer had denied the request for the MRI. By March 30, 2015, Dr. Smith was noting that claimant had a known rotator cuff tear and would likely need surgery.

13. Mr. Norwood, claimant's co-worker, testified at hearing that he was working with claimant on December 27, 2014 and witnessed claimant fall when he slipped on iron. Mr. Norwood testified claimant was talking on the phone and walking away from him when he stepped on iron, slipped and fell, landing on his right side. Mr. Norwood testified he walked over to claimant and asked him if he was OK, to which claimant replied that he was OK. Mr. Norwood testified he asked claimant several times through the day if he was OK, to which claimant responded that he was OK. Mr. Norwood testified he did not notice any difference in how claimant performed his work.

14. Mr. Norwood testified that he did not work with claimant anymore after the shift in which claimant fell (the shift ending December 28, 2014). Mr. Norwood testified he later saw claimant and his supervisor loading claimant's belongings. Mr. Norwood testified he did not hear claimant complain of right arm pain following his fall.

15. Mr. Hansen testified at hearing in this matter that he had spoken with claimant in December 2014 regarding a tire claimant had blown on the loader. Mr. Hansen confirmed that claimant had told him that he had fallen. Mr. Hansen testified he asked claimant if he was OK, and claimant replied that he was OK. Mr. Hansen testified he did not interpret this as claimant reporting a work related injury.

16. Mr. Hansen testified that the next day he removed claimant from the rig he was working on because of complaints employer had received from the rig owner about claimant. Mr. Hansen testified he moved claimant to a different rig and helped claimant move some of his belongings. Mr. Hansen testified that in the drive to the new rig, claimant did not complain of shoulder pain. Mr. Hansen testified he did not tell Mr. Chambers of claimant having fallen at work.

17. The ALJ credits the testimony of claimant and Mr. Norwood and finds that claimant has established that on December 27, 2014 he slipped and fell on ice at work and landed on his right side. The ALJ credits the medical records from Dr. Smith that

document claimant had bruising on his right shoulder on examination on January 2, 2014 and diagnosed claimant with a possible torn rotator cuff and finds that claimant has proven that it is more likely than not that claimant sustained an injury at work when he slipped and fell on December 27, 2014.

18. The ALJ notes that respondents take issue with the fact that claimant indicated he was OK to co-workers after the fall and did not seek medical treatment immediately after the injury. However, the evidence establishes by a preponderance of the evidence that claimant did sustain an injury when he fell on December 27, 2014 that resulted in the need for medical treatment.

19. Claimant was placed on restrictions by Dr. Smith on January 2, 2015. The ALJ finds that the claimant has demonstrated that it is more likely true than not that the medical restrictions are a result of his December 27, 2014 slip and fall when he landed on his right side and resulted in claimant's subsequent wage loss. The ALJ finds that the wage loss continued until February 24, 2015 when claimant returned to work for a new employer.

20. The ALJ notes that claimant sought TTD benefits beginning December 29, 2014. However, the evidence at hearing establishes that claimant was off of work beginning December 29, 2014 due to his normal scheduled time off. Claimant has failed to establish that it is more likely true than not that his failure to work between December 29, 2014 through January 2, 2015 was related to his work injury.

21. Claimant also argues that he is entitled to TPD benefits beginning February 24, 2015. However, claimant has failed to establish that it is more likely true than not that his earnings after he returned to work for the new employer were related to claimant's work injury. Insufficient evidence was presented at hearing of a wage loss after February 24, 2015 related to claimant's work injury and, therefore, claimant's claim for TPD benefits is denied.

22. Respondents presented the testimony of Mr. Merritt, the Senior Human Resources Operations Partner for employer. Mr. Merritt testified that claimant was fired on January 2, 2015 for failing to attend safety meetings and because the owner of the drilling rig had requested claimant be removed from the job site. Mr. Merritt testified if claimant had attended the safety meetings, he would not have been fired.

23. Claimant testified on rebuttal that he missed some safety meetings because the tool pusher in charge of the safety meetings allowed other workers to smoke during the meetings and he did not like being around the smoke.

24. Mr. Cook testified at hearing in this matter. Mr. Cook is the Principal HSE Official for employer. Mr. Cook testified he first became aware of claimant's injury when he was contacted by Axiom, a service that provides 24 hour care through an 800

number, and advised that an employee had called seeking medical care, on January 3, 2015 between 8:00 to 9:00 a.m. Mr. Cook testified he eventually spoke to Mr. Padgett and found out that claimant was a former employee. Mr. Cook testified he called Axiom back and filled out the first report of injury. Mr. Cook testified he did not call claimant when he found out that claimant was claiming an injury.

25. Significant testimony was presented regarding other issues with claimant's employment, including an incident in which claimant was written up for locking a seatbelt behind him in the truck to circumvent a rule that seatbelts be worn at all times when operating a vehicle. Because the ALJ finds that claimant's termination was not related to this incident (as evidenced by the lack of any write ups for claimant for the incident being entered into evidence at hearing), the ALJ finds these incidents immaterial to the ultimate decision of whether claimant committed a volitional act that resulted in his termination of employment.

26. The ALJ finds based on the testimony that was presented at hearing that claimant was terminated for failing to attend the safety meetings. However, insufficient evidence was presented that demonstrated claimant was aware that his failure to attend the safety meetings would result in his termination of employment. Claimant testified that he was not allowed to stand next to an open door to attend the safety meetings, but would have to be in the room exposed to the second hand smoke to attend the safety meetings.

27. The ALJ finds respondents have failed to demonstrate that claimant was terminated for committing a volitional act that he reasonably knew would lead to his termination of employment. The ALJ notes that despite testimony at hearing that indicated employer used a progressive discipline process, claimant was never warned that his failure to fully attend the safety meetings would lead to his termination of employment. Therefore, the ALJ determines that respondents have failed to prove that claimant reasonably should have known that his actions would lead to his termination of employment.

28. The ALJ further finds that claimant's testimony that he objected to being exposed to second hand smoke in the safety meetings was a reasonable excuse on his part to abstain from the safety meetings absent some kind of written warning from employer or the tool pusher that his failure to attend the meetings would lead to his termination of employment.

29. Furthermore, evidence presented at the hearing indicates Mr. Cook issued an e-mail shortly after claimant reported his injury that indicated claimant was terminated December 31, 2014 for "unsatisfactory job performance" and made no mention of claimant's failure to attend the safety meetings or other insubordination that led to his termination of employment. Therefore, the ALJ concludes that respondents have failed to meet their burden of proof in this regard.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. Section 8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. Section 8-43-201, C.R.S., 2006. A Workers' Compensation case is decided on its merits. Section 8-43-201, *supra*.

2. The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and action; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2006).

3. A compensable industrial accident is one that results in an injury requiring medical treatment or causing disability. The existence of a preexisting medical condition does not preclude the employee from suffering a compensable injury where the industrial aggravation is the proximate cause of the disability or need for treatment. *See H & H Warehouse v. Vicory*, 805 P.2d 1167 (Colo. App. 1990); *see also Subsequent Injury Fund v. Thompson*, 793 P.2d 576 (Colo. App. 1990). A work related injury is compensable if it "aggravates accelerates or combines with" a preexisting disease or infirmity to produce disability or need for treatment. *See H & H Warehouse v. Vicory, supra.*

4. As found, claimant has proven by a preponderance that he suffered compensable injury arising out of and in the course of his employment with employer when he slipped and fell on his right side injuring his shoulder. The ALJ notes that claimant's co-worker witnessed the fall and Dr. Smith documented claimant having bruising on his right shoulder when he examined claimant on January 2, 2015. The ALJ finds that claimant has proven by a preponderance of the evidence that the fall caused the injury to his right rotator cuff that necessitated the need for medical treatment.

5. Respondents are liable for authorized medical treatment reasonably necessary to cure and relieve an employee from the effects of a work related injury. Section 8-42-101, C.R.S.; *see Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990). Pursuant to Section 8-43-404(5), C.R.S., Respondents are afforded the right, in the first instance, to select a physician to treat the industrial injury. Once respondents have exercised their right to select the treating physician, claimant may not change physicians without first obtaining permission from the insurer or an ALJ. *See Gianetto Oil Co. v. Industrial Claim Appeals Office*, 931 P.2d 570 (Colo. App. 1996).

6. As found, the treatment provided by Dr. Smith and Dr. Adams, including the recommendation for the MRI of the shoulder is reasonable medical treatment necessary to cure and relieve claimant from the effects of the medical treatment.

7. "Authorization" refers to the physician's legal authority to treat, and is distinct from whether treatment is "reasonable and necessary" within the meaning of Section 8-42-101(1)(a), C.R.S. 2008. *Leibold v. A-1 Relocation, Inc.*, W.C. No. 4-304-437 (January 3, 2008). Section 8-43-404(5)(a) specifically states: "In all cases of injury, the employer or insurer has the right in the first instance to select the physician who attends said injured employee. If the services of a physician are not tendered at the time of the injury, the employee shall have the right to select a physician or chiropractor." "[A]n employee may engage medical services if the employer has expressly or impliedly conveyed to the employee the impression that the employee has authorization to proceed in this fashion…." *Greager v. Industrial Commission*, 701 P.2d 168 (Colo. App. 1985), *citing*, 2 A. Larson, *Workers' Compensation Law* § 61.12(g)(1983).

8. As found, the treatment provided by Dr. Smith on January 2, 2015 was not authorized. As found, claimant initially reported the incident to employer, but didn't express a desire to seek medical treatment. As found, employer was not put on notice of the claimant's desire to seek medical treatment until claimant called Axiom and Axiom informed Mr. Cook of claimant's request for medical treatment.

9. However, after Mr. Cook became aware of the claimant's request for medical treatment, he did not refer claimant to a physician designated to treat claimant for his work injury. Therefore, claimant's treatment with Dr. Smith beginning January 14, 2015 is authorized, as the choice of physician had by then transferred to claimant pursuant to Section 8-43-404(5)(a), C.R.S. As found, Dr. Smith's referral to Dr. Adams is likely deemed authorized as within the chain of referrals.

10. To prove entitlement to temporary total disability (TTD) benefits, claimant must prove that the industrial injury caused a disability lasting more than three work shifts, that he left work as a result of the disability, and that the disability resulted in an actual wage loss. *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). Section 8-42-103(1)(a), *supra*, requires claimant to establish a causal connection between a

work-related injury and a subsequent wage loss in order to obtain TTD benefits. *PDM Molding, Inc. v. Stanberg, supra*. The term disability, connotes two elements: (1) Medical incapacity evidenced by loss or restriction of bodily function; and (2) Impairment of wage earning capacity as demonstrated by claimant's inability to resume his prior work. *Culver v. Ace Electric*, 971 P.2d 641 (Colo. 1999). There is no statutory requirement that claimant establish physical disability through a medical opinion of an attending physician; claimant's testimony alone may be sufficient to establish a temporary disability. *Lymburn v. Symbios Logic*, 952 P.2d 831 (Colo. App. 1997). The impairment of earning capacity element of disability may be evidenced by a complete inability to work, or by restrictions which impair the claimant's ability effectively and properly to perform his regular employment. *Ortiz v. Charles J. Murphy & Co.*, 964 P.2d 595 (Colo.App. 1998).

11. As found, claimant has demonstrated that the injury resulted in work restrictions from Dr. Smith as of January 2, 2015. As found, the work restrictions resulted in a wage loss to claimant. As found, claimant is entitled to TTD benefits commencing January 2, 2015 when the restrictions came into place. The ALJ notes that claimant was off of work prior to January 2, 2015 due to his normal scheduled time off. Therefore, claimant's wage loss did not develop until January 2, 2015 and any wage loss prior to January 2, 2015 is not related to the work injury.

12. The mere fact that Dr. Smith was not an authorized provider at the time that he placed claimant on restrictions does not negate the fact that claimant has proven by a preponderance of the evidence that he sustained an injury that resulted in disability and led to an impairment of wage earning capacity. The TTD benefits continue until February 23, 2015 when claimant returned to work for a different employer.

13. To prove entitlement to temporary partial disability (TPD) benefits, claimant must prove that the industrial injury contributed to some degree to a temporary wage loss. *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995).

14. As found, claimant has failed to provide sufficient evidence that he is entitled to an award of TPD benefits. As found, insufficient evidence was presented at hearing that there was a wage loss that occurred when claimant returned to work for the subsequent employer and that the wage loss was attributable to the work injury.

15. Sections 8-42-105(4) and 8-42-103(1)(g), C.R.S., contain identical language stating that in cases "where it is determined that a temporarily disabled employee is responsible for termination of employment the resulting wage loss shall not be attributable to the on-the-job injury." In *Colorado Springs Disposal v. Industrial Claim Appeals Office*, 58 P3d 1061 (Colo. App. 2002), the court held that the term "responsible" reintroduced into the Workers' Compensation Act the concept of "fault" applicable prior to the decision in *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). Hence, the concept of "fault" as it is used in the unemployment insurance

context is instructive for purposes of the termination statutes. *Kaufman v. Noffsinger Manufacturing*, W.C. No. 4-608-836 (Industrial Claim Appeals Office, April 18, 2005). In that context, "fault" requires that the claimant must have performed some volitional act or exercised a degree of control over the circumstances resulting in the termination. *See Padilla v. Digital Equipment Corp.*, 902 P.2d 414 (Colo. App. 1995) *opinion after remand* 908 P.2d 1185 (Colo. App. 1995).

16. As found, respondents have failed to demonstrate that claimant committed a volitional act that led to his termination of employment. As found, claimant was terminated for failing to attend the safety meetings, but was not advised by employer that his actions would result in his termination of employment. Moreover, when claimant was terminated, he was simply advised that it was for poor work performance, and not specifically for failing to attend the safety meetings. As such, respondents have failed to prove by a preponderance of the evidence that claimant exercised a degree of control over the circumstances surrounding his termination of employment.

ORDER

It is therefore ordered that:

1. Respondents shall pay for the reasonable medical treatment necessary to cure and relieve claimant from the effects of his industrial injury pursuant to the Colorado Medical Fee Schedule after January 14, 2015 from Dr. Smith and Dr. Adams, including but not limited to the recommended MRI scan of the right shoulder.

2. Claimant's claim for payment of the January 2, 2015 medical bill from Dr. Smith is denied as Dr. Smith was not yet authorized to treat claimant for his work related injuries.

3. Respondents shall pay claimant TTD benefits for the period of January 2, 2015 through February 24, 2015 based on the stipulated AWW.

4. Claimant's claim for TPD benefits is denied.

5. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

6. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the

certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUE

Claimant's Average Weekly Wage (AWW).

FINDINGS OF FACT

1. Claimant works for Employer as a cleaner. Claimant performs her cleaning work primarily at Kinder Morgan Day Porter, Cresthill Middle School, and Cougar Run Elementary School.

2. Claimant alleges that she suffered an industrial injury on November 10, 2014.

3. On November 10, 2014 Claimant was earning $9 per hour.

4. On December 5, 2014 Claimant began earning $9.50 per hour for her work as lead cleaner. Claimant continued to earn $9.50 per hour for the months of December, 2014, January, 2015, February, 2015, and March, 2015.

5. Prior to and leading up to her alleged industrial injury, Claimant typically earned $9 per hour with the exception of the month of August, 2014 where she earned $10 per hour on most days and $9 per hour on a few days.

6. Claimant's work involved varied hours per week and on occasion she earned overtime pay.

7. From May 6, 2014 through November 10, 2014 Claimant worked approximately 906.02 hours over 26 and 6/7 weeks, for an average of 33.73 hours per week. During this period of time Claimant earned total gross wages of $8,372.57 for the 906.02 hours, for an average hourly wage of $9.24. Claimant's average hourly wage of $9.24 multiplied by the average number of hours she worked per week of 33.73 comes out to $311.67.

CONCLUSIONS OF LAW

Generally

The purpose of the Workers' Compensation Act of Colorado, C.R.S. §§ 8-40-101, *et seq.*, is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. § 8-40-102(1), C.R.S. The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. § 8-43-201, C.R.S. Respondent bears the burden of establishing any affirmative defenses. A preponderance of the evidence is

that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 592 P.2d 792 (Colo. 1979) The facts in a workers' compensation case shall not be interpreted liberally in favor of either the rights of the injured worker or the rights of the employer and a worker's compensation case shall be decided on its merits. § 8-43-201, C.R.S.

The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *Bodensieck v. Industrial Claim Appeals Office*, 183 P.3d 684 (Colo. App. 2008); *Kroupa v. Industrial Claim Appeals Office*, 53 P.3d 1192 (Colo. App. 2002).

Average Weekly Wage

Section 8-42-102(2), C.R.S., requires the ALJ to base the claimant's AWW on his earnings at the time of injury. However, under certain circumstances the ALJ may determine the claimant's AWW from earnings received on a date other than the date of injury. *Avalanche Industries, Inc. v. Clark,* 198 P.3d 589 (Colo. 2008); *Campbell v. IBM Corp.*, 867 P.2d 77 (Colo. App. 1993). Specifically, § 8-42-102(3), C.R.S., grants the ALJ discretionary authority to alter the statutory formula if for any reason it will not fairly determine the claimant's AWW. *Coates, Reid & Waldron v. Vigil*, 856 P.2d 850 (Colo. 1993). The overall objective in calculating the AWW is to arrive at a fair approximation of the claimant's wage loss and diminished earning capacity. *Campbell v. IBM Corp., supra.* Where the claimant's earnings increase periodically after the date of injury the ALJ may elect to apply § 8-42-102(3) and determine that fairness requires the AWW to be calculated based upon the claimant's earnings during a given period of disability, not the earnings on the date of the injury. *Avalanche Industries, Inc. v. Clark, supra*; *Campbell v. IBM Corp.*, *supra*.

The ALJ concludes that the best way to reach a fair approximation of Claimant's wage loss in this matter is to use the total wages Claimant earned in the six months leading up to her alleged industrial injury. For the 27 and 6/7 weeks prior to her injury Claimant earned approximately $9.24 per hour when her wages varied between $9 and $10 per hour. Claimant worked on average 33.73 hours per week during this time period. $9.24 x 33.73 hours equals an average weekly wage of $311.67. As Claimant's hours varied, the number of overtime hours varied, and her hourly wage varied during this time, the ALJ concludes that taking this average for the 6 months prior to and leading up to her alleged industrial injury is the best way to come to a fair approximation of her diminished earning capacity.

Although the ALJ notes that in the month of December Claimant received a raise to $9.50 per hour, it is unclear if Claimant's wages at that rate were expected to continue, or if they were expected to return back to $9 per hour as they did previously when Claimant received a raise from $9 to $10 per hour and then went back to $9 per hour. The evidence is insufficient to support that calculating wages based on $9.50 per hour would be the best way to fairly approximate her diminished earning capacity. Rather, the ALJ finds it most appropriate to use the calculation outlined above and the average weekly wage based on the 6 months prior to the alleged industrial injury. Claimant's average weekly wage is $311.67.

ORDER

It is therefore ordered that:

1. Claimant's Average Weekly Wages is $311.67.

2. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

/s/ Michelle E. Jones

DATED: July 27, 2015

_____

Michelle E. Jones
Administrative Law Judge
Office of Administrative Courts
1525 Sherman Street, 4th Floor
Denver, Colorado, 80203

Respondent's answer brief was filed on June 3, 2015. On the same date, Claimant indicated that there would be no reply brief. Consequently, the matter was deemed submitted for decision. After a consideration of the briefs, the ALJ hereby issues the following decision.

ISSUES

The issues to be determined by this decision concern the Claimant's Petition to Re-Open; and, if reopened, medical benefits [including a changing of authorized treating physician (ATP)]. The Respondent alleges that it did not have sufficient notice of the "change of physician" issue. There is no space for the "change of physician" issue of the Application for Hearing" form, however, there is a general space for "medical benefits."

The Claimant bears the burden of proof, by a preponderance of the evidence, on all issues, with the exception of alleged lack of sufficient notice on the "change of physician" issue, in which case the Respondents bears the burden of proof by preponderant evidence.

FINDINGS OF FACT

Based on the evidence presented at hearing, the ALJ makes the following Findings of Fact:

Preliminary Findings

1. The Claimant (d.o.b. March 4, 1969), a 14-year employee of the Employer, suffered an admitted compensable low back injury while in the course and scope of employment on April 14, 2013. The Claimant is employed as a firefighter. He underwent conservative treatment for this injury and was eventually placed at maximum medical improvement (MMI) on July 15, 2013.

2. On July 25, 2013, the Claimant authored a memo to his Employer affirming his belief that through treatment he experienced significant improvement in recovering from his injury and that he was ready to return to work. The Claimant returned to work as a firefighter on July 25, 2013, where he remains employed.

3. The Claimant has a pre-injury history of back pain. Both before and during the Claimant's treatment for the admitted April 14, 2013 workplace injury, he repeatedly failed to disclose the full scope and history of related back ailments. Specifically, he did not disclose to the physicians assessing and treating his 2013 workplace injury that he suffered back pain since 2009, which required infrequent chiropractic adjustment.

4. On October 2, 2013, the Respondent filed a Final Admission of Liability (FAL), admitting that the Claimant reached MMI on July 25, 2013, without impairment, and denying post-MMI medical maintenance benefits.

The Change of Condition/Worsening

5. In October of 2014, the Claimant experienced a recurrence and worsening of lower-back and left sciatica pain. He attributes this recurring pain to his April 14, 2013 admitted workplace injury.

6. On October 20, 2014, Chad Prusmack, M.D. evaluated the Claimant to determine the nature and extent of his pain. After a physical examination, and upon reviewing an MRI (magnetic resonance imaging) of the Claimant's back, Dr. Prusmack was of the opinion that the Claimant suffered from an annular tear at L5-S1, and a disc herniation paracentral to the right with some lateral recess stenosis.

7. Dr. Prusmack state the opinion that the Claimant's current lower back pain and left sciatica pain is worse and it is due to the original work-related injury sustained on April 14, 2013. Dr. Prusmack recommends that the Claimant undergo an L3-S1 discectomy and fusion procedure to help remedy the recurrent medial ailment.

The Petition to Re-Open

8. On October 22, 2014, the Claimant informed the Employer of his desire to re-open his claim from April 14, 2013. In addition, the Claimant expressed an interest in having Dr. Prusmack as his ATP, going forward.

9. On October 23, 2014, Respondent contacted the Employer regarding the Claimant's request to reopen the workers' compensation claim. Respondent expressed an unwillingness to voluntarily reopen the claim, given the year-long gap between Claimant achieving MMI and the newly reported injury.

10. On December 2, 2014, the Claimant filed a Petition to Re-open his claim based on change in condition, error, and mistake. He attached to his Petition a report from Dr. Prusmack, in which Dr. Prusmack states the opinion that the Claimant's current injury is worse and this is attributable to the work related injury sustained on April 14, 2013.

11. On December 5, 2014, the Claimant filed an "Application for Hearing and Notice to Set" because his attempt to re-open his workers' compensation claim on October 22, 2014 had been denied.

Medical

12. On December 19, 2014, Giancarlo Checa, M.D., examined the Claimant. Dr. Checa performed a lumbar discogram at L3-L4; L4-L5; L5-S1, finding, in part, that the Claimant suffered the following:

> "- Mild-to-moderate diffuse disc bulge with diffuse grade 4 tearing of the annulus
> at L-4 – L- 5
> - Mild diffuse disc bulge with grade 4 tearing of the annulus anteriority and posteriorly on the right…
> - Mild disc bulge with a shallow central disc protrusion and grade 3 tearing of the anulus posteriorly…
> - Slight convex left curvature on the lumbar spine
> - Slight anterior wedging of L1 vertebral body. This is unchanged from the prior MRI."

13. On December 23, 2014, the Respondent approved the Claimant's request to be examined by the Todd Sweeney, M.D., one of the ATPs for the admitted work-related injury sustained on April 14, 2013.

14. Following the December 23, 2014 examination, Dr. Sweeney noted in his report that he last examined the Claimant in July 2013, at which time the Claimant had reached MMI and returned to work without restrictions. In addition, Dr. Sweeney noted that the Claimant reported a recurrence of sciatica pain down his left and right leg, and that the Claimant recently visited with Dr. Prusmack about this pain. Lastly, Dr. Sweeney stated the opinion that the Claimant's recent symptoms appear chronologically unrelated to previous admitted workplace injury. For the reasons stated herein below, the ALJ finds the opinions of Dr. Prusmack and Dr. Ghazi more persuasive and credible than the opinion of Dr. Sweeney.

15. On April 2, 2015, the Respondent referred Claimant to ATP Usama Ghazi, D.O. After performing a physical examination of the Claimant, and reviewing available medical records, Dr. Ghazi concluded that the Claimant's worsened condition is related to his April 14, 2013 work injury. In his report, Dr. Ghazi stated the following opinion, in pertinent part:

> "- His radicular pain follows the exact same pattern as he complained of prior to
> this and seems to be related to the L4-5 levels.
> - While it has certainly been a long time since he presented with any radicular pain complaints, I still believe his symptoms are related and identical to those that he had in 2013 from his work injury.

- [t]he true nature of radiculopathy and disk injuries is that their symptoms can either recur frequently or remain chronically, or in more rare cases such as Mr. Hanshue's case, they can recur a year or two down the road.
- his onset of radicular symptoms occurred with this injury and his recurrent radicular symptoms are in the same distribution and, therefore, attributable to the same lumbar levels, and as such, his injury and symptomatology is the same for which I saw him back in 2013, and therefore, I believe it is related."

Independent Medical Examination (IME) by Elizabeth Bisgard, M.D.

16. On April 27, 2015, the Respondent's medical expert, Elizabeth Bisgard, M.D., performed an IME of the Claimant, and reviewed available medical records. With this information, Dr. Bisgard prepared a report regarding the Claimant's recurring low back and sciatica pain. In her report, Dr. Bisgard detailed the Claimant's pre-injury medical history as well as the treatment history for the admitted workplace injury. Dr. Bisgard highlighted the fact that the Claimant failed to share relevant pre-injury medical history with the various doctors treating the work injury. In addition, Dr. Bisgard's report emphasizes the differing opinions among the medical professionals who examined the Claimant concerning the cause of his recurrent low back pain—some believed that the Claimant's recurring pain is related to the workplace injury, others did not. Dr. Bisgard requested additional records before reaching a final conclusion regarding the causal relatedness between the Claimant's recurring pain and the admitted workplace injury.

17. On May 20, 2015, Dr. Bisgard prepared an addendum report, following her review of the Claimant's additional medical records. Dr. Bisgard is of the opinion that the Claimant's current symptoms are not causally related to the April 14, 2013, work injury. The ALJ infers and finds that Dr. Bisgard's opinion that the Claimant's recurrent low back and sciatica pain is not causally related to the admitted April 14, 2013 workplace injury is contrary to the weight of the evidence. To accept Dr. Bisgard's opinion in this regard, the ALJ would be required to diminish the seriousness of the admitted injury, and determine that that only a year after MMI the Claimant returned to a baseline of a naturally progressing degeneration of his back, despite the location and nature of his recurrent symptoms. The ALJ infers and finds that such a stretch would be beyond any reasonable bounds.

Notice of "Change of Physician" Issue

18. The Respondent alleges that it did not have sufficient notice of the "change of physician" issue. There is no space for the "change of physician" issue on the Application for Hearing" form, however, there is a general space for "medical benefits." By letter of December 18, 2014, the Respondent denied a change of physician to Dr. Prusmack, and indicated that the Claimant could return to Dr. Sweeney who, in July 2013, was of the opinion that the Claimant's present symptoms (Finding No. 14 herein above) were unrelated to the admitted compensable injury. The ALJ infers and finds that Dr. Sweeney would be in an untenable position to continue to be a workers' compensation ATP, treating the Claimant for non work-related conditions. Indeed, there is no rational reason supporting a return to Dr. Sweeney as an ATP. On the other hand, the ALJ infers and finds that the Respondent was aware that Dr. Prusmack was of the opinion that the Claimant's present condition was work related and Dr. Prusmack had treatment recommendations for a work-related condition. The ALJ, therefore, infers and finds that the Respondent had reasonable notice, prior to the hearing, that the Claimant was seeking a change of physician to Dr. Prusmack. When the "change of physician" prong of "medical benefits" was brought up at hearing, the Respondent offered no underlying reasons concerning any effects of not being provided specific notice, in the form of an articulated sub-category of the "medical" issue, although no space therefore was provided in the "Application" form or the Case Information form. The ALJ, therefore, infers and finds that the Respondent had reasonable notice that "change of physician" would be an issue under the heading of "medical benefits."

Ultimate Findings

19. Considering the totality of the evidence, including the medical records and the Claimant's testimony, the ALJ rejects the opinion of Dr. Bisgard concerning lack of causal relatedness of the Claimant's pain, and instead finds that the opinions and recommendations of Dr. Prusmack, Dr. Checa, and Dr. Ghazi are more consistent with the totality of the evidence. The ALJ finds that the Claimant's recurrent low back and sciatica pain is causally related to the injury of April 14, 2013, and represents a "change of condition" since MMI. Further treatment, as recommended by ATPs, is warranted.

20. The Claimant's testimony, as well as the medical records, establish that the Claimant's need for additional medical treatment and/or surgery is reasonably necessary, causally related to the admitted injury of April 14, 2013, and represents a change of condition since MMI. The ALJ rejects the contrary opinions on lack of causal relatedness, rendered by Dr. Sweeney and Dr. Bisgard.

21. The Respondent had reasonable notice that a "change of physician" request was implicit in the "medical" issues set for hearing.

22. While somewhat scripted and mechanical, the ALJ finds that the Claimant's testimony was credible. Further, the ALJ finds the opinions of ATP Dr. Ghazi, as well as the opinions of Dr. Prusmack and Dr. Checa, to be more significantly more credible than the opinion of Dr. Sweeney and the Respondent's expert, Dr. Bisgard, on the issue of causal relatedness because the opinions of the former are more consistent with the totality of the evidence and the seriousness of the Claimant's admitted back injury.

23. The ALJ makes a rational choice between conflicting opinions, to accept the opinions of Dr. Ghazi, Dr. Prusmack, and Dr. Checa, as based on substantial evidence, and to reject the opinions of Dr. Sweeney and Dr. Bisgard on the issue of causal relatedness of the Claimant's present, worsened condition.

24. The ALJ rejects the Dr. Bisgard's and the Respondent's "age degenerative" theory and finds that the Claimant has proven, by a preponderance of the evidence that his work-related condition has changed and worsened since he reached MMI on July 15, 2013, and that additional medical treatment is reasonably necessary to cure and relieve the effects of the worsened condition, and **not** attributable to the natural progression of pre-existing non-work related back degeneration.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

Credibility

a. In deciding whether an injured worker has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Bodensleck v. Indus. Claim Appeals Office,* 183 P.3d 684 (Colo. App. 2008);*Kroupa v. Indus. Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002); *Rockwell International v. Turnbull,* 802 P.2d 1182, 1183 (Colo. App. 1990); *Penasquitos Village, Inc. v. NLRB*, 565 F.2d 1074 (9th Cir. 1977). The ALJ determines the credibility of the witnesses. A*renas v. Indus. Claim Appeals Office*, 8 P.3d 558 (Colo. App. 2000). The weight and credibility to be assigned evidence is a matter within the discretion of the ALJ. *Cordova v. Indus. Claim Appeals Office*, 55 P.3d 186 (Colo. App. 2002); *Youngs v. Indus. Claim Appeals Office,* 297 P.3d 964, **2012 COA 85.** The same principles concerning credibility determinations that apply to lay witnesses apply to expert witnesses as well. *See Burnham v. Grant,* 24 Colo. App. 131, 134 P. 254 (1913); *also see Heinicke v. Indus. Claim Appeals Office,* 197 P.3d 220 (Colo. App.

2008). The fact finder should consider, among other things, the consistency or inconsistency of a witness' testimony and/or actions; the reasonableness or unreasonableness (probability or improbability) of a witness' testimony and/or actions (this includes whether or not the expert opinions are adequately founded upon appropriate research); the motives of a witness; whether the testimony has been contradicted; and, bias, prejudice or interest. *See Prudential Ins. Co. v. Cline,* 98 Colo. 275, 57 P. 2d 1205 (1936); CJI, Civil, 3:16 (2005). The fact finder should consider an expert witness' special knowledge, training, experience or research (or lack thereof). *See Young v. Burke,* 139 Colo. 305, 338 P. 2d 284 (1959). The ALJ has broad discretion to determine the admissibility and/or weight of evidence based on an expert's knowledge, skill, experience, training and education. *See* S 8-43-210, C.R.S; *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P.2d 501 (Colo. App. 1995). As found, the Claimant's testimony was credible. Further, as found, the opinions of ATP Dr. Ghazi as well as those of Dr. Prusmack and Dr. Checa, were more credible than the opinions of dr. Sweeney and Respondent's expert, Dr. Bisgard, on the issue of causal relatedness of the worsening because the opinions of the former were more consistent with the totality of the evidence and the seriousness of the Claimant's admitted back injury.

Substantial Evidence

b. An ALJ's factual findings must be supported by substantial evidence in the record. *Paint Connection Plus v. Indus. Claim Appeals Office,* 240 P.3d 429 (Colo. App. 2010); *Leewaye v. Indus. Claim Appeals Office,* 178 P.3d 1254 (Colo. App. 2007); *Brownson-Rausin v. Indus. Claim Appeals Office,* 131 P.3d 1172 (Colo. App. 2005). *Also see Martinez v. Indus. Claim Appeals Office,* 176 P.3d 826 (Colo. App. 2007). Substantial evidence is "that quantum of probative evidence which a rational fact-finder would accept as adequate to support a conclusion, without regard to the existence of conflicting evidence." *Metro Moving & Storage Co.v. Gussert,* 914 P.2d 411 (Colo. App. 1995). Reasonable probability exists if a proposition is supported by **substantial evidence** which would warrant a reasonable belief in the existence of facts supporting a particular finding. *See F.R. Orr Construction v. Rinta,* 717 P.2d 965 (Colo. App. 1985). It is the sole province of the fact finder to weigh the evidence and resolve contradictions in the evidence. See *Pacesetter Corp. v. Collett,* 33 P. 3d 1230 (Colo. App. 2001). An ALJ's resolution on questions of fact must be upheld if supported by substantial evidence and plausible inferences drawn from the record. *Eller v. Indus. Claim Appeals Office,* 224 P.3d 397, 399-400 (Colo. App. 2009). As found, the ALJ made a rational choice between conflicting opinions, to accept the implicit opinions of Dr. Ghazi, Dr. Prusmack, and Dr. Checa, as based on substantial evidence, and to reject the opinions of Dr. Sweeney and Dr. Bisgard on the issue of causal relatedness of the present, worsened back and sciatica conditions..

Re-Opening

c. Under § 8-43-303(1), C.R.S., after MMI and within six years of the date of injury, an ALJ may re-open a claim based on fraud, an overpayment, an error, a mistake, or **a change in condition**. See *El Paso County Department of Social Services v. Donn,* 865 P.2d 877 (Colo. App. 1993); *Burke v. Indus. Claim Appeals Office,* 905 P. 2d 1 (Colo. App. 1994); *Hanna v. Print Express, Inc.,* 77 P. 3d 863 (Colo. App. 2003); *Donohoe v. ENT Federal Credit Union,* W.C. No. 4-171-210 [Indus. Claim Appeals Office (ICAO) September 15, 1995]. This is so because MMI is the point in time when no further medical care is reasonably expected to improve the condition. § 8-40-101(11.5), C.R.S; *City of Colorado Springs v. Indus. Claim Appeals Office,* 954 P.2d 637 (Colo. App. 1997). Where a claimant seeks to re-open based on a worsened condition, she must demonstrate a change in condition that is "causally connected to the original compensable injury." *Chavez v. Indus. Comm'n,* 714 P.2d 1328 (Colo. App. 1985). As found, the Respondent's "age degeneration" theory was rejected and the Claimant established that his work-related condition changed and worsened since he reached MMI on July 15, 2013, and the recommendations for additional medical treatment and/or surgery are reasonably necessary and **not** attributable to the natural progression of a pre-existing non-work related back degeneration.

Reasonable Notice of "Change of Physician" Issue

d. "The fundamental requisites of due process are notice and the opportunity to be heard." *Franz v. Indus. Claim Appeals Office,* 250 P.3d 755, 758 (Colo. App. 2010) [quoting *Hendricks v. Indus. Claim Appeals Office,* 809 P.2d 1076, 1077 (Colo. App. 1990)]. Workers' compensation benefits are a constitutionally protected property interest which cannot be taken without the due process guarantees of notice and an opportunity to be heard. *See Whiteside v. Smith,* 67 P.3d 1240, 1247 (Colo. 2003). Notice requirements apply to both parties. Reasonable notice requirements need not specify, in the application for hearing, the exact statute upon which a claimant relies in order to afford adequate notice of the legal basis of a claim. *See Carlee Carson v. Indus. Claim Appeals Office* [(No. 03CA0955, October 7, 2004) (not published), *cert. denied,* February 22, 2005]. A general request for the relief sought will suffice. *See Fang v. Showa Entetsu Co.,* 91 P.3d 419 (Colo. App. 2003). As found, the Respondent had reasonable notice that a "change of physician" request was implicit in the "medical" issues set for hearing.

Medical Benefits

e. To be a compensable benefit, medical care and treatment must be causally related to an industrial injury or occupational disease. *Dependable Cleaners v. Vasquez,* 883 P. 2d 583 (Colo. App. 1994). As found, the Claimant's medical treatment is causally related to the worsening of the originally admitted low back injury of April 14,

2013. Also, medical treatment must be reasonably necessary to cure and relieve the effects of the industrial occupational disease. § 8-42-101 (1) (a), C.R.S. *Morey Mercantile v. Flynt,* 97 Colo. 163, 47 P. 2d 864 (1935); *Sims v. Indus. Claim Appeals Office,* 797 P.2d 777 (Colo. App. 1990). As found, the Claimant's medical care and treatment was and is reasonably necessary to cure and relieve the effects of the worsening of the originally admitted back injury.

f. An ALJ may order a **change of physician** if the present treating physician's long-term treatment worsens or does not improve a claimant's condition. *See Ames v. Indus. Claim Appeals office,* 89 P.3d 477 (Colo. App. 2003). Under a recent statutory amendment, a claimant may obtain a one-time change of physicians by filing a written notice on a form designated by the Director of the Division of Workers' Compensation. § 8-43-404 (5) (a) (III), C.R.S. This statutory change illustrates a loosening of provisions providing strict employer-control over authorized treating physicians (ATPs). The fact that a claimant has more faith in a doctor other than the ATP may not be a sufficient reason for a change in the authorized treating physician. *See Yeck v. Indus. Claim Appeals Office,* 996 P.2d 228 (Colo. App. 1999). If, however, the ATP in the workers' compensation system is of the opinion that a claimant's condition , or worsened condition, is not causally related to a work injury, it may plausibly be plausibly inferred that an injured worker seeking work-related treatment has no **faith** in the ATP. An ALJ would be doing such ATP and such claimant a favor by ordering a change of physicians. As Voltaire said, **faith** is 90% of the cure.

Burden of Proof

g. The injured worker has the burden of proof, by a preponderance of the evidence, of establishing entitlement to a re-opening and subsequent benefits. §§ 8-43-201 and 8-43-210, C.R.S. *See City of Boulder v. Streeb,* 706 P. 2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals Office,* 12 P. 3d 844 (Colo. App. 2000); *Lutz v. Indus. Claim Appeals Office,* 24 P.3d 29 (Colo. App. 2000). *Kieckhafer v. Indus. Claim Appeals.Office*, 284 P.3d 202, 205 (Colo. App. 2012). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark,* 197 Colo. 306, 592 P. 2d 792 (1979). *People v. M.A.,* 104 P. 3d 273 (Colo. App. 2004); *Hoster v. Weld County Bi-Products, Inc.,* W.C. No. 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. *Also see Ortiz v. Principi,* 274 F.3d 1361 (D.C. Cir. 2001). "Preponderance" means "the existence of a contested fact is more probable than its nonexistence." *Indus. Claim Appeals Office v. Jones*, 688 P.2d 1116 (Colo. 1984). As found, the Claimant has sustained his burden with respect to a re-opening and post-MMI medical benefits, including the recommended additional treatment and/or surgery.

ORDER

IT IS, THEREFORE, ORDERED THAT:

A. W.C. No. 4-916-350-01 is hereby re-opened.

B. The Claimant's implicit request for a change of physician to Chad Prusmack, M.D., is hereby granted, prospectively, as of the hearing date, May 26, 2015.

C. The Respondent shall pay the costs of all authorized medical care and treatment for the admitted injury of April 14, 2013, including the additional treatment and/or surgery recommended by authorized treating physicians, including Dr. Prusmack, subject to the Division of Workers' Compensation Medical Fee Schedule.

D. Any and all issues not determined herein are reserved for future decision.

DATED this 19 day of June 2015.

EDWIN L. FELTER, JR.
Administrative Law Judge

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts,**1525 Sherman Street, 4th Floor, Denver, CO 80203.** You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on the certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) that you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) that you mailed it to the above address for the Denver Office of Administrative Courts. **For statutory reference, *see* § 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, *see* Rule 26, OACRP. You may access a form for a petition to review at** *http://www.colorado.gov/dpa/oac/forms-WC.htm*.

ISSUES

The issues addressed by this Order involve permanent partial disability, conversion of scheduled impairment to impairment of the whole person and entitlement to maintenance medical treatment. The specific questions to be answered are:

I. Whether Claimant is entitled to conversion of her 19% scheduled upper extremity impairment to 11% whole person impairment;

II. Whether Respondents have produced clear and convincing evidence to overcome Dr. Castrejon's Division IME opinion that Claimant sustained 19% scheduled permanent impairment;

III. Whether Claimant is entitled to an award of post-MMI maintenance medical benefits.

FINDINGS OF FACT

Based upon the evidence presented, the ALJ enters the following findings of fact:

1. Claimant works as a store manager for Employer who operates a retail store in Westcliffe, Colorado. She has worked in this capacity for the past 5 ½ years.

2. As the store manager, Claimant's duties vary. She supervises four other employees in the store, is accountable for completing payroll, balancing the budget and taking inventory. While she has administrative responsibilities, Claimant also engages in physical tasks including stocking and unloading freight.

3. The claimant sustained an admittedly compensable on the job injury to her right shoulder on August 19, 2013 when she was unloading the distribution center's truck. The claimant indicated that when unloading the truck, product is rolled down from the back of the semi-truck down rollers and into the building where the product is picked up and put into wheeled metal carts called "boats" for stocking onto the sales floor.

4. On August 19, 2013, Claimant maneuvered a boat stacked with 24 packs of 20 oz. bottles of water from the back of the store to the front of the store to unload the water where a product display was set up. She got about a quarter of the material unloaded when she felt a sharp pain in her right shoulder. She stopped for a while thinking the pain would go away but, since the workers only have a short period of time to unload the truck and get everything set up, Claimant attempted to go back and

complete the job. When she returned to work, Claimant heard a ripping sound in her right shoulder resulting in pain so severe that it took her to her knees. Claimant had another worker finish up while she retired to her office to gather herself together.

5. Claimant reported the injury to the employer's telephone injury report line and was referred by them to CCOM in Canon City where she was evaluated by a physician's assistant (PA), Stephen Quakenbush on August 20, 2013.

6. Claimant completed a pain diagram for PA Quakenbush on August 20, 2014, indicating she was experiencing stabbing pain in the right shoulder and pins and needles in the right finger tips. The claimant rated her pain at a level 8/10. PA Quakenbush diagnosed Claimant with a right shoulder sprain, possible rotator cuff injury, and right paracervical, trapezius, and parascapular muscular strain. PA Quakenbush took Claimant off of work and recommended physical therapy and an MRI.

7. An MRI of the right shoulder was completed on August 22, 2013. The MRI demonstrated mild degenerative changes of the acromioclavicular joint, fluid in the subdeltoid subacromial bursa concerning for bursitis and increased signal in the distal supraspinatus tendon, which may represent a partial thickness tear at the attachment. The infraspinatus and subscapularis tendons appeared intact. The quality of the MRI was limited due to "significant motion artifact."

8. Claimant returned to PA Quakenbush on August 23, 2014 where she completed a pain diagram, indicating pain in the back of the right shoulder, without additional pain complaints documented. The claimant rated her pain at a level 5/10. PA Quakenbush kept the claimant off work and referred her to Dr. Jennifer Fitzpatrick, an orthopedic physician, for evaluation.

9. Claimant began physical therapy with the Custer County Clinic on August 26, 2013.

10. Claimant was examined by Dr. Jennifer FitzPatrick on August 27, 2013. Dr. FitzPatrick diagnosed a partial rotator cuff tear with a marked painful right shoulder. Dr. FitzPatrick provided a cortisone injection and instructed Claimant to follow up in a month.

11. Claimant continued with physical therapy. While the aforementioned cortisone injection helped for approximately five days, Claimant's pain complaints did not completely resolve and remained in the same location.

12. Employer offered the claimant modified employment, within the physician-imposed restrictions, which the claimant accepted. The claimant returned to modified work on August 28, 2014.

13. Claimant's continued to improve with physical therapy. However, on September

6, 2013, while at home, Claimant reached up instinctively to grab a plate that was about to fall going to fall, causing extreme shoulder pain and prompting Claimant to report that she was, "back to square one". Respondents assert that this event constitutes an efficient intervening injury severing the causal connection between Claimant's admitted shoulder injury and her entitlement to benefits including her need for additional treatment, i.e. the surgery performed by Dr. Weinstein.

14. Claimant returned to CCOM and was seen by Dr. Richard Nanes on September 12, 2013. She completed a pain diagram on this date which indicates that she was experiencing pain at a 7/10 level with stabbing in the front of the right shoulder as well as the right and left fingertips. Claimant requested to be seen by Dr. David Weinstein instead of Dr. Fitzpatrick.

15. Claimant was evaluated by Dr. Weinstein on September 27, 2013. Dr. Weinstein diagnosed Claimant with right rotator cuff tendinitis with partial rotator cuff tear, right biceps tendinitis, right acromioclavicular joint inflammation, and right trapezial myofascial inflammation. Dr. Weinstein discussed with the claimant that these diagnoses could heal non-operatively. Consequently, he recommended conservative treatment before considering arthroscopic surgery.

16. Additional therapy proved unsuccessful. Thus, Dr. Weinstein performed surgery on the right shoulder on December 7, 2013. Dr. Weinstein's operative note supports that he performed a "right arthoscopic subacromial decompression;" a "right arthroscopic rotator cuff repair of subscapularis and debridement of supraspinatus tendon tear;" a "right arthroscopic biceps tendodesis;" and a "right arthroscopic distal clavicle resection." As noted above, Respondents assert that Claimant's biceps, infraspinatus and subscapularis tendon tears are explained by her instinctively reaching upwards to grab a plate that was about to fall. As support, Respondents cite that the MRI obtained August 20, 2013 demonstrated the infraspinatus and subscapularis tendons to be intact. The ALJ is not persuaded finding that the MRI was of poor quality secondary to "significant motion artifact." Based upon the evidence presented, including the MRI and the findings in Dr. Weinstein's operative report, the ALJ finds that the infraspinatus, subscapularis, and biceps tearing are, more probably than not related to Claimant's August 19, 2013 admitted right shoulder injury from lifting 24 packs of 20 oz. bottles of water.

17. Claimant underwent an extended course of post-operative physical therapy. On December 26, 2013, Dr. Nanes evaluated the claimant and noted the physical therapist felt the claimant's range of motion was "quite good". He released the claimant to return to modified duty as of January 13, 2014. In her treatment associated pain diagram, Claimant documented only aching pain across the front of the right shoulder.

18. Claimant returned to Dr. Weinstein on March 6, 2014, in follow-up. On March 6, 2014, Dr. Weinstein noted the claimant was doing well with a mild amount of discomfort. On physical exam, Claimant had forward elevation to 170 degrees with external rotation to 50 degrees. Dr. Weinstein opined that Claimant was doing "very well" and anticipated MMI in six weeks.

19. On April 8, 2014, Dr. Nanes evaluated the claimant. He noted that Claimant had pain in the right shoulder, which she considered to be "light". On physical exam, Dr. Nanes noted "excellent and nearly full" range of right shoulder motion, with all movements being pain free.

20. Dr. Weinstein's April 30, 2014 progress report indicates that Claimant was "doing much better" with mild weakness and no other complaints. He noted that she was participating in therapy on a regular basis and had experienced good improvement in her symptoms. On physical exam, Claimant had 170 degrees of forward elevation and internal rotation to L5. Dr. Weinstein recommended continued physical therapy and transition to a home exercise program. Dr. Weinstein released Claimant to return to work, without restrictions, and opined that she was approaching MMI.

21. Dr. Nanes re-examined Claimant on May 6, 2014. During this examination, Claimant described her pain as "almost gone", with pain at a level 0/10. On physical exam, Dr. Nanes documented "excellent", pain free full range of motion of the right shoulder. He noted that Claimant would not need an impairment rating, "as all 6 of her right shoulder motion are completely full". He released the claimant to return to work, without restrictions.

22. Claimant returned to Dr. Nanes for evaluation on June 17, 2014. On physical exam, Dr. Nanes again noted, "excellent and full range of motion of the right shoulder and the movement are without any pain". Dr. Nanes opined that Claimant had an excellent response to surgery and had full range of motion in all six directions. Therefore, he placed the claimant at MMI with no impairment, no restrictions and no need for medical treatment post-MMI.

23. Claimant returned to her regular job as a store manager for the Employer on June 17, 2014. As noted above, Claimant's job duties vary. During her testimony, Claimant described physical requirements of the job as including the ability to lift up to 40 pounds, twisting, turning, kneeling, squatting, reaching overhead, gripping, grasping, keyboarding, unloading trucks, moving merchandise, and stocking. Based upon this testimony, the ALJ finds that while Claimant is the store manager, her job is physically demanding. Claimant has worked her regular job with Employer since being placed at MMI by Dr. Nanes.

24. On June 23, 2014, Respondents filed a Final Admission of Liability (FAL) consistent with the opinions expressed by Dr. Nanes' in his June 17, 2014 MMI report. Claimant filed a timely objection and the matter proceeded to a Division Independent Medical Examination (DIME) performed by Dr. Miguel Castrejon on September 17, 2014.

25. Dr. Castrejon agreed that the claimant reached MMI, consistent with Dr. Nanes' opinions. However, Dr. Castrejon opined Claimant suffered 6% scheduled impairment for loss of shoulder range of motion. Dr. Castrejon also assigned 3% scheduled

impairment for "motor weakness involving the supraspinatus/infraspinatus, which equates to the suprascapular nerve" by application of Tables 14 and 11 of the *AMA Guides to the Evaluation of Permanent Physical Impairment,* 3d Ed., Revised. Finally, Dr. Castrejon assigned 10% impairment per the Division's Rating Tips, for the distal clavicle resection performed by Dr. Weinstein. Dr. Castrejon's combined impairment rating totaled 19% scheduled impairment of the right upper extremity. Nineteen percent scheduled impairment converts to 11% percent whole person impairment. Dr. Castrejon opined no additional medical care is necessary to maintain the claimant at MMI.

26. Respondents objected to Dr. Castrejon's impairment rating and had Claimant evaluated by Dr. Jorge Klajnbart. In his report dated March 15, 2015, Dr. Klajnbart noted that he did not "see any evidence of injury to the suprascapular nerve" and that Claimant's muscular weakness arose postoperatively for which treatment was focused on regaining strength in the subscapularis and supraspinatus. According to Dr. Klajnbart, Claimant demonstrated "symmetric strength in all upper extremity musculature." Consequently, Dr. Klajnbart did not "concur with the assignment of impairment per Tables 14 and 11" of the *AMA Guides to the Evaluation of Permanent Physical Impairment*, 3d Ed. Revised (hereinafter the *AMA Guides*)

27. The ALJ takes judicial notice of the *AMA Guides* to find that Table 11 relates specifically to "determining impairment of the upper extremity due to loss of power and motor function resulting from peripheral nervous system disorders". Table 14 relates specifically to "Specific Unilateral Spinal Nerve Impairment Affecting the Upper Extremity". Dr. Klajnbart testified that Table 11 of the AMA Guides deals with determining impairment based on loss of power and motor deficits which he did not observe during his evaluation.

28. Respondents contend that Dr. Castrejon erred when he included an additional 3% scheduled impairment per Tables 11 and 14 for weakness equating to the suprascapular nerve because Claimant sustained injury to her shoulder injury only, without peripheral nerve involvement. As emphasized, the ALJ finds Respondents argument to stress that there must be some direct nerve injury/condition causing loss of power or weakness in the muscles innervated by the specific nerve affected before it is appropriate to resort to Table 11 and 14 in determining upper extremity impairment. The *AMA Guides* specifically refers to such nerve involvement as "peripheral spinal nerve lesions" supporting Respondents contention that a particular peripheral spinal nerve must be involved and compromised before rating upper extremity impairment through the use of Tables 11 and 14.

29. Based upon the evidence presented, the ALJ finds Claimant's upper extremity weakness and loss of power is, more probably than not, a function of favoring/protecting the injured arm and not the result of any peripheral nerve injury. Indeed, careful review of the medical record does not support a finding that Claimant sustained any injury to a peripheral nerve, either during the initial event or as a consequence of any treatment necessitated thereafter. Accordingly, the ALJ finds the Dr. Castrejon deviated from and misapplied the *AMA Guides* when he rated Claimant for the consequences of a disorder

that she does not have. Based on the evidence presented, the ALJ finds that Claimant's rating for decreased range of motion in the right shoulder addresses the extent of impairment in the shoulder for weakness and loss of power. Consequently, Respondents have proven by clear and convincing evidence that it is highly probable that the DIME physician's opinions concerning permanent impairment are incorrect. Dr. Castrejon's impairment rating has been overcome by clear and convincing evidence.

30. Dr. Klajnbart, in his report of March 15 indicates that he disagrees with Dr. Castrejon regarding the goniometric ratings of the claimant's loss of range of motion slightly but admitted during his deposition that these could be based upon the claimant's activities before the examination. He agreed that the Division of Worker's Compensation rating tips indicated that a 10% rating was required for a distal clavicle resection (excision) but was somewhat confused initially as to whether that was as a whole person or on the schedule in his deposition. Although Dr. Klajnbart did not attach a rating impairment work sheet to his report in his deposition of May 7, 2015, he opined that the claimant sustained an overall impairment of 8% percent as whole person when the scheduled impairments for range of motion loss and the distal clavical resection were combined and converted. Dr. Klajnbart further stated that he was not aware of any need for apportionment.

31. Claimant testified credibly that she has pain in the back of her neck all the way across to the shoulder and pain in the scapula area which is a nonstop, constant pain. She has additional pain in the front that extends from the neck to the shoulder and increases with activity. The pain in the scapula area is constant and never goes away. It is like a dull throb. Claimant described its location as being about 3 inches from the bottom of the armpit towards the back. She stated that, if she attempted to make a golf swing, the pain in the area of the scapula becomes intense like a sharp, stabbing pain. The issues with the pain on top in front of the clavicle occur when she has attempted to do things such as bowling. When she attempted to take the bowling ball behind her, she has a pulling sensation and pain across the top by the neck. The pain is located between her neck and shoulder. The claimant cannot sleep on her right shoulder as the pain in the back and scapula hurts. Claimant still has pain and soreness in the area where dry needling attempts were performed by Dr. Scheper. If Claimant attempts to perform activities such as vacuuming or wiping down a counter, she has pain across the back between the shoulder and neck and her scapula pain increases. If she attempts to unload the trucks at work, the pain in the scapula area increases and she must stop after 10 minutes of work. Claimant has a horse that she can no longer saddle as cinching the saddle on the horse causes intense scapular pain.

32. Based on Dr. Klajnbart's deposition testimony, the ALJ infers and finds that the acromiom and clavical are located on the front of the body, on top of the shoulder proper and medial (more towards the center of the body) to the glenohumeral joint in the sagittal plane. Consequently, the ALJ finds the acromion and clavicle anatomic structures beyond the glenohumeral joint and not part of the arm itself.

33. The preponderance of the persuasive evidence presented demonstrates that

Claimant's permanent impairment extends beyond her left arm. Accordingly, the ALJ finds that conversion of Claimant's scheduled impairment to impairment of the whole person is warranted in this case.

34. The ALJ credits Dr. Klajnbart's impairment rating opinions to find that Claimant has 8% whole person impairment.

35. Based upon the evidence presented, Claimant failed to meet her burden of proving that she requires medical treatment to maintain her condition at MMI.

CONCLUSIONS OF LAW

Based upon the forgoing findings of fact, the ALJ draws the following conclusions of law:

A. In accordance with Section 8-43-215, C.R.S., this decision contains Specific Findings of Fact, Conclusions of Law, and an Order. In rendering this decision the ALJ has made credibility determinations, drawn plausible inferences from the record, and resolved essential conflicts in the evidence. See *Davison v. Industrial Claim Appeals Office*, 84 P.3d 1023 (Colo. 2004). This decision does not specifically address every item contained in the record; instead, incredible or implausible testimony or unpersuasive arguable inferences have been implicitly rejected. *Magnetic Engineering, Inc. v. Industrial Clam Appeals Office,* 5 P.3d 385(Colo. App. 2000)

B. When a claimant's injury is listed on the schedule of disabilities, the award for that injury is limited to a scheduled disability award. *Section 8-42-107(1)(a), C.R.S.* However, a claimant may establish that his/her injury has resulted in "functional impairment" beyond the schedule enumerated in C.R.S. §8-42-107(2)(a); thus, entitling him/her to "conversion" of the scheduled impairment to impairment of the whole person. This is true because the term "injury" as used in § 8-42-107(1)(a)-(b), C.R.S., refers to the part or parts of the body which have been impaired or disabled, not the situs of the injury itself or the medical reason for the ultimate loss. *Walker v. Jim Fucco Motor Co,* 942 P.2d 1390 (Colo. App. 1997); *see also Strauch v. PSL Swedish Healthcare System,* 917 P.2d 366 (Colo. App. 1996). In the case of a shoulder injury, the question is whether the claimant has sustained functional impairment beyond the arm at the shoulder. *Langton v. Rocky Mountain Health Care Corp*., 937 P. 2d 883 (Colo. App. 1996); *Strauch v. PSL Swedish Healthcare System, supra.*

C. "Functional impairment" is distinct from physical (medical) impairment under the AMA Guidelines and as noted above, the site of functional impairment is not necessarily the site of the injury itself. The site of functional impairment is that part of the body which has been impaired or *disabled*. *Strauch, supra*. Physical impairment relates to an individual's health status as assessed by medical means. Disability or "functional impairment", on the other hand, pertains to a person's ability to meet personal, social, or occupational demands, and is assessed by non-medical means. Consequently, physical impairment may or may not cause "functional impairment" or disability. *Lambert*

& Sons, Inc. v. Industrial Claim Appeals Office, 984 P.2d 656, 658 (Colo. App. 1998). Physical impairment becomes a disability only when the medical condition limits the claimant's capacity to meet the demands of life's activities. Lambert & Sons, Inc. v. Industrial Claim Appeals Office, supra at 658.

D. It is true, as Claimant points out, that "functional impairment" need not take any particular form. *See Nichols v. LaFarge Construction, W.C. No. 4-743-367 (October 7,2009); Aligaze v. Colorado Cab Co., W.C. No. 4-705-940 (April 29, 2009); Martinez v. Albertson's LLC, W.C. No. 4-692-947 (June 30, 2008).* Moreover, as noted by Claimant "referred pain from the primary situs of the industrial injury may establish proof of functional impairment to the whole person." *Hernandez v. Photronics, Inc., W.C. No. 4-390-943 (July 8, 2005); Latshaw v. Baker Hughes, Inc*., W.C. No. 4-842-705 (ICAO, December 17, 2013). Nonetheless, symptoms of pain do not automatically rise to the level of a functional impairment. To the contrary, the undersigned concludes that there must be evidence that such pain limits or interferes with Claimant's ability to use a portion of his body to be considered functional impairment. See *Mader v. Popejoy Construction Co., Inc.*, W.C. No. 4-198-489 (August 9, 1996), aff'd *Popejoy Construction Co., Inc.,* (Colo. App. No. 96CA1508, February 13, 1997)(not selected for publication)(claimant sustained functional impairment of the whole person where back pain impaired use of the arm). In order to determine whether permanent disability should be compensated as physical impairment on the schedule or as impairment of the whole person, the issue is not whether the claimant has pain, but whether the injury has impacted part of the claimant's body which limits his/her "capacity to meet personal, social and occupational demands." *Askew v. Industrial Claim Appeals Office, 927 P.2d 1333 (Colo. 1996).* Consequently, an injury to the structures which make up the shoulder may or may not result in functional impairment beyond the arm at the shoulder. *Walker* v*. Jim Fucco Motor Co, supra; Strauch v. PSL Swedish Healthcare System, supra; Langton v. Rocky Mountain Health Care Corp., supra.*

E. In this case, the ALJ agrees with Claimant that the persuasive evidence warrants conversion of her scheduled impairment to impairment of the whole person. As found, both the acromion and the distal clavicle are structures beyond the "arm." Consequently, the subacromial decompression and distal clavicle resection, which permanently altered these anatomical structures, were performed above and medial to the glenohumeral joint and therefore, above the "arm." *See, e.g., Martinez v. Albertson's LLC*, W.C. No. 4-692-947 (ICAO, June 30, 2008)(finding that subacromial decompression was done at the acromion and the coracoacromial ligament to relieve the impingement, which was related to the scapular structures above the level of the glenohumeral joint"); *Velasquez v. UPS*, W.C. No. 4-573-459 (ICAO, April 13, 2006) (finding that distal clavicle resections are proximal to the glenohumeral joint and therefore, on the trunk of the body). Furthermore, the consistent and convincing evidence establishes that Claimant suffers from persistent pain and weakness in the scapula and surrounding stabilizing musculature of the upper back (infraspinatus, supraspinatus and subscapularis) which affects her sleep and limits her ability to perform activities, including lifting with the right arm. In concluding that Claimant is entitled to conversion of her scheduled impairment to impairment of the whole person, the ALJ finds the opinion of the Industrial Claim Appeals Panel in *Steinhauser v. Azco,*

Inc., W.C. No. 4-808-991 (ICAO, January 11, 2012) and *Franks v. Gordon Sign Co.*, W.C. No. 4-180-076 (ICAO, March 27, 1986) instructive. In *Steinhauser,* the Panel affirmed the conclusion of the ALJ that pain and muscle spasm in scapular and trapezial musculature warranted whole person impairment. Similarly, in *Franks* pain affecting the trapezius and difficulty sleeping on injured side supported the ALJ's finding of whole person impairment. On the evidence presented, the ALJ concludes that the instant case is analogous to *Steinhauser* and *Franks* in that Claimant has produced convincing evidence that she has persistent scapular pain and weakness in the muscles stabilizing the scapula which limits her functional abilities and her sleep. Accordingly, the ALJ concludes that Claimant has proven by a preponderance of the evidence that she sustained a "functional impairment" of bodily function not listed on the scheduled of disabilities which warrants conversion of his scheduled impairment to whole person impairment.

F. Section 8-42-107, C.R.S., sets forth two different methods of compensating medical impairment. Subsection (2) provides a schedule of disabilities and Subsection (8) provides a Division Independent Medical Examination ("DIME") process for whole person ratings. The threshold issue is application of the schedule and this is a determination of fact based upon a preponderance of the evidence. The application of the schedule depends upon the "situs of the functional impairment" rather than just the situs of the original work injury. *Langton v. Rocky Mountain Health Care Corp.,* 937 P.2d 803 (Colo. App. 1996); *Strauch v. PSL Swedish Health Care System*, 917 P.2d 366 (Colo. App. 1996). The heightened burden of proof in Subsection (8) applies only if the threshold determination is made that the impairment is not limited to the schedule. Then, and only then, does either party face a clear and convincing evidence burden to overcome the rating of the DIME. *Webb v. Circuit City Stores, Inc.*, W.C. No. 4-467-005 (ICAO, August 16, 2002). Because the ALJ concludes that Claimant has sustained functional impairment beyond the schedule, the clear and convincing burden to overcome the DIME applies in this case.

G. Section 8-42-107(8), C.R.S., provides that the DIME physician's finding of medical impairment is binding unless overcome by clear and convincing evidence. Clear and convincing evidence has been defined as evidence which demonstrates that it is highly probable the DIME physician's determinations are incorrect. *Qual-Med, Inc. v. Industrial Claim Appeals Office*, 961 P.2d 590 (Colo. App. 1998); *Metro Moving & Storage Co. v. Gussert*, 914 P.2d 411 (1995). Consequently, to overcome the DIME report, there must be evidence which proves that it is highly probable that the DIME physician's opinions are incorrect. *Metro Moving & Storage Co. v. Gussert, supra.* Whether the party challenging the DIME physician's determinations has overcome the report by clear and convincing evidence is generally one of fact for determination by the ALJ. *McLane Western Inc. v. Industrial Claim Appeals Office*, 996 P.2d 263 (Colo. App. 1999); *Metro Moving and Storage Co. v. Gussert, supra.*

H. Workers' compensation physicians in Colorado are charged with utilizing the *AMA Guides, Revised 3rd Edition* and the *Division of Workers' Compensation Accreditation Guidelines* in rendering a determination as to a patient's permanent impairment rating stemming from a work related injury. The Division has additionally

propounded *Impairment Rating Tips* to assist rating physicians in assigning permanent impairment ratings. Whether a physician has properly applied the *AMA Guides* in arriving at a Claimant's impairment rating is a question of fact for the ALJ's determination. *See* *Metro Moving & Storage Co. v. Gussert, supra*. As found here, substantial evidence establishes that Dr. Castrejon deviated from and misapplied the *AMA Guides* when he rated Claimant according to Tables 14 and 11 for the consequences of a peripheral nerve that is not contributing to her impairment. Based upon evidence presented, the effect of such deviation resulted in Claimant receiving impairment for weakness when impairment for weakness was taken into account based upon Claimant's impairment for range of motion loss. Consequently, the ALJ concludes that it is highly probable that Dr. Castrejon's opinions concerning permanent impairment are incorrect. As Dr. Castrejon's impairment rating has been overcome and Claimant has functional impairment beyond the arm at the shoulder, the ALJ adopts Dr. Klajnbart's 8% whole person rating as expressed in his deposition testimony.

I. In *Milco Construction v. Cowan,* 860 P.2d 539 (Colo. App. 1992), the Court of Appeals established a two-step procedure for awarding ongoing medical benefits under *Grover v. Industrial Commission,* 759 P.2d 705 (Colo. 1988). Citing *Grover*, the Court reaffirmed that "before an order for future medical benefits may be entered there must be substantial evidence in the record to support a determination that future medical treatment will be reasonably necessary to relieve the injured worker from the effects of the work-related injury or occupational disease." Thus, while a claimant does not have to prove the need for a specific medical benefit, and respondents remain free to contest the reasonable necessity of any future treatment, the claimant must prove the probable need for some treatment after MMI due to the work injury. *Milco Construction v. Cowan, supra.* If the claimant reaches this threshold, the court stated, as the second step, that the ALJ should enter "a general order, similar to that described in *Grover*." In this case, the ALJ concludes that Claimant failed to introduce persuasive evidence to substantiate her claim for post MMI maintenance medical benefits. Indeed, no physician has recommended medical benefits to maintain Claimant at MMI for her industrial shoulder injury.

ORDER

It is therefore ordered that:

1. The permanent impairment rating of Dr. Castrejon is set aside and the rating expressed by Dr. Klajnbart during his deposition is adopted.

2. Claimant's request for conversion of the award of scheduled impairment benefits to whole person permanent physical impairment benefits is GRANTED.

3. Insurer shall pay permanent partial disability benefits consistent with a 8% whole person disability rating pursuant to C.R.S. § 8-42-107(8)(d), taking credit for any PPD benefits previously admitted and paid.

4. Claimant's request for an award of medical benefits post-MMI is DENIED AND DISMISSED.

5. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

6. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

STATE OF COLORADO OFFICE OF ADMINISTRATIVE COURTS 222 South 6th Street, Suite 414, Grand Junction, CO 81501	
In the Matter of the Workers' Compensation Claim of: **JOHN ABEYTA,** Claimant, vs. **MESA COUNTY COLORADO,** Employer, and **TRISTAR RISK MANAGEMENT,** Insurer, Respondents.	▲ **COURT USE ONLY** ▲ **CASE NUMBER:** **WC 4-620-040-04**

FINDINGS OF FACT, CONCLUSIONS OF LAW, AND ORDER

Hearing in this matter was held on October 1, 2014 and on December 9, 2014 before Keith E. Mottram, Administrative Law Judge.

Claimant was present and represented by Christopher Richter Esq. Respondents Mesa County and Tristar Risk Management were represented by Thomas W. Blake Esq. Respondent Mesa County and Pinnacol Assurance were represented by Jeff Francis, Esq. This matter was digitally recorded in Grand Junction, Colorado from 1:01 p.m. until 5:06 p.m. on October 1, 2014 and from 8:33 a.m. until 3:24 p.m. on December 9, 2014. Claimant's Exhibits 1-17 were admitted at hearing. Respondents Mesa County and Tristar Risk Management Exhibits A-JJ and LL-MM were admitted at hearing. Respondents Mesa County and Pinnacol Assurance Exhibits AAA-VVV were admitted at hearing.

In this order, John Abeyta will be referred to as "Claimant"; Mesa County will be referred to as "Employer"; Pinnacol will be referred to as "Insurer 1" and Tristar Risk Management will be referred to as "Insurer 2."

Also in this order, "Judge" refers to the Administrative Law Judge, "C.R.S." refers to Colorado Revised Statutes (2003); "OACRP" refers to the Office of Administrative Courts Rules of Procedure, 1 CCR 104-1, and "WCRP" refers to Workers' Compensation Rules of Procedure, 7 CCR 1101-3.

CERTIFICATE OF MAILING OR SERVICE

I hereby certify that I have served true and correct copies of the foregoing **FINDINGS OF FACT, CONCLUSIONS OF LAW, AND ORDER** by U.S. Mail, or by e-mail addressed as follows:

Christopher Richter Esq.

ISSUES

- Whether claimant has proven by a preponderance of the evidence that his use of the medication Provigil is authorized, related, and reasonably necessary to cure and relieve him from the effects of his November 21, 2003 work injury?

- Whether claimant has proven by a preponderance of the evidence that his use of the medication Provigil is authorized, related, and reasonably necessary to cure and relieve him from the effects of his April 11, 2005 work injury?

- Whether Insurer 1 and/or Insurer 2 have proven by a preponderance of the evidence that claimant suffered a subsequent, intervening injury/condition which severs liability for claimant's use of the medication Provigil in whole or in part?

- Whether Insurer 2 has proven by a preponderance of the evidence that liability for claimant's use of the medication Provigil should be apportioned to the November 21, 2003 work injury and/or to claimant's non-work-related conditions?

- Whether Insurer 1 has proven by a preponderance of the evidence that Insurer 2 and/or claimant are barred by the doctrines of issue preclusion (collateral estoppel) and/or law of the case from apportioning liability for claimant's use of the medication Provigil to the November 21, 2003 work injury?

- The parties requested that the Order indicate that all medical bills are to be paid pursuant to the Colorado Medical Fee Schedule.

FINDINGS OF FACT

1. Claimant was employed with employer at the detention center. Claimant testified his job duties for employer required him to handle disruptive or combative inmates and his job involved significant physical activities. Claimant sustained a compensable injury to his cervical spine on November 21, 2003. Insurer 1 admitted liability for this claim which was assigned W.C. No. 4-620-040.

2. Claimant was referred for medical treatment following his November 21, 2003 injury to Dr. Stagg. Dr. Stagg referred claimant to Dr. Copeland for orthopedic evaluation. Dr. Copeland recommended physical therapy. Dr. Stagg also referred claimant to Dr. Gilman for diagnostic testing.

3. Dr. Gilman performed an electromyelogram and nerve conduction study (EMG/NCV) of claimant's right upper extremity on January 19, 2004. The EMG was noted to be normal with no evidence of cervical radiculopathy, but suggestive of borderline carpal tunnel syndrome.

4. Dr. Stagg referred claimant for a magnetic resonance image ("MRI") of the cervical spine on January 27, 2004. The MRI was performed on February 5, 2004 and demonstrated a bulging disc and C5-6 with a smaller disc bulge at C6-7. The radiologist that reviewed the MRI noted that the C5-6 bulge extended into the right C6 foramen and noted potential nerve root compression on the right at C5-6.

5. Claimant was subsequently referred to Dr. Gebhard. Dr. Gebhard evaluated claimant on February 23, 2004. Dr. Gebhard noted claimant's MRI results and diagnosed claimant with a herniated nucleus pulposus at C5-C6 on the right. Dr. Gebhard recommended claimant continue with conservative non-operative treatment. Dr. Gebhard noted that if claimant did not improve, he may be a candidate for a decompressive discectomy and fusion at the C5-C6 level.

6. Claimant was referred to Dr. Janssen for a second opinion regarding his cervical spine on April 6, 2004. Dr. Janssen noted that claimant had a C5-6 cervical disk herniation with right C6 radiculitis, but no evidence of radiculopathy or myelopathy. Dr. Janssen noted claimant had no decreased function and only decreased sensation along the C6 distribution. Dr. Jannsen noted claimant denied wanting to have surgery and recommended claimant return to Dr. Gebhard.

7. Claimant returned to Dr. Stagg on May 20, 2004 and noted he was doing quite a bit better. Claimant was eventually placed at maximum medical improvement ("MMI") by Dr. Stagg on July 14, 2004. Dr. Stagg provided claimant with a permanent impairment rating of 13% whole person and recommended ongoing medical treatment consisting of nonsteroidal anti-inflammatory medications and continued follow up visits.

8. Insurer 1 filed a final admission of liability ("FAL") admitting for the whole person impairment rating on July 21, 2004. The FAL also admitted for maintenance medical treatment.

9. Claimant continued to follow up with Dr. Stagg after being placed at MMI. Claimant was evaluated by Dr. Stagg on November 18, 2004 and noted he was having difficulty sleeping and reported numbness into his upper extremity. Dr. Stagg noted that when claimant was placed at MMI, there were indications that if claimant's symptoms worsened, he may need additional physical therapy and potentially surgery. Dr. Stagg noted that claimant remained at MMI, but recommended a short course of physical therapy.

10. Claimant sustained his second injury with Employer on April 11, 2005 when he was participating in physical agility testing and was assisting with a tackling dummy. Claimant was injured while catching the tackling dummy.

11. Claimant sought treatment following the injury with Dr. Duke on April 20, 2005. Claimant presented an accident history to Dr. Duke that he had helped his wife with housecleaning and developed a onset of severe upper back pain and left arm pain five days prior. Claimant denied any new injuries. Claimant eventually sought a hearing on this claim to determine if the symptoms were related to a new injury on April 11, 2005. This claim was determined to be compensable by Order of an ALJ on September 8, 2006.

12. Claimant was referred by Dr. Duke to Dr. Janssen. Claimant eventually underwent a microscopic dissection of the spine; intraoperative fluoroscopy for localization at the subaxial spine, an anterior C6-7 cervical discectomy, hemicorpectomy, bilateral spinal cord decompression, removal of extruded disc fragment, with C7 nerve root decompression, and foraminotomy and anterior C6-7 cervical prosthesis of 5 mm extra-large Prodisc reconstructions and an anterior C5-6 cervical arthroplasty on May 25, 2005 under the auspices of Dr. Janssen.

13. Claimant underwent an MRI of the lumbar spine on June 10, 2005. The MRI of the lumbar spine showed moderate left foraminal encroachment at L4-5 secondary to eccentric disc protrusion and facet arthrosis. Claimant returned to Dr. Janssen on June 28, 2005 and noted that his left upper extremity pain had been relieved post surgery. However, claimant was experiencing severe lower extremity pain.

14. Claimant underwent a course of treatment for his lumbar spine with Dr. Janssen including a translaminar lumbar epidural steroid injection on June 28, 2005. Dr. Janssen eventually performed a left sided L5 foraminotomy and nerve root decompression and left-sided L4 formaminotomy and partial discectomy and decompression at the L4-L5 level on September 8, 2005.

15. Claimant also continued to complain to Dr. Janssen of right upper extremity symptoms. Dr. Janssen noted on August 23, 2005 that he was referring claimant for an EMG of his right upper extremity. The EMG was performed by Dr. Leimbach on September 8, 2005. Dr. Leimbach noted that the findings were consistent with a right C6 radiculopathy. Dr. Price testified at hearing that the EMG showed right sided radiculopathy and demonstrated a change from the prior EMG in January 2004.

16. Claimant underwent surgery on his lumbar spine on November 3, 2005 under the auspices of Dr. Janssen.

17. Claimant continued to treat conservatively with physical therapy for his cervical condition. Claimant was referred for a repeat cervical MRI on June 1, 2006 that showed no evidence of cord compression or high grade foraminal narrowing. Claimant also underwent a repeat MRI of the lumbar spine. The MRI of the lumbar spine showed evidence of a recurrent herniation at the L5-S1 level that compromised the neural foramen.

18. Dr. Janssen noted on June 2, 2006 that his review of the MRI's showed no evidence of extradural compressive pathology in the cervical spine. Dr. Janssen did recommend additional lumbar surgery that was performed on October 11, 2006. The surgery consisted of a left sided L4 foraminotomy and nerve root decompression with a left sided L5 foraminotomy and removal of the partial disc herniation at the L5 level. Following the surgery, claimant continued to complain of left leg pain and numbness.

19. With regard to claimant's cervical spine, claimant was referred to Dr. Price for medical treatment. Dr. Price evaluated claimant initially on December 13, 2006. Dr. Price has provided various treatments for claimant, including but not limited to medications (Gabapentin, Lyrica, Lidoderm patches, Cymbalta, Percocet and Oxycontin), acupuncture, stimulation, and physical therapy. Claimant additionally had diagnostic studies during this time including follow up x-rays, and a follow up EMG study. The EMG study showed signs of a C8 radiculopathy on the right side. Dr. Janssen noted that the C8 radiculopathy would correlate with claimant's report of grip weakness in the right hand.

20. Claimant underwent additional MRI's of the lumbar and cervical spine on February 13, 2007. The cervical MRI showed questionable neural foraminal narrowing, but no high grade central stenosis at C5-6. The lumbar MRI showed evidence of claimant's surgical intervention including scarring that extended anteriorly along the left lateral aspect of the thecal sac to surround the left L5 nerve root as it descends into the lateral recess.

21. Claimant returned to Dr. Price on March 6, 2007 and noted that he had not felt better since his cervical spine surgery. Dr. Price noted the results of the EMG study showing a possible C8 radiculopathy and referred claimant to Dr. Bowen for pain management.

22. Claimant was subsequently evaluated by Dr. McLaughlin on March 29, 2007 for an independent medical evaluation ("IME"). Dr. McLaughlin noted that Dr. Price was recommending ongoing treatment including acupuncture and counseling. Dr. McLaughlin noted that in his opinion, claimant was not yet at MMI and provided claimant with a provisional rating of 45% whole person, with 14% being apportioned to the prior injury. Dr. McLaughlin noted the provision rating for the April 11, 2005 injury would then be 36% whole person. Dr. McLaughlin noted that claimant reported he did well

following his 2003 injury, but had some residual discomfort, although he was able to return to work without restrictions. Dr. McLaughlin recommended claimant continue to treat with Dr. Price.

23. Dr. Price testified at hearing that claimant had changes at the C6-7 level between February 2004 and April 20, 2005. Dr. Price testified that the surgical intervention claimant underwent in May 2005 would also change the condition of claimant's C5-6 disk. Dr. Price subsequently testified after reviewing additional records that the surgery performed by Dr. Janssen only involved the C6-7 disk.

24. Dr. Price testified that she began prescribing Provigil for claimant in 2008 due to claimant's depression. Dr. Price testified the Provigil was to replace other anti-depressant medications. Dr. Price testified she would related claimant's Provigil to the C6-7 work injury in 2005. Dr. Price noted that claimant's prescription for Provigil was now being handled through Dr. Mattox in Durango who had taken over claimant's maintenance medical treatment.

25. Dr. Mattox evaluated claimant on January 14, 2008 as part of his psychiatric treatment. Dr. Mattox noted claimant was reporting that he was limited by pain and fatigue. Dr. Mattox noted claimant's current medications included Gabapentin, Cymbalta and Lunesta. Dr. Mattox diagnosed claimant with major depressive disorder and back and neck pain, among other diagnoses. Dr. Mattox did not prescribe claimant's opiate medications, but did begin providing claimant with a prescription for Provigil. Dr. Mattox consistently diagnosed claimant with a major depressive disorder and chronic pain throughout his treatment that has continued through 2014.

26. Insurer 2 obtained a physician advisor report from Dr. Antonelli on February 27, 2013. Dr. Antonelli reviewed the claimant's medical records and issued a report that opined that the use of Provigil was not reasonable, necessary or related to the April 11, 2005 work injury.

27. Claimant was referred for an independent medical examination ("IME") with Dr. Anderson-Osser on September 25, 2013 at the request of Insurer 2. Dr. Anderson-Osser indicated in her IME report that it was her opinion that the Provigil should be apportioned 1/3 to the November 21, 2003 injury, 1/3 to the April 11, 2005 injury and 1/3 to his non-work related factors, including his low back pain and nocturnal hypoxia. Dr. Anderson-Osser opined that claimant's use of the Provigil was related to multiple factors, including his work injuries, chronic pain and possibly underlying sleep apnea.

28. Dr. Anderson-Osser issued a second IME report on March 10, 2014 after reviewing additional medical records. Dr. Anderson-Osser noted in her report that Dr. Price had indicated that claimant's depression was related to not only the November 21,

2003 injury, but also the April 11, 2005 injury. Dr. Anderson-Osser noted that the apportionment of the Provigil between his two work related injuries and his non-work related conditions was very subjective, but maintained that it should be split up between the three factors by equal 1/3 amounts.

29. Claimant underwent a Division sponsored Independent Medical Evaluation ("DIME") with Dr. Hughes on April 1, 2014. Dr. Hughes provided claimant with a permanent impairment rating of 29% whole person, but apportioned claimant's prior impairment rating of 13% whole person and opined that for the April 11, 2005 injury, claimant's impairment rating was 19% whole person. This rating included a 3% whole person impairment rating for claimant's depression. With regard to the Provigil, Dr. Hughes opined that 25% of claimant's use of the Provigil was related to his work related injury of April 11, 2005 and the rest was related to his non-occupational conditions including his lumbar spine and extremity joints. Dr. Hughes opinion regarding claimant's use of the Provigil references the cervical spine injuries, and in that regard, the ALJ interprets Dr. Hughes opinions as referencing both cervical spine injuries.

30. Dr. Price testified at hearing that she would apportion at least 80% of the need for Provigil to the April 2005 injury and subsequent surgery. Dr. Price testified that she was treating claimant for the C6-7 injury and the C5-6 injury, but the C6-7 injury was more involved. Dr. Price testified that when she initially prescribed claimant Provigil on March 14, 2008, she did so to treat his neck pain only. As of March 14, 2008, Dr. Price provided claimant with samples of Provigil 100 mg to be taken in the morning. By September 10, 2008, claimant was taking Provigil 200 mg twice per day. This was being prescribed by Dr. Mattox. Dr. Price testified that she has tried to wean claimant off the Provigil, but it has not worked.

31. The ALJ notes that while Dr. Price testified that Dr. Stagg indicated that he would not provide treatment to claimant after the April 11, 2005 injury, and indicated in her testimony that this supported the opinion that Dr. Stagg believed claimant's April 11, 2005 injury caused the new symptoms in his neck, the ALJ is not persuaded that this is the case. The ALJ notes that when Dr. Stagg began providing treatment for claimant following the April 11, 2005 injury, he did not provide an opinion regarding the compensable nature of claimant's symptoms. Instead, Dr. Stagg noted that the claim had been denied and stopped treating claimant based on that denial, not based on any opinion expressed by Dr. Stagg.

32. Claimant testified at hearing that he is unable to function without the Provigil. The ALJ credits claimant's testimony and the supporting medical records and determines that claimant has demonstrated that his use of Provigil is reasonable and necessary medical treatment related to his industrial injuries.

33. The ALJ finds that claimant was prescribed Provigil in 2008 and finds that there is insufficient evidence of an intervening injury that would sever the causal connection of the prescription for Provigil to the industrial injuries. While claimant subsequently had surgical intervention involving his low back, Dr. Price, who originally prescribed the Provigil, testified that the basis for his Provigil prescription was due to his neck pain.

34. Insurer 1 obtained an IME from Dr. Scott on July 10, 2014. Dr. Scott reviewed claimant's medical records, obtained a medical history and performed a physical examination of claimant. Dr. Scott noted in his report that Dr. Price's medical records did not explain why she started claimant on Provigil in March 2008. Dr. Scott opined in his September 5, 2014 report that claimant's use of the Provigil was not related to the November 21, 2003 work injury. Dr. Scott based this opinion on the fact that claimant was not prescribed Provigil until after the April 11, 2005 work injury and was used to treat a major depressive disorder that developed after the April 11, 2005 injury.

35. Insurer 1 also argues that the issue of apportionment of the Provigil is barred by issue preclusion based on the prior Order of ALJ Martinez that found claimant suffered a new injury. The ALJ is not persuaded that issue preclusion would apply to the apportionment argument raided by Insurer 2 in this case. Specifically, the ALJ finds that the issue of apportionment of Provigil was not litigated at the prior hearing. Therefore the ALJ determines that the issue of apportionment for maintenance medical benefits is not identical to an issue raised, litigated and decided by the September 8, 2006 Order of ALJ Martinez.

36. The ALJ notes that the issue involving apportionment in this case arises under the law as it existed for the time of the April 11, 2005 and November 21, 2003 work injuries. Insurer 1 argues in their position statement that the court should either refuse to apportion the need for the Provigil or alternatively, find that the use of Provigil is not reasonable, necessary or related to claimant's industrial injuries. Insurer 2 argues that the Provigil should be apportioned 1/3 to the November 21, 2003 work injury, 1/3 to the April 11, 2005 injury and 1/3 to the non-industrial injuries.

37. The ALJ credits the opinion of Dr. Price and the medical records from Dr. Janssen and Dr. Stagg and concludes that claimant's use of the Provigil is related to the April 11, 2005 work injury and not the November 21, 2003 work injury. The ALJ finds that the use of Provigil was originally prescribed by Dr. Price in May 2008 in relation to treatment related to Claimant's April 11, 2005 injury. The ALJ further notes that based on *Resources One, LLC v. Industrial Claim Appeals Office,* 148 P.3d 287 (Colo. App. 2006), it would be improper to apportion the use of Provigil between the work related injury and claimant's non-work related conditions.

38. The ALJ concludes based on the testimony of Dr. Price and claimant's testimony that while claimant's non-work related conditions, including his low back condition, may benefit from claimant's use of the Provigil, the Provigil was originally prescribed and continues to be prescribed as treatment for the effects of claimant's April 11, 2005 work injury. The ALJ further finds and concludes that claimant has demonstrated that it is more probable than not that his continues prescription of Provigil from Dr. Mattox is related to the April 11, 2005 work injury. As such, apportionment is inappropriate in this case.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. Section 8-40-102(1), C.R.S, 2008. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S., 2010. A preponderance of the evidence is that leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. Section 8-43-201, *supra*. A Workers' Compensation case is decided on its merits. Section 8-43-201, *supra*.

2. The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and action; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2006).

3. The need for medical treatment may extend beyond the point of maximum medical improvement where claimant requires periodic maintenance care to prevent further deterioration of his physical condition. *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988). An award for *Grover* medical benefits is neither contingent upon a finding that a specific course of treatment has been recommended nor a finding that claimant is actually receiving medical treatment. *Holly Nursing Care Center v. Industrial Claim Appeals Office*, 992 P.2d 701 (Colo. App. 1999); *Stollmeyer v. Industrial Claim Appeals Office*, 916 P.2d 609 (Colo. App. 1995). Section 8-42-101, C.R.S., thus

authorizes the ALJ to enter an order for future treatment if supported by substantial evidence of the need for such treatment. *Grover v. Industrial Commission*, *supra.*

4. As found, claimant has proven by a preponderance of the evidence that the prescription for Provigil is reasonable medical treatment necessary to prevent further deterioration of claimant's condition.

5. For injuries occurring prior to July 1, 2008, medical benefits may be apportioned between successive industrial injuries or between an industrial injury and a subsequent non-industrial injury where both injuries contribute to the need for additional medical treatment. See, e.g., *Duncan v. Industrial Claim Appeals Office*, 107 P.3d 999 (Colo. App. 2004); *University Park Care Center v. Industrial Claim Appeals Office*, 43 P.3d 637 (Colo. App. 2001); *State Compensation Insurance Fund v. Industrial Commission*, 697 P.2d 807 (Colo. App. 1985).

6. However, the Court of Appeals noted in *Resources One, L.L.C. v. Industrial Claim Appeals Office*, 148 P.3d 999 (Colo. App. 2006) that there were three main types of apportionment: (1) between employers, where disability results from successive injuries or exposures; (2) between an employer and a Second or Subsequent Injury Fund; and (3) between an employer and the claimant, when a prior injury or condition contributes to the final disabling result. *Resources One, L.L.C. v. Industrial Claim Appeals Office*, 148 P.3d 999 (Colo. App. 2006), citing *Larson's Workers' Compensation Law* § 90.2 at 90-3. The Court of Appeals noted that unlike in the first two types of apportionment, the third type of apportionment may result in a reduction of claimant's benefits. The Court of Appeals went on to note that the apportionment statutes did not authorize the apportionment of medical and temporary disability benefits. The Court of Appeals in *Resources One, L.L.C.* went on to acknowledge that divisions of the court had previously approved the apportionment of medical and temporary disability benefits, but noted that these decisions involved the apportionment of benefits between successive employers. Insofar as the *Duncan* decision supported a finding that would allow for apportionment between a work related injury and a non-work related condition, this division of the Court of Appeals refused to follow it.

7. The ALJ notes that after the decision in *Resources One, L.L.C.*, the legislature went on to amend the statutory provisions involving apportionment to no longer allow an employer to apportion medical and temporary disability benefits between a work related injury and a non-work related condition.

8. The ALJ finds that reasoning expressed by the Court of Appeals in *Resources One, L.L.C. v. Industrial Claim Appeals Office*, *supra.* to be persuasive, especially in light of the amendments that were then made to the Colorado Workers' Compensation Act in 2008. The ALJ therefore determines that apportioning medical benefits between work related injuries and non-work related conditions is inapplicable.

The Court notes that the exception to this rule carved out by the legislature involving *Anderson v. Brinkhoff*¸ 859 P.2d 819 (Colo. 1993), involved an occupational disease, and not a specific injury and is therefore, inapplicable to the analysis in this case.

9. The ALJ notes prior decisions from the Industrial Claim Appeals Panel including *Lancaster v. Arapahoe County Sherriff Department*, W.C. Nos. 4-744-646 and 4-746-515 (May 12, 2010) that have remanded cases in which the ALJ did not consider apportionment of medical benefits where the medical benefits were related to the combination of a work related injury and a non-work related injury. However, this case can be distinguished from *Lancaster* in that the ALJ in *Lancaster* found that claimant's development of the specific condition for which he was receiving medical treatment (CRPS) was related 50% to the claimant's work injury and 50% to a non-work related injury.

10. In this case, claimant's condition for which he was originally prescribed Provigil was the April 11, 2005 work injury. Furthermore, as found, claimant has proven by a preponderance of the evidence that his continued use of Provigil is related to his April 11, 2005 work injury. The mere fact that claimant's use of Provigil may provide him with some relief of symptoms related to non-work related injuries is not sufficient to allow for this court to apportion the cost of his medication between the compensable work related injury and non-work related event based on the facts of this case.

11. The ALJ notes that this leaves the possibility that the cost of the Provigil could be apportioned between the insurance carriers. However, the ALJ credits the testimony of Claimant and Dr. Price along with the supporting medical records and determines that the Provigil was related to Claimant's April 11, 2005 injury and not the November 21, 2003 injury. In support of this conclusion, the ALJ notes that claimant's April 11, 2005 injury involved a different level of his cervical spine than the November 21, 2003 injury and credits Dr. Price's testimony that her initial prescription of the Provigil was designed to treat claimant for the April 11, 2005 injury.

12. Based on the foregoing determination, the court need not consider Insurer 1's argument that issue preclusion would prohibit an Order finding them responsible for a portion of the cost of the Provigil.

ORDER

It is therefore ordered that:

1. Claimant has proven by a preponderance of the evidence that the Provigil is reasonable and necessary medical treatment related to claimant's April 11, 2005 work injury.

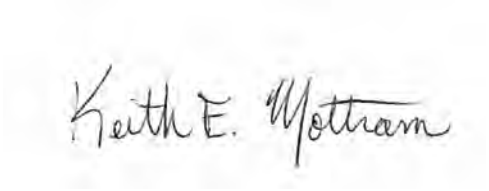
2. Insurer 2 shall pay for claimant's prescription of Provigil being provided by Dr. Mattox.

3. All medical bills shall be paid pursuant to the Colorado Medical Fee Schedule.

4. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: June 17, 2015



Keith E. Mottram
Administrative Law Judge
Office of Administrative Courts
222 S. 6th Street, Suite 414
Grand Junction, Colorado 81501

ISSUES

- Whether claimant has proven by a preponderance of the evidence that she sustained a compensable injury arising out of and in the scope of her employment with Employer?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that the medical treatment she received was reasonable and necessary to cure and relieve claimant from the effects of the injury?

- If claimant has proven a compensable injury, whether claimant has proven by a preponderance of the evidence that she is entitled to temporary total disability benefits for the period of June 18, 2014 until February 2, 2015?

- Whether respondents have proven by a preponderance of the evidence that claimant is an independent contractor pursuant to Section 8-40-202(2)(b)(II), C.R.S.?

- Whether respondents have proven by a preponderance of the evidence that claimant's benefits are subject to a 50% penalty for a willful violation of a safety rule pursuant to Section 8-42-112(1)(b), C.R.S.?

- At the commencement of the hearing, claimant sought to add the issue of penalties for failure to obtain workers' compensation insurance to the hearing, but the motion was denied by the ALJ. Therefore, whether Respondent properly obtained workers' compensation insurance is not an issue decided by this Order.

FINDINGS OF FACT

1. Claimant testified at hearing that she ran into Mr. Cintron, owner of Respondent, during the summer of 2014. Claimant testified Mr. Cintron told her he may have some work available for her as a painter over the summer. Claimant testified she subsequently had a meeting with Mr. Cintron in which he inquired as to whether she had insurance and she informed him that she had health insurance. Claimant testified that Mr. Cintron informed claimant that if he had enough work to keep claimant busy, she would need to get liability insurance. Claimant testified Mr. Cintron offered to take the money out of her check for the liability insurance. Claimant testified at hearing that she thought she was being hired as a temporary employee, and if Mr. Cintron hired her full time she would be an independent contractor and would need to get her own insurance. Claimant testified at hearing that she did not have her own liability insurance at the time of her injury.

2. Mr. Cintron testified claimant approached him when he came to pick up his daughter from school on the last day of work. Mr. Cintron testified that claimant asked him if he had any work for her as a painter and he informed her that he did not, but took her phone number in case he had extra work. Mr. Cintron testified he subsequently set up two meetings with claimant, one at her house and one at his house. Mr. Cintron testified he inquired at the first meeting if claimant had insurance and she informed him that she had medical insurance through a concurrent employer. Mr. Cintron testified he informed claimant that "all of my guys carry liability insurance".

3. Mr. Cintron testified that at the second interview he again asked claimant if she had insurance and claimant assured him that she had the necessary insurance. Mr. Cintron apparently did not require claimant to present proof of the insurance, however.

4. Claimant began working for Respondent at the Rocky River Resort project on June 11, 2014. Mr. Cintron testified claimant worked two half days on this site. Claimant testified she was paid $15 per hour for her work with Respondent.

5. Mr. Cintron testified that he normally pays his sub-contractors a percentage of the painting contract. Mr. Cintron testified he paid claimant hourly because he was trying to figure out if claimant could paint and complete a job on her own.

6. Mr. Cintron testified that he does not hire any employees and does not oversee the work performed by his painters. Mr. Cintron testified that if a job is not properly performed by one of his painters, he does not call the painter back for the next job.

7. Mr. Cintron testified that he does not provide tools for his painters, but does provide materials, such as paint, stains, thinner, primer, and ladders. Mr. Cintron testified he provides his contractors 1099 forms at the end of the year unless the contractor does not earn the minimum amount for a 1099 form of $600. Mr. Cintron noted that claimant was not provided a 1099 form because she did not earn the minimum amount of $600 in her work with Respondent.

8. Claimant testified that she was instructed by Respondent to work from 9-3 each day. Mr. Cintron testified he did not instruct claimant to show up at a particular time and she had advised him that she could only work until 3:00 p.m. because she had a second job during the evening.

9. Mr. Cintron testified that during their meetings before painting, claimant informed Mr. Cintron that she was afraid of heights. Claimant testified that she informed Mr. Cintron that she would not go above the twelfth rung on the ladder because she was only being paid $12 per hour. Regardless, on the first job that claimant worked with Respondent, Mr. Cintron secured a ladder to a pole so claimant could climb onto the low roof in order to pain the fascia.

10. Conflicting evidence was presented at hearing regarding the amount of work claimant performed at the first job site. Regardless of the amount of painting claimant completed at the job site, the parties agree that claimant was paid for two days working approximately six hours each day.

11. Claimant testified at hearing that she was paid for her first job by check issued to her directly. Copies of the checks were entered into evidence and are issued from Respondent's business account to claimant individually. Claimant was paid $230 for her work on the first painting project which included $180 for 12 hours of work at $15 per hour and $50 for a bonus.

12. Claimant was issued a second check for her work on the second project that was for $140, representing 10 hours at $14 per hour. This check was made out to claimant individually. Claimant kept track of her own hours and submitted the hours to Respondent to be paid.

13. Mr. Cintron testified at hearing that he did not require claimant to work exclusively for his company. This is evidenced by the fact that claimant had concurrent employment while working for Mr. Cintron.

14. Claimant worked on the second project, a painting job at Wild Goose Lane, on June 16, 2014. Claimant testified she worked June 16, 2014 painting areas on the condominium she could reach with 12 rungs on the ladder. Claimant testified Mr. Cintron was present and instructed the painters on what to do. On June 17, 2014, claimant arrived at work and set up a ladder to paint the peak of an awning at the entrance of the condominium when the ladder collapsed and claimant fell fracturing her right wrist and suffering a laceration on her face.

15. Claimant was taken by another painter from the project site to the emergency room ("ER") where she was treated for her injuries. Claimant underwent x-rays of her right hand and wrist along with computed tomography studies of her face, cervical spine, thoracic spine and head. Claimant was diagnosed with a right comminuted fracture of the distal radius.

16. Following her treatment at the ER, claimant followed up with Dr. Griggs. Dr. Griggs performed surgery on her right distal radius fracture on June 17, 2014. Claimant followed up with Dr. Griggs after her surgery and she was given work restrictions as of July 28, 2014 that limited her lifting to no more than 10 pounds. Claimant's work restrictions were increased to 30 pounds as of September 8, 2014 and to 50 pounds on November 16, 2014. Dr. Griggs eventually placed claimant at maximum medical improvement as of February 2, 2015.

17. Mr. Cintron testified that on June 17, 2014 he noticed the ladder laying on the ground and realized it was the top half of a 24' ladder that did not have the bottom half with the feet on it. Mr. Cintron testified he knew the ladder belonged to another painter and had considered using it until he realized the ladder did not have the feet.

Mr. Cintron testified he moved the ladder back to the owner's truck. Mr. Cintron testified he found out later when standing on the other side of the condominium complex of claimant's fall from the ladder.

18. Conflicting testimony was presented as to whether claimant used brushes on the second job provided by Respondent. Claimant testified she used her own brushes on the first job, but because the second job was an oil based job, and she didn't own oil based brushes, she used brushes belonging to Mr. Cintron. Mr. Cintron denied allowing claimant to use his brushes.

19. Respondent presented the testimony of Mr. Brokos, a friend of Mr. Cintron who was present when Mr. Cintron and claimant in June at Mr. Cintron's residence. Mr. Brokos testified he heard Mr. Cintron ask claimant if she had insurance and heard claimant tell Mr. Cintron she did and that she had insurance through her concurrent employer.

20. Respondent presented the testimony of Mr. Hyatt, a painter for Respondent. Mr. Hyatt testified he works as a sub-contractor for employer. Mr. Hyatt testified that he has also worked as an employee of painting companies and testified the work performed as an employee is different than the work performed as an independent contractor. On cross-examination, Mr. Hyatt noted that his current employer provides brushes, paints, shirts and other materials. Mr. Hyatt testified that as an independent contractor, he provides his own brushes, paints and ladders.

21. Respondent presented the testimony of Mr. McDougal who testified he has worked as an independent contractor for Respondent. Mr. McDougal testified he carries his own general liability insurance and completed paperwork for Respondent. Mr. McDougal testified he has requested Respondent hire his friend as painters in years past, but was told his friend could not be hired because his friend did not have insurance.

22. Claimant testified that following the injury, she was unable to continue working for her concurrent employer. Claimant eventually filed a claim for workers' compensation benefits and a hearing was set on the matter.

23. Conflicting testimony was presented at the hearing as to whether claimant represented to Mr. Cintron that she had liability insurance. Nonetheless, the evidence does establish that Mr. Cintron did not require claimant to provide a certificate of insurance prior to hiring claimant to perform work as a painter. Mr. Cintron paid claimant per hour and made checks payable to claimant directly, and not to a trade name. Mr. Cintron provided claimant with the paint and drop cloths and ladders used to perform the painting. While the paint would be considered material and not tools, the ALJ determines the drop cloths and ladders would be considered tools.

24. Conflicting testimony was presented regarding whether Mr. Cintron provided brushes for claimant to use on the second job. The testimony did establish

that claimant provided her own brushes for the first job. Mr. Cintron denied providing claimant with brushes for the second job, but the ALJ finds claimant's testimony that she did not have oil based brushes for the second job to be credible and persuasive. Claimant's testimony regarding the oil based work performed on the second job is supported by the photographs of the condominium entered into evidence and is found to be credible and persuasive. Therefore, the ALJ finds that claimant's testimony that Respondent provided tools consisting of brushes for the second job is accepted by the ALJ.

25. The ALJ notes that the evidence establishes that claimant was paid in a different method than the other painters who identified as independent contractors. While those contractors were paid a percentage of the painting contract, claimant was paid an hourly rate. Mr. Cintron testified that this occurred because he was gauging whether claimant was a capable enough painter to handle the work, but the evidence leads the trier of fact to determine that claimant's different method of payment leads one to the conclusion that claimant was under an employer-employee relationship with Respondent at the time of her injury.

26. The ALJ concludes from a review of the evidence that claimant has established that it is more probable than not that she was an employee of Respondent at the time of her injury. The ALJ finds that claimant was paid an hourly rate, with checks made directly payable to claimant, and that Respondent provided certain tools for claimant, including ladders, drop cloths and brushes for the second job. The ALJ finds that Respondent oversaw claimant's work as evidenced by the fact that he secured the ladder to the pole at the first job site, allowing claimant access to the fascia that was to be painted.

27. The ALJ concludes that Respondent did not require claimant to work particular hours, but arranged for claimant to work six hour days from 9:00 a.m. until 3:00 p.m. so claimant could continue to work for her concurrent employer. These work hours are established by the fact that claimant worked two days at the first job site for a total of 12 hours and worked an additional 1 ½ days at the second job site before she was injured. The ALJ finds Respondent did not provide training for claimant and could terminate her job at any time by virtue of simply asking her to leave the job site. The ALJ further finds that claimant was not required to work exclusively for Respondent.

28. The ALJ credits the testimony of Mr. Hyatt and claimant and finds that the employment of a painter can take different forms, as either an employee or as an independent contractor. While Mr. Cintron testified he only hired independent contractors, the evidence presented established that some painting contractors will hire employees. Therefore, the ALJ credits the testimony of claimant in this case and finds that the claimant in this case, who had performed painting in the past, was not customarily engaged in an independent trade or business.

29. The ALJ credits the testimony at hearing that claimant had performed painting work previously for a different company in Crested Butte, but did not hold

herself out as a painting contractor and performed other work not associated with painting, including that of a substitute teacher, part time bartender and her work with her concurrent employer.

30. Taking the relationship between claimant and Respondent into account, the ALJ finds claimant was an employee of Respondent and was not an independent contractor.

31. The ALJ credits the medical records and determines that claimant has established that it is more likely true than not that the medical treatment she received from the ER and from Dr. Griggs was reasonable and necessary to cure and relieve claimant from the effects of her industrial injury. The ALJ finds that the claimant has proven that it is more likely true than not that the ER treatment was authorized as emergency treatment as claimant was taken directly to the ER following her injury with a broken wrist.

32. The ALJ credits claimant's testimony that she was unable to continue her work with her concurrent employer after her work injury and finds that claimant is entitled to an award of temporary total disability ("TTD") benefits commencing July 18, 2014 and continuing until she was placed at MMI.

33. Respondent argues that claimant's benefits should be reduced by 50% for claimant's violation of a safety rule. The ALJ is not persuaded. Presumably, the safety rule violation involves claimant using the ladder, or using a ladder without feet. However, there was no credible evidence presented that claimant was ever instructed not to use the ladder. In fact, Mr. Cintron testified he helped claimant use a ladder on the first painting job by securing the ladder to the pole allowing claimant to climb on the roof to access the fascia.

34. The ALJ determines that Respondent has failed to demonstrate that the claimant willfully violated a safety rule resulting in her injury. Respondent's request to have claimant's benefits reduced by 50% is therefore denied.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. Section 8-40-102(1), C.R.S. (2009). A Claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-41-301, C.R.S. A Claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the

employer. Section 8-43-201, C.R.S., 2011. A Workers' Compensation case is decided on its merits. Section 8-43-201, *supra*.

2. The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000). When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P2d 1205 (1936); CJI, Civil 3:16 (2008).

3. A compensable industrial accident is one that results in an injury requiring medical treatment or causing disability. The existence of a preexisting medical condition does not preclude the employee from suffering a compensable injury where the industrial aggravation is the proximate cause of the disability or need for treatment. *See H & H Warehouse v. Vicory*, 805 P.2d 1167 (Colo. App. 1990); *see also Subsequent Injury Fund v. Thompson*, 793 P.2d 576 (Colo. App. 1990). A work related injury is compensable if it "aggravates accelerates or combines with "a preexisting disease or infirmity" to produce disability or need for treatment. *See H & H Warehouse v. Vicory, supra.*

4. "Employee" includes "every person in the service of any person, association of persons, firm or private corporation … under any contract of hire, express or implied." Section 8-40-202(b), C.R.S.

5. The ALJ credits the testimony of claimant and finds that claimant has proven that she was in the service of Respondent under an implied contract of hire as of June 17, 2014. The ALJ credits the paychecks establishing that claimant was paid for her work with Respondent as evidence of the contract of hire.

6. Respondents have the burden of proving any affirmative defenses raised at hearing by a preponderance of the evidence. In this case, the issue involving claimant's status as an independent contractor requires respondents to meet the appropriate burden of proof. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. Section 8-43-201, C.R.S., 2006. A Workers' Compensation case is decided on its merits. Section 8-43-201, *supra*.

7. With regard to claimant's employment status, Respondent argues that Claimant is an independent contractor pursuant to Section 8-40-202. The ALJ is not persuaded.

8. Section 8-40-202(2)(b)(II) sets out a nine part test to establish whether an individual is an independent contractor. Section 8-40-202(2)(b)(II) provides in pertinent part that in order to prove independence it must be shown that the person for whom services are performed does not:

- Require the individual to work exclusively for the person for whom services are performed; except that the individual may choose to work exclusively for such person for a finite period of specified in the document;

- Establish a quality standard for the individual; except that the person may provide plans and specifications regarding the work but cannot oversee the actual work or instruct the individual as to how the work will be performed;

- Pay a salary or at an hourly rate instead of a fixed or contract rate;

- Terminate the work of the service provider during the contract period unless such service provider violates the terms of the contract or fails to produce a result that meets the specifications of the contract;

- Provide more than minimal training for the individual;

- Provide tools or benefits to the individual; except that materials and equipment may be supplied;

- Dictate the time of performance; except that a completion schedule and a range of negotiated and mutually agreeable work hours may be established;

- Pay the service provider personally instead of making checks payable to the trade or business name of such service provider; and

- Combine the business operations of the person for whom service is provided in any way with the business operations of the service provider instead of maintaining all such operations separately and distinctly.

9. Section 8-40-202(2)(b)(II), C.R.S. allows for these provisions to be proven through a written document. Pursuant to Section 8-40-202(2)(b)(IV), C.R.S. the written agreement then creates a rebuttable presumption that an independent contractor relationship between the parties exists. However, the written agreement must be signed by both parties, must contain a disclosure, in type which is larger than the other provisions in the document or in bold-faced or underlined type, that the independent contractor is not entitled to workers compensation benefits and that the independent contractor is obligated to pay federal and state income tax on any moneys earned pursuant to the contract relationship. Section 8-40-202(2)(b)(IV) also requires that all signatures on any such document must be duly notarized.

10. In this case, no written documentation was presented between the parties, and therefore, the burden of proof remained with Respondent to establish that claimant was an independent contractor.

11. The ALJ makes the following findings regarding the employment relationship between claimant and Respondent:

- Claimant was paid at an hourly rate.
- Claimant was issued checks made personally to her as opposed to payable to a trade or business name.
- Respondent provided tools in the form of ladders, drop cloths at the first and second job site and paint brushes for claimant at the second job site.
- Respondent oversaw the work as it was performed as evidenced by Mr. Cintron securing the ladder to the pole to allow claimant the ability to get on the roof and paint the fascia on the first pain job.

12. As found, the ALJ determines that Respondent has failed to prove by a preponderance of the evidence that claimant was an independent contractor of Respondent. As found, while Mr. Cintron may have wanted to hire claimant as an independent contractor, his actions in paying claimant as an hourly worker and providing claimant with tools to perform her work represents a degree of control over claimant's work that results in claimant being considered an employee of Respondent.

13. As found, claimant has proven by a preponderance of the evidence that the injury resulted in the need for medical treatment from the ER and Dr. Griggs that was reasonable and necessary to cure and relieve claimant from the effects of her work injury. As found, Respondent is liable for the cost of the medical treatment provided by the ER and Dr. Griggs.

14. To prove entitlement to temporary total disability (TTD) benefits, claimant must prove that the industrial injury caused a disability lasting more than three work shifts, that he left work as a result of the disability, and that the disability resulted in an actual wage loss. *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). Section 8-42-103(1)(a), *supra*, requires claimant to establish a causal connection between a work-related injury and a subsequent wage loss in order to obtain TTD benefits. *PDM Molding, Inc. v. Stanberg, supra*. The term disability, connotes two elements: (1) Medical incapacity evidenced by loss or restriction of bodily function; and (2) Impairment of wage earning capacity as demonstrated by claimant's inability to resume his prior work. *Culver v. Ace Electric*, 971 P.2d 641 (Colo. 1999). There is no statutory requirement that claimant establish physical disability through a medical opinion of an attending physician; claimant's testimony alone may be sufficient to establish a temporary disability. *Lymburn v. Symbios Logic*, 952 P.2d 831 (Colo. App. 1997). The impairment of earning capacity element of disability may be evidenced by a complete

inability to work, or by restrictions which impair the claimant's ability effectively and properly to perform his regular employment. *Ortiz v. Charles J. Murphy & Co.*, 964 P.2d 595 (Colo.App. 1998).

15. As found, claimant has proven by a preponderance of the evidence that her injury resulted in a wage loss based on the fact that claimant could no longer continue her work for Respondent or for her concurrent employer. As found, claimant has proven by a preponderance of the evidence that she is entitled to TTD benefits for the period of July 18, 2014 through February 2, 2015.

ORDER

It is therefore ordered that:

1. Respondent shall pay for the reasonable medical benefits necessary to cure and relieve claimant from the effects of her work injury including the medical bills from the ER and Dr. Griggs.

2. Respondent shall pay claimant TTD benefits for the period of July 18, 2014 through February 2, 2015.

3. Respondent shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

4. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. ISSUES

- Did Claimant prove by a preponderance of the evidence that a topical cream containing the drug ketamine constitutes reasonable and necessary post-maximum medical improvement medical treatment designed to relieve ongoing symptoms associated with complex regional pain syndrome?

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. At the hearing Claimant's Exhibits 1 through 7 were admitted into evidence. Respondents' Exhibits A through D were admitted into evidence.

2. Claimant sustained a compensable injury to her right ankle in 2007. Subsequently she underwent at least 7 surgical procedures designed to alleviate ongoing ankle and right lower extremity pain.

3. On April 9, 2011 the Insurer filed a Final Admission of Liability including an admission for ongoing medical benefits after maximum medical improvement (MMI).

4. On March 24, 2014 J. Tashof Bernton, M.D., an authorized treating physician, examined Claimant. He assessed "chronic pain in the right foot and ankle following multiple surgeries." Dr. Bernton expressed concern for potential complex regional pain syndrome (CRPS) given the "appearance of the foot."

5. On May 12, 2014 Claimant underwent an Autonomic Testing Battery that demonstrated a "positive diagnostic assessment" for CRPS.

6. On August 25, 2014 Dr. Bernton noted Claimant had a positive diagnostic response to an initial sympathetic nerve block. Dr. Bernton stated that in conjunction with the results of the Autonomic Testing Battery Claimant met the Colorado Medical Treatment Guidelines (MTG) criteria for CRPS.

7. On September 22, 2014 Dr. Bernton stated Claimant had undergone a second sympathetic block. Dr. Bernton noted Claimant experienced transient improvement of her pain but experienced marked coldness of the entire leg with swelling and dramatic color change. Dr. Bernton stated that he did not want to move

forward with further blocks because Claimant "had a paradoxical response to blocks with some overall worsening of her condition, both subjectively and objectively."

8. On September 30, 2014 Dr. Bernton documented discoloration of Claimant's right leg from foot to mid thigh with evident swelling and "some hyperalgesia to light touch."

9. On December 23, 2014 Dr. Bernton noted that Claimant had CRPS of the right leg with evidence of ipsilateral spread to the right upper extremity. He stated Claimant had done poorly with blocks and suggested she return for a trial of topical analgesia. Dr. Bernton observed Claimant had "really shown the most benefit from this approach."

10. On January 8, 2015 Dr. Bernton documented "significant hypersensitivity and allodynia to the plantar aspect of the foot, more in the heel as well as the lateral aspect of the right foot and the medial aspect of the foot."

11. On January 12, 2015 Claimant reported to Dr. Bernton that she had not received the topical analgesic because the "the insurance company won't pay for it."

12. On January 12, 2015 Dr. Bernton wrote a letter to the Insurer stating that CRPS was "clearly a work-related condition" and that he prescribed topical analgesics in accordance with the MTG for CRPS page 79. Dr. Bernton stated that Claimant's condition was "likely to worsen, potentially irreversibly" as a result of the Insurer's failure to meet its obligation to provide care.

13. On January 29, 2015 Claimant reported to Dr. Bernton that she was in horrible pain with increased pain in the right foot and leg as well as in the right arm. She still had not received medications. Dr. Bernton noted Claimant's right foot and leg were discolored and swollen. Dr. Bernton recorded the presence of "mild hyperalgesia." He also observed mild swelling of the right hand. Dr. Bernton emphasized the importance of getting authorization for the medication and prescribed Gralise (long-acting gabapentin) and Vicodin.

14. On February 2, 2015 Dr. Bernton noted discoloration and in the distal right leg and into the foot. He also noted the dorsum of the right hand exhibited swelling and "some hyperalgesia." Similar findings were noted on February 10, 2015.

15. Claimant credibly testified as follows. In June or July, 2014 Dr. Bernton first prescribed a topical cream containing ketamine. She received the cream in the mail and applied it to painful areas of her right ankle and leg. The cream reduced her pain from 8 on a scale of 10 (8/10) to 4/10. She used the cream until the prescription ran out at the end of September or October 2014. The pharmacy then told her that further prescriptions for this compound had been denied by the Insurer. In January or February, 2015 she requested a prescription for Vicodin because she was in severe pain and had nothing to treat it. She did not need Vicodin when she was using the cream. She prefers the cream to Vicodin because the effects of Vicodin last only 3

hours and she wakes up in pain. Also, Vicodin causes Claimant to feel "groggy" and she fears becoming addicted to it.

16. WCRP 17, Exhibit 7, (G) (7) (j) (v.) (b) pp. 79-80, of the MTG for treatment of CRPS, provides that use of ketamine topical cream is a permissible non-operative treatment for CRPS under certain circumstances. This section of the MTG states that although there is good evidence that low dose ketamine cream (1%) does not relieve neuropathic pain, it is "physiologically possible" that higher doses of topical ketamine could have some effect on neuropathic pain. However, "use of … ketamine should be limited to patients with neuritic and/or sympathetically mediated pain with documented supporting objective findings such as allodynia and/or hyperalgesia." Further use of ketamine topical cream "beyond the initial prescription requires documentation of effectiveness, including functional improvement, and/or decreased use of other medications, particularly decreased use of opiates or other habituating medications."

17. Claimant proved it is more probably true than not that topical ketamine cream is a reasonable and necessary treatment for her CRPS.

18. Dr. Bernton credibly and persuasively opined that the use of ketamine based topical cream is a permissible treatment for CRPS under the MTG. Dr. Bernton credibly and persuasively opined that use of ketamine cream is appropriate under the MTG. In this regard Dr. Bernton has documented the presence of both allodynia and hyperalgesia. He has noted that application of topical medication has been the most effective treatment of Claimant's CRPS. Considering the totality of the evidence, the ALJ gives great weight to Dr. Bernton's testimony that use of ketamine cream is appropriate under the MTG.

19. Claimant credibly testified use of topical ketamine cream significantly reduced her pain before the Insurer stopped payment for the drug. She also credibly testified that after ketamine was stopped she had no effective relief from pain and was forced to request a prescription for Vicodin. The medical records corroborate Claimant's testimony. On December 23, 2014 Dr. Bernton noted Claimant had "shown the most benefit" from topical analgesia and suggested another trial. On January 29, 2015 Claimant reported "horrible" pain and Dr. Bernton prescribed Vicodin. The ALJ infers from this evidence that if Claimant is allowed to use topical ketamine cream there is a reasonable chance that she can reduce consumption of other medication, especially Vicodin.

20. The evidence produced by the Respondents, particularly the January 6, 2015 letter authored by Nicole Peck, R.N., is not persuasive insofar as it argues that ketamine topical cream is not a reasonable and appropriate treatment for Claimant's CRPS. First, this letter/report incorrectly states that the Colorado MTG do not address the "issue" of the use of ketamine cream for treatment of CRPS. As found above, and as mentioned by Dr. Bernton, the Colorado MTG for treatment of CRPS do in fact address this issue and indicate that use of ketamine topical cream may be appropriate under the specified conditions. Second, the January 6 report admits that use of

ketamine is “under study” and has shown “encouraging results” in “non-controlled studies for CRPS 1 and post-herpetic neuralgia.”

21. Evidence and inferences contrary to these findings are not credible and persuasive.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

The purpose of the Workers’ Compensation Act of Colorado (Act), §§8-40-101, *et seq.*, C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201(1), C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of respondents. Section 8-43-201(1).

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005). A Workers' Compensation case is decided on its merits. Section 8-43-201(1). The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions.

REASONABLENESS AND NECESSITY OF KETAMINE TOPICAL CREAM

Claimant argues she proved by a preponderance of the evidence that the ketamine topical cream prescribed by Dr. Bernton constitutes reasonable and necessary post-MMI treatment designed to cure and relieve the effects of CRPS. The ALJ agrees with this argument.

Respondents are liable to provide such medical treatment “as may reasonably be needed at the time of the injury or occupational disease and thereafter during the disability to cure and relieve the employee of the effects of the injury.” Section 8-42-101(1)(a), C.R.S. Colorado courts have ruled that the need for medical treatment may extend beyond the point of MMI where the claimant presents substantial evidence that future medical treatment will be reasonably necessary to relieve the effects of the injury or prevent further deterioration of her condition. *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988); *Stollmeyer v. Industrial Claim Appeals Office,* 916 P.2d 609 (Colo. App. 1995).

In cases where the respondents file a final admission of liability admitting for ongoing medical benefits after MMI they retain the right to challenge the compensability, reasonableness, and necessity of specific treatments. *Hanna v. Print Expediters Inc.,* 77 P.3d 863 (Colo. App. 2003). When the respondents challenge a claimant's request for specific medical treatment the claimant bears the burden of proof to establish entitlement to the benefits. *Ford v. Regional Transportation District,* W.C. No. 4-309-217 (ICAO February 12, 2009). The question of whether a claimant proved that specific treatment is reasonable and necessary to maintain her condition after MMI or relieve ongoing symptoms is one of fact for the ALJ. *See Kroupa v. Industrial Claim Appeals Office,* 53 P.3d 1192 (Colo. App. 2002).

When determining the issue of whether proposed medical treatment is reasonable and necessary the ALJ may consider the provisions and treatment protocols of the MTG because they represent the accepted standards of practice in workers' compensation cases and were adopted pursuant to an express grant of statutory authority. However, evidence of compliance or non-compliance with the treatment criteria of the MTG is not dispositive of the question of whether medical treatment is reasonable and necessary. Rather the ALJ considering the totality of the evidence may determine the weight to be given evidence of compliance or non-compliance with the MTG. *See Adame v. SSC Berthoud Operating Co., LLC.*, WC 4-784-709 (ICAO January 25, 2012); *Thomas v. Four Corners Health Care*, WC 4-484-220 (ICAO April 27, 2009); *Stamey v. C2 Utility Contractors, Inc.*, WC 4-503-974 (ICAO August 21, 2008). *See also*, § 8-43-201(3), C.R.S.

As determined in Findings of Fact 17 through 20, Claimant proved it is more probably true than not that ketamine topical cream constitutes reasonable and necessary medical treatment to relieve the ongoing effects of injury-related CRPS. As found, Dr. Bernton credibly opined that ketamine topical cream has been the most effective treatment for relieving Claimant's CRPS symptoms. Dr. Bernton also credibly and persuasively opined that the MTG for treatment of CRPS authorize the use of topical ketamine cream under the conditions and circumstances present in this case. As determined in Finding of Fact 18, Claimant credibly testified that use of topical ketamine cream significantly reduced the symptoms of her CRPS. She also credibly testified that when ketamine cream was no longer available her symptoms increased and she was forced to request a prescription for Vicodin. As determined in Finding of Fact 18, the ALJ infers that if Claimant is permitted to use topical ketamine cream there is a reasonable prospect that she can reduce the consumption of other medication including Vicodin. Although respondents presented some evidence to the contrary, the ALJ finds this evidence is not credible and persuasive.

ORDER

Based upon the foregoing findings of fact and conclusions of law, the ALJ enters the following order:

1. Insurer shall provide ketamine topical cream as a form of reasonable and necessary post-MMI medical treatment. Insurer shall continue to provide this treatment as long as it remains reasonable and necessary and causally-related to the injury.

2. Issues not resolved by this order are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

The sole issue presented for hearing is:

1. Whether the Claimant has proven, by a preponderance of the evidence, that she is permanently totally disabled.

Background, Education and Employment History

1. The Claimant was born on August 29, 1963. She is currently 51 years old. The Claimant lives in Aurora, Colorado, and her commutable labor market is the Denver Metropolitan area. The Claimant is currently able to drive herself to medical appointments in Denver, Englewood and Centennial on a regular basis, with round trip commutes of 20-26 miles from her home. Other than these commutes, the Claimant drives locally, within 10-15 miles from her home.

2. The Claimant graduated from high school in Hilliard, Ohio in 1981. The Claimant attended Ohio State College and studied general education courses while working contemporaneously. She did not receive a diploma and is not certain how many college credits she earned.

3. The Claimant began working for the Ohio Division of Wildlife in 1981, working for the Ohio Administrative Code Department, and she assisted with writing rules and laws, performing secretarial and administrative work and scheduling meetings. The Claimant continued to work for the Ohio Division of Wildlife for 18 years, until 1999. She testified that she held various jobs. The last position she held with this employer was as an administrative assistant in the law enforcement/administrative offices. She typed, filed, helped write the Ohio Wildlife Code, wrote and administered the budget, managed the office, placed orders, paid bills and helped with the undercover office to provide the officers what they needed to do their jobs.

4. While working for the Ohio Division of Wildlife, the Claimant also served in the National Guard from 1985 until 1993, which was a part-time program requiring service for two weeks a year and some weekends. She worked on electrical equipment and was responsible for installing cameras and working on radars.

5. The Claimant worked in a sales position at Radio Shack approximately 25 years prior to the hearing. She was hired by her best friend Annette Gordon, who was the manager of the store, and she worked there for one year. Ms. Gordon testified that

she was an excellent employee who was enthusiastic, punctual and excellent with customers. Ms. Gordon has not worked with the Claimant since both of them left that job approximately 24 years prior to the hearing.

6. From approximately 1999 to 2006, the Claimant did not work outside the home, but rather stayed at home with her children. During this time period, the Claimant did study for and receive an Ohio real estate license. The Claimant does not have a Colorado real estate license.

7. The Claimant was employed as an administrative assistant/paralegal in the Colorado Attorney General's Office between 2006 and 2007. The Claimant's former supervisor, Pamela Ponder, testified credibly that the Claimant was a good employee and a reliable team player who was good at communicating, researching, drafting documents, working on the computer and finding solutions. The Claimant left this position to take a job with the Department of Education.

8. The Claimant worked at the State Board of Education as an administrative assistant to the Director from 2007 until the date of her accident on October 15, 2008. Her job duties included making travel arrangements, scheduling monthly meetings, coordinating conventions, setting up legal files, filing briefs, answering phones, answering correspondence, filing court documents and proofreading legal documents.

The Claimant's October 15, 2008 Injury and Initial Emergency Response

9. The Claimant sustained an admitted injury on October 15, 2008 when she was employed as an administrative assistant for the Director of the Colorado State Board of Education. She was performing her normal job duties, filing paperwork at the office of the Colorado Secretary of State, when she was involved in an accident walking across the street in the crosswalk at the intersection of Broadway and 17th Street.

10. During the course of the hearing, there was conflicting evidence presented regarding the details of the Claimant's injury in the various medical records, in discovery and from the Claimant's testimony.

11. At the hearing, the Claimant testified that she came out of the building and started to cross the street near an intersection. She saw the pedestrian light and started across the street and, while in the crosswalk, the light started to flash red with numbers counting down. The Claimant recalled seeing the light flash to 10, but before it flashed to 9, she felt the impact of a vehicle hitting her. She testified that her head hit the windshield of the car. The Claimant testified that she did not entirely realize what was happening at the time, and she was dazed and hazy. She testified that she next recalls lying in the street with people calling her name (from her work name badge). She testified that her clothes were "scrapped up" and that the force of the impact had knocked off her "tie up" tennis shoes. According to the Claimant, "some lady had collected all my stuff, my sunglass, my cell phone, my tennis shoes …." It is not entirely clear what the Claimant means by "scrapped up" clothing, however, the medical records

show that the Claimant had no bruises, bumps, contusions, or outward signs of an injury. The Claimant testified that she could also hear sirens of an approaching ambulance. When the EMTs arrived, she recalls an EMT telling her to control her breathing and she remembers losing control of her hands. The Claimant testified that they strapped her to a board and as they lifted her on the board, she saw the front of the car that struck her and that is how she knows it was a Cadillac. One of her running shoes had come off and someone collected her shoe, briefcase and purse and gave it to the EMTs to put into the ambulance. The Claimant testified that she does not recall talking to the EMTs or early medical providers and does not recall what she said to them about her level of consciousness at the time of the injury. The Claimant testified that she does not remember arriving and unloading at the emergency department. She testified that she does remember that when they entered, they were stopped and her bags were searched. She recalls that she underwent an ultrasound and she was wheeled into an area and left there. She testified that at some point, they put in an IV and she was told she'd be given medicine for pain. She doesn't remember exactly when her husband arrived, but testified that it took some time. She testified that she was not examined and she was not put into a gown until they performed x-rays. The Claimant testified that she does not remember if she was monitored the entire time by hospital personnel or if they asked her questions about her condition. She testified that she did not get up for any balance test and she was not checked for double vision. The Claimant denied being given any type of a motor exam in the ER. She testified that she never got off the gurney or bed until she left the ER. The Claimant testified that she did not receive a mental status examine. She denied having her balance tested. This testimony is inconsistent with her testimony that she was in a daze and she was not clear about the events in the emergency room, and it is not consistent with the emergency room records.

12. In answers to Interrogatories provided on March 19, 2013, the Claimant stated that she hit the driver's windshield with the right side of her head and the rear of her head hit the pavement after she was thrown from the hood of the car. She stated that she was struck by the vehicle on the right rear side and landed on the pavement on her back.

13. A Denver Police report confirms that the Claimant was struck by a car in the left turn lane of southbound Broadway as it was turning onto 17th Street and the Claimant was hit in the crosswalk. The driver of the vehicle stated that the light was green, there was a lot of sun glare, and the driver just didn't see the Claimant.

14. The EMT responding to the auto-pedestrian accident noted that the Claimant's chief complaint was right thigh pain. The EMT reported that the Claimant was struck at less than 5 miles per hour by a full-size sedan that struck the Claimant in her legs, knocking her onto the hood of the car. The EMT noted that the Claimant denied drugs or alcohol, loss of consciousness, vision difficulty, dizziness, abdomen pain, and nausea or vomiting. The Claimant was described as awake and alert, answering questions appropriately, speaking in full sentences without slurred speech, and no facial droop or odor of alcohol on her breath. The EMT also reported that, en

route to the hospital, the Claimant stated that she was having numbness in both of her hands. Her initial trauma score was listed as 14 and her initial GCS (Glasgow Coma Score) was listed as 15 and the severity impression was described as mild.

15. Upon arrival at the emergency department, the initial physician's note reports that the Claimant was involved in a low speed pedestrian vs. motor vehicle accident as the Claimant was crossing the street in a crosswalk. The note states the Claimant remembered being airborne and she rolled or landed on the hood of the car. Per the paramedic, there was no evidence of external trauma. The Claimant had thigh pain and generalized back pain to palpation but no focal points of pain. The Claimant arrived at the emergency department at 16:13 and she was discharged at 21:40 in good condition with prescriptions for Vicodin and Valium. A nursing note at 16:15, shortly after the Claimant's arrival, notes knee, hip and back pain with spasms. The note states the Claimant hit the pavement, but denied loss of consciousness. Another note taken at 16:15 states that the Claimant was hit by an automobile on her right side and fell to the pavement, but she denied hitting her head and there was no trauma. The emergency trauma flow sheet lists the Claimant's pain level at 7/10 as of 16:30 and her mental status was listed as alert, conscious and cooperative. There was no visible trauma to her face or head. By 18:10, the Claimant's pain score was reported as 3/10, per nursing notes, and her GCS remained 15. The Claimant's discharge instructions were to wear a cervical collar for comfort, follow up with her primary care doctor, and return to the emergency department if her condition worsened.

16. On October 16, 2008, the Claimant reported to Dr. Erin Woessner that she was hit from behind by a turning vehicle as she crossed the street. It was noted that the vehicle was "turning left on red after complete stop" which supports that the Claimant was likely hit by a vehicle travelling at a lower speed. Dr. Woessner's note stated that the Claimant had, "a direct hit on her right hip and behind, fell back onto car, brakes slammed, then pt was airborne and fell on the street." The Claimant told Dr. Woessner that she does not think she hit her head and that any loss of consciousness would have been brief.

17. On October 17, 2008, the Claimant reported to Dr. Rick Artist that she was hit by a car and knocked up onto the hood and then slid to the ground. The Claimant denied any loss of consciousness and denied numbness or tingling in her upper extremities. At that point, the Claimant advised that her neck and her back were the most bothersome. She reported that she had a headache at the time of the examination, but not a "migraine type."

18. On December 8, 2008, the Claimant described her injury to Dr. Caroline Gellrick. The Claimant reported that, "she does not remember if she lost consciousness or not. She remembers being hit and she remembers then the ambulance taking her to the hospital. She remembers the ambulance itself, but there is a period of time where she does not recollect what exactly happened. She stated that the vehicle was at a stop and then accelerated and that is when she got hit. She feels it was about 20 miles per hour."

19. On December 30, 2008, the Claimant reported her injury to Walter Torres, Ph.D, as follows:

> She began to walk across the street upon seeing the 10 second pedestrian right-of-way signal, while talking on her cell phone with her husband. She stated that before the countdown hit 9, she was hit. She stated that the individual who struck her had the sun in his eyes and did not see her. She described the incident as feeling that she was being lifted up. She stated that she was struck on the right, rear side of her body, was lifted up onto the car's hood and windshield. She believes that when the driver applied the brakes she went flying and hit the pavement. She remembers people on either side of her yelling at her, asking questions. She stated that she does not know if she incurred any period of consciousness [sic], but that if she did, it would have been brief to momentary. As noted in the neuropsychological testing report she experienced a dazed mental state in the immediate aftermath of the impact and was unsure of what happened. She stated that in the impact's immediate aftermath she could not move her right side, had no control of her legs, and that she felt her body "going into shock," a sense that her arms were drawing into her body. She voiced a complaint about the emergency medical technician in the ambulance as having shown a "nasty disposition" toward her and complained that at Denver Health her injury was not taken very seriously because she was not bleeding and had no fractures.

20. On July 1, 2009, Dr. Torres notes that he conducted EMDR with the Claimant and that "recall of the accident elicited intense anxiety, but she was able to tolerate it and appeared to be processing the traumatic memories. She reached a memory of her head striking the vehicle's windshield, experiencing a sense of bright light and colors, intense pain developing on the right side of her head, followed by darkness and confusion. Her reaching this memory elicited a very intense pain on the right side of her head, which she was not able to free herself of during the course of the procedure."

21. During September 15 and 17, 2009 exams with Dr. Suzanne Kenneally, the Claimant described the accident and remembered "being hit on her right side, rolling up onto the hood of the car and then rolling down onto the street. [The Claimant] reports no loss of consciousness, retrograde amnesia or anterograde amnesia associated with the incident. She stated that she 'felt foggy and could hear people around her yelling.' She was transported to the emergency room where she was examined and released the same evening."

22. On September 12, 2011, the Claimant described her accident to Dr. Judith Weingarten as follows:

> While she was crossing the street, a car went through a red light and she got hit. She stated that she didn't break anything but if she didn't turn at the right time she could have lost both of her legs. She stated that she got hit from the right rear and the right side of her head smashed against the windshield and she went unconscious. She stated that the driver hit the brakes and she went flying off the car and landed on her back and the back of her head smashed on the pavement so that she struck her head twice. She stated that she had a loss of consciousness for a few minutes and remembered that there were a few people calling her name. She states that she remembers parts of the accident. She stated that she would not suggest going to Denver Health for anything because they didn't do anything. She stated that they didn't even do a CAT scan and released her in good condition and tossed a neck brace and a bottle of Vicodin at her and said that she should check with her doctor. She stated that in the first few weeks she was in such pain, that she didn't do a lot of thinking. She states that she has severe injuries to her neck, back and shoulder and pretty much screwed up everything. She states that she had severe whiplash and that the muscles healed in a protective mode. She states that as the initial pain started to wear off, she realized that she also had cognitive problems.

23. The Claimant was evaluated by David W. Zierk, PsyD on January 30, 2013 and March 13, 2013. The Claimant reported her accident to Dr. Zierk as follows:

> The accident involved [the Claimant] crossing the street in a crosswalk and being struck unexpectedly by a vehicle, a black Cadillac, travelling between 5-20 miles per hour. Secondary to this accident, which impacted [the Claimant] on the right rear aspect of her body, she was knocked onto the hood, striking her head against the vehicles windshield and then sliding to the ground, possibly striking her head again. According to the paramedic report at the time of the index event, [the Claimant] did not experience a loss of consciousness. Upon arrival at Denver Health Medical Center, [the Claimant] was examined on an emergent basis, diagnosed with multiple musculoskeletal sprains and contusions along with cervical, thoracic, and lumbar strain, provided medication, given a Glasgow Coma Scale of 15 with no CT scan of the brain being completed (normal CT findings on 10-24-08), and eventually discharged with after-care instructions.

24. The Claimant's report of her accident to Dr. Thwaites on March 8, 2013 contains some significant variations from some of her other reports. Dr. Thwaites' notes state:

> She was walking back to work, crossing what she remembers as being 17th street. She noted that a car turned left on a red light and struck her. She believes that she hit the windshield and then went flying. She recalls impact and all of the events leading up to it. She recalls the vehicle hit her

> in the right rear lower extremity and she recalls striking the right side of her head against the windshield. She saw a flash of colors and then everything went black. Her next personal recollection is of being on somebody's lap and people calling her name (she was wearing her employee badge with her name listed on it). She recalls hearing sirens and knowing they were for her and she recalls the arrival of the Denver Health Medical Center ambulance crew. She recalls being boarded for spinal precautions and seeing the front of the vehicle that hit her. She does appear to have patchy recall of the accident scene after she regained memory/consciousness and she also has patchy recall of the transport.

25. At the hearing, the Claimant testified that her recollection of the accident as of the hearing date is different than what she previously told doctors since she has been through EMDR therapy with Dr. Torres in an effort to more clearly remember details about the accident.

26. The Claimant's husband testified that at the time of the accident, he was speaking to his wife on the telephone. Her husband heard a yell, and the Claimant's phone shut off. The Claimant's husband called back but was unable to get an answer. He called back a second time and was told by the person who answered the phone that the Claimant had been hit by a car. The Claimant's husband stated that the lady who answered the phone stayed on the line until the paramedics arrived, and the paramedics then told the Claimant's husband that they would transport the Claimant to Denver Health. The Claimant's husband testified that he arrived at Denver Health Hospital between 4:45 and 5:00 PM on October 15, 2008. He was permitted to see the Claimant at approximately 6:30 or 7:00 PM. The Claimant's husband testified that the Claimant was crying, confused, slurring her words, and experiencing extreme pain to her head, neck, right arm, right hip, and right leg. He testified that, while at Denver Health, the Claimant recalled being hit and thrown onto the vehicle, hitting the back of her head on the windshield, and ultimately hitting the ground. The Claimant's husband also testified that Claimant could not recall much else. The Claimant's husband testified that Claimant was confused and "[a]t one point she thought it was earlier in the day, and it was probably dark outside." He testified that, while he was present at Denver Health, no medical personnel asked the Claimant about the circumstances of the accident, and she was not asked about being thrown upon the hood of a Cadillac and then being thrown to the street.

Medical Treatment Subsequent to Initial Emergency Response

27. On October 16, 2008, the Claimant was examined by Dr. Erin Woessner, her primary care physician at Kaiser. The diagnoses included a whiplash injury to the neck, headache, hip pain and leg pain. The cause of the injury was noted to be an MVA. Dr. Woessner noted that the Claimant reported that she was hit from behind by a turning vehicle as she crossed the street. The Claimant reported:

> direct hit right hip and behind, fell back onto car, brakes slammed, then pt was airborn [sic] and fell on street. Doesn't think she hit head, may have had LOS [sic], but would have been brief. No head bumps open sores or lacs. Started HA at 7am today; has h/o migraines, this is worse than her normal migraine, more shooting pains in temples, nausea, no emesis, vision: maybe more blurry, but can focus, hearing: no change, no localized weakness/N/T in extremities, denies confusion, memory problems. Now: feels achy everywhere, most severly [sic] in ant neck.

Dr. Woessner noted that the Claimant was provided with a handout on head trauma and "strongly precautioned on signs/symptoms of intracranial bleed." Dr. Woessner also noted that she recommended a head CT non-contrast scan to evaluate for a bleed, but that the Claimant and her husband refused and preferred to monitor closely. The Claimant was advised to return to the emergency department "if N/V/confusion/weakness/numbness/tingling or other worsening in condition."

28. The Claimant saw Dr. Rick Artist at Exempla on October 17, 2008. Dr. Artist described the Claimant as an "alert, pleasant, healthy appearing female who appears to be fairly uncomfortable, sitting very stiffly and not moving all that much." The Claimant's main complaints were her neck and back and her right hip was not as painful. Dr. Artist also noted that the Claimant's right knee and ankle were stiff and sore. There was no bruising. The Claimant denied numbness or tingling in her hands and upper extremities. Her range of motion was somewhat restricted for her neck, back and ankle. Dr. Artist assessed the Claimant with: "sprain right ankle, contusion and sprain right knee, contusion of ribs and low back, strain of the neck, strain of the back." At this initial Worker's Compensation medical evaluation, Dr. Artist advised that her symptoms were likely to resolve but "whether a couple more days, a couple weeks or a couple months is difficult to tell at this point." The Claimant was encouraged to engage in activity as tolerated to a modest degree. He referred the Claimant for physical therapy.

29. On October 20, 2008, the Claimant saw PA Marion Bauer at Exempla. Ms. Bauer noted that the Claimant reported "feeling a little bit better after the weekend." The Claimant reported that she was taking Motrin, Vicodin and Valium in order to resolve her headaches. The Claimant stated that she could not drive while taking the medication and was wondering about work, but otherwise, she was doing well.

30. On October 22, 2008, the Claimant saw Dr. Dave Hnida at Exempla after a physical therapy appointment. The Claimant reported dizziness, difficulty finding words and difficulty processing thoughts. She also reported that she still had neck and lumbar pain. The Claimant reported that she was off medication, except for Ibuprofen. She stated that all of her symptoms were worse and that she now had cognitive symptoms. Dr. Hnida noted that the Claimant moved slowly and changed positions slowly. He noted that the Claimant's mini mental status exam was normal but at times slow. Although, he also reported that the Claimant responded to questions such as her job description and what was performed physical therapy. Dr. Hnida assessed the Claimant with a closed head injury and noted she should be off work. He referred her for a non-contrast CT scan of the head.

31. On October 24, 2008, the Claimant underwent a head CT scan without contrast. The impression was that there was "no traumatic or focal abnormality." There was no fracture, bleed or discrete brain lesion noted.

32. On October 27, 2008, the Claimant reported her overall symptoms improved, but her dizziness was worse. Dr. Artist recommended a neuropsychological evaluation, continued physical therapy and continued medications.

33. On November 10, 2008, the Claimant reported to Dr. Artist that she was trying to be more active but that she fatigued extremely easily. The Claimant's husband accompanied the Claimant to the visit, and he reported that her reflexes and reaction time were markedly slowed and that the Claimant was having difficulty with speech and memory. The Claimant's headaches were better, not as severe, nor as often. The Claimant reported that she was not using Vicodin or Flexeril at all because they made her feel "weird." The Claimant also reported dizziness at times for no good reason. Dr. Artist assessed the Claimant with a closed head injury, concussion, persistent symptoms and poor short term memory, neck and back strain-modestly improved and insomnia and headaches-improved. The Claimant's husband indicated that he would like the Claimant to see more specialists, as it did not seem to him that the Claimant was getting better rapidly. Dr. Artist cautioned that the Claimant's issues required time to resolve and perhaps some neuropsychological cognitive therapy and continued physical therapy would be beneficial.

34. The Claimant was initially referred by Dr. Artist for physical therapy Colorado Athletic Conditioning Clinic (CACC) on October 22, 2008. CACC records demonstrate that the Claimant was compliant with care and did not miss any sessions. Dr. Artist reported on November 10, 2008 that the Claimant showed "modest improvement" with physical therapy and he added massage therapy to the Claimant's treatment regimen.

35. Dr. Artist last saw the Claimant on November 25, 2008. He reported that he had spoken to Dr. Broadhurst who stated that the Claimant should recover completely from her injuries, and that it would likely take sixty to ninety days, possibly longer. He noted that the Claimant was still having sleep interrupted most nights and she still has headaches every day. However, he noted her "speech is a little more clean that the last time she was here." He noted she continued to have memory issues. He reported that the Claimant was "unable to drive motor vehicles."

36. In advance of an evaluation of the Claimant, Dr. Caroline Gellrick was asked to review the Claimant's medical records. She reviewed the initial emergency response records and the records of Dr. Artist. Based on this review, Dr. Gellrick concluded:

> Status post pedestrian motor vehicle accident, right-sided body contusion with closed head injury, concussion with cervical/thoracic/lumbar strain,

cephalagia, mild traumatic brain injury (TBI) with concussion with x-rays showing some degenerative change thoracic spine, computed tomography (CT) of the brain normal with little response to physical therapy seen in the records with issues of insomnia continuing and altered memory processes.

37. The Claimant was initially seen by Dr. Gellrick on December 8, 2008. She reported that she did not have an exact recollection of what occurred at the time of the accident, but that the vehicle that struck her was at a stop and then accelerated and hit her. The Claimant reported that seeing Cadillac commercials on TV caused her distress. The Claimant reported that her appetite was poor, her sleep was disturbed by neck and back pain and she has nonstop headaches. She reported vertigo problems and memory problems, and she stated that she was not driving. Dr. Gellrick noted that the Claimant had a visual acuity of 20/20, together with 20/20 on the right and 20/50 on the left. The Claimant reported to Dr. Gellrick that she had been to her eye doctor and had exams before and since the accident and that, "ophthalmology is not concerned about problems with the vision as a result of the accident at this point in time." Dr. Gellrick assessed the Claimant with, "concussion, mild traumatic brain injury with cervical/thoracic/lumbar strain with vertigo and cephalalgia with evidence of mild depression/some post traumatic stress disorder." Dr. Gellrick referred the Claimant for an MRI of the brain, cervical, thoracic and lumbar spine and to Dr. Torres for psychological evaluation. Dr. Gellrick restricted the claimant to "no driving" and discontinued physical therapy. Dr. Gellrick's December 15, 2008 restrictions continued to include "no driving."

38. The Claimant's December 18, 2008 brain MRI report demonstrated an incidental finding of little or no clinical significance, but was an otherwise normal brain MRI. A cervical spine MRI of the same date showed mild degenerative changes of the cervical spine with mild left-sided foraminal narrowing at C4-C5 and C5-C6. A December 19, 2008 lumbar MRI showed mild degenerative changes at the mid to lower spine without central canal stenosis or nerve root contact at any level. A December 31, 2008 CT guided right shoulder arthrogram was reported to be unremarkable. These results were reviewed with the Claimant by Dr. Gellrick on December 29, 2008 and Dr. Gellrick noted "patient is relieved that the MRIs are essentially normal." Dr. Gellrick also noted that the Claimant was again seen with a family member as "she is afraid to drive long distances." Dr. Gellrick referred the Claimant to Dr. Sheldon Goldberg to consult about the potential traumatic brain injury and to Dr. Eric Hammerberg on the persistence of cephalalgia in a background of migraine headaches. Physical therapy was reinstated twice a week at CACC as the Claimant's spine was determined to be "essentially intact."

39. A December 31, 2008 right shoulder MRI showed infraspinatus tendonitis, mild AC joint fusion, synovitis and a possible Grade 1 slap tear.

40. On January 14, 2009, the Claimant was referred by Dr. Gellrick to Dr. Eric Hammerberg for evaluation of neurological symptoms. The Claimant advised that she

developed daily headaches and vertigo, described as a spinning sensation lasting one to two minutes and aggravated by head movement. Dr. Hammerberg noted that her mental status was intact "scoring 27/30" on the Mini Mental Status Examination. He found her verbal fluency to be "mildly diminished: with a score of 31 on the FAS Task." Her speech was described as "normal with no dysarthria and no aphasia." Dr. Hammerberg assessed "post-concussion syndrome, mild, with post-traumatic vertigo, resolving, and post-traumatic headache, mild and cervical strain." He recommended the Claimant start on a progressively increasing dose of Gabapentin with the objective of weaning her off Ibuprofen and Tylenol. He noted that neuropsychological testing may be indicated in a few months.

41. On January 30, 2009, the Claimant had a follow up appointment with Dr. Gellrick. Dr. Gellrick discussed information received from consulting providers Drs. Hammerberg and Torres. Based on the physical examination, as well as consultation with the other providers, Dr. Gellrick assessed the Claimant with traumatic brain injury, post traumatic stress disorder, depression, cervical strain, cephalalgia, some cognitive dysfunction, thoracic strain, lumbar strain, and symptoms of vertigo.

42. The Claimant saw Dr. Gellrick again on February 13, 2009. The Claimant reported that she felt unsteady and was having some problems sleeping. She reported feeling better in the mornings, but still having problems with concentration. Dr. Gellrick observed, "the patient's speech is belabored. She is having trouble finding words today and it is particularly noticeable today more than other days."

43. On February 13, 2009, Dr. Gellrick completed a form for Nancy Mohler, a Pinnacol return-to-work specialist, stating that the Claimant would be off work for 2 months, per Dr. Torres recommendations.

44. Dr. Gellrick reported on February 26, 2009 that she received two video surveillance DVDs which showed among other things, the Claimant driving. She reported that, "Patient goes on to tell me it shows her driving at times and she drives short distances back and forth from the house. She no longer has dizziness and with her headaches clearing she has been able to tolerate driving. She avoids heavy traffic and freeway driving and when she does not feel safe to drive she asks family members to do so." Dr. Gellrick reported that the Claimant had been to physical therapy 29 times and was making progress with range of motion and that she tracked her dates of appointments correctly. Prior to this appointment and the receipt of the video surveillance, the Claimant had not disclosed to Dr. Gellrick that she had been driving, nor had Dr. Gellrick cleared the Claimant to drive. After the appointment, Dr. Gellrick spent an hour reviewing video surveillance and prepared a written report dated February 28, 2009. Dr. Gellrick essentially noted that the video surveillance confirmed that the Claimant could drive herself short distances and could lift lighter items under 15 pounds. However, as of February 28, 2009, Dr. Gellrick still opined, "I do not want her driving on the freeway quite yet. She is too scared to do that. This will need to be processed more with psychology with Dr. Walter Torres before she attempts this."

45. On March 19, 2009, Dr. Gellrick noted that speech therapy had previously been ordered for the Claimant. Dr. Gellrick spoke with the Claimant's case manager about this, but the speech therapy had not yet started. The Claimant continued in physical therapy with CACC and was working with foam rolls.

46. On March 24, 2009, Dr. Gellrick referred the Claimant to Dr. B. Andrew Castro. The Claimant reported back spasms that were significant but somewhat improved. The Claimant had received a series of trigger point injections with Dr. Gellrick which provided some short-term diagnostic relief, but no sustained relief. Dr. Castro advised the Claimant that "her symptoms likely will resolve with time" and recommended continued conservative management. He did not see the need for a surgical intervention, but noted that the Claimant may consider an injection at T1 as this might be the area causing some spasm in the upper thoracic and shoulder girdle areas.

47. On March 25, 2009, the Claimant was initially assessed for speech-language cognitive issues by Ms. Judith Haddow, a Speech-Language Pathologist. Ms. Haddow noted that the Claimant "exhibits moderate dysfluency in spontaneous speech," but had not experienced any problems with fluency in childhood or as an adult. Ms. Haddow noted that the Claimant reported dizziness with postural changes and recommended a visual-vestibular evaluation. The Claimant also reported functional problems with memory and attention. The Claimant reported feeling overwhelmed by keeping track of her appointments. Ms. Haddow provided a planner system as an external memory aid and to assist with planning to avoid cognitive fatigue. Ms. Haddow noted that the Claimant reported receiving a letter from her employer offering light duty, part time work, but Ms. Haddow opined that the Claimant did not appear ready to return to work in the capacity outlined in the letter because of on-going cognitive deficits, pain complaints and problems with anxiety. Ms. Haddow noted that six sessions were authorized for home-based speech-language treatment addressing fluency, word retrieval, memory, executive control and attention skills.

48. The Claimant saw Dr. Hammerberg for reevaluation on March 31, 2009, reporting the same symptoms, but he noted that the Claimant felt "the symptoms are less troublesome at the present time." He recommended an increase in the dose of Gabapentin to decrease the headache and the Claimant's neck and shoulder pain.

49. On April 1, 2009, Ms. Haddow noted that the Claimant reported that it took her all week to organize tax information that, prior to her injury, would have been completed in one evening. The Claimant was provided with ear filters and printed information on cognitive fatigue. Ms. Haddow also provided the Claimant with simple Sudoku puzzles and simple exercises for word retrieval and fluency that appeared to overwhelm the Claimant, per Ms. Haddow. On April 13, 2009, Ms. Haddow noted that the Claimant had a migraine one afternoon the prior week, and incurred household situations that required repairs. Ms. Haddow stated that the Claimant exhibited "slow but accurate word retrieval skills" and only noted one incidence of fluency problems in conversational speech towards the end of the session. Ms. Haddow opined that the Claimant's fluency difficulties were related to cognitive fatigue and the speed of word

retrieval, as opposed to true stuttering. The Claimant had difficulty following simple procedures that were trained the prior week and consistently required reminders to attend to the procedures. Ms. Haddow recommended referral to a behavioral optometrist familiar with evaluation after TBI. She indicated that Dr. Thomas Politzer would be an appropriate referral.

50. On April 2, 2009, Dr. Gellrick noted that the Claimant had seen, or was scheduled to see, a number of specialists to address the Claimant's various conditions. By this point, Dr. Gellrick noted that she had reports from the Claimant for evaluations by Dr. Castro for her spine, Dr. Morales for her esophageal/swallowing issue, Judith Haddow for speech therapy, Dr. Hammerberg for neurology and cephalalgia, and Dr. Torres for psychological issues. In addition, Dr. Gellrick wanted the Claimant to see Dr. Lipkin for her dizziness and vestibular issues, and noted that follow up with Dr. Kenneally was also scheduled. At this point, Dr. Gellrick noted that the Claimant was experiencing negative side effects from some of her medications, and some were not effective, so she anticipated a period of medication adjustment involving evaluation by several of the Claimant's treating physicians.

51. Dr. Gellrick referred the Claimant to Dr. Alan Lipkin, an otolaryngologist, who initially evaluated the Claimant on April 20, 2009. Dr. Lipkin diagnosed the Claimant with moderate vertigo, tinnitus, lightheadedness, dizziness and headache. Dr. Lipkin recommended additional testing.

52. On May 4, 2009, following an ENG test (electronystagmography), which showed bilateral vestibular weakness plus central findings, Dr. Lipkin opined that the Claimant was likely suffering from post-traumatic vestibular dysfunction and was a candidate for vestibular rehabilitation. Dr. Lipkin recommended that the Claimant avoid muscle relaxants and sedating medications in order to expedite recovery.

53. On her return from the appointment with Dr. Lipkin on May 4, 2009, the Claimant met with Ms. Haddow. The Claimant advised Ms. Haddow that she had borrowed her father's RV and went camping with the family the prior weekend. The Claimant reported that preparation for the trip was overwhelming and she had trouble getting started, so she began with laundry, which is something she knows how to do, and then gradually started to do more tasks related to the trip. Ms. Haddow built on this and encouraged the Claimant to work on breaking larger tasks into smaller components and start with the components she was comfortable performing.

54. Dr. Gellrick referred the Claimant to Dr. Chester Roe, an ophthalmologist. The Claimant completed a Medical History Questionnaire dated May 6, 2009, denying that she was currently having problems with double vision, loss of side vision, and glare/light sensitivity. She did check "yes" to flashes or floaters and dryness, and she placed a question mark in the "yes" box under fluctuation vision. The Claimant reported that she was doing a limited amount of driving and did not have visual difficulties when driving. She did report "having trouble focusing, difficulty reading, constant headaches – sometimes right over eyes." At a May 12, 2009 visit (and in an addendum dated May

13, 2009), Dr. Roe noted that the Claimant was light sensitive even though this was checked negative in the questionnaire. Dr. Roe did not impose any limitations/restrictions for the Claimant and opined that this was a "grossly normal eye exam" which was age appropriate. The Claimant had no convergence insufficiency, no strabismus and no focusing issues related to her injury of October 15, 2008. He reported that the Claimant did not need any eye-related treatment due to her October 15, 2008 injury and that the Claimant did not need eye exercises or vision therapy. After evaluating the Claimant, Dr. Roe reported that he phoned Dr. Gellrick and reviewed his findings with her.

55. On May 14, 2009, Dr. Gellrick provided a written response to a prior request for psychiatric services. Dr. Gellrick explained to the Claimant's nurse case manager that the Claimant "has not responded to psychotropics provided by this examiner at the recommendations of Walter Torres, Ph.D. Therefore, we need further intensive M.D. psychiatry to further evaluate this. Request has been made for referral to Howard Entin, M.D. to review medication management and treatment goals."

56. Dr. Howard Entin began to treat the Claimant on June 9, 2009, per the referral of Dr. Gellrick. The Claimant was still treating with Dr. Entin as of the time of his deposition on May 6, 2013. During his initial evaluation, Dr. Entin diagnosed the Claimant with major depressive disorder, post-concussive syndrome, post-concussive headaches, and a cognitive disorder. Dr. Entin also conducted a mental status examination from which he determined that the Claimant had problems with speech, including stuttering often; difficulty word-finding; and difficulty finishing sentences. Dr. Entin also reported that the Claimant had high levels of anxiety, trouble reading/retaining information, and difficulty with concentration, focus, and memory.

57. On June 17, 2009, Dr. Gellrick reported that the Claimant was receiving therapy at Exempla Wheat Ridge with a vestibular therapist who was also evaluating the Claimant's cervical spine. Dr. Gellrick reported that these therapy sessions were being extended to almost double the length of time because the Claimant traveled from a distance away and that it would be easier for the Claimant to extend her appointments to give her maximum benefit on site. Dr. Gellrick also noted the Claimant was experiencing difficulty during this transition period of medication adjustments and the Claimant "finds that she is angry and irritable…at times she loses it so to speak and breaks down." Dr. Gellrick continued to note that the Claimant "cannot drive with oncoming traffic, as it precipitates problems and is dangerous to the patient."

58. The Claimant saw Dr. Barton Goldman on referral from Dr. Gellrick for an electrodiagnostic evaluation on August 4, 2009. Dr. Goldman noted that the Claimant was "very anxious with strong tendency for inhalation retention, gasping, startle response and hyperventilation…." Dr. Goldman concluded it was an abnormal study, but due to the complexity of the case and the extensive time needed to complete the test and the Claimant's presentation, he was "unable to opine within medical probability if any of the above findings are OJI related," and his impression was that the Claimant had a "pseudothoracic outlet syndrome."

59. On August 4, 2009, the Claimant also had a home therapy session with Ms. Haddow. Ms. Haddow related phone contact with the adjuster for the Insurer who requested an updated treatment plan and had questions about why the Claimant "wasn't making any progress." Ms. Haddow disagreed that the Claimant wasn't making progress and opined that the Claimant was "making significant gains in her ability to apply compensatory strategies to help her manage life demands" and that the Claimant was "extremely cooperative with treatment recommendations but she presented with pain, vestibular problems, headaches and sleep disturbances which can exacerbate cognitive problems in 'real world' settings." Ms. Haddow then outlined the Claimant's short term goals for the next 60 days, with treatment once per week. These goals were:

- Recall 3 tasks she intends to perform in a period of 3 hours
- Recall the topic of a 15 minute conversation after a 45 minute delay
- Successfully develop and follow through with menu planning and meal preparation for her family 4 nights per week
- Sustain attention to cognitive stimuli for 60 minutes without excessive mental fatigue
- Improve speed with basic computer activities by 40%

60. On August 10, 2009, Dr. Gellrick noted that the Claimant was making slow progress with physical therapy for her back and very slow progress with her OT Plus rehabilitation services. The Claimant reported that she tried to do the computer exercises that were given to her but with fast moving objects on the screen, she experienced vertigo. Dr. Gellrick also noted that the Claimant had started EMDR with Dr. Torres and these sessions were very anxiety-producing and draining for the Claimant. As of an August 26, 2009 office visit with Dr. Gellrick, the Claimant reported that she was making slow progress on her physical complaints, but felt stale-mated and overwhelmed regarding the mental issues. On review of OT notes from Judith Haddow, Dr. Gellrick reported that the Claimant's abilities for reading instructions had improved 80% and her word retrieval skills had improved by 50% with a corresponding reduction in stuttering. Per Ms. Haddow's recommendation, Dr. Gellrick reduced the speech therapy from twice a week to once a week for the following 2 – 3 months. Dr. Gellrick also specifically noted the Claimant's frustration with the speed of her progress in achieving her goals, but counseled the Claimant that it is not unusual for closed-head/brain injuries to take a year or two years to resolve. However, Dr. Gellrick opined that the Claimant's prognosis was good.

61. On September 23, 2009, the Claimant reported to Ms. Haddow that she was experiencing increased tension with her family and she was going to visit a friend in Kansas for two weeks to have a break. The Claimant attributed the increase in tension to her frequent headaches, emotional volatility and current difficulty coping with life's demands. In preparation for the trip, Ms. Haddow noted that the Claimant "planned ahead to make sure she has an adequate supply of prescription medications and has made lists of things to pack for the trip. She is attempting to make lists for her family of household chores, so they can help her with chores on a regular basis." Additionally,

Ms. Haddow noted that the Claimant "exhibited improved performance on reasoning tasks that require complex attention to detail."

62. The Claimant also had an office appointment with Dr. Gellrick on September 23, 2009. Dr. Gellrick noted that the testing with Dr. Kenneally was completed, although Dr. Gellrick did not yet have the report. Therapy and medical records were reviewed and, overall, there was very slow progress in all areas. Dr. Gellrick noted that Dr. Entin and Dr. Torres remarked on the Claimant's anxiety levels. There is discussion about the Claimant leaving town to visit a friend in the Midwest for 2 weeks. At this appointment, Dr. Gellrick specifically noted the Claimant's "mood and affect is one of anxiety. She is clinging to a soft object in her hand when this examiner first comes in and repetitively fingering it, but she does let go as we have continued with the exam."

63. On October 21, 2009, the Claimant was seen by Dr. Gellrick who was now in possession of Dr. Kenneally's report, which had also been reviewed by Dr. Entin, who saw the Claimant on October 7, 2009. In this medical note, Dr. Gellrick states, that neuropsychiatric testing shows conscious attempt to fake injury and all interpretation of Dr. Kenneally's data is "suspicious and indicates a minimal level of performance." Dr. Gellrick went on to note that the testing results showed the Claimant "has had a decline in performance since prior history of 11/2008 testing, which is inconsistent with head injury, but more consistent with psychiatric factors or malingering. Testing indicates above. These findings are inconsistent with mild TBI. Psychiatric history indicates increased somatization and histrionic tendencies. Conclusion: no evidence to support traumatic brain injury." Dr. Gellrick also noted that "Dr. Entin is recommending beginning to wind down treatment and indicated he would discuss this with Dr. Torres. Dr. Gellrick noted that the Claimant has not seen Dr. Kenneally yet to review the results of the neuropsychiatric assessment and that the Claimant told her that Dr. Entin did not mention much at all about it when she saw him earlier.

64. On November 4, 2009, Dr. Gellrick again referred the Claimant to Dr. Goldman, this time for a consultation regarding the Claimant's cervical brachial dysfunction and a rehabilitation consultation. Dr. Goldman noted that it was "rather challenging to get a cohesive history from [the Claimant]." Dr. Goldman noted that the Claimant expressed frustration that she has not made much progress and "her number one problem are headaches and neck pain and secondarily bilateral hip pain, sacroiliac joint and low back pain." The Claimant reported that most of her treatments at this point were of a passive nature and that she was not enthusiastic about more active treatment options because they caused her pain. After going over a history with the Claimant and an extensive and thorough record review, along with a physical examination, Dr. Goldman's impression was that that right cervical and shoulder girdle myofascial pain was secondary to the work injury. He found that the Claimant had probable mild to very mild cognitive dysfunction and vestibular dysfunction secondary to her work injury. He deferred to Drs. Entin and Torres as to specific diagnoses, but found the Claimant had anxiety and depressive disorder. Dr. Goldman felt the Claimant had a pain disorder and recommended ruling out factitious disorder, and vascular and tension headaches of

myofascial origin. He noted the Claimant had a positive fibromyalgia screen that was most likely associated with sleep dysfunction and somatization disorders. Dr. Goldman expressed concern that the Claimant had "extensive treatment over at least the last six months with highly qualified professionals….but is noting minimal progress." He opined that there is a "likelihood that overall treatment at this time is inadvertently and iatrogenically re-enforcing some of the patient's dysfunction and identification with the victim role." He found that the Claimant would be a very poor candidate for injections, and recommended winding down the vestibular, physical and speech therapies." In an addendum to this medical note, Dr. Goldman advised against an FCE for the Claimant as it would be unlikely to be helpful or necessary with her type of biopsychosocial presentation, and due to the fact that based on his examination, she would most likely remain in the sedentary to light work category.

65. On November 9, 2009, Dr. Gellrick noted that "the patient is seen to obsess and perseverate on the findings of Dr. Kenneally in her report. The patient essentially feels Dr. Kenneally did not consider all factors presented and that the neuropsychiatric results are not an accurate representation of what she is feeling." The Claimant asked Dr. Gellrick for a handicap sticker for driving. Dr. Gellrick denied the Claimant's request for a handicapped sticker, explaining to the Claimant that she had no problems walking and so does not need a handicap sticker. Dr. Gellrick further noted that with her dizziness, the Claimant should not be driving.

66. Also on November 9, 2009, Ms. Haddow noted that she communicated with Dr. Gellrick about the Claimant's visual skills, which may have been linked to her vestibular problems and dizziness, and recommended an evaluation by a neuro-optometrist or an occupational therapist for visual perception screening. Ms. Haddow noted concern for the Claimant's ability to cope with current life demands and her expression of hopelessness regarding her injury.

67. Dr. Gellrick referred the Claimant to Dr. W. Bruce Wilson, a neuro-ophthalmologist, who evaluated the Claimant on December 1, 2009. Dr. Wilson's evaluation included validity testing, and Dr. Wilson noted that, "she said she is having trouble with her vision in the way of not being able to either hold concentration on what she is reading so that she can read it accurately or is having trouble assimilating information accurately or forgetting it or all three. It is very difficult to get a definite feeling from her in trying to sort this out." While Dr. Wilson noted that the eye examination showed 20/20 vision in soft contacts, he reported that, when changing distances to two meters and using a double sized target and doing a tangent visual field, there was no enlargement, so there was some functional component in regard to visual fields. There was no abnormality to her nerves and retinas or pupil abnormality and the examination of her ocular movements was normal. He ultimately opined that, "it is not convincing that [the Claimant] had any brain damage and probably definitely had no visual system damage that is demonstrable and that some of the visual field examination techniques suggest the possibility that this is functional, although it does not suggest malingering necessarily."

68. On December 8, 2009, Dr. Entin issued a psychiatric report. In his report, he specifically stated that the Claimant had a cognitive disorder. Dr. Entin also noted that reports from family members, friends, and employers were consistent with the doctor's observations, which indicated a dramatic change in the Claimant's functioning from her pre-injury levels.

69. The Claimant was examined by Dr. Gellrick again on December 21, 2009. The Claimant reported that she was still unable to drive due to dizziness and vertigo which continue. In reviewing the recent evaluation reports of Dr. Kenneally, Dr. Goldman and Dr. Entin, Dr. Gellrick clarified that Dr. Entin was on record stating that he did not believe the Claimant was consciously exaggerating her symptoms, nor malingering, but that she is anxious and her psychological state interfered with her function. Dr. Gellrick noted that Dr. Goldman found that the Claimant's worsening of symptoms was not consistent with a head injury, but "more consistent with the emotional sequelae of the same." Dr. Gellrick noted that both Dr. Goldman and Dr. Entin agreed that passive modalities should be discontinued but that the Claimant should continue to receive ongoing psychological support from Dr. Torres and Dr. Entin. Per Dr. Entin's recommendations, Dr. Gellrick recommended that the Claimant be seen by Dr. Schmitz for review of the neuropsychological testing data. The Claimant was also to continue be treated by seeing Dr. Lipkin for the vestibular issues.

70. On December 23, 2009, Dr. Goldman issued another written report based on the review of additional medical records. He pointed out that he had not seen the Claimant since November 4, 2009, but that the Claimant's attorney believed that his report from November 4, 2009 conflicted with some of the additional information that she provided to Dr. Goldman. Therefore, the attorney requested an updated report. In addition to the record review, Dr. Goldman also had an opportunity to consult with Dr. Gellrick and discuss the case again. Dr. Goldman clarified that he did find the Claimant's presentation to him to date to be consistent, nor was it consistent with her presentation to Dr. Torres and Dr. Entin. However, his "chief concern" relative to the Claimant "is whether various aspects of her present temporary disability are being overly emphasized or potentially misunderstood leading to a less than optimal functional recovery." Dr. Goldman still considered that "the psychological and emotional issues the greatest obstacle to recovery for [the Claimant]." He points out that the invalidation of the neuropsychological testing, for whatever reason, prevents objective categorization of what, if any, residual cognitive dysfunction remains for the Claimant, and how that might have been impacting her vocational reentry prognosis. Dr. Goldman noted that, having specifically considered the subjective feedback from associates, co-worker's, friends and family of the Claimant, as well as the medical opinions, his overall opinion remained unchanged from his prior report. Dr. Goldman went on to opine that "from a pain management and rehabilitation perspective, my chief concern is that if in fact [the Claimant's] primary rate-limiting issues are more in the psychosocial than cognitive realm, that if we and the patient overly endorse cognitive issues as being the primary rate-limiting rehabilitation factor to future recover, then in my experience the patient will have a great deal of difficulty in making any further progress relative to cognitive and behavioral interventions that might bear the greatest fruit in terms of facilitating both

physical and cognitive recovery." Dr. Goldman also continued to opine that "there remains subjective aspects (which are certainly quite consistent in presentation) that suggest a much stronger emotional component to the patient's present pain, suffering and disability than there are objective and physical conditions."

71. Dr. Lipkin determined that the Claimant was at MMI for her vestibular condition on January 6, 2010. He assigned an 8% whole person impairment rating from an ENT standpoint. At that visit, the Claimant reported to Dr. Lipkin that she had continued short episodes, seconds to minutes, of dizziness and unsteadiness, that she was unable to drive, and she continued to run into walls and had trouble walking straight. In arriving at the 8% whole person impairment rating, Dr. Lipkin found that the Claimant "is at the more severe end of Class 2 vestibular impairment with objective signs of impairment," although he noted "she has no problems with basic self care." Dr. Lipkin opined that there was no other specific treatment recommended at that point.

72. On January 6, 2010, the Claimant was discharged from speech therapy/cognitive intervention. Ms. Haddow provided final modifications for cognitive strategies to meet daily life demands. Ms. Haddow noted that the Claimant might benefit from short term cognitive intervention (3 to 5 sessions).

73. The Claimant participated in a Functional Capacity Evaluation (FCE) on January 25, 2010 for 7 hours and 30 minutes. In summary, the evaluator, Patrick Coughlan, found that the Claimant demonstrated work tolerance consistent with the "Below Sedentary" PDC level. Although, it was noted that the Claimant's effort was "variable," based on effort measures and clinical observations. Thus, the report should be considered to establish the Claimant's "minimal capabilities." Mr. Coughlan noted that the Claimant's "discomfort seemed to be related to anxiety with lifting and fear of falling more so than pain or strength." Over the course of the testing, the Claimant rated her pain at 8/10. The day following the FCE, the Claimant was instructed to contact the clinic to report her condition. The Claimant reported experiencing "a full blown migraine" and that she slept for 15 hours following the testing.

74. On February 3, 2010, Dr. Gellrick noted that the Claimant had seen Dr. Lindberg on January 8, 2010 for evaluation of her shoulder. Per Dr. Gellrick, Dr. Lindberg did not anticipate surgical intervention but he wanted a physiatry consult. It was also noted that Dr. Lipkin found the Claimant at MMI for the vestibular condition and rated the Claimant's impairment at 8% whole person. Dr. Gellrick also noted that the Claimant had completed an FCE on January 25, 2010 and reviewed the report with the Claimant.

75. The Claimant saw Dr. Gellrick on March 11, 2010 expressing that she was anxious to be able to drive to close places in her neighborhood. She told Dr. Gellrick that she had not been able to engage in her home exercise program at the local gym because she did not have a way to get there. So, she wanted to pass the driving evaluation so she could start driving, although the Claimant did express that she knew that she was not stable to drive on the freeway. Dr. Gellrick noted that her office was

attempting to obtain clearance from Dr. Lipkin's office so that the Claimant could participate in the driving evaluation. Dr. Gellrick noted that the Claimant continues to express "disgruntlement" and "is seen to obsess" about Dr. Kenneally. The Claimant was more satisfied with her contact with Dr. Schmitz.

76. Dr. Gellrick referred the Claimant to Dr. Zimmerman, who initially saw the Claimant for osteopathic manipulation and injections on March 31, 2010. The Claimant reported "constant headaches since the accident" and pain that seemed to originate from the occipitocervical junction that radiated over the top of her head and included bilateral temporal pain. The Claimant also reported neck pain in the cervicothoracic region, radiating into the trapezius and shoulder regions with associated numbness and tingling down the right upper extremity when the shoulder and neck pain was severe. She also reported low back pain that radiated into the upper buttock pain. Dr. Zimmerman diagnosed the Claimant with general myofascial pain of the cervical, thoracic, and lumbar spine with positive fibromyalgia screen; segmental dysfunction of the cervical spine with associated headaches; a history of postconcussive syndrome, anxiety and PTSD with a history of cervical spinous process fractures, stable and a right shoulder injury with evidence of a possible SLAP lesion. Dr. Zimmerman began osteopathic manipulative therapy on the initial visit.

77. At an April 6, 2010 visit with Dr. Zimmerman, the Claimant reported she was mildly sore after her initial manual treatments but that she was fine the following day. She continued to treat with Dr. Zimmerman through April 2010 with no change in her daily headaches or upper cervical pain. Although there was improvement noted on April 27, 2010 to her thoracic, shoulder, hip and lumbar spine, and the Claimant reported increased tolerance for activity such as shopping and being comfortable in a car. On May 3, 2010, the Claimant's level of activity further increased, with the Claimant reporting that she did some mild hiking over the weekend and she "tolerated the uneven terrain and hiking that lasted several hours without difficulty." On May 24, 2010, the Claimant reported that she went hiking over the weekend for a one-hour duration on uneven terrain in Rocky Mountain National Park. Dr. Zimmerman also noted that Dr. Entin was reducing several of the Claimant's medications on a tapering schedule over the next several weeks.

78. On April 29, 2010, Dr. Gellrick noted that the Claimant underwent a driving evaluation and was able to drive short distances, although Dr. Gellrick opined that the Claimant should avoid freeway driving. Dr. Gellrick noted that, per Dr. Schmidt, although the Claimant's performance on his testing was "clearly internally inconsistent" and indicative of nonorganic factors impacting her test behavior, it fell short of a supportable finding of conscious exaggeration. Dr. Gellrick opined that the Claimant was not yet at MMI.

79. On June 2, 2010, Dr. Zimmerman performed medial branch block procedures on the left side at C2-C3, C3-C4, C4-C5 and the third occipital nerve. There was a diagnostic response for the left-sided medial branch blocks with 60-75% relief reported on the left side and no change on the right side, which was not treated. On

June 7, 2010, the Claimant reported her relief lasted two to three hours with soreness the following day and a return to a baseline level of discomfort after. Bilateral medial branch blocks were performed by Dr. Zimmerman on June 9, 2010. In the recovery room, the Claimant reported a 50-75% relief in her headache and a 50% relief in neck pain. On June 14, 2010, the Claimant reported that the relief lasted a couple of days and she demonstrated improved cervical range of motion on examination. On June 21, 2010, Dr. Zimmerman reported that the Claimant "tolerated camping activity over the weekend including collecting firewood and doing short hikes as well as cooking outside. No increase in symptoms. She states her neck pain seems to be improving and the intensity of her headaches is also slowly decreasing, although they are still constant in nature."

80. On June 23, 2010, the Claimant underwent radiofrequency neurotomy at right C2-3, C3-4, C4-5 and right occipital nerve. Dr. Zimmerman noted a diagnostic response in the recovery room and some, although lessening, continued relief. On July 19, 2010, the Claimant reported increased outside stressors to Dr. Zimmerman, including her son getting married in another state. Dr. Zimmerman opined that "[the Claimant] has recently undergone medication changes by Dr. Howard Entin and she is experiencing increased anxiety due to psychosocial stressors at home. This in combination with the complexity of her post concussive syndrome, anxiety, and PTSD disorder. I do not recommend proceeding with RF neurotomy at this time. [The Claimant] is experiencing somatization response and I am concerned that additional RF treatment may not provide net benefit at this time." On July 26, 2010, it was noted that the Claimant was leaving town for a week and she would be driving to Mississippi for her son's wedding. At the next appointment on August 5, 2010, Dr. Zimmerman noted that the Claimant reported that she tolerated the road trip to Mississippi "without any exacerbation in pain," and further reported that "her headaches have been reducing in frequency and are no longer constant." On August 9, 2010, Dr. Zimmerman noted that the Claimant reported her headache frequency and intensity continued to reduce, although the Claimant was active over the past weekend, going camping, although she did not tolerate wearing a camel back with water longer than 15-20 minutes before spasms occurred.

81. On June 29, 2010, the Claimant followed up with Dr. Gellrick, who was then at a new office in Denver, having left the Exempla office in Wheat Ridge since the Claimant's last appointment. The Claimant's symptoms flared since the rhizotomy with Dr. Zimmerman, which was not unanticipated. Overall, the Claimant reported that she trusted the procedure and felt that her headache condition was improving and that the treatment by Dr. Zimmerman had made a big difference in her physical presentation. The Claimant reported that she was driving more and tolerated back streets and side roads for trips of 30-45 minutes, depending on her level of headache. The Claimant reported that she was staying off freeways. The Claimant complained of continued symptoms of photophobia, headaches and memory problems, and tenderness in the thoracic region. Dr. Gellrick noted that the Claimant was "actually upbeat" on the day of the appointment and "very well organized" with a day-keeper with all of her dates and that the Claimant was able to track things well.

82. Dr. Gellrick referred the Claimant to Thomas Politzer, O.D., because, per Dr. Gellrick, the Claimant continued to have complaints of visual problems when she came in to Dr. Gellrick's office and at the OT Plus appointments. The Claimant was initially seen by Dr. Politzer on September 7, 2010. Dr. Politzer noted that the Claimant had visual motion hypersensitivity, convergence insufficiency with episodic double vision, and oculomotor dysfunction. He recommended that the Claimant be refit for both of her contact lenses for distance vision and to help reduce her dizziness symptoms. He also recommended oculomotor therapy with her occupational therapist Judy Haddow.

83. At a follow up visit on September 21, 2010, Dr. Politzer noted that the Claimant reported some improvement with her new lenses with regards to visual motion hypersensitivity. The lenses were further evaluated and modified with a prescription to give enhanced acuity and improvement in visual motion hypersensitivity.

84. On October 14, 2010, the Claimant began to see Shari Barta for occupational therapy, with goals related to visual retraining, cognitive retraining and perception retraining until discharge from O/T services on March 9, 2011.

85. By October 14, 2010, Dr. Zimmerman noted that, "subjectively, [the Claimant's] symptoms seem to have stabilized and she continues to report temporary partial relief from manual medicine from myself, chiropractic/accupuncture treatments, and massage treatments. However by October 25, 2010, the Claimant is reporting to Dr. Zimmerman that she is overall the same with her headache, cervical, thoracic and lumbar pain unchanged and occurring unpredictably." The Claimant felt Dr. Zimmerman's treatments were maintaining her current condition, as opposed to continuing to improve her condition.

86. On October 19, 2010, the Claimant saw Dr. Gellrick for a follow up appointment. The Claimant was seeing Dr. Politzer and Shari Barta for vision therapy, and seeing Dr. Zimmerman and Dr. Gridley for alternating OMT and acupuncture every other week. The Claimant also reported that she was set up at the gym for her home exercise program. Dr. Gellrick noted that the Claimant was not yet at MMI for all conditions, but expected MMI by the end of November. Dr. Gellrick noted that she was going to ask Dr. Entin to do the psychiatric impairment rating, as it appeared that the Claimant was at MMI for this.

87. On November 16, 2010, Dr. Entin issued a Neuropsychiatric MMI/Impairment Report. In that report, Dr. Entin again opined that the Claimant's pedestrian/motor vehicle accident had caused emotional reactions and post-concussive syndrome that affected her cognitive functioning. In the November 16, 2010 report, Dr. Entin gave the Claimant a 10% neurological impairment rating using the AMA Guides 3rd edition for impairment of cerebral function. The doctor stated in his report that the Claimant continued to have trouble with cognitive fatigue, memory problems, difficulty multitasking, organization, etc. He also stated the Claimant "could not return to her previous level of functioning." Dr. Entin stated that it was unclear if the Claimant could

do even fairly simple repetitive jobs on a consistent basis due to cognitive fatigue, disorganization, and chronic pain.

88. On December 6, 2010, the Claimant reported to Dr. Zimmerman that her symptoms were essentially unchanged. She was trying new medications. Her underlying headache was persistent but she noted decreased frequency and intensity of the severe migraines. At this point, the Claimant was alternating chiropractic and acupuncture every other week with OMT/manual medicine. On December 20, 2010, Dr. Zimmerman noted that the Claimant reported a difficult last two weeks due to nausea that she thought was related to Topamax and she has lost 10-pounds. She also reported a cold and upper respiratory viral infection. With respect to musculoskeletal issues, the Claimant reported decreased severe migraines with no change to her underlying headache. Her cervical and thoracic discomfort were better controlled.

89. On December 20, 2010, Dr. Politzer reported that the Claimant was, "improving with regards to her vision" and that vision therapies with Sherry at OT Plus were helping. On January 20, 2011, Dr. Politzer and the Claimant discussed the option of evaluating for Botox because the Claimant was not happy with the side effects of Topamax, even at a reduced dosage.

90. On January 10, 2011, the Claimant participated in a Functional Capacity Evaluation (FCE) administered by Vickie Mallon, OTR. At the time of the testing, the Claimant reported to Ms. Mallon that her pain level that day was a 7/10, which was described as a typical day, at the beginning of the FCE and it was reported to be 9.5/10 at the end of the evaluation. The Claimant's main complaints were headache, neck tightness with muscle spasms, achiness throughout her cervical, thoracic and lumbar spine, tingling in both arms and hands, and a feeling of extreme anxiety. Ms. Mallon noted that the Claimant's job at the time of her injury was administrative assistant to the State Board of Education. The job was identified as most consistent with Dictionary of Occupational Titles job DOT 169.167-010, and is classified in the sedentary work category. The FCE was performed over 4 hours, and the Claimant demonstrated an ability for sustained sitting of approximately 20 minutes with frequent change of positions from sit to stand. Her sustained standing/walking was demonstrated to be 45 minutes. The validity measures indicated that the Claimant may not have put forth consistent effort during the testing. Ms. Mallon concluded that, "the [Claimant] appears to have a hesitant and frustrated perception of her ability to work." With respect to testing for lifting, carrying, pushing and pulling, the Claimant's overall demonstrated abilities were "most consistent with the light work category at this time." It was also noted that, with respect to dexterity testing, the Claimant exhibited decreased manipulative ability with both hands, working at a very slow, noncompetitive rate of speed. The evaluator noted that the Claimant contacted her the day following the FCE to describe her pain and symptoms following testing. The Claimant reported that she took a hot bath following the test and slept most of the afternoon. She reported a strong headache, but not a migraine, and increased cervical pain and right upper extremity pain.

91. On January 17, 2011, the Claimant reported to Dr. Zimmerman that the Topamax did seem to significantly decrease the frequency and severity of her acute migraine headaches. However, the Topamax interferes with her appetite and she continued to have weight loss and was down to about 106 pounds. The Claimant also reported that she had an FCE one week prior and she had "a slight flare-up in left-sided neck pain from a certain activity during the test, and those symptoms are slowly returning to baseline." On January 31, 2011, Dr. Zimmerman noted that, while the Topamax was effective at reducing the Claimant's migraines, the appetite suppressant side-effect persisted, and so, he recommended a nutrition consult, as well as consideration of Botox for migraine treatment to reduce the Topamax needs.

92. Dr. Gellrick evaluated the Claimant on February 8, 2011, and determined MMI. She provided an impairment rating for those conditions not already rated by other treating physicians. Dr. Gellrick assigned a 26% whole person rating for the cervical, thoracic and lumbar spine and a 7% upper extremity rating for the right shoulder. Dr. Gellrick combined this 26% spine impairment rating with the cognitive impairment rating of Dr. Entin of 10% for 33%. The 33% rating was then combined with the 8% vestibular impairment resulting in a 38% whole person. This 38% was then combined with a 4% right shoulder impairment, resulting in a 40% whole person impairment for all conditions rated. Dr. Gellrick's impairment rating report contained an extensive and thorough review of the Claimant's history of present illness and subsequent medical treatment. Dr. Gellrick listed the following final diagnoses for the Claimant: MTBI with cognitive dysfunction; post-concussion syndrome with cephalalgia (headache); cervical strain; thoracic strain; lumbar strain; persistent vertigo; major depressive disorder with generalized anxiety disorder; pain disorder associated with psychological factors and medical conditions; right shoulder impingement; deconditioning; and ongoing emotional dysfunction. In conclusion, Dr. Gellrick noted that although the findings of the most recent Functional Capacity Evaluation put the Claimant in a sedentary work category, "mentally the patient will have good and bad days where she is unable to track her task and be consistent with her performance."

93. On February 28, 2011, the Claimant reported to Dr. Zimmerman that "her overall migraine severity has remained stable, which is significantly improved for the past several months." She completed her Topamax taper and was off this medication.

94. On March 10, 2011, Dr. Gary Zuehlsdorff issued a written opinion after being asked to review the IME of the Claimant and the final impairment rating from Dr. Gellrick provided in February of 2011. Dr. Zuehlsdorff opined that "in reviewing her report and Dr. Howard Entin, the psychiatrist's report, I would concur that the numbers obtained seem to be reasonable, given the gravity of the injury." Dr. Zuehlsdorff did not have disputes with the impairment ratings for the cervical, thoracic, and lumbar spine and the right shoulder or vertigo ratings. Dr. Zuehlsdorff also opined that the 10% rating from Dr. Entin for primarily TBI symptoms with minimal psychiatric components of 10% made sense from a medical standpoint.

95. On March 15, 2011, Dr. Gellrick saw the Claimant for maintenance treatment and, with the Claimant present, completed a 7-page form "courtesy of Barbara Furutani, Esq. regarding permanent needs and set-asides for the patient, …" Dr. Gellrick assigned permanent restrictions via this form, which she later changed. However, in the form, Dr. Gellrick gave the Claimant the following permanent work restrictions after MMI: sitting limited to 20 minutes per episode; walking and standing limited to 20 minutes per episode; with typical breaks where she could sit, stand, and walk. These activities were limited to about 4 hours per episode.

96. Respondents filed a Final Admission of Liability on March 16, 2011, admitting for a 38% whole person rating and a 7% scheduled rating for the shoulder. The Respondents' final admission incorporated the ratings of Drs. Gellrick, Entin and Lipkin, as set out in Dr. Gellrick's February 8, 2011 report.

97. On April 25, 2011, the Claimant reported to Dr. Zimmerman that she hurt everywhere, and was very non-specific in her pain description. She could not clearly articulate the location, timing, intensity or triggers that brought on symptoms in her hips, cervical, thoracic and lumbar spine.

98. The Claimant saw Dr. Adam Wolff on June 21, 2011 for a neurology consultation to consider alternatives for headache relief such as Topamax, which provided benefit for her severe headaches, but also caused side effects at increased dosages for the Claimant. At the first visit, Dr. Wolff recommended Depakote and a trial of Botox. After five days on Depakote, Dr. Wolff reported on June 29, 2011, that the Claimant was tired. The initial treatment with Botulinum Toxin was tried on June 29, 2011. As of August 3, 2011, the Claimant reported to Dr. Wolff that the Botox injection helped but the Claimant was still getting chronic headaches, although they were a little less severe. On September 1, 2011, the Claimant was started on Topamax again. By September 21, 2011, the Claimant received a repeat injection of Botox and was also doing better with her migraines on the Topamax. By October 19, 2011, the Claimant was reporting improvement in her headaches to Dr. Wolff. Dr. Wolff noted She is still getting a headache most days, but they are coming on in the evening. She is feeling somewhat better during the day and she is not getting as many migraines. She describes perhaps 3 or 4 significant migraines over the last month."

99. On November 2, 2011, following a phone call from the Claimant's counsel, Dr. Politzer reported a diagnosis of visual motion sensitivity, for which the Claimant was receiving therapy. He noted that his other initial diagnoses of convergence insufficiency with episodic double vision and oculomotor dysfunction were problematic only because of the motion sensitivity. Dr. Politzer noted that, by taking a conservative approach with regards to equalizing her contact lenses and through occupational therapy, the Claimant's "visual dominance" and "visual motion sensitivity" were reduced.

100. Dr. Gellrick issued a Medical Record Review Special Report and Video Surveillance Review on November 5, 201,1 at which time she updated her opinion of the Claimant's restrictions. In preparation for this report, Dr. Gellrick reviewed IMEs

performed by Dr. Tashof Bernton, Dr. Judith Weingarten and Dr. Armin Feldman, along with video surveillance from August and September of 2011. With respect to the reports of Dr. Bernton, Dr. Gellrick noted that Dr. Bernton found that the Claimant's conditions were consistent with those initially identified by Dr. Rick Artist and ultimately determined that the Claimant was capable of performing in an administrative position and she should not be placed on a disabled status, as she was physically capable of performing vocational activity. Dr. Gellrick also took note of the IME of Dr. Weingarten which took place for 3 hours on September 22, 2011, and was attended by Dr. Armine Feldman (although he did not participate). Dr. Gellrick noted that Dr. Weingarten ultimately concluded that the Claimant's symptoms were consistent with pain disorder, and histrionic personality disorder and that her symptoms were not caused or aggravated by her work injury. Dr. Weingarten found no reason the Claimant could not work and encouraged the Claimant to return to work to help build confidence. Dr. Gellrick noted that Dr. Feldman disagreed with and refuted some of Dr. Weingarten's statements. Dr. Gellrick noted that Dr. Feldman concluded that the Claimant's current medical condition included postconcussion syndrome with cognitive loss, depression and headaches and was a direct result of the auto-pedestrian work injury. Dr. Gellrick generally disagreed with the opinions of Drs. Bernton and Weingarten and agreed with Dr. Feldman. Dr. Gellrick also chronicled her review of portions of the surveillance video. Dr. Gellrick noted that on September 10 and 11 of 2011, the Claimant was able to pick up two one-gallon buckets of paint and carry them to check out and then load them into her vehicle. Dr. Gellrick also reviewed the August 20, 2011 video from the Peach Festival. She notes that the Claimant was basically seen walking for 2 ½ hours with a break of approximately 30 minutes sitting on the ground and then stood and walked again from 1:45 p.m. until leaving at 2:30 p.m. She noted that the Claimant was able to bend at the waist with more range of motion than had been seen at the time of the closure of her claim. She noted that the Claimant was able to lift boxes of Peaches which presumably weighed 15-20 pounds and was able to lift and carry them and that from her prospective, the Claimant's function had improved in terms of the Claimant's ability to lift and carry 15-20 pounds for at least brief periods and able to stand and walk for more time that she was able to do previously. Dr. Gellrick ultimately translated this to a best case scenario where "with improvement in function this patient would function for 3 maybe 4 hours on a job with the ability to sit at will and stand and walk and lift up to 10 to 15 pounds on and occasional basis." However, Dr. Gellrick cautioned that "beyond a 4 hour period though it is doubtful what the patient's function would be based on video surveillance. The patient is anticipated to have good days and bad days. There will be days when the headaches she has experienced will preclude her activity."

101. On November 17, 2011 the Claimant saw Dr. Wolff for follow up and reported that the Botox was wearing off and she was getting more headaches. Dr. Wolf reported that the Claimant was also under increased stress over the last month due to the death of a friend. Dr. Wolf recommended repeating the Botox injections in the facial musculature and avoiding the neck so she would tolerate it better. Then the Claimant would follow up with Dr. Zimmerman for neck injections and treatment.

102. On November 23, 2011, Dr. Lipkin responded to an inquiry from Respondents' counsel regarding the Claimant's vestibular conditions. He noted that, as of her last visit to his office on January 6, 2010, the Claimant was reporting that her balance was improving but she still had difficulty walking in a straight line and she felt unsteady and unable to drive. After communication with Dr. Gellrick's office at a later date, the Claimant was reevaluated to see if she could drive. Dr. Lipkin stated that he had not seen the patient in the office since that time. In response to questioning about her level of functioning (after reviewing surveillance video from the summer of 2011), Dr. Lipkin opined that, "she is capable of a level of functioning that clearly has improved since her January 6, 2010 visit in that she does not have any obvious instability when walking and is capable of driving. Patients with vestibular injuries can have intermittent symptoms, but at least some of the time she appeared to be capable of both sedentary and moderate levels of activity. There would be no otolaryngology contraindication towards her being employed at sedentary or light work, with the understanding that if she does have fluctuating symptoms, periodic breaks could be medically necessary."

103. On December 13, 2011, the Claimant returned to Dr. Zimmerman for medical maintenance treatment. Specifically, Dr. Gellrick requested consideration for a repeat third occipital nerve and cervical RF neurotomy to treat recurrent headache pain. Dr. Zimmerman noted that the Botox injections provided some relief but the Claimant did not tolerate the neck injections due to neck weakness sensation. She is scheduled for repeat face and head injections with Dr. Wolff on 12/20/2011. Dr. Zimmerman notes pain behaviors with full flexion and extension of the shoulder and diffuse shoulder pain. After performing a medical record review, Dr. Zimmerman opined that "the majority of headache relief and increased function came from manual medicine treatments on the left side of her neck and reduced stress in her life. It appears the RF neurotomy treatment on the right side of her neck did not provide any lasting benefit or any increase in function." So, Dr. Zimmerman did not recommend a repeat RF neurotomy as he found no clinical indication that it improved overall headache relief or improved level of function.

104. On January 6, 2012, the Claimant reported to Dr. Gellrick that Botox injections had helped control the headaches overall by 50%. The Claimant was getting headaches almost every week before, and at that point she was getting them every 2 to 2 1/2 weeks. So, Dr. Gellrick found that the Botox appears to have helped along with the concurrent use of Topamax.

105. On February 29, 2012, at an annual comprehensive vision exam, Dr. Politzer reported an improvement in the Claimant's ongoing headaches with the Botox treatment and a lower dose of Topamax. The Claimant reported some deficits with visual tracking but her "double vision has resolved." He reported improvement with headaches and the visual system overall.

106. On April 2, 2012, Dr. Zimmerman reported that the Claimant returned for osteopathic manipulation for the first time in four months. The Claimant reported that her father had recently passed away and she commuted by car to Ohio and back (20

hours each way) which made her cervical, thoracic and lumbar spine sore and there was stress due to the loss of her family member. Dr. Zimmerman noted that the Claimant appeared fatigued and that she lost some weight. However, he also noted that the Claimant showed no signs of sedation, withdrawal or anxiety.

107. The Claimant treated with Dr. Zimmerman for osteopathic manipulations on September 7, 2012 and again on September 24, 2012. On September 24, 2012, the Claimant reported that she was sore after the OMT treatment on September 7, 2012, but experienced significant benefit with the loosening of the cervicothoracic junction and relief in the low back and anterior hip. The Claimant reported that "her tolerance for activity is increased with activities of daily living, and she is starting a walking program one-half mile two times per week" and she was tolerating stairs better at home." Dr. Zimmerman also noted that she only stuttered one time during the visit that day and her speech pattern appeared more relaxed. She was also able to get on and off the examination table with minimal hesitation and stiffness.

108. On September 7, 2012, Dr. Wolf prepared a letter summarizing his treatment of the Claimant for chronic headaches. Dr. Wolf stated that the Claimant had been effectively treated with Imitrex and Botox. He opined that, due to the 3+ years chronicity of the headaches, it was likely these therapies would need to continue indefinitely. He further opined that there was a reasonable degree of medical probability that the Claimant would have chronic headaches as a result of her head trauma.

109. On September 20, 2012, the Claimant saw Dr. Gellrick again for maintenance medical treatment. Dr. Gellrick also noted that after the visit, she was provided with a medical record review prepared by Dr. David Reinhard dated April 16, 2012. She noted that Dr. Reinhard ultimately concluded that based on the lack of objective information regarding reported cognitive deficits, the amount of cognitive impairment would not produce any significant permanent cognitive residual and there would be a negligible long term effect on the Claimant's ability to work. In response, Dr. Gellrick noted that she would defer to the opinions of Dr. Howard Entin and felt that, if anything, the Claimant should be considered for reevaluation and neurocognitive testing follow-up with Dr. Schmitz.

110. On October 15, 2012, the Claimant reported to Dr. Zimmerman that what he was doing for her neck was helping and "the combination of OMT, chiropractic and acupuncture and the work at CACC is providing some significant temporary relief." The Claimant was walking a mile up to three times per week.

111. On November 5, 2012, the Claimant reported that her back and neck symptoms were improved overall in the last two months and she had increased mobility. Her activities were not as painful. Dr. Zimmerman did note that the Claimant appeared somewhat fatigued and occasional stuttered and had word find struggles. He also noted increased muscular tone on physical examination. This was the last medical record of OMT treatment with Dr. Zimmerman submitted into evidence.

112. On February 11, 2013, Dr. Politzer saw the Claimant again for an annual comprehensive exam noting the Claimant still reported difficulty with migraine headaches, blurred vision for distance and near, as well as with reading. Dr. Politzer noted that the Claimant was still not able to achieve her desired level of acuity with bifocal contact lenses and additional lenses were ordered for the Claimant to evaluate.

113. On March 14, 2013, Dr. Politzer completed an Ophthalmological Functional Capacity Questionnaire. He diagnosed the Claimant with convergence insufficiency and ocularmotor dysfunction. Dr. Politzer reported that the Claimant was sensitive to light, had episodic double vision and that her double vision condition caused "eye fatigue" such that the Claimant would need to rest her eyes at unpredictable intervals and, after fixing her gaze on an object, computer screen or printed matter after two hours. At that point, the Claimant would have to close her eyes to rest them for up to 5 to 10 minutes. Dr. Politzer checked that the eye impairment would not impair or preclude the operation of an automobile but it would impair or preclude the operation of a computer. He opined that the Claimant's eye impairment would significantly impair her ability to use tools, coordinate eye-hand movements and see well enough to work with small objects. However, it would not, or only moderately, impair the Claimant's ability to view objects when looking up, down or to the side or straight ahead. He also noted it would not impair her ability to read or to clearly view a computer screen on regular basis for two hour segments. Her condition would not, or only moderately, impair her ability to recognize errors and record information, work with speed and accuracy in the performance of tasks, coordinate eyes and hands rapidly and accurately to make precise movements with speed or impair the Claimant's ability to avoid ordinary hazards.

114. On March 27, 2013, Ms. Haddow prepared a written response to various questions related to the Claimant that were posed by the Claimant's attorney. In her report, Ms. Haddow stated that the Claimant "frequently appeared to forget the question or topic and often provided excessive detail" and she "exhibited moderate problems with fluency." The Claimant advised Ms. Haddow that she had problems with reading and recall, dizziness and balance. The Claimant also reported that she was cleared to drive but was uncomfortable driving more than a mile or two from her home. Ms. Haddow opined that the Claimant's "visual deficits, cognitive deficits, cognitive fatigue and persistent headaches would interfere with her ability to perform reliably and consistently with testing that extended beyond 15 to 30 minutes." Ms. Haddow opined that the Claimant functioned better when she was in a quiet environment rather than noisy, visually stimulating environments if sustained cognitive attention was required. Ms. Haddow stated that she did not observe the Claimant reading and understanding an 8x11 printed page or writing a page of long text as she did not ask the Claimant to attempt these tasks since Ms. Haddow believed they were too difficult for her. Ms. Haddow documented that the Claimant was hypersensitive to noise, startled easily, and had trouble sustaining attention in crowded stores and noisy environments. Ms. Haddow reported that the Claimant had "problems recalling recent events, [and] headaches with any cognitive effort (attempting to read, listen to a conversation, watch a television program, following a recipe, shop for groceries)." Ms. Haddow noted that at the time she

completed her treatment with the Claimant, the Claimant required accommodations for computer work, in order to follow written or spoken directions and to read or write anything. Generally, she required additional time, someone to check for accuracy and frequent breaks. Ms. Haddow ultimately concluded that, based on the March 14, 2013 report of Dr. Politzer, in spite of some improvement in visual functioning, the Claimant would still have difficulty reading and writing on paper or with a computer.

115. On March 28, 2013, Dr. Gellrick completed a form stating that she agreed with Dr. Walter Torres' March 15, 2013 Mental Residual Functional Capacity Statement.

116. Dr. Gellrick testified by evidentiary deposition on May 6, 2013. She testified that she began treating the Claimant on December 8, 2008. She testified that it was significant to her that Dr. Hnida had ordered a CT scan, because due to his experience with combat situations and head trauma, he picked up on the Claimant's dizziness and a probable head trauma where Dr. Artist and the EMTs would not have. Dr. Gellrick testified that she was trained at the Denver Health Emergency Department and in her experience, in a Level 1 trauma emergency room, they will not be as concerned with someone who is not experiencing acute trauma evidenced by bleeding or loss of consciousness. She did not see any evidence that emergency room personnel performed any kind of mental status exam other than the Glasgow Coma Scale. Dr. Gellrick testified that during the golden hour the blood supply goes to the brain and to the heart and the patient may not be aware of some of her injuries. During the first hour to three hours (the time frame varies depending on the patient) the body clamps down and is "capable of doing amazing things to try to survive." Even emergency personnel may not recognize the extent of the patient's injuries. It is not until the patient gets past the golden hour that the patient's injuries will start surfacing. Dr. Gellrick testified that because of the golden hour, the Claimant could have looked good initially. Dr. Gellrick thought (mistakenly) the Claimant had neurologic deficit which was documented in the paramedic report as slurred speech and facial drooping (although review of the record shows these symptoms were listed as negative with a minus symbol). Dr. Gellrick testified that you can have a Glasgow Coma Scale score of 15 and still have a mild traumatic brain injury. Dr. Gellrick testified that Claimant's traumatic brain injury was caused by a bump or blow, as defined by the Division of Workers' Compensation Rule 17, Exhibit 10, Section C, and this does not require a laceration or hematoma. Rather, "you can have a countercoup injury, and the force of the brain being jolted around inside the skull can cause symptoms of mild TBI." Dr. Gellrick testified that Dr. Woessner's recommendation to have a head CT indicates that Dr. Woessner was concerned that the Claimant had a brain injury, even though the Claimant and her husband declined it. Dr. Gellrick noted that under the Mild Traumatic Brain Injury Guidelines, the Claimant had most of the symptoms associated with mild TBI. Dr. Gellrick also testified that, in her training, she learned that there are outliers (approximately ten percent of patients with TBIs) who do not get better. Based on Dr. Gellrick's personal experience, she verified that there are patients with TBIs who never recover. Dr. Gellrick also found that the patients who fall into the 10-20% outlier category may recuperate from depression and other similar diagnosis, however the vestibular symptoms, i.e., dizziness and headaches, may continue. Dr. Gellrick testified that Client has visual blurriness and

difficulty looking at a computer screen. Dr. Gellrick stated that these symptoms fit within the Treatment Guidelines E9 for TBI and that a visual dysfunction in these circumstances is a common problem. Dr. Gellrick testified that fatigue is a common symptom for patients experiencing chronic pain. Dr. Gellrick testified that the Claimant is not the type of person who doesn't want to go back to work: "This patient wanted to go back to work. It's one of the things she said to me when I first evaluated her. . . . This -- is based on work reviews, the Claimant had -- she presented -- according to those comments made by previous . . . employers or supervisors, as more of a -- what we call a type A, a person that's driven to do well and do it correctly and do it perfectly." Dr. Gellrick testified that "I don't see that she would have secondary gain from avoiding work." Dr. Gellrick stated that the Claimant's headaches stemmed from two sources: 1) The MTBI and 2) Cervicogenic pain as a result of the injury to Claimant's neck. Dr. Gellrick testified that Claimant has speech difficulties, including word-finding and stuttering. Dr. Gellrick agreed with Dr. Wolff's report that Claimant's chronic headaches would affect her ability to function. Dr. Gellrick testified that the Claimant would not necessarily be able to work even part-time (15-20 hours per week), because the Claimant suffers from severe headaches that can last over the course of several days. Dr. Gellrick agreed that the Claimant had improved since March of 2011. It was obvious that she can now walk more than two city blocks, she can sit for more than 20 minutes and stand for more than 20 minutes. She agreed that the Claimant can probably sit/stand and walk a little more than four hours in an eight hour day. To the extent that the Claimant would need to lie down that wouldn't necessarily be every single day and could be done at a break such as lunch. Based on her review of the surveillance video, Dr. Gellrick believes that the Claimant was able to lift 20 pounds and the video showed that the Claimant's ability to twist, stoop, bend and crouch, may have gotten better. Dr. Gellrick did not know how often the Claimant gets dizzy spells at this time. Dr. Gellrick testified that Dr. Roe is a competent ophthalmologist and Dr. Wilson is a competent neuro-ophthalmologist. Dr. Gellrick had every confidence in their ability to evaluate the Claimant. Dr. Gellrick would defer to Dr. Lipkin regarding vertigo and dizziness.

117. Dr. Gellrick's evidentiary deposition was completed supplementally on July 24, 2013. Dr. Gellrick testified that she didn't know what the Claimant can do today. If you really want to know what the Claimant can do you should do a repeat FCE. It doesn't change MMI but gives you more objective data. Dr. Gellrick agrees that her opinions about restrictions are guess work. She agrees that the Claimant showed improvement from March through August, 2011 and would have hoped that the Claimant's improvement would have continued through her use of a gym program and continued strengthening. Dr. Gellrick does fall back on the surveillance video since it showed a longer period of time than she normally had a chance to observe the Claimant and at no point did the Claimant appear to be having difficulty or being uncomfortable in the surveillance video from the Peach Festival. At no point did the Claimant appear uncomfortable while walking nor did she appear to be dizzy or have dizzy spells.

Video Surveillance of the Claimant

Multiple CDs with video surveillance were provided as part of the record in this case. From this, a few relevant portions are summarized below:

January 8, 2009

118. At 10:28 a.m. the Claimant is seen exiting her house through the garage and going down to hand outgoing mail to the driver of a mail truck and retrieving that day's mail. After this, the Claimant has a conversation with a woman walking by and she has no apparent difficulty communicating. At 10:48 a.m., the Claimant is seen driving off alone in the minivan and she goes into an office. She is seen exiting the office at 12:36 p.m. walking while talking on her phone. She gets back into her minivan while talking on the phone with no apparent difficulties and drives off. At 12:53 that day, the Claimant is seen out in front of her house talking with a woman who has arrived in a dark gray SUV and the Claimant gets into the passenger side of the vehicle. The woman drives the Claimant to Exempla and the Claimant is at this appointment until approximately 2:05 p.m. when the Claimant and woman exit the building, return to the vehicle and the Claimant enters on the passenger side with no apparent difficulty. The Claimant arrives at her home at about 2:40 p.m.

January 13, 2009

119. The Claimant is seen driving off in the minivan from her home at approximately 9:47 a.m. The Claimant parks and enters a King Soopers at approximately 9:52 a.m. She drives off at 9:59 a.m. and drives home. At 11:13 a.m. that day, she backs the minivan out of her garage again, stopping in the driveway. She exits the vehicle and walks over to the mailbox over a snowy area but exhibits no balance issue or walking difficulty. She reenters the vehicle and drives to Mission Viejo Elementary school and enters the building. She exits the elementary school at approximately 11:18 and reenters the minivan.

January 14, 2009

120. At approximately 7:15 a.m. the Claimant is seen leaving her house in the minivan and she drives to Colorado Athletic Conditioning Clinic. The Claimant is at Colorado Athletic Conditioning Clinic until approximately 9:12 when she exits the building with a gentleman with whom she is conversing. They walk out to his truck and continue to converse. Then, the Claimant enters her minivan which is parked next to the truck at approximately 9:14 a.m. The Claimant continues to talk to the gentleman until she drives off at approximately 9:15 a.m. At 10:16 a.m., the Claimant is seen leaving her house and getting into the passenger side of a dark gray SUV. The Claimant and the woman who drove run errands, stop to eat and go to the grocery store where the Claimant is seen pushing the grocery cart full of groceries and shopping with the assistance of the woman who drove her. They leave the store at approximately 12:27p.m. and both women take bags out of the car and put time into the back of the SUV.

August 20, 2011

121. The Claimant, her husband and another couple, the Morelands, drove to Palisade, Colorado and spent several hours at a Peach Festival. Later in the day she went to a farmer's market, winery, and out to dinner that evening in Fruita, Colorado. Her activities were videotaped. The Claimant is left on her own on and off throughout parts of the day. The Claimant is seen bending over at the waist to look at items being sold at various booths. She is shown conversing with many vendors without any apparent communication problems. Throughout the day the Claimant is shown walking, going from standing to sitting positions, lifting, bending at the waist, crouching/squatting and reaching overhead with both arms. At one point she picks up a large box of Peaches and carries it for a bit. The Claimant testified that the video does not show that she had difficulty carrying it and set it right down for her husband to carry. However, even taking this into consideration, the video surveillance shows a regular and normal amount of activity on the part of the Claimant over the course of the day, including a lengthy car ride and typical activity at the Peach Festival. Despite it being a sunny day, the Claimant doesn't wear sunglasses (except on her forehead). She demonstrates no problems with photophobia. Her interaction with friends and strangers appear normal and comfortable. She demonstrates no balance problems and she exhibits fine motor skills. Contrary to her testimony at the hearing, Rosemary Moreland exhibits no apparent concern about balance issues or dizzy spell and she leaves the Claimant on her own, intermittently throughout the day.

August 26, 2011

122. On this day, the Claimant was videotaped on and off from approximately 9:20 a.m until mid-afternoon. Over the course of the day, the Claimant is seen retrieving her mail while talking on the phone with the phone cradled between her right neck and shoulder. She is next seen driving the family's minivan to the pharmacy to pick up her prescriptions. She is wearing different clothes than those she was wearing in earlier video footage from that day. While at the pharmacy, the Claimant has no apparent problems signing the payment pad and appears able to read the print on her receipt as she looks at it. Later, after returning home, the Claimant comes outside and does some gardening which involves kneeling and crouching. There are no signs of discomfort. She is outside in the sun without sunglasses with no apparent vision or photophobia issues. Still later that day, the Claimant attends an IME with Dr. Bernton. Following that evaluation she is shown carrying on a conversation, smiling and laughing. The Claimant shows no apparent ill effects from the day's activities which included driving to the pharmacy, gardening and attending an IME. She seems animated without any apparent problem with speech, communication or social skills or fatigue.

September 10, 2011

123. On this day, the Claimant drives the minivan to Lowe's at 12:00 p.m. She arrives at Lowe's and is at the customer service window at 12:11 p.m. She has her handbag slung over her shoulder and is on the phone. She picks up two 11 pound cans of paint and carries them to the register and then to her car all while her handbag is slung over her shoulder. She drives home. At no time does she display confusion or

discomfort. The Claimant testified at the hearing that she ran this errand, despite "really not feeling all that well."

September 11, 2011

124. The day after running an errand to Lowe's to pick up paint cans, the Claimant goes to church. She arrives at 8:53 a.m. The family vehicle is parked a good distance from the church. The Claimant is seen walking into the church with a bag slung over her shoulder and a coffee cup in her hand. The Claimant is observed outside the church at 12:09 p.m., about 3 hours and 15 minutes later. Contrary to her and Ms. Moreland's testimony, she does not appear the least bit fatigued from the morning's activities. She is very animated and expressive, carrying on a conversation. She does a little dance. The claimant looks to have good muscle tone without atrophy. At 12:14 p.m. the Claimant, while walking to the car, appears to be carrying 3 or 4 different items at once including a duffle bag or pillow case full of items.

December 7, 2011

125. At 11:36 a.m the claimant is shown outside her house having a conversation. She again appears animated and engaged. While engaged in this conversation at 11:37 a.m., the claimant is bending over and laughing. Later that day, at 1:53 p.m. the Claimant drives the minivan over snow-covered streets to 16900 E. Quincy Avenue and she drives home. At 2:42 p.m. the Claimant again drives her minivan on the snow-covered streets and goes to the chiropractor. She comes out of the chiropractor's at 4:04 p.m. and drives to Michael's, a craft store, where she is seen at 4:14 p.m. She crouches down to look at merchandise. She exits Michael's at 4:20 p.m. carrying a bag of merchandise.

Lay Testimony Related to the Claimant's Abilities and Limitations

126. Over the course of the hearing, the Claimant testified that, as a result of her work-related injury, she suffers from headaches every day. The Claimant testified that the more extreme headaches cause her to feel shooting pains through her head. The Claimant also stated that she experiences extreme headaches whenever the weather patterns change. The Claimant testified that she does not drive on days when she experiences extreme headaches or dizzy spells. The Claimant testified that, on many occasions after the accident, she would have to cancel plans with friends because her headaches were so severe. The Claimant testified that when she feels rushed, she experiences confusion, increased anxiety, and worsening of her headaches. The Claimant testified that as her headaches get worse, she becomes fatigued. This can then cause her to have double vision. She also testified that after 10-15 minutes of sitting at a computer, looking at the lights on the screen causes unbearable headache pain. The Claimant also testified that headaches make it harder for her to focus, and her cognitive functioning decreases. The Claimant further testified that her headaches increase when she gets upset or stressed, and that can cause emotional problems, physical pain and more confusion. The Claimant testified that since the accident, her ability to think, process information, concentrate, and focus is diminished. The Claimant stated that she had been trained by Ms. Haddow, a speech and occupational specialist,

to keep a calendar for medical appointments, personal appointments, mileage, and notes. The Claimant stated that her calendar provided her with constant reminders of appointments, prescription refill requests, and questions that needed to be asked of her physicians. The Claimant also testified that, despite using the calendar as a compensatory device, she continues to experience difficulty remembering details, such as specific questions to ask a physician during an appointment. The Claimant testified that her computer skills have diminished, and even her ability to compose a simple email without mistakes has diminished. She testified that she has the ability to compose short e-mails but often relies on her husband to check them for her for errors. The Claimant testified that since the accident, she has a problem with blurting out statements she does not mean, or that come out in way that she did not intend. She stated that some of her unintended comments have caused difficulties in her relationships with friends and family members. The Claimant testified that the medications she takes makes her feel extremely fatigued and tired.

127. The Claimant testified for a full day on August 16, 2013 and two half days on September 26 and November 22, 2013. The Claimant was present in person for testimony taken at the OAC on April 19, 2013, August 16, 2013, September 26, 2013 and November 22, 2013. In addition the Claimant was present for the deposition testimony of Dr. Schmitz on April 30, 2013, Drs. Gellrick and Entin on May 6, 2013, Dr. Torres on May 7, 2013, Dr. Thwaites on May 9, 2013, Drs. Bernton and Reinhard on May 10, 2013, and Dr. Zierk and Ms. Antcil on December 6, 2013. The Claimant was also present by phone for the testimony of Dr. Weingarten on May 13, 2013. During testimony at the OAC, the ALJ notes that the Claimant demonstrated a great deal of stamina, endurance and mental fortitude. She appeared to be able to follow along with the testimony of other witnesses and she had the ability to respond to questions thoughtfully and otherwise participate meaningfully in the hearing process. In addition, the Claimant also attended most of the days of deposition testimony with the expert witnesses which occurred over seven days. During redirect testimony by the Claimant on November 22, 2013, after participation in previous hearing dates in the matter, the Claimant stated she was bedridden for at least two days following each hearing.

128. Over the course of the hearing, there was testimony that the Claimant reviewed many of the medical records including most or all of the IME reports, and she has read some of the deposition transcripts although she has not read any of them in whole. During testimony, the Claimant was able to recall from memory the names of the multiple medications which she was taking in connection with this claim, as well as when she took them and what they are for. She also demonstrated a good memory of her job history, going back to her teenage years when she worked at a grocery store as a bagger and for a fulfillment company stuffing envelopes. This employment included using a computer/word processor while working out of her house.

129. The Claimant testified to problems with reading and small print, yet was able to read the IME reports of Drs. Bernton, Weingarten, Reinhard and Kenneally and form opinions about whether she thought those reports were accurate. In fact, she prepared a three page ethics complaint against Dr. Kenneally. Further, on cross-

examination, the Claimant prepared nine pages of notes in anticipation of her testimony which were entered into evidence. The notecards were primarily handwritten by the Claimant, although there are some type written notes which are cut and pasted into the exhibit. These were notes that the Claimant testified that she prepared to help her memory. However, the Claimant, by and large, did not need to refer to the notes. She acknowledged her testimony was from memory. All of the handwritten notes were prepared by the Claimant and are in her handwriting. The rest of these notes were prepared on a computer/word processor and they were cut and pasted onto the notecards. The Claimant testified that this was accomplished with her husband's help.

130. The Claimant testified that her hands are continuously busy whether it is continuous wringing of her hands, stuffed animals or a smooth stone. She testified, "my hands are usually busy doing something." However, in surveillance video and during substantial portions of time over 4 days of hearing testimony, the Claimant was often noticed without anything in her hands or without the motion of wringing her hands.

131. The Claimant testified that her previous jobs required a level of detail that she does not believe she is capable of performing now. The Claimant stated that her job at the Department of Education required her to file documents in various buildings. The Claimant stated that she would be unable to do the walking and navigating in downtown that her job required because of the noise, and her anxiety related to the traffic. The Claimant also testified that the noise and number of people associated with the Department of Education job would cause her headaches, which would cause her decreased cognitive ability so that she could not handle the details required in the job. Claimant stated that even bagging or cashiering in a Grocery Store would cause her difficulty. The Claimant testified that the noise and anxiety related to the number of people in a grocery store would be difficult for her to "filter out." The Claimant testified that she feels more fatigued after going to the gym, or following her medical appointments because this requires the use of more energy. The Claimant testified that, following her testimony on April 19, 2013, she experienced a migraine that lasted for several days. the Claimant testified that she spent the following day in bed, and it took her several days to recover from the headache.

132. The Claimant testified that she uses a day planner to stay organized that was provided by Ms. Haddow. The fact that the Claimant uses compensatory measures such as a day planner evidences her ability to adapt and plan. It demonstrates organizational skills. Moreover, even before using the tool, there is evidence that the Claimant maintained some organizational skills as corroborated by Dr. Gellrick's report on February 26, 2009 that the Claimant had been to 29 physical therapy appointments and that she had been able to, "track her appointment dates correctly," which is notable as the Claimant was first seen by Judith Haddow on March 25, 2009, a month later. The medical records demonstrate and the Claimant acknowledged that she was able to consistently keep her physician and therapy appointments. As is exhibited by the pharmacy log, the Claimant picks up her prescriptions on a regular basis. In her answers to interrogatories the Claimant stated that between the date of her injury and the date she reached MMI, approximately 2 1/2 years, she would spend 30 to 40 hours

a week attending appointments. She testified that she kept these medical appointments because, “it was important,” and because she was “dependable.”

133. The Claimant has also engaged in multiple activities that contradict her testimony about her ability to work on the computer, write e-mails and engage in tasks that require cognitive functions. The Claimant prepared mileage logs in which she kept track of medical appointments and prescription pickups. She would calculate her mileage each month and send the log to the claims adjuster with a cover email which she prepared. This demonstrates that the Claimant is capable of calculating miles, preparing an email transmittal as a cover sheet on a pdf format, scan an attachment and email those materials to the claims representative. The Claimant, her husband and another couple owned a rental property in Ohio which they sold in 2013. Notwithstanding her claimed disabilities, the Claimant was responsible for receiving payments and taking care of repairs. The Claimant was able to enter information on an Excel spreadsheet prepared by her husband in connection with her management duties attributable to this property. The Claimant and The Claimant’s husband testified that she could barely balance a checkbook, yet she continued to perform this activity. Further, the Claimant’s emails to Kaiser, post accident, demonstrate the extent of the Claimant’s involvement in her kids’ medical care. After reviewing the Peach Festival’s surveillance video, the Claimant prepared a page and one-half rebuttal statement on October 15, 2011. She was apparently able to review the 120 minute video and then thoughtfully respond to the information in the video. In addition she obtained rebuttal statements from her husband and Mark and Rosemary Moreland.

134. While volunteering at the church daycare, the Claimant worked with infants because she testified that she couldn’t handle the noise of the older kids or pick up the older kids. However, this testimony is inconsistent with some of the other testimony offered by the Claimant over the course of the hearing. Babies cry and make noise which the Claimant has indicated would lead to headaches and migraines and more cognitive dysfunction. Further, according to the Claimant, she would walk around the nursery holding the babies. This is not consistent with the Claimant’s avoidance of a number of activities due to balance problems and claims of intermittent dizzy spells.

135. Much has been made of the Claimant’s attendance at the Peach Festival in August of 2011 with regard to the Claimant’s ability to perform certain activities. At the hearing, the Claimant testified that in August 2011, she attended a Peach Festival on the Western Slope with her husband and some friends, the Morelands. The Claimant stated that before driving to the Peach Festival she had taken extra medication to assist her with managing her symptoms. She testified that the day of the Peach Festival was “not a bad day.” The Claimant testified that she slept during nearly the entire ride, except when they stopped on a couple of occasions to get out and stretch. The Claimant testified that, on the day of the Peach Festival, the weather was warm and her body didn’t hurt as much as it usually did. Also, her headache was not as terrible as usual, for part of the day. The Claimant testified that videos the Respondents took during that day did not show all the times she rested or needed to deal with her dizziness during her time at the Peach Festival. She testified that, when she was dizzy

while at the Peach Festival, she would lean up against a booth or hold onto her husband or Ms. Moreland to steady herself. The Claimant testified that she was able to sit down at the Peach Festival whenever she needed to. The Claimant testified that she sat in the rocking chairs at one booth on multiple occasions, but the video did not show it. The Claimant and her husband testified that, since the accident, she engages in OCD behavior that the Claimant did not perform before the accident. The Claimant and her husband testified that the Claimant's OCD behavior was demonstrated during the Peach Festival when she insisted on sorting the Peaches to ensure she got the best box of Peaches. The Claimant testified that she should not have tried to sort the Peaches, even though she was compelled to do so, because it put extra strain on her neck, arms, and shoulders. The Claimant testified that, because both Mr. and Mrs. Moreland were carrying a box of Peaches, Claimant also wanted to help by carrying her own box of Peaches. The Claimant, her husband and Mrs. Moreland testified that the Claimant was only able to carry the box of Peaches for about ten feet before she had to set the box down. Her husband then carried the Peaches out to the car after the Claimant set them down. However, the video tape did not show the Claimant setting down the box. The Claimant testified that by the end of the Peach Festival she was tired and overwhelmed. The group then made a few stops, returned to the hotel, and the Claimant took an hour-and-a-half nap before dinner. The Claimant testified that the group did not return home from the Peach Festival until the next day. The Claimant testified that she slept in the car on the way home for about eight hours. These statements were corroborated by the Claimant's husband and the Morelands.

136. The Claimant has engaged in travel and camping activities after her injury, prior to MMI, and subsequent to MMI. In the Claimant's answers to interrogatories, she stated that she had only taken one overnight in-state trip since her accident when in fact she had taken multiple trips to Ohio, Kansas, Mississippi and Virginia. The medical records and therapy records also document several times when the Claimant travelled or went on camping trips with her family. More recently, the Claimant flew to Newport News, Virginia by herself on short notice in March of 2013 to take care of her son's infant due to a family medical emergency. She was responsible for taking care of her fifteen month old grandson while her son and daughter in-law were at the hospital with their premature newborn. The Claimant's son and in-laws were aware of the Claimant's condition, yet they trusted that the Claimant could provide the necessary care. The Claimant flew to Ohio and spent a week on her own when her father was sick in March of 2012. She stayed, by herself, at the family home. Notwithstanding the fact that she hadn't lived in the Columbus area for 7 or 8 years, she drove locally, without any apparent problems getting lost. The day after the Claimant flew back to Colorado, her father passed away and the Claimant returned to Ohio in the Suburban, a 20-25 hour road trip each way.

137. The Claimant testified that it was never necessary to schedule an emergency appointment with Dr. Gellrick or any other provider following her out of state trips. She was not required to go to urgent care or the ER following these trips or while on these trips. According to the Claimant's testimony, traveling takes its toll. She stated that it normally takes a couple of weeks for her to recuperate. However, this is not

necessarily reflected in the medical records. It is not seen in the August 26, 2011 surveillance video, which shows the claimant's activities five days after the Peach Festival at which time she drove to the pharmacy, gardened, and attended an IME without any apparent visible difficulties.

138. Prior to the accident, the Claimant's husband testified that Claimant was the life of the party. She conversed well, and she talked nonstop. He also testified that prior the accident the Claimant enjoyed camping, hiking, walking, exercising, assisting with home improvement projects, gardening, and collecting large rocks for the family rock garden. In addition, prior the accident, the Claimant enjoyed Denver Bronco games, family baseball games, photography, and hosting family get-togethers, including cooking elaborate meals and cleaning up afterwards. The Claimant's husband testified that Claimant does not enjoy family camping trips in the same way she did prior to the accident. Prior the accident, Claimant would often camp with her family. The Claimant's husband testified that the family does not take as many camping trips because of Claimant's injury. In addition, The Claimant's husband testified that he takes his kids to go hiking, but that Claimant stays near the campsite. The Claimant's husband testified that she also organized all the family activities and outings before she was injured. He further testified that, prior to the accident, the Claimant passed the Ohio real estate exam, managed the family finances, managed all family real estate transactions and refinancing, and worked easily on a computer. The Claimant's husband testified that, prior to the accident, Claimant weighed approximately 130 pounds, and she had no issues with her weight. In 2012, Claimant's weight plummeted to 99 pounds, although she has regained about 15 pounds since that time. The Claimant's husband testified that, he and Claimant were not able to participate in as many dinner parties and card games with friends after the accident. As a result, The Claimant's husband stated that he and Claimant lost many friendships.

139. The Claimant's husband testified that, the day following the accident, the Claimant experienced a headache and she had difficulty rising from bed. The Claimant's husband testified that this was unusual for his wife, so they made an appointment with the family doctor. The Claimant's husband testified that, following the accident, the Claimant's husband testified that Claimant suffered from a constant headache, pain in her limbs, and difficulty moving. He also testified that her mood changed. She became highly irritable and she stuttered when she spoke. The Claimant's husband testified that, weather fronts, family pressure, stress, and OCD behavior can cause Claimant to suffer from Migraine headaches. The Claimant's husband testified that, on days Claimant suffers from a migraine, she is unable to get out of bed. The Claimant's husband testified that Claimant's migraines can last from several hours to several days, and she experiences severe migraine headaches six or seven days per month. The Claimant's husband testified that, following the accident, Claimant was no longer capable of putting together Sunday brunch for her extended family and was no longer even capable of cooking family meals, other than very simple meals. The Claimant's husband testified that she has extreme difficulty participating in family game night, family get-togethers, baseball games, or concerts because the noise associated with these types of activities, causes migraine headaches for the Claimant. If she tries to do these types of activities

she generally must then lay down afterwards to manage her headaches. The Claimant's husband now manages the family finances as the Claimant is no longer capable of doing this activity. The Claimant's husband also testified that, following the accident, Claimant developed problems with her eyes. The Claimant's husband explained that fast forwarding commercials on the TiVo causes Claimant to jump, so she shuts her eyes whenever The Claimant's husband fast forwards the television. In addition, cars or motorcycles passing Claimant's car from behind cause the Claimant to jump and feel frightened. The Claimant's husband testified Claimant also does not enjoy photography like she used to, because she has difficulty working on the computer.

140. The Claimant's husband testified that prior to the accident, Claimant was a confident driver, following the accident, the Claimant became a very nervous driver. Following the accident, The Claimant's husband testified that Claimant had difficulty finding her words, getting lost in thought, being off-topic, changing the subject abruptly, and misplacing words. The Claimant's husband testified that Claimant had a difficult time recovering from the wedding trip for their son. The Claimant's husband testified that Claimant suffered from bad headaches while they were in Mississippi and that the 20-hour drive was difficult for Claimant each way. The Claimant's husband testified that he created a bed in the back area of his vehicle for the Claimant when the family drove to Mississippi. The Claimant's husband testified that Claimant slept in the back of the vehicle for the majority of the twenty-hour trip. The Claimant's husband testified that Claimant was unable to participate in most of the wedding festivities due to migraine headaches.

141. With regard to the Peach Festival, the Claimant's husband testified that two friends accompanied the Claimant and him to the Peach Festival. The Claimant's husband testified that, Claimant sat in the passenger seat behind the driver's seat of the family Chevy Suburban. The Claimant's husband testified that Claimant leaned against the window with a pillow, closed her eyes, and slept most of the way. The Claimant's husband testified that they took a break from driving, and exited the vehicle in Silverthorne and at a rest stop during the 4-hour trip to the Peach Festival. The Claimant's husband testified that the day of the Peach Festival, the sky was blue, the weather was warm, and no storms were coming in that would bring on a migraine. The Claimant's husband testified that he walked with the Claimant and their two friends around the Peach Festival for about one and a half hours before lunch. During this time, they socialized with their friends, and looked at jewelry booths and different Peach booths to determine from which vendor they wanted to purchase Peaches. The Claimant's husband testified that they then bought lunch from a food vendor and sat in a grassy area for a half hour or so eating their lunch. As the weather was very warm, they decided to move to a shaded area under a tent to finish their lunch. The Claimant's husband testified that they sat in the shady area for another fifteen to twenty minutes. Afterwards, they returned to walking around the Peach Festival for forty-five or fifty minutes and Claimant picked out the Peaches she wished to purchase. The Claimant's husband testified that, since the accident, Claimant suffers from OCD behavior, which was shown when she insisted on picking out the very best Peaches during the Peach Festival. The Claimant's husband testified that the Peach vendor asked Claimant to

stop opening and moving the Peach boxes, but she was ultimately permitted to pick the Peaches she wanted. The Claimant's husband testified that they purchased two boxes of Peaches. Claimant picked up one box, and The Claimant's husband picked up the other. The Claimant's husband testified that Claimant walked with a box of Peaches for about 10-15 steps, but she had to set the box down because she was unable to carry it any further. The Claimant's husband testified that he picked up the second box of Peaches and he carried both boxes to their car. The Claimant's husband testified that the video failed to show Claimant setting the box down or The Claimant's husband's assistance in carrying both boxes of Peaches to the car. The Claimant's husband testified that the video ended abruptly after Claimant took a few steps holding the box of Peaches. The Claimant's husband testified that, after purchasing the Peaches, Claimant and her husband and friends went to their car. The Claimant's husband testified that they had parked in a handicapped spot that was fairly close to the Festival entrance. In total, The Claimant's husband testified that they spent three hours at the Peach Festival, which included a one-half hour lunch. After leaving the Peach Festival, The Claimant's husband testified that they drove towards the hotel. On the way to the hotel, they stopped at a fruit stand. The Claimant's husband testified that Claimant and Ms. Moreland exited the vehicle and looked at fruit for about five minutes. They did not purchase anything, and they got back into the vehicle. They continued down the road, and noticed a winery which Ms. Moreland wished to visit. They stopped and everyone exited the vehicle to visit the winery and gift shop for about 20 minutes. After the winery, they went to the hotel. The Claimant's husband testified that Claimant took some medication and then she slept for an hour and a half. Following Claimant's nap, The Claimant's husband testified that he and Claimant went to dinner with the Morelands at a restaurant a few minutes down the road. The Claimant's husband testified that it had been a long time since they had had such a nice day with another couple. They returned to the hotel about 8:00 PM after dinner. The Claimant's husband testified that the Claimant then went straight to bed. From the time they left home at about 6:00 AM to the time the Claimant went to bed at about 8:00 PM, the Claimant's husband estimated that the Claimant was only awake 5-6 hours out of 14 hours.

142. Ms. Rosemary Moreland testified that she had known the Claimant for about three years after meeting the Claimant at church. Ms. Moreland testified that on August 20, 2011 she and her husband traveled to the Peach Festival in Palisade with the Claimant and her husband. Ms. Moreland testified that the Claimant slept for the majority of the time that they were traveling. Ms. Moreland testified that the Claimant experienced an episode of dizziness while they were looking at jewelry at the Peach Festival and the Claimant had to grab onto Ms. Moreland's arm so she could steady herself. Ms. Moreland testified that it appeared that the Claimant became tired and uncomfortable so they decided to stop and have lunch and rest. Ms. Moreland testified that the Claimant carried a box of Peaches for about ten feet before she had to set it down. Ms. Moreland testified that The Claimant's husband then carried the Peaches to car. Ms. Moreland testified that they left the Peach Festival and drove down the street to a fruit stand. Ms. Moreland testified that, after they left the fruit stand, they drove to winery where they stopped for about 15 minutes. Ms. Moreland testified that after they left the winery, they drove to the hotel. Ms. Moreland testified that they went to dinner at

about 6:30 or 7:00 PM. Following dinner, they returned to the hotel and everyone went to their rooms. Ms. Moreland testified that, the following day, they packed the vehicle, and then they ate at a restaurant. They then left the hotel at approximately 11:00 AM on Sunday morning. Ms. Moreland testified that the Claimant slept for the majority of the time they were driving home.

143. Ms. Moreland testified that the Claimant often fell asleep during social visits. Ms. Moreland testified that the Claimant often cancelled planned social visits due to headaches or doctor appointments. Ms. Moreland testified that the Claimant left church service on occasion due to headaches and dizziness. Ms. Moreland testified that, on occasion, she drove the Claimant to some of her doctor's appointments because the Claimant advised her she was unable to drive due to severe headaches. Ms. Moreland testified that she observed Claimant becoming dizzy on several occasions. Ms. Moreland testified that she observed the Claimant lose her balance and hold onto the wall on several occasions. Ms. Moreland testified that she observed the Claimant's difficulty with reading, stuttering, mispronouncing words, and other speech problems such as inserting the wrong word or making sudden topic changes. Ms. Moreland testified that she observed the Claimant's difficulty with memory. Ms. Moreland stated that Claimant forgot that Ms. Moreland's daughter-in-law was pregnant, despite discussing it on multiple occasions. Ms. Moreland testified that the Claimant often forgets the topic being discussed right in the middle of a conversation. Ms. Moreland testified that she has observed the Claimant become extremely nervous when the Claimant is driving, and when the Claimant is a passenger in a car. Ms. Moreland testified that she has never driven on the highway with the Claimant.

144. Annette Gordon also testified at the hearing in this matter. Ms. Gordon testified that she has been friends with the Claimant for more than 30 years. Ms. Gordon testified that, prior to the accident, the Claimant was a good mother, and an intelligent, quick witted, capable, kind, and thoughtful person and she had no difficulty with home chores such as painting homes, moving, or packing to assist with moving. Ms. Gordon testified that, approximately 25 years earlier, she had hired the Claimant in a sales position at Radio Shack where Ms. Gordon was the manager. Ms. Gordon testified that the Claimant was an excellent employee. According to Ms. Gordon, the Claimant was punctual, enthusiastic, and good at customer service. Ms. Gordon testified, that prior to the accident, the Claimant had no difficulty working on computers or corresponding by email and that the Claimant was a voracious reader and they often swapped books.

145. Ms. Gordon testified that, following the accident, the Claimant began repeating herself so often that they developed a signal to alert the Claimant when she was repeating herself. Ms. Gordon testified that, also following the accident, the Claimant began stuttering and she had difficulty with word finding and that she developed obsessive compulsive type behavior, such as rubbing a stuffed animal or a piece of glass. Ms. Gordon testified that, following the accident, the Claimant communicated with Ms. Gordon mostly in phone conversation rather than by emails. Ms. Gordon testified that when Claimant does send emails, they are mostly inspirational

email forwards. According to Ms. Gordon, she and the claimant speak on the phone two to three hours at a time, pretty frequently. In fact, Ms. Gordon testified that she bought a headset since she could not be stationary when talking to the Claimant. This activity is another indicator of the Claimant's stamina and endurance. Ms. Gordon testified that, following the accident, she believes the Claimant would have significant difficulty drafting substantive emails. Ms. Gordon testified that the Claimant suffers from poor stamina. Her disposition is better so long as she takes a nap each day.

146. Ms. Pamela Ponder testified at the hearing that she is the current office manager for the State Services section of the Colorado Attorney General's Office. Ms. Ponder testified that part of her duties include supervision of three administrative assistants. Ms. Ponder testified that she supervised the Claimant when the Claimant was employed as an administrative assistant in the Colorado Attorney General's Office between 2006 and 2007. This was prior to the Claimant being hired by the Department of Education. Ms. Ponder stated that the Claimant was an energetic, friendly, reliable, team player. Ms. Ponder stated that the Claimant was good at communicating, taking on additional work, finding solutions, researching issues, drafting documents, and working on the computer. Ms. Ponder testified that the Claimant stopped by the Attorney General's office around March, 2010 to visit. Ms. Ponder stated that, at the time of the visit, the Claimant was not herself, the Claimant spoke slowly and with a stutter that she hadn't had before, and the Claimant -had difficulty finishing sentences. Ms. Ponder testified that she would not have initially hired the Claimant for the job of administrative assistant, if the Claimant had presented in an interview the way the Claimant presented during that visit. Ms. Ponder stated she did not have confidence that the Claimant could complete her job competently and she could not rely on her consistently.

The Claimant's Psychological Condition

147. Dr. Artist referred the Claimant for a neuropsychological evaluation which was performed by Thomas Broadhurst, M.A., N.C.C. under the supervision of Dr. Kenneally, PsyD. The referral information provided to Dr. Kenneally and Mr. Broadhurst was that the Claimant's MVA "resulted in postconcussive symptoms including difficulty with short-term memory, difficulty with processing speed, difficulty forming thoughts and complete sentences, as well as a feeling of not being herself. The referral question was to assess her current cognitive functioning, impairments, and to make recommendations as far as further treatment." The Claimant was interviewed and provided a personal history as well as a history of the present illness. The following procedures were administered during the course of testing:

Wechsler Memory Scale, Third Edition (WMS-III)
Wechsler Adult Intelligence Scale, Third Edition (WAIS-III)
Test of Memory Malingering (TOMM)
Beck Depression Inventory II (BDI-II)
PPI
Millon Clinical Multiaxial Inventory III (MCMI-III)

Controlled Oral Word Association Test (COWA)
Trail Making Test A and B
Seashore Rhythm Test
Speech Sounds Perception Test
Computerized Assessment of Response Bias

148. In a November 12, 2008 neuropsychological evaluation report, it was noted that the Claimant was given two psychological tests to assess effort levels and symptom exaggeration. It was reported that, "In both tests, [the Claimant] presented with scores that were significantly below results observed in research samples of individuals with significant brain injuries. This type of profile is suggestive of an individual who is consciously exaggerating the extent and nature of a variety of clinical symptoms or cognitive impairment, and/or an individual who is not putting forth maximum effort." It was noted that because the Claimant exhibits a high level of anxiety in regards to the testing and regarding her injury in general, this likely had an effect on the effort she put into the testing procedure. Thus, taking her high level of anxiety into account, the results of the psychological evaluation were considered valid but it was noted that the Claimant's scores on many of the performance scales were estimated to be in the lower range or her usual or normal capabilities. Dr. Kenneally and Mr. Broadhurst summarized the testing results concluding that "in addition to her somatic complaints, [the Claimant] is exhibiting significant deficits in working memory and processing speed. Additionally, she is exhibiting a high level of stress and anxiety, which she is reluctant to acknowledge at this time." However, the Claimant's symptoms were expected to dissipate and it was expected her cognitive functioning would return to normal. It was again stressed that the psychological evaluation did not represent the Claimant's maximum efforts and that the results represented the "lower echelon" of the Claimant's capabilities. Retesting in six months was recommended.

149. On December 30, 2008, the Claimant saw Walter Torres, Ph.D.., on referral from Dr. Gellrick, for a psychological evaluation. Dr. Torres reviewed the prior neuropsychological evaluation from November 12, 2008 and conducted a psychodiagnostic interview with the Claimant. At this evaluation, the Claimant's speech was organized and of a normal rate and volume, however, Dr. Torres noted a "slight stutter was evident several times during the interview." The Claimant commented on it to Dr. Torres and noted that it had gotten better and she had been stuttering quite a bit in the weeks after the accident. The diagnostic impression offered by Dr. Torres was:

Axis I:	Posttraumatic Stress Disorder Depressive Disorder, NOS Cognitive Disorder, NOS Pain Disorder Associated with Psychological Factors and a General Medical Condition
Axis II:	Deferred

Dr. Torres noted that "in addition to her cognitive dysfunction, she appears to be suffering from and anxiety disorder and mild depression" and her sleep remains

impaired. Dr. Torres recommended psychological counseling aimed at helping the Claimant to accept and manage her cognitive impairments and relieve symptoms of anxiety. He also recommended a low dose of an antidepressant such as Zoloft. He estimated the need for 8 psychological counseling sessions.

150. Dr. Gellrick referred the Claimant to Dr. Howard Entin, a psychiatrist, for a psychiatric evaluation. Dr. Entin initially saw the Claimant on June 9, 2009. The Claimant reported to Dr. Entin that she was struck by a vehicle traveling perhaps 15 miles per hour. The Claimant reported to Dr. Entin that she "probably had a brief loss of consciousness and was quite dazed." Dr. Entin reported that the Claimant told him that after retaining an attorney, Ms. Furutani, a change of physician was instituted and she began seeing Dr. Gellrick. The Claimant advised that the conservative treatment managed by Dr. Artist resulted in no improvement over months. As for physical conditions, the Claimant reported daily headaches with shooting electric pains and occasional migraines once or twice a week. Dr. Entin reported that the Claimant's vision and hearing are okay. Dr. Entin noted that the Claimant advised him that she is overwhelmed and gets no joy out of anything and that she had trouble with motivation. Her anxiety was reported as quite high. Cognitively, the Claimant reports that she has difficulty with speech and finds herself stuttering with difficulty finding words. She has trouble with concentration, focus and memory. Dr. Entin reported that "at this point she is so overwhelmed emotionally and cognitively she does not feel she is capable of working and is not seeking employment." Dr. Entin diagnosed the Claimant with major depressive disorder – moderate, with associated anxiety, cognitive disorder and post concussive syndrome. Dr. Entin recommended continued follow up with Dr. Torres and, as the Claimant's sleep and mood improves, he may begin to add cognitive enhancing medicine such as stimulants or Provigil. He reported that hopefully when the claimant's emotional symptoms improve the cognition will also improve. However, he ultimately concluded the Claimant is likely to have residual impairment.

151. Dr. Gellrick referred the Claimant to Dr. Kenneally again for an neuropsychological assessment on September 15 & 17, 2009 and Dr. Kenneally prepared a written report dated September 25, 2009. In addition to a clinical interview, Dr. Kenneally administered the following procedures during the course of testing:

Wechsler Memory Scale, Third Edition (WMS-III)
Wechsler Adult Intelligence Scale, Third Edition (WAIS-III)
Halstead Reitan Battery
- A. Category test
- B. Seashore Rhythm Test
- C. Speech Sounds Perception Test
- D. Trails A & B

Test of Memory Malingering (TOMM)
Behavioral Dyscontrol Scale (BDS)
Paced Auditory Serial Association Test (PASAT)
Rey 15 Item Test
Controlled Oral Word Association Test (COWAT)

Millon Behavioral Medicine Diagnostic
Millon Clinical Multiaxial Inventory III (MCMI-III)
Pain Presentation Inventory

152. Dr. Kenneally made a number of behavioral observations about the Claimant in her written report of September 25, 2009. She noted the Claimant was not driving per Dr. Gellrick's orders, She was "mentally alert, well oriented to person, place and time and able to communicate her thoughts in a clear manner with no unusual ideation noted. Dr. Kenneally opined that the Claimant's speech rates and motor rates were within normal limits. She did note the Claimant took a small stuffed toy from her purse and played with it in her hands during much of the evaluation. Dr. Kenneally noted that the Claimant's pain behavior was high, consisting of frequent verbal reporting of pain symptoms, anxious movements with her hands and holding her head in her hands and putting her head down on the desk.

153. Relating to validity considerations, Dr. Kenneally noted that the Claimant's neuropsychological test results indicate a marked degree of variability that is atypical. This degree of variability in her test results is inconsistent with the pattern of test results seen in individuals with documented traumatic brain injury. Dr. Kenneally reported that the Claimant's test scores on the TOMM were below those seen in, "institutionalized elderly demented patients." Dr. Kenneally found her performance indicative of the intentional production of wrong answers. Dr. Kenneally opined that failure at this level is actually a complex cognitive task requiring the patient to learn both the right and wrong answers to the test materials; and deciding in real time to provide the incorrect answers. Moreover, on other tests such as the Category test and the Paced Auditory Serial Addition Test, the Claimant performed at the mean or above average. Given that the Claimant performed successfully on these tests, her failure on the simpler measures is inconsistent since the simpler tests cover items considered "building blocks" to the more complex cognitive tasks tested in areas where she performed better. Dr. Kenneally opined that the Claimant's current test results cannot be interpreted in standard fashion given her failure of validity measures, the marked degree of variability in her test scores and the stark contrast between her impaired test scores and her observed and self-reported level of daily functioning. Dr. Kenneally noted that individuals with documented traumatic brain injuries do not obtain this highly variable pattern of test results. Further, the Claimant's test scores on certain measures, if valid, would indicate that her level of impairment would make it impossible for her to sustain a conversation or independently dress or bathe herself on a daily basis. Dr. Kenneally noted that the testing did indicate that Claimant's depression and anxiety appear to be worsening and this may be having a negative impact on cognition, sleep, pain and recovery. She found that the Claimant's test results "indicated a marked translation of psychological distress into physical symptomatology" and Dr. Kenneally advised the Claimant's medical treaters to obtain objective measures of the Claimant's pain symptom report when possible. Ultimately, Dr. Kenneally found "no objective neuropsychological test data to indicate that the Claimant has cognitive deficits resulting from her work injury on October 15, 2008.

154. On October 27, 2009, the Claimant attended a feedback session and Dr. Kenneally noted that she reviewed neuropsychological test results indicating no brain based cognitive sequelae associated with the injury during the session. Dr. Kenneally recommended a review of her antidepressant medications and the Claimant requested that Dr. Kenneally speak with Dr. Entin.

155. On November 11, 2009, Dr. Torres reviewed the psychological testing report of Dr. Kenneally. He noted that he found "the psychological test findings inconsistent with [his] observations of her clinical condition and course. The psychological testing suggests that her depression and anxiety are worse now than they were at the time of her first psychological testing. That is patently not the case. Both depression and anxiety are significantly less severe now than they were from January through at least June of this year. A review of the progress notes of her psychological therapy stands as evidence to this effect." Dr. Torres further found that his observations of the Claimant's cognitive disorder have been consistent and that they are diminishing. He noted that the Claimant "vented" about the report and "felt invalidated and strongly offended by it."

156. On November 19, 2009, Dr. Torres noted that he reviewed written observations made by the Claimant's long-time friend over a recent 14-day visit in Kansas. Dr. Torres found that the behaviors noted by the friend are "generally inconsistent with the notion that her deficits are due to malingering or a factitious disorder." He opined that the "behaviors described may suggest a picture in which deficits of function that do stem from cognitive disorder are aggravated by her shame about these, by emotionally motivated avoidance of situations that elicit awareness of her deficits, as well as by overcompensation for her deficits." Dr. Torres further noted that, "it is my opinion that [the Claimant] suffers from a cognitive disorder….I believe that her cognitive dysfunction is aggravated by posttraumatic anxiety and possibly by performance anxiety, and other stressors. Controversies regarding the validity of her dysfunctions have also impacted her, as they have added a significant layer of stress. I do not see her deteriorating, but the recent controversies have contributed to some degree to the disorganization in her functioning."

157. On December 8, 2009, partially in response to Dr. Goldman's report, Dr. Entin stated that he did not believe the Claimant was consciously exaggerating symptoms nor malingering. Rather, he opined that she is anxious, easily overwhelmed, high-strung and can be easily frustrated, and irritable. He felt that the Claimant's psychological state interferes with her functioning. Dr. Entin admitted that he did not know how to explain the significant variability found in Dr. Keneally's report. He further acknowledged that he did "not have enough expertise in neuropsychological testing to know if severe anxiety and being overwhelmed could explain the variability and invalidate the testing," but he nevertheless suspected that something of this nature occurred during the testing to cause the variability and scatter in the results. Dr. Entin opined it would be useful to have another neuropsychologist review the raw data from Dr. Kenneally to see if the same conclusions would be drawn. He recommended either Dr. Schmitz or Dr. Thwaites.

158. On November 16, 2010, Dr. Entin, in a Neuropsychiatric MMI/Impairment Report, gave a final diagnosis of major depressive disorder largely in remission, generalized anxiety disorder largely in remission, pain disorder and post-concussive syndrome with ongoing headaches, cognitive and emotional symptoms. Dr. Entin found the Claimant was stable and plateaued from a neuropsychiatric perspective with a date of psychiatric MMI of February 1, 2010. Dr. Entin assigned a 10% whole person impairment rating for impairment of the complex integrated cerebral function with an ability to carry out most activities of daily living. He reported that the Claimant could not do complex cognitively demanding jobs and it was unclear if she could even do simple repetitive jobs on a consistent basis due to cognitive fatigue, disorganization and chronic pain. He reported improvement in terms of decreased depression, anxiety, improved sleep, better pain management and better social function, but opined that she still has significant deficits and recommended continued medication and supportive counseling.

159. Dr. Steven Schmitz, a neuropsychologist, saw the Claimant for an initial neuropsychological consultation on April 9, 2010. As part of this evaluation, Dr. Schmitz conducted a thorough medical record review, and he also reviewed letters from the Claimant's family and friends, reviewed the raw test data from the neuropsychological evaluations conducted in 2008 and 2009 and he interviewed Drs. Torres and Entin along with the Claimant and her husband. Dr. Schmitz notes that the Claimant's initial medical records shortly following the injury "were suggestive primarily of orthopedic injuries." He notes that within the first week, the Claimant did report to Dr. Artist of "dizziness, difficulty finding words, and slowed processing of thoughts." Dr. Schmitz finds that it is reasonable to conclude that this does not mean that the symptoms only emerged at that time, but rather that she was experiencing cognitive symptoms earlier in the week closer in proximity to the accident but was not yet demonstrating any psychiatric conditions. He further opines that "given the predominance of the acute and traumatic physical pain conditions following an assault such as is typically associated with a pedestrian/automobile accident….it is not unreasonable to conclude that [the Claimant] did sustain a concussive injury in the accident and that her subsequent cognitive complaints were of a timely nature, related to that injury, and also associated with her pain condition at the time." As for her current condition, Dr. Schmitz believes that it is reasonable to conclude that the Claimant's current condition "is a combination of her physical, emotional, and sleep difficulties. While he supposes that she may still be experiencing the residual effects of a concussive injury, "it would appear that those other factors are much more prominent to her current condition." Dr. Schmitz also opines that there is nothing to support that the Claimant is consciously exaggerating her symptoms or malingering. As part of his April 9, 2010 evaluation, Dr. Schmitz conducted no new psychological testing himself, rather he commented on the data obtained from the 2008 and 2009 testing. He reports that: "my analysis of the neuropsychological test results obtained in November 2008 finds that the patient demonstrated a number of cognitive deficits likely due to a combination of her physical pain, sleep difficulties, emotional distress, medications, and the lingering effects of the concussion she sustained in the accident." Dr. Schmitz opined that while the Claimant's test

performances were influenced by all of those factors, there is no evidence that the Claimant consciously exaggerated her condition. Rather, "her test scores accurately reflected her functional cognitive distress at the time, due from a combination of sources."

160. Also in his April 9, 2010 report, Dr. Schmitz disagrees with Dr. Kenneally's conclusions from the second neuropsychological evaluation in 2009 that the Claimant was demonstrating behavior consistent with a conscious exaggeration of her condition and inconsistent with patients with a documented traumatic brain injury. Dr. Schmitz argues that the Claimant's performance on the TOMM was impacted by her physical pain and sleep disturbance accounting for her poor performance on the validity measure. Further, Dr. Schmitz found it "inappropriate to conclude that a patient's test battery results are invalid on the basis of one single test." He opined that the Claimant's good performance on many of the tests in the battery is "clearly indicative of good effort." Dr. Schmitz found that the Claimant's deterioration in performance from some tests in 2009 compared to her 2008 results is indicative of the impact that the confounding factors, such as chronic pain and sleep difficulties, on her scores. Thus, he disagrees with Dr. Kenneally's conclusion that this decline is not attributable to the effects of the October 2008 injury. Dr. Schmitz also takes issue with Dr. Kenneally's comment that the Claimant's working memory score in the 3rd percentile is equivalent to almost no working memory ability and, if valid, would put the Claimant's level of impairment at a level that would make it impossible for the Claimant to sustain a conversation or independently dress or bathe herself on a daily basis.

161. On November 21, 2012, the Claimant saw Dr. Torres and he noted that the Claimant "struggled to complete the neuropsychological testing" although Dr. Torres also noted that the Claimant "felt Dr. Schmitz's stance was respectful and that it strongly fostered for doing the best she could. She felt that she could therefore be more at peace with the results." Upon reviewing Dr. Schmitz's findings, Dr. Torres noted that, "the behavior which he described raised the question for me as to whether an attention-deficit disorder profile of symptoms is contributing to the highly erratic level of participation in test activities."

162. Dr. Schmitz performed another neuropsychological evaluation and prepared a written report dated November 26, 2012. Dr. Schmitz refers to his prior April 9, 2010 report as well as the reports of Drs. Goldman, Weingarten, Feldman, Gellrick Entin, Torres, Bernton and Reinhard. He notes that the doctors fall into two camps, one of which opines that there is nothing essentially wrong with the Claimant and that she is functional and able to return to work, the other which has concluded that the Claimant experiences ongoing cognitive, physical and emotional difficulties related to the October 15, 2009 injury.

163. Dr. Schmitz noted that the Claimant reported that prior to beginning the testing, the Claimant stated that she knew her effort was going to be assessed and she was concerned that shooting pains she felt in her body were uncontrollable and that they might impact her performance. She also expressed her general paranoia about

being watched since she had recently been videotaped related to this case. The Claimant reported shooting pains, seeing spots in her vision and having a severe headache and she commented on her symptom complaints throughout the day. Other behavioral observations by Dr. Schmitz during the testing included,

> [The Claimant's] effort was suspect throughout much of the testing day. She displayed an attitude of uncaring and a notable lack of engagement.
>
> ....
>
> It was often difficult to engage her in the testing. At various times, for example, she began rummaging through her purse and on one of those occasions was seen flossing her teeth. During the IOVA test she was standing and walking around during the majority of the test and appeared to not be trying.
>
> ....
>
> [On a test of fine motor coordination] At times she appeared to have placed the instrument correctly but then turned it to an incorrect position.
>
> ....
>
> Her performance on purported measures of effort was generally poor and strongly suggestive of her giving incomplete effort. Additionally, many of her performances on the clinical tests were at or below the 1st percentile. Some of her scores had dropped from her previous testing in 2009.
>
> ....
>
> Her performance on the MMPI-2-RF was strongly indicative of the overreporting of somatic, cognitive, and memory complaints.

164. Dr. Schmitz noted under his clinical impression that, "despite being clearly aware of the importance and necessity of providing good effort on the current neuropsychological test battery, [the Claimant's] performance was considerably less than optimal and suggestive of a non-cooperative approach to the assessment process. Unfortunately, as a result it is impossible to offer a definitive determination of the patient's current level of neurocognitive functioning. On the other hand, she did perform quite well on a few of the measures in the battery and most specifically on a test considered very sensitive to the effects of cerebral dysfunction. Her "impaired" performances, however, were confounded by a distinct lack of effort and were therefore uninterpretable." He went on to conclude that "it is likely that her current presentation is reflective of a combination of the conscious and unconscious exaggeration resulting in her actual condition being far worse than would otherwise be expected….While she did apparently sustain an actual physical injury (including a concussion) as a result of the original accident, it would appear that her 'response' to this injury has been quite dramatic and it is likely that these non-organic factors are playing a substantial role in the maintenance of her ongoing complaints."

165. Dr. Schmitz met with the Claimant and her husband on November 29, 2012 to discuss the testing. In spite of his acknowledgement that the Claimant's performance was poor and suggestive of incomplete effort, Dr. Schmitz does not believe the Claimant is malingering in her condition. He opines that "fundamentally, [the Claimant] remains incapacitated from functioning effectively at her pre-accident level. As evidenced on the neuropsychological testing her cognitive functioning fluctuates on a daily or even minute by minute basis. She has developed a self-perception of being totally disabled, which clearly exacerbates any physical pain or cognitive difficulties she may be experiencing." Dr. Schmitz acknowledges that the Claimant represents an "outlier" in her response to a traumatic event, but finds that "but for" the event of October 15, 2008, the Claimant would not be as functionally disabled as she has become. He went on to opine that it is unlikely that the Claimant would experience any considerable improvement in functioning with further treatment and he finds her condition permanent.

166. On March 6, 2013, Dr. Torres reviewed with the Claimant some of the behaviors that Dr. Schmitz identified in his report "which were clearly disruptive to her participation in the neuropsychological testing." With Dr. Torres, the Claimant identified some of what was going on with her during the testing situation and she tried to clarify what she recalls was actually occurring, presenting a notably different perception related to the same behaviors. In looking at the broader context for this behavior, Dr. Torres opined that, "it speaks for deficits in self-regulation that result in significant behavioral dyscontrol and a tendency to produce behavior that is significantly discordant with what a situation calls for." Ultimately, Dr. Torres concluded, "neuropsychological testing batteries may not be the most suitable instruments for evaluating this kind of problem, and may instead simply yield descriptions of her as erratic and uncooperative."

167. Dr. Thwaites performed an Independent Neuropsychological Evaluation on March 8, 2013. He performed a thorough review of the previous medical records which were provided to him, including the earlier record and the prior psychological evaluations along with the treating physician records and IME reports. The record review was exhaustive. He also interviewed the Claimant and administered the following:

Rey 15 Item Test
Word Memory Test
Wechsler Adult Intelligence Scale IV
Benton Judgment of Line Orientation Test
Trail Making Test
Digit Vigilance Test
Seashore Rhythm Test
Rey Complex Figure Test
Boston Naming Test
Multilingual Aphasia Examination (verbal fluency)
Wechsler Memory Scale-IV subtests
California Verbal Learning Test-II (alternate form

Wisconsin Card Sorting Test
Booklet Category Test

168. Dr. Thwaites noted that the Claimant arrived unaccompanied and she exhibited a normal, “narrow-based” gait without any loss of balance or assistance required. She only exhibited a tremor in her hands when Dr. Thwaites advised her she was looking for that. He noted no right/left confusion and no motor asymmetry. She showed “extreme slowing” with fine motor movements with her hands bilaterally, but Dr. Thwaites comments that this “would not be consistent with what is known about her medical history.” He noted that the Claimant’s speech was disfluent and halting, but inconsistent, throughout the interview. He did not observe any loss of cognitive set, impulsivity, or disinhibition during the examination and “no obvious cognitive problems at the conversational level.” Dr. Thwaites found that the Claimant “performed in the significantly impaired range on a formal test of effort and motivation” and he found that her test results, “are not believed to be an accurate depiction of her current abilities.”

169. In his March 8, 2013 report, Dr. Thwaites notes that from a neuropsychological perspective, there are a couple of relevant issues in the Claimant’s case. The first issue is whether or not the Claimant suffered a concussion (which he notes may be used interchangeably with the term “mild traumatic brain injury”). Dr. Thwaites notes that there is a convergence of literature to suggest that this is a neurologic event and the World Health Organization and the National Academy of Neuropsychology recommend diagnosing this injury based on the history and on acute injury parameters and “not by how a person is reporting their symptoms at a later point in time.” Dr. Thwaites notes that relevant injury parameters include “retrograde amnesia, loss of consciousness, altered consciousness, posttraumatic amnesia and the signs and symptoms of concussion are all used to make the diagnosis. The Glasgow coma scale score and neuroimaging (if available) are also helpful diagnostically.” Dr. Thwaites notes the discrepancy between the acute injury parameters and the Claimant’s current self-report about the injury, but opines that “it is most prudent to offer diagnosis of very minor concussion within a reasonable degree of probability” based on the available information.

170. Dr. Thwaites goes on to note that the next neuropsychological issue in this case is one of prognosis from a concussion standpoint. Dr. Thwaites points out that in a minor concussion with no loss of consciousness and brief posttraumatic amnesia with no observable cognitive symptoms in the field and in the early aftermath, there is an excellent prognosis for complete cognitive recovery within days to weeks. It is extremely rare to have symptoms beyond seven to ten days from a cognitive perspective following this level of injury. Of the population that does not have a complete cognitive recovery, it is typical that the individuals have neurologic vulnerability or and advanced age or other confounding factors. A person of the Claimant’s age without other prior concussions or neurologic difficulties (which are not present in the Claimant’s case) are expected to have a good cognitive recovery.

171. The next relevant issue that Dr. Thwaites addresses is that of the Claimant's neuropsychological assessments. He notes that these are used to determine a person's functioning at a later point in time following the initial event. He points out that to understand the brain-related cognitive functioning, the other factors that can contribute to poor test scores must be ruled out. In this vein, Dr. Thwaites notes that the Claimant "has not participated fully in now four different neuropsychological evaluations." He opines that the Claimant's test scores in these evaluations cannot be perceived as an accurate reflection of her true cognitive abilities from a brain functioning standpoint. Further she displayed an onset and course of neurologic symptoms over time that would not be consistent with residuals from a concussion.

172. Dr. Thwaites ultimately concluded on March 8, 2013 that the Claimant's neurologic complaints across time are not associated with a concussion and her neuropsychological test data are not an accurate reflection of her abilities. He opines that she may have mild cognitive error, possibly based on her current medication regimen or based on psychiatric factors and pain. However, Dr. Thwaites concludes that, "we are without objective data that would indicate that she has cognitive impairment within a reasonable degree of probability, even though that is certainly a strong possibility." He finally notes that "it is safe to say that what we are seeing in her presentation does not make sense neurologically based on a minor concussion, a normal MRI, and what is known about her medical history.

173. On March 30, 2013, Dr. Kenneally reported that she found no objective evidence or data to change the clinical opinions included in her neuropsychological evaluation of September 25, 2009. She agreed with Dr. Schmitz's conclusion that non-organic factors are playing a substantial role in the maintenance of her ongoing complaints and she opined that "these psychological factors have been a consistent element of [the Claimant's] presentation since she was first psychologically evaluated in November of 2008." Dr. Kenneally agreed with Dr. Weingarten's conclusions of September 2011 and with her diagnosis of pain disorder with associated psychological factors versus malingering and personality disorder. She agrees with Dr. Reinhard that the Claimant has no permanent cognitive impairment resulting from the subject accident. Dr. Kenneally specifically references and agrees with Dr. Reinhard's conclusion that "the magnitude of cognitive dysfunction this patient displays far exceeds that which originates from the amount of neurological damage stemming from a mild concussion. Her course of recovery is contrary to the pattern of spontaneous neurologic improvement one reliably observes following traumatic brain injury of any severity." Dr. Kenneally concludes that the Claimant has no permanent cognitive impairment from the October 16, 2008 claim. Dr. Kenneally also took issue with "incorrect assumptions" that Dr. Schmitz made in his April 9, 2010 record review about the November 2008 neuropsychological testing of the Claimant and provided a letter she had previously sent to Dr. Schmitz to clarify misconceptions.

174. Dr. Schmitz testified by evidentiary deposition on April 30, 2013. In preparation for his deposition, he reviewed the substantial medical records in this case, the surveillance video taken on August 20th, 26th, September 10th, 11th, December 16th,

17th, 24th and February 9th, 10th, 14th and 18th of 2011. He also reviewed the Claimant's personnel records along with statements of lay witnessed regarding the Claimant's pre-accident functioning. Based upon his review of the initial emergency and medical treatment records, Dr. Schmitz testified that he found that the Claimant met the criteria for suffering a mild traumatic brain injury. He testified that he does not believe that the Claimant could function at a job at her pre-injury levels without a lot of accommodations. Dr. Schmitz testified that he does not feel a diagnosis of malingering is appropriate for the Claimant and he does not believe that any of her treating providers consider the Claimant to be malingering or exaggerating. Rather, the neuropsychological testing performed in his office and on the three other occasions with other providers merely shows that she is performing poorly, suggestive of poor effort, and inconsistent with what the Claimant was doing with Ms. Haddow. Dr. Schmitz testified that he finds that other factors are influencing her performance on the neuropsychological testing such as headache, speech problems, dizziness, emotional distress and sleep difficulties. Nevertheless, Dr. Schmitz did testify that his "neuropsychological test results with respect to the impact on her cognitive functioning are -- are uninterpretable." Even so, Dr. Schmitz opined that this does not support a diagnosis of malingering since, "there are additional and alternative and more expansive explanations of the patient's performances…." Dr. Schmitz characterizes the Claimant's performance on testing as "inconsistent" and "poor effort" and notes that it is "unusual" but he testified that he does not believe this constitutes the intentional production of exaggerated symptoms. He does agree that the Claimant's symptoms have "been expanded upon as she has matured into this injury" but Dr. Schmitz testified that this falls short of grossly exaggerating symptoms since her symptom complaints are consistent with what many people describe following traumatic brain injury. Dr. Schmitz also disagreed that patients always experience a pattern of spontaneous neurologic improvement. He testified that there is improvement that occurs on a physiologic level but even once that is sustained, "it's not the case that they no longer have any cognitive difficulties." With specific reference to the Claimant, Dr. Schmitz testified that she "is impaired and does have cognitive difficulties rendering her disabled." Dr. Schmitz also testified regarding the validity measures during the neuropsychological testing. With respect to the TOMM, he stated that "it only accurately identifies incomplete effort 55 percent of the time." Dr. Schmitz acknowledged that the Claimant's condition and her presentation is unusual, but in looking at her behavior during neuropsychological testing and the marked changes to the Claimant's condition reflective of an impairment of functioning, he still finds that "it does make sense neurologically" in spite of the unusualness. Dr. Schmitz testified that he would classify the Claimant as an "outlier, a person who does not present in a way that is, I'll say, typical of patients who have experienced similar injuries." In terms of the Claimant's abilities and functional restrictions, Dr. Schmitz testified that her ability for recall and remembering would be inconsistent as would her ability to carry out instructions and maintain attention and concentration for extended periods. He further testified that the Claimant would be inconsistent in maintaining regular attendance, punctuality and sustaining an ordinary routine. He opined the Claimant would also inconsistently be able to perform work without distractions or interruptions. Dr. Schmitz also testified that the Claimant would inconsistently be able to interact appropriately with the public, coworkers or supervisors without exhibiting

behavioral extremes. Dr. Schmitz also testified that the Claimant would likely be absent from work three or more times a month due to significant fatigue.

175. On cross-examination at his April 30, 2013 deposition, Dr. Schmitz agreed that his "bottom-line opinion" of the Claimant's condition is that, "based upon her course over the past four years, her prognosis is quite poor. It is unlikely she would experience any considerable improvement in functioning with any further treatment. For all intents and purposes, her condition should be considered permanent." Dr. Schmitz again agreed that the Claimant's case is not "normal or garden-variety" but rather "is a case that has unusual and complicated elements." Dr. Schmitz agreed that "conscious exaggeration" and "malingering" generally mean the same thing. Dr. Schmitz nevertheless does not agree that the Claimant was malingering. He testified that although he "certainly found a lot of behavior that was consistent with what we consider to be incomplete effort," he did not find it "profound" enough to reach a determination that the Claimant was malingering. Although Dr. Schmitz did acknowledge that his threshold for making a determination of malingering is high. On re-direct examination at the deposition, Dr. Schmitz testified that that when he stated in his report that the Claimant was in the "first percentile" this means that the Claimant's performance is at the very lowest end in comparison to women of her age with her level of education who had an absence of any history of neurologic compromise. In other words, 99 percent of women with no history of brain injury performed better than the Claimant on the testing. Overall in the testing performed at his office, Dr. Schmitz testified that the Claimant performed inconsistently with performances across the board, but ultimately, "her effort on the testing made any conclusions to be drawn regarding her cognitive functioning inappropriate." Also during redirect testimony, Dr. Schmitz is referred to the initial emergency medical records and he incorrectly agreed that "incontinence and slurred speech and facial droop" were objective findings that were observed by EMTs. As noted elsewhere in this Order, these symptoms were noted to be negative, thus, not present for the Claimant.

176. Dr. Entin testified by evidentiary deposition on May 6, 2013. With respect to the validity testing on the neuropsychological evaluations, he testified that there are a number of factors that can interfere with the ability to take a test consistently and reliably such as insomnia, pain, anxiety, distraction and medication. This is why Dr. Entin finds that there are problems with validity testing that compares patients with head injuries to people without such injuries. Dr. Entin testified that he performed a mental status exam and finds that, from his perspective, the Claimant has been consistent in how she presents. He testified that there are times when she has difficulty with speech fluency and stutters but, as she gets more comfortable, the stuttering stops. He testified that her word-finding difficulties present similarly. He found that this is how it has been all along. After reviewing the Claimant's history and mental status exam, Dr. Entin testified that he found the Claimant had evidence of a major depressive disorder with a moderate degree of associated anxiety. He also thought she had a cognitive disorder that he labeled "NOS" meaning "not otherwise specified." He testified that this is basically the same thing as a post-concussive syndrome, which he also diagnosed. Dr. Entin testified that he also found she clearly met the criteria for mild traumatic brain

injury. He testified that the mechanism of injury of a pedestrian being hit by a car at 5 miles an hour results in a significant trauma and he finds that the Claimant has describe an altered mental state due to the inability to remember all of the details and the feeling of being somewhat dazed. Dr. Entin discounts the value of the Glasgow Coma Scale, noting it is a gross test and not helpful in assessing the Claimant's cognitive state. Dr. Entin testified that the psychological testing with Dr. Kenneally showed that the Claimant has trouble doing the validity testing and thus, all of the rest of the testing isn't very helpful or useful. He testified that the Claimant was a high functioning individual pre-injury. He believes that due to her perfectionistic tendencies, she tried to fake it and minimized her symptoms for a long time and subjectively reported she was not having terrible depression or anxiety. However, the psychological testing picked up that she was depressed and anxious. As for the diagnosis of somatization, Dr. Entin notes that this means that physical symptoms are not completely explained by objective physical testing and therefore it is determined that unconscious psychological factors are playing a role in a patient's presentation. However, he testified that this doesn't mean it is all psychological, there can be an organic physical component as well. He differentiates this from "malingering" or "facticious disorder" which is purposely faking symptoms for secondary gain. Dr. Entin testified that he does not believe that the Claimant is malingering or has facticious disorder and he does not believe her treating, as opposed to evaluating, physicians find that the Claimant is malingering. He does agree with Dr. Weingarten that the Claimant presents somewhat histrionic. He agrees that you don't develop a personality disorder following an injury and he agrees that the degree of Claimant's cognitive complaints far exceeds what would be expected in a mild brain injury so the Claimant's presentation is not consistent with the usual recovery. However, he does not agree with Dr. Kenneally that research shows mild traumatic brain injury is a short-lived event from which most patients make a full recover. Rather, he testified that 20% of patients do not recover as expected. He characterizes the Claimant as an "outlier" and repeatedly emphasizes that he believes the Claimant is not "intentionally" exaggerating her symptoms. Yet, Dr. Entin does agree that the Claimant is incorrect in asserting that none of her symptoms are improved. In his opinion, there has been significant improvement since he first saw the Claimant, improvement in all parameters, depression is better, anxiety is better, sleep is better, headaches are better, thinking is better and the ability to do tasks has improved. Dr. Entin specifically disagreed with Dr. Thwaites statement that the Claimant has an onset and course of neurologic symptoms over time that would not be consistent with residuals from a concussion. He testified that he thinks, "all of her symptoms are consistent with someone who is an outlier, has ongoing post-concussive symptoms, all of the post-concussive symptoms she has are usual and normal types of symptoms….[although] they don't usually persist in most patients." He does not believe the Claimant presents with bizarre, weird or out of the ordinary symptoms. He finds her symptoms were consistent and that they improved over time. Dr. Entin testified that Drs. Thwaites, Weingarten, Reinhard, Kenneally, Goldman, Bernton and Wilson do not adequately address how the Claimant's ongoing symptoms of chronic headaches, chronic pain, insomnia, anxiousness and mental and physical fatigue could play in the Claimant's presentation.

177. On cross-examination, Dr. Entin agreed that since all the Claimant's neuropsychological testing is invalid, there is no way to objectively quantify the Claimant's neurologic dysfunction. Dr. Entin would defer to Dr. Lipkin on vestibular, vertigo and dizziness issues. Dr. Entin testified that as of MMI, and currently, the Claimant's major depressive disorder and her generalized anxiety disorder are largely in remission and that the Claimant's pain disorder has improved over time. The Claimant's depression and anxiety doesn't significantly interfere with her ability to work. Dr. Entin also conceded that motivation is a factor of what the Claimant can and cannot do, but he pointed out that the Claimant's ability to function on a sustained basis is not largely based on motivation. Dr. Entin does believe the Claimant can drive, including highway driving for short periods of time although he does not think it's a great idea given the Claimant's complaints of visual problems and difficulties with reaction time and her dizziness and difficulties with concentration and attention. In fact, Dr. Entin testified that he would be surprised if there was a driving evaluation that said the Claimant could drive without limitation. Dr. Entin also testified that the Claimant's condition is still stable and plateaued, with little change since MMI and she remains largely on the same medications. In terms of the Claimant's ability to perform work, Dr. Entin opined that the Claimant would "have difficulty doing more than very simple, routine, repetitive tasks and cannot do them consistently. Dr. Entin testified that, in an eight-hour-day, the Claimant would have some level of difficulty with the following: remembering and carrying out short, simple instructions; remembering and carrying out detailed instructions; with attention and concentration for extended periods of time; sustaining an ordinary routine without special supervision; work in coordination with others without being distracted by them; make simple work-related decisions; interact appropriately with the general public; get along with co-workers without distracting them or exhibiting behavior extremes; maintain socially appropriate behavior and appear neat and clean; and travel in unfamiliar places or use public transportation. He did not believe she could work an 8-hour day and was not sure if she could work a 4-hour day. However, if a vocational counselor came up with an in-the-home job where the Claimant could work 15 to 20 hours at her own pace, Dr. Entin testified that he would encourage the Claimant to do this.

178. On May 7, 2013, Dr. Walter Torres testified by evidentiary deposition. Dr. Torres is a clinical psychologist who has treated injured workers with psychological problems for 20 years. Dr. Torres began treating the Claimant about two and a half months after her injury. Dr. Torres testified that, upon his review of the Claimant's medical records and psychological testing up to that date, he was "concerned that her conditions were not being adequately represented." He stated that he believed the Claimant had shown evidence of conditions of anxiety and/or depression that did not result in a diagnosis for either of these conditions. He testified that his concern was that these conditions were "at risk of being ignored" and he opined that these conditions could be affecting the Claimant's presentation. Dr. Torres testified that he diagnosed the Claimant with posttraumatic stress disorder, a depressive disorder, not otherwise specified, a cognitive disorder, not otherwise specified and a pain disorder associated with psychological factors of a general medical condition. Dr. Torres testified that as a result of her posttraumatic stress disorder stemming from her accident, the Claimant

had difficulty with driving. She had difficulty tolerating cars coming towards her from behind whether she was in a vehicle or walking on the sidewalk. Dr. Torres testified about the EMDR he conducted with the Claimant and explained how in EMDR, he asked the Claimant to focus on the circumstances of her accident and notice the emotional reactions, physical reactions and thoughts that she had in reaction to the accident. Dr. Torres testified that while questioning a person about a trauma, they are in a state of hyperarousal, or increased anxiety, and you have them move their eyes left and right for 30-40 seconds and then you stop them and ask "what's there?" and you get them to notice details. Dr. Torres testified that the purpose of EMDR is to expose the person back to thinking about a trauma and develop a greater ability to discriminate what was there. He disagrees that the EMDR process produces false memories. Rather, Dr. Torres testifies that through the EMDR process, people will recall things that they did not previously recall when the person focuses intensively on moments of an accident and details emerge. Ultimately, Dr. Torres explains, the EMDR allows certain experiences that are "vivid" in the present to become more like ordinary memories and their vivid quality recedes which diminishes the vivid, persistent, intrusive quality of the memories. Dr. Torres testified that in the Claimant's case the vivid quality of flashbacks diminished pretty significantly, but she "appeared to have developed as a symptom of her brain injury an inability to tolerate rapidly shifting fields" and this didn't have to be in a car, but could also be rapid movement on the television. Dr. Torres explains that this could be another component to why driving is jarring to the Claimant. Dr. Torres also noted that he had to alter the way he performed EMDR with the Claimant as she could not tolerate the movement of hands in front of her face or the rapid eye movements. So, instead, he would use headphones to alternate sounds from one ear to the other or he tapped on her hands alternating the hands. Interestingly, the Claimant testified that she believed that she never really got the hang of EMDR.

179. During his deposition testimony, Dr. Torres disagreed with Drs. Bernton, Reinhard and Weingarten with respect to a diagnosis of malingering. He testified that he did not note the Claimant exhibiting the intentional production of false or grossly exaggerated physical or psychological symptoms. Dr. Torres testified that in the Claimant's employment records prior to her accident, her work performance is excellent and she is regarded as someone good with detail, organization and bringing order to chaotic situations. He finds this inconsistent with an "accusation" of malingering. Dr. Torres testified that the Claimant developed personality changes as a result of her brain injury, including obsessive-compulsive disorder features and possibly mild hypomanic features, such as a tendency to be expansive in her flow of thought so that when she starts talking about one topic, it expands broadly in a way that is out of control. Dr. Torres also testified that, whereas before her accident, the Claimant's likely "histrionic" personality features made her someone engaging who was able to make things happen, now the features are operating in a different context and having a disruptive effect because the Claimant doesn't have the cognitive organization and the sense of competence that she had before, resulting in disorganized and disruptive behavior. Dr. Torres testified that, contrary to Dr. Weingarten's opinion, the Claimant has improved and the psychotherapy is of benefit to her. Dr. Torres also testified that Claimant exhibited post-concussive symptoms associated with outlier patients who do not recover

from a TBI. Dr. Torres, stated that 10 to 20 percent of patients in his practice do not recover from TBI. Dr. Torres attributes a number of conditions to the Claimant's mild traumatic brain injury in this case, namely: visual disturbance, speech disturbance (stuttering or stammering), word-finding problems, and her confusion and disorientation. Dr. Torres testified that he could not necessarily attribute some of her other symptoms to the head injury as they could be related to physical issues or psychological distress, or a combination of the two. These symptoms included the headaches, the sleep dysfunction, the dizziness and balance and the feeling of being foggy. Dr. Torres testified that with respect to the Claimant's post-injury behavior, she is overwhelmed by information and stimuli and has difficulty multitasking. She is prone to circumlocution, rambling, expansiveness and obsessive-compulsive features. Dr. Torres noted that these behaviors were noted during psychological testing (e.g. the Claimant flossing her teeth), but "it wasn't understood as a probable representation of a psychiatric disorder that was disruptive to her functioning in that situation." Rather it was explained as conscious behavior. Dr. Torres additionally testified that, this resulted in the Claimant failing the effort testing and being characterized as not having applied effort; that she was able to apply effort but she simply didn't. However, Dr. Torres stated that in his opinions "there may be any number of other factors that are disruptive to her functioning in relationship to the effort test" namely, the tendency to become overloaded by demand and interaction that results in disorganized, impulsive and fixating behavior. Dr. Torres finds the neuropsychological testing to be only one component of the gold standard to determine if a person has a mild traumatic brain injury. The overall gold standard would encompass "an adequate set of observations" including treating practitioners as well as persons who observe the Claimant in her daily life. Dr. Torres testified that it is not unusual for the paramedics and DHMC Emergency Department not to conduct an in depth neurological evaluation. Dr. Torres explained that because the ER is dealing with more pressing matters, they only conduct brief neurological screenings to determine if the patient has a condition that must be resolved immediately. Dr. Torres testified that the paramedics and DHMC made some observations that are relevant to a determination of Claimant's cognitive status, but the evaluation was not thorough. With respect to the video surveillance of the Claimant, particularly the days of the Peach Festival, Dr. Torres testified that he did not see activities in the cognitive domain that were inconsistent with what he would expect to see as far as her behavior. Referring to his written report at Claimant's Exhibit 6, pp. 80-81, Dr. Torres testified regarding modifications to his original opinion regarding various interferences with the Claimant's function during an eight-hour workday. In considering a part-time or 4-hour work day, Dr. Torres felt that the interferences with the Claimant's function would be less due to less fatigue and overload. Although he opined that even in her home environment, the Claimant is prone to become overloaded.

180. On cross-examination, when questioned if he would encourage the Claimant to take a job where she could work at home, about 15 to 20 hours a week, at her leisure and take breaks when overloaded or fatigued, Dr. Torres testified that he would encourage the Claimant to try such a position. Dr. Torres defined cognitive overload as "stimuli of a conceptual nature, of a visual nature, of a factual nature that is hard for the person to process." In this context, he testified that he did not think an

environment that included newborn babies and potential for crying and noises that newborn babies make would probably not be an appropriate environment for the Claimant.

181. Dr. Thwaites testified by evidentiary deposition on May 9, 2013. Dr. Thwaites conducted a neuropsychological evaluation of the Claimant on March 8 and 28, 2013. Dr. Thwaites performed a medical record review and took a history from the Claimant, including personally interviewing the Claimant for two hours. His diagnosis is of the Claimant's condition is "cognitive disorder not otherwise specified by self report." During his testimony, Dr. Thwaites outlined the physiology associated with a concussion or mild traumatic brain injury. He testified that, "when sufficient force is transmitted through the head, there's a series of cellular changes that take place….there is an uncoupling of automatic regional cerebral blood flow probably because of an influx of calcium into the intracellular space. So at a time when the brain is working very hard to reestablish homeostasis, there is a lack of automatic regional blood flow that supplies glucose and energy to the brain. And this series of events causes a metabolic or energy crisis to the brain which causes the appearance of a lot of signs and symptoms that we see in the early aftermath [of a brain injury]." A diagnosis of concussion is based on the history, you look at certain signs, symptoms and factors at the time the accident occurred to establish the diagnosis. Neuropsychologists help to establish or refute that diagnosis depending on the facts. Neuropsychological testing is utilized to understand a person's level of functioning at a later point in time. Neuropsychologists try to rule out other factors that could contribute such as pain disorder, medication effect, sleep disorder, mood disorder, psychological factors and lack of participation in the exam. Validity tests were administered to determine if the Claimant could participate fully in the examination. The validity testing for the Claimant showed that she was not able for whatever reason to participate fully in the exam. Prior test results from Drs. Schmitz and Kenneally are also invalid. Testing shows that the Claimant was not able to put forth her best effort. Thus, while it establishes the lowest level of the Claimant's functioning, Dr. Thwaites testified that he believes, as do other evaluators in this case, that the Claimant is actually "functioning at a higher level than her test results would suggest." Referring to his written report, Dr. Thwaites confirms that he did opine that the Claimant sustained "a very minor concussion" in her 2008 accident. Dr. Thwaites testified the basis for this is the Claimant's history and certain diagnostic variables. In this case, Dr. Thwaites testified, "there is a bit of a discrepancy between what the acute records show about those injury parameters and what she has later said about those injury parameters." Dr. Thwaites testified that the pre-ambulance trip did not suggest any retro-grade amnesia, loss of consciousness, altered consciousness, post traumatic amnesia, or impaired cognition although later the Claimant reports these injury parameters. Therefore, Dr. Thwaites testified that he gave the Claimant the benefit of the doubt in diagnosing a concussion. Dr. Thwaites explained that the early medical records in this case are important because, "there is a convergence of literature that suggests that cognitive symptoms and concussion symptoms are worst generally speaking closer to the time of the accident and improve across time." There is animal literature to suggest that the cellular cascade occurs almost immediately within minutes to hours and then improves and resolves by two weeks post injury. There is a sports

concussion literature beginning in the 1990s that shows an immediate onset increased symptoms and decreased cognitive test scores right after the concussion and with serial testing the cognitive symptoms improve rapidly across time. Dr. Thwaites testified that, with this in mind, it was important to note that "when [the Claimant] would have been at her worst from a cognitive perspective, she really wasn't displaying or reporting much in the way of cognitive symptomatology." He further testifies, "the overwhelming majority of individuals do well particularly if they are young, neurologically healthy and this is their first concussion." The small minority of patients whose symptoms persist beyond six months are older populations, people with multiple concussions, people with neurological comorbidity. All human literature about brain functioning after a mild injury shows that it is worst right away and improves across time and then resolves. There is a wide consensus about that among researchers. Although Dr. Thwaites agrees that you can't have human testing at a cellular level because you would have to kill the test subject, "we do have indirect evidence that the energy metabolism issue does start right away and goes away, resolves." Dr. Thwaites testified that this is found in MRI data in Sports Concussion Studies and the Department of Defense Treatment Guidelines says that concussions are generally worse right away and improve across time. This is applicable to mild brain injuries although it would not necessarily be true for severe brain injuries because you have brain bleeds that grow. With more catastrophic injuries you can be up and down. In referring back to the Claimant, Dr. Thwaites agrees that "it is possible she has some cognitive error in her daily routine" due to medications, pain and sleep disturbance. However, he points out, there is no objective testing that her brain is not capable of working in a normal way, that she is not functioning cognitively. Rather, it is based on self report. Dr. Thwaites testified that, he doesn't believe you can only use the Claimant's self report to make a diagnosis that the Claimant has a cognitive disorder.

182. Dr. Thwaites testified that he did rotations at the Denver Health ER. He disagrees with the notion that paramedics and ER doctors did not do a full work up. He testified he also sees a fair number of records from time to time from Denver Health which are not consistent with that conclusion. He has never seen an ER record where they have done a mini mental status exam. It doesn't render the ER records unreliable and does not mean that they did not fully work up the Claimant. Dr. Thwaites has read thousands of paramedic reports and it is pretty common for paramedics to include witnesses' statements of the accident. It can be useful and give qualitative information about the mechanism of injury. Dr. Thwaites disagrees with Drs. Gellrick and Schmitz that the record supports a positive finding of slurred speech and that that constitutes evidence of mild TBI. That's a negative note. She did not have slurred speech or facial droop. The EMTs were thorough, they checked whether she was awake, alert and answering questions appropriately, whether she was speaking in full sentences, whether her head had any signs of trauma, they went through motor asymmetry, they looked for fluidity of speech, and asked her personally about consciousness, headaches, vision changes, dizziness, nausea and vomiting. The report shows that they specifically asked the Claimant if she was confused which she denied. Dr. Thwaites testified that typically people with post traumatic amnesia look dazed and confused and are repeating themselves. Overall, Dr. Thwaites testified that he finds information from

early medical providers helpful in drawing conclusions about whether or not a concussion occurred in a specific case.

183. Dr. Thwaites further testified that when he was with the Claimant for two hours he did not see her lose her train of thought, she wasn't disimpulsive, disinhibitated, and he didn't notice any cognitive errors in his discussion with her. He saw no obvious cognitive problems at the conversational level. Based on the available information, Dr. Thwaites opined that there would be no reason the Claimant would be unable to sit at a computer screen for a sustained amount of time. Dr. Thwaites testified that there was not any objective evidence to suggest that the Claimant couldn't do her prior job from a cognitive perspective. Dr. Thwaites testified that he agrees with the statement found on page 3 of Dr. Schmitz' November 26, 2012 report, where he states that the Claimant's "current presentation is reflective of a combination of conscious and unconscious exaggeration, resulting in her actual condition being far worse than what otherwise would be expected." However, Dr. Thwaites testified that Dr. Schmitz' explanation of the use of the words conscious exaggeration made no sense to Dr. Thwaites. He testified that, "I think that we all understand in neuropsychology what conscious versus unconscious means, I think it's clear." Conscious exaggeration means a person is aware that they are not doing their best or looking more impaired than they typically would be otherwise. Dr. Thwaites "adamantly disagrees" that symptoms following a concussion will appear months later. He has seen people who refuse to report symptoms and will minimize symptoms until they are spiraling and getting worse and then have to tell someone. However, he testified that this is extremely rare. Dr. Thwaites did agree that some concussive symptoms may not surface until several days, such as cognitive fatigue. He testified that, "if a person was in a hospital with multitrauma and they underwent emergency surgery right after their accident, they were unconscious and then highly sedated for a week and really were out of it for a period of time because of artificial sedation, I can see them a week later, going gosh. And they get back to home, noticing some symptoms, yes. That's not really what we're talking about here." In fact, Dr. Thwaites testified that the early responders "didn't diagnose a brain injury" and he felt there was "consensus in that regard." Dr. Thwaites disagrees that there is objective findings related to the Claimant's various cognitive symptoms such as the speech disfluency and her anxiety related behaviors. He testified that her display of these symptoms is "a form of self-report." He notes that she shows them to some providers and not others, and even when she shows the symptoms it is not consistent. Dr. Thwaites did not see any objective testing by Judith Haddow. He characterizes the work with Ms. Haddow as a "cognitive retraining module" but states that it is not objective testing, rather Ms. Haddow provided the Claimant with "tasks." He opined that Ms. Haddow's statement that 30% of patients cannot pass validity measures on neuropsych testing is completely false and misstates the large literature regarding effort and testing.

184. During cross-examination, Dr. Thwaites continued to assert that the Claimant's presentation is unusual and that he doesn't think that it is accurate from a neurologic perspective. He testified that he doesn't believe that, "what [the Claimant] is reporting and portraying is her true level of brain function." He opined that you can get a

blossoming of inflammatory and metabolic factors in the 24-48 hours post injury but disagrees that you can get a worsening neuropathology over weeks or months. With regard to the validity testing, Dr. Thwaites noted that the Claimant scored worse than people with advanced severe Alzheimer's, people with severe traumatic brain injury, catastrophic brain injury, and mental retardation. Dr. Thwaites does not believe it is plausible. While Dr. Thwaites did diagnose the Claimant with a mild traumatic brain injury, he disagrees with some of the Claimant's other medical providers who find that the Claimant continues to have neurogenic-based cognitive difficulties because of her concussion. Moreover, Dr. Thwaites opined that adding symptoms over time is not consistent with a mild traumatic brain injury.

Independent Medical Evaluations of the Claimant

185. The Claimant was evaluated by Dr. Tashof Bernton in an independent medical examination on August 26, 2011. Dr. Bernton took a history from the Claimant and conducted a thorough records review. He noted that the Claimant's presentation to him and in the medical records, "is one of an individual who is extraordinarily disorganized and requires extreme help from others and is essentially unable to function. This is entirely inconsistent with the nature of the accident and the documented medical history." In reviewing the medical records, Dr. Bernton notes that the early records from the paramedics, DHMC, Exempla and Kaiser do not report symptoms which would be consistent with a closed head injury/traumatic brain injury. With respect to the initial evaluation by Dr. Artist, Dr. Bernton notes that, "at this point, two days after the accident, at which point in time organic symptoms due to head injury would have been at worst, there is no notation of any cognitive symptoms. There is no notation of any headache. There is no notation of any confusion and there is no indication on examination of any stuttering or cognitive symptoms. Two days after the accident it was noted specifically that the patient "denies any loss of consciousness." Dr. Bernton opined that he found the assessment of injuries contained in Dr. Artist's initial assessment to be the most accurate and reliable assessment of the injuries the Claimant suffered on October 15, 2008. Dr. Bernton further notes that, the Claimant did return (to Exempla) for re-evaluation on October 20. The reports note that the patient "says she is feeling a little bit better over weekend." The report notes that the patient "says she can't drive when she takes medications and is wondering about work." Again, Dr. Bernton points out there is no notation of any cognitive impairments or abnormalities and the patient is described as "in no apparent distress, healthy appearing female who is alert and oriented x 3. She is appropriate." Dr. Bernton opined that head injury due to organic head trauma symptoms are at their worst at the time of the injury or shortly thereafter, certainly within 24 hours, with the exception of a subdural in which the blood slowly accumulates in the brain with symptoms presenting on a slow and increasing course. However, Dr. Bernton points out that there was no evidence of a subdural hematoma on the Claimant's CT scan. Therefore, Dr. Berton opines that there is simply no way that organic head injury due to the accident could produce the change in symptoms seen in this case. Additionally, although the absence of loss of consciousness does not rule out a mild concussion, it would be extraordinarily unlikely and certainly not medically probable that a trauma of that type could produce long-

lasting, functionally, extremely significant cognitive complaints. Even if such did occur, the patient's problems would be evident immediately. Dr. Bernton found that the Claimant's clinical course is not in any way consistent with that. Dr. Bernton further opined that the Claimant's reported cognitive complaints may be on the basis of conscience representation for external gain (malingering), conscience representation for emotional support (a factitious disorder), or unconscious symptom production including increased symptoms on the basis of anxiety or depression. However, these do not represent organic cognitive complaints, they are not disabling, and do not preclude the Claimant from employment. Thus, Dr. Bernton opines that the Claimant clearly does not have a physical inability on the basis of the accident to return to work. Dr. Bernton opines that the Claimant has not had a head injury, has multiple non-physically-based symptoms and that she would not be prohibited from returning to vocational activities she performed prior to her injury. He opined that it would be counter-therapeutic for the Claimant to be placed in a disabled status as she is physically capable of performing vocational activity.

186. Dr. Bernton also testified by evidentiary deposition on May 10, 2013. Dr. Bernton testified that he frequently evaluates patients for TBI, mostly with mild traumatic brain injuries. He has also been a primary reviewer on the Committee drafting the back, chronic pain and head injury chapters of the Medical Treatment Guidelines. Dr. Bernton testified that while the Claimant may have had a minor concussion, the type of head injury the Claimant had cannot produce, and is not consistent with, the marked deficits that the Claimant demonstrates at this point. Dr. Bernton testified that these complaints are based on malingering or on a very similar diagnosis such as factitious disorder which is the conscious production of symptoms for emotional support. Neither malingering or factitious disorder is an accident related diagnosis. Of these differential diagnoses, factitious disorder is more probable. With factitious disorders, the primary enforcers are not so much financial gain as they are emotional support. With factitious disorder you are more likely to find behaviors that are frequently maintained across a wide variety of circumstances including family and friends. The TOMM (Test of Memory Malingering) is the best information for determining whether the Claimant is giving full effort in a neuropsychological testing. If a patient intentionally does poorly on a neuropsychological test, it is useless. If you can't address the issue of effort there is no value in the testing at all because any individual can simply go in and intentionally do poorly and all you would ever say is "well the brain injury did it." Confounding factors such as anxiety, depression, chronic pain and insomnia are typical conditions associated with TBI patients, so you wouldn't expect them to skew the neuropsychological results. The TOMM testing is relatively insensitive to brain injury but is sensitive to a voluntarily lack of effort. Dr. Bernton testified that he doesn't know one way or the other whether the Claimant had a mild TBI, and he gives the Claimant the benefit of doubt that she has a TBI, but Dr. Bernton opines that it doesn't matter. Dr. Bernton agrees that the Glasgow Coma Score is a gross test as to whether or not the Claimant had a minimal brain injury. However, he testified that when we are talking about a situation in which a patient years later states that she has gross defects that prevent her from functioning on the basis of a head injury, a Glasgow Coma Score of 15 immediately after the accident is extremely useful and important. Because of the risk of

significant head injury, both emergency room personnel and EMTs are taught to assess patients for just those factors because they are quite clinically important. Dr. Bernton testified that the Claimant would not be awake, alert and answering questions appropriately at the time of the incident and then years later be disorganized, non-functional and stuttering. Slurred speech and facial droop in the EMT report represented a negative finding, otherwise other things described such as an odor of alcohol and a pelvic mass would have also been present. Additionally, you would not get a facial droop from a mild TBI. In reviewing the questionnaire the Claimant provided to Dr. Bernton, he testified that her account of the injury on that form was internally inconsistent. Dr. Bernton testified that in the questionnaire, the Claimant stated she struck the front windshield with her head where she was rendered unconscious, then she was thrown from the car to the pavement where she struck the back of her head on the pavement. Specifically, Dr. Bernton notes that if she was unconscious from the first head strike against the windshield, then she would not remember being thrown from the car and an impact with the ground. Dr. Bernton also pointed out that the account of the injury that the Claimant gave him was also inconsistent with the EMT records and the ER records. Dr. Bernton testified that he disagreed with Drs. Gellrick and Schmitz and he opines that in the Kaiser record with Dr. Woessner the day after the injury, when the Claimant says things like she "doesn't think" or "may have," that does not constitute evidence of post traumatic amnesia. Dr. Bernton opines the most likely explanation for the headaches reported on October 16 and 17, is that the Claimant had stress as a result of her accident which would not be unexpected and certainly could trigger a migraine. Even if it was associated with mild TBI, Dr. Bernton testified that it makes no difference. The Claimant's presentation down the road of a dramatic decrease in function is not characteristic of a head injury. When weeks, months, years later progressive neurologic symptoms develop which become disabling and markedly evident on examination preventing the Claimant from functioning, it doesn't happen that way anymore than if you get hit on the head today and six months later have a loss of consciousness. Dr. Bernton testified that there are no accident related impairments or restrictions which prevent the Claimant from returning to her pre-injury job as an administrative assistant. Dr. Bernton disagrees that the Claimant has physical restrictions that would prevent her from working as a result of the October 15, 2008 injury. Specifically, he disagrees that as a result of the injury, she is limited to sitting at a computer for 30 minutes at a time, that she has processing problems and that she has balance issues. Dr. Bernton pointed out that in the August 20, 2011 video, at one point, the Claimant was carrying a cup or something and was able to do so without evidence of balance problems. At one point she carried some food in one hand and ate and walked without evidence or concerns for balance. Dr. Bernton also testified that in another video, the Claimant was carrying a phone against her shoulder while holding mail. Yet, people with balance sensitivity have difficulties with changes in head position. Dr. Bernton testified that he saw the Claimant five days after she had gone to the Peach Festival. She did not disclose that to him nor did she say that she was wiped out as a result of her activities associated with attending the Peach Festival.

187. Dr. Bernton also testified regarding the Claimant's ability to drive. He opined that it does not make sense to say that someone is safe in a certain situation

such as local driving but not highway situations, because although the consequences to the individual in a vehicle may be greater at higher speeds on the highway, complex tasks which put other people at direct risk are clearly present in local, slower speed driving. For example, auto-pedestrian interactions are more common in local, slower speed driving. You don't want someone driving without a neurologic capacity to do so. Either an individual does or does not have capacity for driving. Dr. Bernton testified that "worst at first" applies to brain-injured patients. It is an organ like a liver or a valve. There may be some process of inflammation or swelling which may mean that you'll see the worst deficits within 24 hours. You can't have a psychological reaction to essentially a non-physical event that then becomes absolutely predominant and controls your life. Dr/ Bernton testified that in the Claimant's case her injury was, at best, a physically minor event, particularly in terms of a head injury. In reference to the Medical Treatment Guidelines at page 8, section C(6)(a), and discussing the 10%-20% of brain injury patients that don't respond, Dr. Bernton testified that they tend to be at the more severe end of the minor brain injury which includes unconsciousness up to 30 minutes. They also tend to have comorbid conditions such as preexisting neurologic conditions, previous history of concussions, and other things that put them at risk. And most importantly, according to Dr. Bernton, "even if that were the case, there's still no basis for the patient having symptoms at this point in time that were dramatically greater than the symptoms which were present at the point in time at which symptoms would have been at their worse right after the injury." So, the passage about outliers, in terms of brain injury patients who don't recover as expected still would not explain the Claimant's current status. Dr. Bernton also testified in regard to an abstract by Professor Ron Ruff and multiple clinicians from a June 2004 article. He agreed with the conclusion of the literature that symptom exaggeration and fabrication occurs in a sizable minority of neuropsychological examinees with a greater prevalence in the forensic context, that is, with respect to individuals engaged in a legal process.

188. On cross-examination, Dr. Bernton agreed there are errors in medical records all of the time. However, he further testified that there is nothing in the emergency room records which show that they somehow did an incompetent job and missed a very evident marked brain injury or that there is reason to doubt the observations in terms of the Glasgow Coma Scale. A Glasgow Coma Score of 15 in a period immediately following head injury indicates that the patient did not have a significant or severe head injury, although it doesn't rule out a mild traumatic brain injury. Dr. Bernton also testified that the medical records are very clear that the Claimant denied confusion and memory problems and he rejected an attempt to try to deconstruct the medical note from the day after her accident since he found it clear on its face. Dr. Bernton goes on to testify that if the Claimant has no confusion or memory problems 24 hours after the accident, there is no basis for her to have those problems two years later. Dr. Bernton opined that when the Claimant reported additional symptoms to Dr. Hnida, we were beginning to see the evolution of what could either be psychological or other factors. The symptoms reported by Dr. Hnida are precisely the same symptoms that are manifested by anxiety. Going back to the accuracy of the initial medical records in this case, Dr. Bernton testified that the idea that emergency room physicians don't assess mental status is clearly incorrect. A critical factor of emergency

room evaluation is to look for potentially life or limb threatening conditions. Among life or limb conditions which are important to evaluate are head injuries, particularly in an auto-pedestrian accident. Dr. Bernton testified, "And the idea that one of the primary trauma centers in the State simply doesn't do the evaluation for one of the most important conditions for which they are supposed to be evaluating the patient is nonsense." Specific to this case, Dr. Bernton expressed his opinion that there is documentation of an appropriate and appropriately detailed examination of mental status. And whether or not subtle cognitive symptoms might have been missed is irrelevant to the observations which are present, which is the fact that the patient was described as alert, conscious, answering questions in full sentences, Glasgow Coma Scale of 15, was clearly evaluated for head injury and was found not to have one. During his testimony, Dr. Bernton ultimately concluded, consistent with his prior written report, that "an individual who was noted to have no loss of consciousness by several observations at the time, was noted to have a Glasgow Coma Scale of 15 initially and in the emergency room, was noted to be alert and cooperative, and the day after the accident was noted to have no problems with confusion and memory loss, cannot be said to have an organic head injury several years later which leaves her so confused that she stutters, has balance loss, has inability to function, can't work, that all of these multiple symptoms are not physically present from that accident. And I think that that's entirely consistent with the medical record and demonstrated by it."

189. Dr. Judith Weingarten performed an independent psychiatric evaluation of the Claimant over a three hour period on September 12, 2011 and Dr. Weingarten's opinions are set for the in a written report dated September 22, 2011. Dr. Armin Feldman was also present during the interview with the Claimant during this evaluation, but he observed and did not participate. At the outset of the interview, the Claimant expressed to Dr. Weingarten that she was anxious about this evaluation. Dr. Weingarten took a detailed history (set forth in detail previously in this order). The description of the injury that the Claimant provided to Dr. Weingarten is inconsistent with other accounts and is notable for recollection of two separate instances where the Claimant hit her head and the fact that the Claimant now specifically alleges a loss of consciousness. The Claimant reports to Dr. Weingarten that "she stutters now which she never did before and started slurring her speech and could not put things together or remember things. She states that she has balance issues and has been in vestibular therapy and in and out of physical therapy. She states that she has had a headache for almost four years which are migraines and shooting pains through her head….She states that she is still in pain…and cannot put into words the amount of pain she has had. She states that over three years, her pain has changed. She does not have endurance or physical capabilities that she used to have. She states that she used to take eight hour hikes in the mountains and cannot do that anymore and she's always running into things." The Claimant reported the different therapies tried for pain alleviation, noting that massage therapy would result in her inability to move for three days and acupuncture offered only temporary relief and after 2-3 weeks, she is back to square one. The Claimant reported RF blocks "were a disaster" and now she is trying Botox therapy for her migraines. The Claimant reported that none of her treatments have worked for any length of time, although at one point while she was treating with an

osteopath and had acupuncture and medical massage, she was able to maintain with some pain and they made things a little more bearable, but these treatments stopped once the Claimant reached MMI. The Claimant reported that her current symptoms are poor memory, getting easily overwhelmed, slow processing, headaches, and balance issues. The Claimant did state that her vision is better but her vision brain processing is not. The Claimant stated that she is depressed now whereas before the accident, she was optimistic and didn't believe in depression or anxiety. The Claimant reported to Dr. Weingarten that before MMI, "she would spend her time almost 40 hours per week going to doctors appointments." She reported to Dr. Weingarten that she walks around in circles and just loses track of time. The Claimant reported that she does simple chores, such as laundry, and finds small projects and goes to appointments because she feels she has control when she does. In addition to the interview, Dr. Weingarten performed a record review which she summarized in her written report. During the course of the mental status examination, Dr. Weingarten noted that the Claimant was on time, cooperative and changed positions from sitting to standing every so often. Dr. Weingarten noted the Claimant was talkative and wordy and her speech was vague and she took a while to get to the point. Dr. Weingarten noted that in the beginning of the interview the Claimant was wringing her hands, then she didn't and then at the end of the interview the Claimant did this again. The Claimant's stuttering behavior was similar with some stuttering in the beginning and at the end of the interview, but not during the middle. Dr. Weingarten also noted that she reviewed surveillance video from August 20, 2011 and August 26, 2011. Dr. Weingarten's diagnosis was for pain disorder and histrionic personality disorder. She reports that the claimant describes her symptoms in a very vague and dramatic way. She goes on to report, "I am extremely concerned that even though her treating providers agree that her diagnosis of Pain Disorder and have seen the personality testing, that shows somatization and histrionic features that she is not being treated for Pain Disorder regardless of the question of malingering. Patients with Pain Disorder should not have treatment recommendations on subjective complaints alone, but only on clear objective findings. After a reasonable workup they should not have continued multiple referrals and passive treatments, especially when there is no improvement." Dr. Weingarten expressed concern for a diagnosis of malingering after reviewing surveillance video which showed a marked contrast to the Claimant's presentation in her office and other providers' offices as opposed to how she presents herself in daily life. She notes that the three-days of surveillance video she reviewed shows the claimant doing normal activities without pain behavior which was very different than the Claimant's report of her abilities and symptoms to her providers and me. The Claimant's ability to ride to Palisades is inconsistent with the Claimant's statement that she can barely be a passenger in a car. Dr. Weingarten recommended that the patient's pain disorder be treated by seeing one physician with limited medications and no further referrals of modalities of therapy. She noted that pain disorder rarely improves with psychotherapy, the Claimant was unlikely to improve with EMDR and that she did not recommend that form of treatment. She recommended that the Claimant undergo an MMPI to evaluate for malingering. Dr. Weingarten does not get the sense that the Claimant is vested in returning to work and expressed concern that the Claimant was taken off work based on her subjective complaints. In conclusion, Dr. Weingarten opined that the Claimant's diagnoses of pain disorder or malingering

would not be caused or aggravated by her work injury. Dr. Weingarten goes on to state, "I don't see any reason she could not work. In fact, I would encourage her to return to work as it may help her confidence."

190. On March 26, 2013, Dr. Weingarten provided supplementation to her written report after reviewing additional records from Dr. Reinhard, Dr. Bernton, Dr. Kenneally and Dr. Schmitz. After her review of these records, Dr. Weingarten opined that she continued to believe that there was no psychiatric or cognitive limitations or restrictions on the Claimant's ability to work. She stated that not only did she believe that the Claimant could work but that she should be encouraged to return to work.

191. Dr. Weingarten testified by evidentiary deposition on May 13, 2013. Dr. Weingarten is board certified in neurology and psychiatry and Level II accredited. She has also a Level II EMDR certification. Dr. Weingarten testified that the Claimant had a good memory of her medical history and what happened to her, except that sometimes there was inconsistency between what the Claimant said and what was in the medical records. The Claimant reported that prior to her injury, she was juggling 150 things at once, with 4 kids at home and a lot of people relying on her. Dr. Weingarten felt like the Claimant was at the end of her rope and it seemed like the Claimant's pre-injury activities were overwhelming her. From a mental status exam, Dr. Weingarten opined that the Claimant's memory was intact. Dr. Weingarten's accident diagnosis was a pain disorder associated with psychological factors and a general medical condition, chronic versus malingering. Dr. Weingarten noted that the Claimant did not stutter during the middle of her exam when she was more distracted, when she was talking about more things and not focusing on stuttering. Dr. Weingarten testified that she felt that was consistent with her questioning the diagnosis of malingering. Dr. Weingarten also testified that she observed the Claimant wringing her hands at the beginning and end of her interview but not in the middle when she was distracted, similar to the stuttering and Dr. Weingarten found that when the Claimant was distracted and thinking of other things, she was not attentive to doing those sorts of behaviors. Dr. Weingarten testified regarding her concern with the surveillance video of the Claimant presenting a marked contrast in the way that the Claimant would present herself to Dr. Weingarten and some of her other providers. For example, the Claimant told Dr. Weingarten that she always had to force herself to keep her shoulders down in order to be in a protective mode. Yet, Dr. Weingarten did not observe that in the surveillance video. The Claimant reported that she can't relax, she's always tense, she's always running into things, she couldn't even walk in a straight line which Dr. Weingarten did not observe in the video. She did not observe any pain behaviors. The Claimant reported that she can only do things in 15 minute intervals and had to rest and Dr. Weingarten observed the Claimant doing things for longer than 15 minutes in the video. The Claimant reported that she always had to change positions and there was no evidence of that in the video. The Claimant did not appear to be in distress. The Claimant said she had photophobia, yet she was out in the sun, not wearing sunglasses which you would expect. Dr. Weingarten disagrees with the diagnosis of post traumatic stress disorder. The Claimant was not experiencing PTSD when Dr. Weingarten saw her. Dr. Weingarten testified that if the Claimant did have anxiety disorder or depression it was in remission when she saw the

Claimant. There is a component of conscious exaggeration in the Claimant's diagnosis whether it be malingering or factitious disorder. Dr. Weingarten's Axis II diagnosis for the Claimant was personality disorder with histrionic features. Histrionic means that a person is vague, dramatic and needing to be the center of attention. Dr. Weingarten testified that she disagrees with Dr. Torres' opinion that histrionic features are acquired. Dr. Weingarten opines that rather, this is a part of a personality disorder that develops in early adolescence or early adulthood. Dr. Weingarten also disagrees with Dr. Torres that observation of the patient is more important in determining diagnosis than neuropsychological testing. Dr. Weingarten opined that neuropsychological testing is the gold standard in determining cognitive function. If that testing is invalid, then, Dr. Weingarten opines, "one has to put together the whole history and the medical records and try to make an assessment of why it's invalid." Dr. Weingarten testified that she thinks the Claimant had a "premorbid personality" of doing a lot and she tried to help a lot of people and she was overwhelmed and had to get a job even though she was not particularly invested in the job, even though the Claimant would say that she loved the job. However, based on this, the Claimant was at a high risk for things happening to her to get her to the position where she didn't have to work. Dr. Weingarten noted that although, the Claimant's accident was minor with a musculoskeletal injury and it was "her ticket out of the dilemma of feeling overwhelmed and preferring not to work." Then, things just snowballed from there. Whether or not Dr. Schmitz' use of the word "conscious exaggeration" was inartful (in his opinion), Dr. Weingarten testified that agrees with his use of those words. She also testified that she disagrees with Dr. Torres that a minimal job would be bad for the Claimant's esteem. Dr. Weingarten opined that, "anything that would get her out of the house and have her feel like she was performing a function and help her feel like she is making a contribution would help her self esteem."

192. On cross-examination, Dr. Weingarten testified that, being momentarily dazed after an accident and not remembering everything is not what the Medical Treatment Guidelines are talking about with regards to amnesia. Dr. Weingarten acknowledged that within a week of her accident, the Claimant complained of dizziness, difficulty finding words, and difficulty processing thoughts, and, other than the dizziness, these are possible symptoms associated with cognitive problems. Dr. Weingarten also admitted that a week after her accident the Claimant was exhibiting a number of acute and chronic symptoms that the Medical Treatment Guidelines list as associated with a mild traumatic brain injury. Dr. Weingarten agreed that Dr. Hnida diagnosed the Claimant with a closed-head injury on October 22, 2008 and on October 27, 2008, so did Dr. Artist. In discussing the notation in her written report about the Claimant talking excessively and not getting to the point and not answering questions, Dr. Weingarten testified that it is common for people she sees not to get to the point and talk excessively and not answer questions because they have their own agenda. She further testified that vague and circumstantial speech is very common in personality disorders, especially histrionic, and it's not at all inconsistent with functioning well at a job. Dr. Weingarten testified that this is talking about two completely different things. Dr. Weingarten also testified that she continues to stand by her diagnosis of personality

disorder, although she conceded that she does not have expertise in traumatic brain injuries, but rather, her expertise is in psychiatry.

193. On redirect examination during her deposition and in reviewing Dr. Hnida's medical record, Dr. Weingarten testified that Dr. Hnida did not report PTSD, but rather, closed head injury. Dr. Weingarten testified that when Dr. Hnida reported that the Claimant's mini mental status exam was "normal" that probably means that she got 30 points, a perfect score or maybe 28 and 29. If she had gotten a lot wrong and had obvious memory problems, he would not have reported that as normal. Dr. Weingarten noted that the Claimant did better on Dr. Hnida's mini mental status exam than on Dr. Weingarten's mental status exam and she testified that you would have expected to see better results on Dr. Weingarten's testing. In looking at the initial emergency medical records again, Dr. Weingarten opines that the EMT report does not indicate any loss of cognition and the EMT reports facial droop and slurring in the negative.

194. Dr. David Reinhard completed a thorough records review and prepared a written report dated April 16, 2012. Dr. Reinhard was specifically asked to address whether or not the Claimant suffered any cognitive injuries as a result of her October 15, 2008 pedestrian vs. motor vehicle accident. The records reviewed include the treatment medical records, independent medical evaluations, therapy records, FCEs and records of neuropsychological testing, among other records. After an 8-page summary of the records that Dr. Reinhard found most relevant, he offers his assessment and opinion as follows,

> It is my opinion that there is no cognitive impairment on the basis of a neurological injury. If a concussion occurred and resulted in a brain injury, then this would have been a mild traumatic brain injury at the very mild end of the spectrum of mild traumatic brain injury. The magnitude of the cognitive dysfunction this patient displays far exceeds that which originates from the amount of neurological damage stemming from a mild concussion. Her course of recovery is contrary to the pattern of spontaneous neurological improvement one reliably observes following traumatic brain injury of any severity. Instead of there being cognitive improvement and normalization over time, she reports an ongoing cognitive disability the degree of which far exceeds what one could reasonably expect to see following a mild concussive injury. This type of delayed recovery and the level of cognitive complaints [the Claimant] demonstrates are often results of psychological factors such as anxiety, depression and somatization. When validity measures show a significant lack of effort being put forth then the diagnosis such as factitious disorder and malingering become more reasonable diagnostic considerations.

Ultimately, Dr. Reinhard concludes, "Whether or not a concussion occurred is a question that has been argued a lot, but it is not all that critical in making an assessment of cognitive impairment in this case. That is to say, the amount of organically based cognitive impairment that would have resulted from a mild concussion would not

produce any significant permanent cognitive residual. Furthermore, there would be negligible long term impact in one's ability to work, need for any cognitive restrictions or for one's career longevity."

195. Dr. David Reinhard testified by evidentiary deposition on May 8, 2013. Dr. Reinhard is a board certified physiatrist. He is fellowship trained in traumatic brain injury at the Moss Rehab Hospital and was an assistant professor at the University of Pennsylvania Medical Center in their Division of Neuro Rehabilitation. He was the Medical Director at Spalding Rehabilitation Hospital. He has worked at Centennial Rehab and since joining CROM, about 50% of his practice is treating patients with traumatic brain injuries. Dr. Reinhard testified that he evaluates brain injured patients, orders appropriate tests to evaluate symptoms, prescribes a course of treatment which can include medications, therapeutic injections, physical therapy, occupational therapy, speech therapy and neuropsychological evaluations. Dr. Reinhard testified that most of his work is clinical and 80%-90% of his brain injured patients have mild traumatic brain injury as opposed to moderate or severe traumatic brain injuries. Dr. Reinhard has testified in about 40 cases going back to 2008 with about half of those civil and half workers' compensation cases. Most of those cases had something to do with brain injury and between 70-75% of the time, Dr. Reinhard was testifying for the Plaintiff/Claimant and about 25-30% of thei time he would have been testifying for the Defendant/Respondent. In reviewing his written report of the medical records review that he conducted, Dr. Reinhard testified that he continued to support his ultimate conclusions, including his opinion that, "there is no cognitive impairment on the basis of a neurological injury. If a concussion occurred and resulted in a brain injury, then this would have been a mild traumatic brain injury at the very mild end of the spectrum of mild traumatic brain injury. The magnitude of the cognitive dysfunction this patient displays far exceeds that which originates from the amount of neurological damage stemming from a mild concussion. Her course of recovery is contrary to the pattern of spontaneous neurological improvement one reliably observes following traumatic brain injury of any severity." Dr. Reinhard further testified that, "the concussion itself whether it's mild, moderate or severe, goes back to the initial event, the initial injury and not necessarily the course that follows." Dr. Reinhard testified that based on the initial symptoms here, this injury would be the mild end of a mild TBI. Dr. Reinhard testified that it is difficult to determine that the Claimant even suffered a concussion, but even if it is assumed that the Claimant suffered a concussion, the paramedic report would be evidence of the Claimant's injury being mild. Dr. Reinhard specifically reviewed the report and noted that the dash in the paramedic report was a negative meaning that symptoms of facial droop, slurred speech and odor of alcohol were not present. So, Dr. Reinhard testified, for clinicians to rely on all those symptoms being positive, it would be misleading. Dr. Reinhard testified that the Claimant's lack of confusion in the ER is significant, if she was confused, that would be more in line with things you would see in mild TBI. Word finding difficulties could possibly be due to anxiety, pain medication or pain, those would be the most common things. If it were due to a brain injury you would expect to see it in the ER records. When you are talking about cognitive or neuro-cognitive effects of the brain injury itself, worst first usually applies. Dr. Reinhard testified that he agrees with the Clinical Practice Guideline, Management of

Concussion, Mild Traumatic Brain Injury put out by the VA and the Department of Defense in April of 2009 which states that the vast majority of people recover from mild TBI within one and half months. He testified that, "the initial injury would be the thing most predictive of the course of recovery." So, because it was quite mild, he testified that, "[i]f you're months or years down the road and still have big functional issues, big disability, then it's usually because of other factors such as psychological factors, such as anxiety and depression, or physical factors such as medication effects, pain, and lack of sleep." Dr. Reinhard testified that when the Claimant reported a headache the next day at Kaiser, it's hard to say how that fits in, is it a concussive headache, a cervicogenic headache or just a tension headache? He testified that it would be speculation, in the absence of other pieces, that you would expect to find with a concussion. When asked to respond to opinions of other witnesses in this case as to the issue of whether or not the EMTs and ER personnel sufficiently worked the Claimant up for mild traumatic brain injury or, were instead, preoccupied with her physical injuries, Dr. Reinhard testified that the role of the ER personnel would be to look for emergent and catastrophic situations, son, in doing this, they would evaluate for focal and neurologic deficits to make their determinations, and they would be looking to make sure that someone was safe with discharge. In his opinion, Dr. Reinhard found that, based on the medical records, the ER personnel was not picking up on cognitive brain symptoms. They were likely not seeing post traumatic confusion or post traumatic amnesia. Dr. Reinhard testified that he agrees with the Medical Treatment Guidelines which state that deterioration after mild TBI is uncommon and in those situations where you have worsening complaints, other issues such as psychological or social stressors should be considered in the differential and an unidentified diagnosis. As far as the differential and unidentified diagnosis, Dr. Reinhard testified that the psychological group of factors could include factitious disorder, malingering or somatization.

196. On cross examination, Dr. Reinhard confirmed that he works with Dr. Bernton who is a partner in the medical practice of which he is a part. Dr. Reinhard also testified that he has worked with Dr. Torres, Dr. Entin and Dr. Gellrick before and he is also familiar with Ms. Haddow at OT Plus and he has also referred patients to Dr. Politzer. Dr. Reinhard testified that he respects the abilities of these doctors and Ms. Haddow. Dr. Reinhard testified that he is not familiar with Dr. Weingarten. Dr. Reinhard testified that for the purposes of the Medical Treatment Guidelines, the criteria "loss of memory for events immediately before or after the injury" could be fulfilled by any loss of memory, including someone saying that they don't remember if they hit their head, it could be an example of posttraumatic amnesia. Dr. Reinhard also conceded that blurry vision could be a neurological deficit as well. However, the fact that the Claimant reported dizziness 12 days after the accident doesn't mean it's due to a brain injury. It could be, but Dr. Reinhard testified that it could also be due to an inner ear injury. Dr. Reinhard testified that the symptoms reported by Dr. Artist 12 days after the accident are consistent with having been thrown up onto a car and thrown to the ground. He also agreed that symptoms of having difficulty thinking, finding words and concentrating are cognitive problems. Dr. Reinhard testified that his experience is not consistent with Ms. Haddow who says 30% of patients with TBI are unable to pass validity testing. He testified that he believed Ms. Haddow sees more moderate and severe TBI patients. Dr.

Reinhard testified that most of the patients he treats have passed validity measures, which is why this stands out to him when it's off. Dr. Reinhard admitted that, as Dr. Schmitz has discussed, that it is difficult to determine the reason why a person doesn't pass validity measure due to unknowns. However, a situation where it's more convincing that there is a conscious attempt to exaggerate cognitive weaknesses in a test like the TOMM. Dr. Reinhard testified that the Claimant's development of anxiety and depression could exacerbate symptoms of a mild traumatic brain injury and could "put in motion a number of different problems that can be a big problem for functioning." Dr. Reinhard testified that he doesn't have any doubt that "there was a big change from how [the Claimant] was functioning before this injury to how she was functioning afterward." Dr. Reinhard testified that the most frequently reported post concussive symptoms include headaches, cognitive difficulties and dizziness. Patients may also complaint of irritability, fatigue, photophobia, sonophobia, tinnitus, visual changes, hearing loss and insomnia. Dr. Reinhard also testified that standard diagnostic tests including CTs and MRIs often fail to show abnormalities.

197. On redirect examination, Dr. Reinhard agrees with the Medical Treatment Guidelines section D(1)(b) that the speed of the auto is an important piece of information, as is information from first responders, witnesses, paramedics, etc. to obtain details of the event and the injured person's behavioral and cognitive responses immediately following the injury. In referring to TBI patients who are outliers, Dr. Reinhard agreed that normally when you are looking at the 10%-20% of outliers, you are looking for people with preexisting neurological conditions, someone with a prior concussion, someone of an advanced age, or you are looking for differential diagnosis. Dr. Reinhard testified that this is consistent with the Medical Treatment Guidelines. Dr. Reinhard testified that he did not understand Dr. Schmitz' explanation of the use of the term "conscious exaggeration" in the context of evaluating for malingering or a facticious disorder although Dr. Reinhard opined that "usually there has to be some pretty overwhelming evidence to make the diagnosis or to make it correctly." In Dr. Reinhard's opinion when the Claimant was seen in the ER on October 15, 2008, there weren't any symptoms that would typically trigger getting a CT of the head. Dr. Reinhard also testified that his interpretation of the ER medical records is that the Claimant reported that she did not hit her head without equivocation. Further, he testified that there is nothing to indicate that the Claimant had posttraumatic amnesia about whether or not she hit her head. When the Claimant says without equivocation in the ER that she didn't hit her head, has a clear memory of it, and then the memory becomes less clear on day two saying she doesn't know, Dr. Reinhard would attach more weight on the thing closer in time to the event rather than the subsequent telling. Dr. Reinhard testified that it would be an extraordinarily unusual scenario for the Claimant to have almost no symptoms five days from for her injury as was reported on October 20, 2008 and then two days later appear with an array of new and different symptoms. In terms of the order TBI symptoms would be expected, Dr. Reinhard testified that headache would be "right out of the gates," and disorientation and altered mental status should come on simultaneously with headaches. In the context of videotape review, Dr. Reinhard testified that he did not see no signs or symptoms of vertigo, disequilibrium or balance on the video tapes. In conclusion, Dr. Reinhard stands by the opinion he offered in the

written report for his record review that, to a reasonable degree of medical probability that the Claimant has no cognitive impairment on the basis of neurological injury and that her course of recovery is contrary to the pattern of spontaneous neurological improvement that is reliable observed following a traumatic brain injury of any severity. Dr. Reinhard testified that it is still his opinion that the Claimant has no neurological cognitive deficit that would preclude her from working.

Vocational Assessments and Evaluations

198. David W. Zierck, PsyD. Evaluated the Claimant on January 30, 2013 and March 13, 2013 and issued a written report entitled "Integrated Psychological and Vocational Evaluation" report on March 28, 2013. The Claimant was described by Dr. Zierk as "sufficiently polite, cooperative and friendly throughout the interview and testing process. She was able to communicate her thoughts in a clear manner and normal voice, albeit with infrequent episodes of stuttering and staccato speech patterns with word finding difficulties, and associated self-degrading comments…She was sufficiently oriented to place, time and situation and displayed intelligence consistent with her level of education without exhibiting any overt thought disorders or psychotic symptoms in her verbalizations." Dr. Zierk found that the Claimant displayed average to above average intelligence and did not display signs of psychosis or signs of serious mental illness or grave disability. Dr. Zierck reported that the Claimant's overall personality characteristics are consistent with someone who experienced early childhood parental insensitivity and disengagement that may have resulted in an element of underdeveloped personality with regard to self-image, self-esteem, and internalized validity as a person of worth. Dr. Zierk theorized that the Claimant used her practical intelligence, driven nature, and vocational life as a means of compensating for her history of parental insensitivity. "Thus, the loss of her vocational life due to case-related physical and mental injuries has not only introduced unwanted physical pain and functional limitations, but has essentially robbed her of her core identity and primary organizing principles as a human being. As part of his written report, Dr. Zierk prepared a summary of the portions of the voluminous medical records that he found "most relevant to the issue of [the Claimant's] residual functional capacity, permanent work restrictions, remaining labor market values and capacity to resume and sustain competitive employment under present day circumstances." Dr. Zierk also took into account the Claimant's subjective symptomatic complaints and functional limitations, especially the symptoms and limitations related to the Claimant's tolerance for activities. Dr. Zierk posited that the critical issue for him was whether the Claimant's disability would "allow her to satisfy the performance expectations of prospective employers as related to punctuality, reliability, dependability, and reasonably meet key requirements of a specific job as related to physical, cognitive and environmental demands and essential functions." Dr. Zierck reported that when considering the opinions of treating physician, Dr. Gellrick, the Claimant retained, at best, a capacity for sedentary employment but that when you incorporated discipline-specific functional parameters from Drs. Politzer, Entin, Torres, Wolffe and Ms. Haddow, that the Claimant's "capacity to resume competitive employment on a predictable, sustainable and productive basis, is substantially compromised and consistent with sub-sedentary and non-feasible

residual employability." Alternatively, when considering the medical opinions of Drs. Weingarten, Bernton, Kenneally and Goldman, Dr. Zierk concluded that the Claimant has retained sufficient residual functioning to resume employment in the local labor market in sedentary/light duty categories.

199. Dr. Zierk noted that he administered a number of assessment tools and tests, including:

- Mini-Mental Status Examination (MMSE)
- Health Index Questionaire (HIQ)
- Clinical Assessment of Depression (CAD)
- Perceived Stress Scale (PSS)
- Modified Somatic Perception Questionnaire (MSPQ)
- Oswestry Neck Disability Questionnaire (ONDQ)
- McGill Pain Questionnaire – Short Form (MPQ-SF)
- Illness Intrusiveness Rating Scale (IIRS)
- The Migraine Disability Assessment (MIDAS)
- Minnesota Multiphasic Personality Inventory, Second Edition (MMPI-2)
- Survey of Pain Attitues (SOPA)
- Millon Behavioral Medicine Diagnostic (MBMD)
- Brief Battery for Health Improvement – 2 (BBHI-2)

200. On the Clinical Assessment of Depression (CAD) and the Health Index Questionnaire (HIQ), Dr. Zierk noted the Claimant's scores reflected depressed mood, anxiety and worry, diminished interest and cognitive and physical fatigue. The Claimant scores further reflected moderate to severe functional problems related to depressive symptomatology. The claimant's Modified Symptomatic Perception Questionnaire (MSPQ) indicates that the Claimant's pain complaints "are likely somewhat influenced by symptomatic preoccupation or symptom exaggeration." The Claimant took a Million Behavioral Medicines Diagnosis (MBMD) inventory test which demonstrated among other things, that the Claimant's "capacity to moderate stress appears to be markedly impeded by the combination of illness apprehension, functional deficits, pain sensitivity, and future pessimism" along with "an inadvertent or intentional resistance to following medical recommendations." On the Brief Battery for Health Improvement – 2 (BBHI-2), the Claimant's score, "represented an obvious concern either related to a 'cry for help,' an exaggeration of symptoms for secondary gain, or desire to convince others of the seriousness of her plight….Her level of reported depression can impede physical rehabilitation and recovery." The Claimant's Minnesota Multiphasic Personality Inventory (MMPI-2) profile "presents a clear pattern of symptoms in which somatic reactivity under stress in a primary difficulty." According Dr. Zierck's interpretation of this testing on the PSY-5 scales, the Claimant also is or has become socially introverted and has little capacity to experience joy and pleasure. Ultimately, Dr. Zierck's psychological diagnosis was for Mood Disorder due to General Medical Condition and Pain Disorder

Associated with both Psychological Factors and a General Medical Condition. His Axis II diagnosis was "deferred" and he listed Histrionic, Negativistic and Avoidant Personality Features.

201. Dr. Zierk's vocational evaluation summary takes into account the consideration of five factors related to the Claimant's medical and non-medical issues. In terms of "defining the problem," Dr. Zierk opines that the Claimant's overall disability is multifaceted, variable and unpredictable. "Consequently, the relevant issue related to [the Claimant]'s current employability involves the assessment of her residual functional capacity against the physical/mental demand characteristics associated with alternative work opportunities in the open labor market." Dr. Zierk also notes that the various medical opinions about the Claimant's diagnosis and prognosis contain stark contrasts and the second factor he addressed is the ability to select pertinent information to solve the problem. He notes that on the one hand, Dr. Gellrick's medical restrictions of February 8, 2011 are consistent with the Claimant's resumption of work in a sedentary capacity on a modified basis. However, factoring in Dr. Entin's expressed concerns about the Claimant's ability to perform both complex and fairly simple and repetitive tasks, along with the additional medical opinions of Drs. Wolff, Politzer and Torres and Ms. Haddow, regarding the Claimant functioning, further alters assessment of the Claimant as capable of resuming sedentary work. However, Dr. Zierk also notes that the opinions of Drs. Weingarten, Bernton, Kenneally and Goldman do not attribute any physical or mental functioning difficulties to the October 15, 2008 work injury and/or, there is not sufficient objective evidence to support the ongoing "organicity" to account for the Claimant's markedly disabled presentation. Next, Dr. Zierk addresses the factor of consideration of the Claimant's self-reported symptomatic difficulties and functional problems in the context of the credibility of the Claimant's presentation. Regarding this factor, Dr. Zierk ultimately concludes that, "in light of the interplay between injury variables, neurophysiological and neuropsychological variables, metacognitive and emotional variables, and social and environmental variables, it is opined [the claimant] is likely experiencing a foundation of organic-based physiological distress and chronic and episodically incapacitating pain that is exacerbated by relatively poor adaptive functioning, inadequate coping skills, and insufficient social support." In addressing his fourth factor, Dr. Zierk expressly considers the opinions of the Claimant's treating physicians, including the discipline-specific functional parameters noted by Drs. Politzer, Entin, Torres and Wolff and Ms. Haddow, and in incorporating these opinions into his determination of the Claimant's overall employability equation, Dr. Zierk opines, "it appears her capacity to resume competitive employment on a predictable, sustainable, and productive basis is substantially compromised and consistent with sub-sedentary and non-feasible employability" and she "lacks the ability for quality work performance as well as the capacity for stability of employment performance consistent with everyday work demands that would satisfy reasonable management expectations." Finally, in terms of the fifth factor Dr. Zierk identified, the ability to draw valid conclusions and judge the validity of inferences, Dr. Zierk finds that, as "[the Claimant's] primary care physician, psychiatrist, and psychologist have collectively identified discipline-specific precautions and functional limitations, this consultant concludes that [the Claimant's] residual functional capacity is equivalent with the sub-sedentary category of

employment and that reemployment of any kind is non-feasible….[the Claimant] lacks the capacity to be considered a reasonable candidate for new employment on a sustainable, predictable, and productive basis."

202. Dr. Zierck testified by evidentiary deposition on December 6, 2011. When questioned about the expertise and qualifications of Drs. Thwaites, Schmitz and Kenneally, Dr. Zierk conceded that "they have a lot more years under their belt than I do. So they have a lot more experience and a lot more dealing with issues of high degree of variety. I have three years compared to their whatever. So the distinction is that I like to consider myself as having a very short learning curve and being smart in record time, but I also bow my head down to those people who have substantial [sic] more experience than I do, such as Schmitz, Thwaites, and Kenneally." Dr. Zierk testified that he identified the Claimant as having, "primarily a mood disorder. The mood disorder is expressed with an anxious presentation that she has a preoccupation…with her disability. It's become the primary source of her identity. She has a hard time letting go of it….so that's one of the reasons why you get some of these clinical elevations across different areas that are sensitive to somatic expressions." As a result of this, "there's an element of exaggeration as identified through the MSPQ." Dr. Zierk further testified that he disagrees that the Claimant is malingering or has a factitious disorder, but rather "she falls on the exaggeration continuum" which is one of the reasons he identified her with a pain disorder, which "is a pain condition that's legitimate and organic in nature where a person becomes overly attached to the significance of that pain disorder and begins processing their life around it. If you will, they develop a relationship with their pain….and so the person begins to become more exaggerated in their expressions of their disabilities….and uses their expressions of somatic distress as a plea for help." In this case, Dr. Zierk testified that he believes that this does not translate into a "secondary gain" issue for the Claimant as "there are secondary losses associated with secondary gain. The losses seem to far exceed the gains; and, therefore it doesn't seem to be reasonable that she's trading in all of her hope and talents for her to live the life as a disabled individual. I don't see where the benefit lies." Dr. Zierk testified that his main concern is the Claimant's unpredictability and he opines that, "she can get a job, she can present sufficiently to convince an employer to take a chance on her. But I'm mostly concerned about her ability to stay on job and stay on task on performance." He disagrees with Ms. Patricia Antcil's earlier testimony that there are some jobs out there that would work for the Claimant and testified that, "I can't even get my hands around that. I mean, it's so axiomatic. You have to be predictable in order to stay employed." With respect to the availability of jobs where you can work from home at your own pace, Dr. Zierk testified, "I don't liken it as being competitive employment. I liken that to college kids taking the year off. It's a joke." With respect to jobs with the company Expediter, Dr. Zierk would consider this "a bridge work employment opportunity where there is a heavy level accommodation to see – take an employee out on a trial run to see if they can satisfy the demands of an employer, and if they pass that probationary test, then and only then do they segue or bridge into real employment." Dr. Zierk testified that he would identify the three primary components to the Claimant's disability which lead to her unpredictability as vestibular (per Dr. Lipkin), vision (per Dr. Politzer) and headaches (per Dr. Wolff). Based on the comprehensive

assessments from these providers, Dr. Zierk finds, "that the level of ongoing problems across all three of those areas is such that she is no longer predictable. She's highly unpredictable, as a matter of fact." Thus, even based on the restrictions from Drs. Gellrick and Entin which put the Claimant in the sedentary category of work, Dr. Zierk opines the Claimant cannot do any of the jobs listed in the third paragraph of page 48 of Patricia Antcil's written report, due to the Claimant's "unpredictability, cognitively, physically, as well as interpersonally." Dr. Zierk further testified that "the length of this disability has reached a threshold that has convinced the individual that she's unemployed….the host of providers that have been orchestrating around her…have informed her, and she's that state of mind where she had to find a little bit of peace of mind, if you will, around it. She's accepted the fact that she has a severe incapacitating disability, and as a result of that, her behavior falls in line. She hasn't looked for work as a result of that." When questioned about the video surveillance of the Claimant doing different activities and how he would correlate that with what he saw when he evaluated her, Dr. Zierk testified that it, "didn't change my mind. Good days, bad days, that old expression, if you will." He found that this did not affect the issue of consistency which is important in the vocational setting. Based on the permanent restrictions from Dr. Entin and Dr. Gellrick alone, leaving aside the restrictions from Drs. Wolff and Politzer, Dr. Zierk still finds the Claimant incapable of earning any wages physically and psychiatrically.

203. On cross-examination, Dr. Zierk agreed that the ability to earn wages in the same or other employment would be applicable to part-time, unskilled, and minimum wage employment. He also conceded that according to Drs. Bernton, Weingarten, Reinhard, Kenneally and Goldman (who he identifies as "Camp B"), the Claimant would be capable of earning wages in the same or other employment. Dr. Lipkin, the vestibular specialist, is one of the major components utilized to determine the Claimant's ability to work according to Dr. Zierk. However, Dr. Zierck conceded that he had not seen Dr. Lipkin's November 23, 2011 report indicating that there would be no limitation from an otolaryngological basis for the Claimant being employable in a sedentary or light work based, in part, on the review of the video surveillance of the Peach Festival trip. In light of this, Dr. Zierk agreed that this "increased functionality" and there was "real world evidence that the vestibular issue, balance issue, is not a significant problem as long as you put her into a cautionary, sedentary category." Dr. Zierk also conceded that after reviewing the video surveillance of the Peach Festival trip, Dr. Gellrick also opined that the Claimant was capable of increased exertional capacity so that the Claimant "fell more into the sedentary light category." Dr. Zierck testified that he would have no problems with the Claimant going out to look for work. That would be true as a vocational rehabilitation specialist or as a psychologist. However, Dr. Zierck did not refer the Claimant out for vocational services nor did he conduct a labor market survey on the Claimant's behalf. Now, on cross-examination, rather than the three components affecting the Claimant's unpredictability, Dr. Zierk focuses on the headaches and he testified that the biggest impediment to the Claimant returning to work is headaches. He testified that it is his understanding that visual stimuli associated with looking at a computer screen leads to eye fatigue which contributes to onset of her headaches. Dr. Zierk testified that visual stimulation could include the intensity of lights, peripheral

motion, or a lot of other different stimuli that is no longer static. He agreed peripheral vision can absolutely be an issue when you drive a car. Dr. Zierk also agreed that when you are talking about computer screen brightness, you can dial it down. However, Dr. Zierk testified that he couldn't explain the discrepancy between the Claimant's testimony that she could not tolerate fluorescent lighting as it was like the light from a computer screen to her, but she nevertheless was able to sit in a courtroom for three days under fluorescent lighting and in this deposition which was lit by fluorescent lighting. Dr. Zierk also agreed there is nothing Dr. Politzer's opthamology functional capacity questionnaire that would indicate that the Claimant would have to rest her eyes after fixing her gaze on a computer screen for a period of time shorter than two hours and eye fatigue would not necessarily be an impediment to continuing to look at a computer screen. When questioned about other vision evaluations the Claimant underwent in this case, Dr. Zierck was not aware of Dr. Roe's report or that the Claimant had seen Dr. Roe. Zierck was not aware of the fact that the Claimant saw Dr. Wilson on referral from Dr. Gellrick. If you consider Drs. Roe's and Wilson's opinions, it would not appear that the Claimant had any visual impairment. Diplopia and double vision are the primary vision difficulty that contributes to fatigue and then sets into motion the headaches. Double vision contributes to the Claimant's headaches, however, Zierck has no understanding of the frequency of the Claimant's double vision. Dr. Zierk conceded that if the Claimant's double vision resolved you would have expected headaches to be less of a problem. He had not seen Dr. Politzer's February 29, 2012 report which said that the Claimant's double vision had resolved but he does agree that it's important as "any updated medical information from a treating or informed physician that gives us a better understanding of the ongoing nature, or lack thereof, is informative." Dr. Zierk testified that he wasn't aware that Judith Haddow hadn't seen the Claimant since January 6, 2010, that hit had been so long ago. He testified that the Claimant is capable of writing on an 8 by 11 page of long text but that, whether or not the Claimant was capable of reading an 8 by 11 page of text would depend on what that page looked like, the complexity of the page. Somatoform disorder is one of Dr. Zierck's diagnosis. It is described in the DSM-IV as unconscious exaggeration. Factitious disorder is conscious exaggeration and a factitious disorder you know you are deceiving, you just don't know why and malingering is a conscious disorder where there is an obvious external incentive. In describing the Claimant's memory, Dr. Zierk testified that the Claimant's remote memory is intact, recent memory is episodically disrupted. She does fine in conversation narrative. He saw the claimant twice on January 30 and March 13 and each time, the Claimant was on time, dressed appropriately and drove herself. Dr. Zierk's testing took three hours. He has a difference of opinion with Dr. Entin regarding whether the Claimant's anxiety and depression continues to be in remission. His psychological diagnosis is mood disorder superimposed on preexisting anxiety. Dr. Zierk testified that the Claimant's MSPQ testing, RBS testing, which is a neuro scale in the MMPI shows that the Claimant is sensitive to over reporting of cognitive and memory problems. Zierck agrees that testifying at hearing was "right up there in terms of being as stressful a situation as the Claimant was going to find herself in that would have amplified her symptoms." However, he thought she did variably well in terms of testifying, attentiveness, comprehending questions asked of her and communicating her

answers. Dr. Zierk agreed that the act of driving a vehicle is considered complex from a cognitive standpoint. He testified that, “driving is an executive functioning task.”

204. Ms. Patricia Anctil, a vocational rehabilitation specialist, prepared an Assessment Report on March 20, 2013. Ms. Anctil reviewed pertinent medical records, interviewed the claimant twice and then reviewed approximately 2 1/2 hours of video surveillance covering periods August 20, 2011 through December 7, 2011. Following her review of the medical records, Ms. Antcil drafted summaries of the medical assessments and recommendations. She indicated that “the medical records are extensive and will not be outlined in their entirety in this report.” Rather she focused on the “pertinent medical information used to complete this assessment” as set forth in the summary of the medical aspects of the Claimant’s evaluation from page 2 to page 23. Ms. Ancil also interviewed the Claimant over two meetings, the first conducted in person at the office of the Claimant’s attorney, and the second by telephone with the Claimant and her attorney present in order to complete the interview. During the course of the interview, Ms. Anctil noted that after talking more slowly and regulating her breathing, the Claimant was better able to control her speech and was only “occasionally observed to stutter.” The Claimant reviewed her current medical treatment and medications with Ms. Antcil, noting she sees Drs. Gellrick, Wolff, Entin, Torres and Politzer on a continuing basis. The Claimant indicated that her treatment with Dr. Zimmerman, Dr. Gridley and at Colorado Athletic Conditioning Clinic was not currently active, but that she would like to be treating with these providers as “it made her more functional and her life easier.” The Claimant reported working out at a gym with a trainer but stated that “some days she does not feel well enough to participate in her independent exercise program due to her headaches. With respect to her medical progress and ongoing symptoms, the Claimant reported that she is unable to multi-task and continues to have difficulty finding words. Overall, the Claimant said, “she has not really improved since the accident” with reference to her cognitive difficulties. The Claimant reported that “her ears are blogged and she feels like she is under water. She is distracted by noises.” The Claimant also reported continuing headaches, especially on days when a weather front is coming in. She reported that the Botox and Topamax help but she will also lie in bed when she has a headache. The Claimant reported having a headache every day and one or two migraines every other week. The Claimant also reported numbness and tingling in both arms and painful episodes in her right knee and stated that after sitting for approximately 15 minutes, when she unbends it, “it is as painful as giving birth. I am not exaggerating.” The Claimant reported that she is still having problems with her vision and “referenced her eye and brain not tracking.” The Claimant reported she was wearing multifocal lenses and stated that her “faraway” vision is good and her “reading is not so good” and noted difficulties with small print. The Claimant reported that when her anxiety gets really bad, relaxation techniques provided by Dr. Torres, “do not work real well.” Ms. Anctil’s report included multiple opinions of medical providers regarding her ability to function and her return to work capacity. These opinions range from physical limitations that generally place the Claimant in a sedentary light category, to cognitive performance opinions that run the gamut from “no psychiatric cognitive limitations or restrictions” to questioning if the Claimant can consistently perform even simple cognitive tasks on a recurrent basis. Ms. Antcil also noted her review of the

Claimant's FCE results and the observations made by the evaluators. Ms. Antcil also noted some of the inconsistencies between the Claimant's clinical presentation and what was viewed in the video surveillance. Ultimately, Ms. Antcil noted that the January 2011 FCE results pointed to "overall demonstrated abilities [which] are most consistent with the light work category at this time." In reviewing the surveillance video, Ms. Anctil observed and reported a number of inconsistencies when compared with the Claimant's presentation at her interview. These included:

- She was not holding an item in her hands, which during our meeting included a polished rock and per the records included small stuffed animals.
- Rubbing the left and right side of her forehead.
- Bending at the waist, numerous times, reaching below knee level, leaning forward at the waist, and quickly reaching down to pick up her bottle off the ground – her husband was standing next to her when this occurred.
- Squatting – sustained – observed several times, for 30 to 60 seconds at one time.
- Lift 2 cans of paint, each weighing approximately 10 pounds.
- Multi-tasking, talking on the phone, walking, looking at the mail.
- Simultaneously weeding and watering – use of hands/arms in extended position.
- Walking backward, sideways, walking in crowds.
- Extended reaching with both upper extremities.
- Playful, energetic while talking with people.
- Standing from a seated position, on the ground, with no assist to get up.
- Walking/Standing for approximately 1 ½ hours while wearing sandals.

In going through the Claimant's activities of daily living, Ms. Antcil notes that during the telephone portion of the interview, after approximately an hour, the Claimant's attorney asked the Claimant if she was okay or if she needed a break. Interestingly, although the Claimant responded that she would like to take a break, she also volunteered that "while she was on the telephone, she was walking around and doing things, she got some coffee and let the dogs out," which contradicts her testimony and statements to numerous evaluators that she is unable to multitask or do other things while she is on the phone. In discussing the Claimant's transportation issues, Ms. Antcil noted the Claimant reported that most of her local driving is within 10-15 miles or less and that while she avoids highway driving, there are certain places she will drive for a couple of miles on the highway during non peak hours. The Claimant has gone out with her daughter who has a driver's permit, but this is "nerve-racking" to her and the anxiety is too much to deal with so usually her husband takes her daughter out to accumulate driving hours. Ms. Anctil also conducted vocational research including a transferrable skills analysis. Considering all of the restrictions imposed by Drs. Gellrick and Entin, Ms. Anctil felt that the Claimant would need a selective placement, not sheltered employment, possibly part time work and vocational rehabilitation services to assist her gradual return to work in a sedentary position. In considering the return to work capacity opinions which included physical and cognitive abilities provided by Drs.

Kenneally, Goldman, Lipkin, Bernton, Weingarten and Reinhard, Ms. Anctil identified numerous occupations classified at the sedentary or light levels which would be appropriate for the Claimant including, but not limited to, teacher's aide, contract clerk, administrative assistant, office manager, school secretary, hospital admitting clerk, outpatient admitting clerk, file supervisor, general clerk, customer service representative, and registration clerk. She summarized by reporting that based on the opinions of Drs. Kenneally, Goldman, Lipkin, Bernton, Weingarten and Reinhard, and the 2011 FCE, the Claimant was capable of returning to work in a position she had previously held along with numerous other occupations which had been previously identified in her report.

205. Ms. Anctil testified by evidentiary deposition on December 6, 2013. Ms. Anctil testified that she has been employed as a vocational rehabilitation specialist since October of 1982. She has worked as a supervisor training peers in this field of work. She is a certified rehabilitation counselor, certified disability management, specialized certified case manager and a qualified rehabilitation counselor. She has received referrals from respondents where she has rendered opinions that injured workers are incapable of earning wages in the same or other employment. Ms. Antcil testified generally consistent with her written report. In response to questioning regarding the distinctions between sheltered work and selective placement which may involve vocational services that are available to assist people with situation assessments, trial work periods and on the job evaluations. Ms. Antcil clarified that this is called selective placement, not sheltered work. Ms. Antcil testified, as Dr. Zierk had previously, that this case was more complicated than most from a vocational evaluation standpoint "because of the varying opinions of the medical professionals," which is why Ms. Antcil testified that she focused more on the opinions from the medical records that related to the Claimant's limitations and ability to return to work. Although, Ms. Antcil noted that "knowing the diagnoses is also connected to that." When meeting with the Claimant on March 22, 2013, Ms. Antcil testified that within 10 minutes of the beginning of the meeting, the Claimant began displaying a lot pain behaviors such as rubbing her forehead with her hand, standing up, stuttering and rocking. At this point, Ms. Antcil referenced and recommended Ms. Haddow's compensatory strategies such as breathing techniques and using this strategy, the Claimant was not stuttering as much. The second interview (of approximately three hours) was done by phone on March 27, 2013. The Claimant did not request any breaks until a break was suggested by her attorney an hour into the meeting. The Claimant was stuttering, but Ms. Antcil testified that the Claimant did not have any problems understanding or answering questions and she did not appear to have any memory problems with the materials being discussed. On the ultimate question of whether the Claimant, taking into account her limitations, has the ability to earn any wages in the same or other employment, Ms. Antcil used the same classification of Camp A and Camp B to distinguish the contrasting opinions from each group of physicians. Ms. Antcil testified that in considering the opinions of the Camp B doctors, including Drs. Lipkin, Roe, Wilson, Thwaites, Reinhard, Bernton, Weingarten and maybe one or two others, the Claimant is capable of wages in the same or other employment. On the other hand, Ms. Antcil testified, if you consider the opinion of the Camp A doctors such as Drs. Entin, Gellrick and Torres, the Claimant

would be able to return to selective employment but she would need some assistance in getting back to work. It would be challenging. Ms. Anctil testified that she was informed by DVR counselors of an organization that provides information regarding legitimate at home employment where clients are placed providing part time employment for persons with disabilities that is within their physical capabilities. Ms. Antcil also testified that there is a company called Asurion that provides customer service phone work 3-4 hours a day that can be done at the employees own pace. This company provides virtual reality training and they hire people with disabilities. Asurion provides services for lost or damaged cell phones or road side assistance. The calls are inbound. If a person gets tired they can log out and pick it back up later. The log in and log out time basically determines how many hours a person has worked and how they get paid. Later in redirect testimony, Ms. Antcil reiterated that Asurion is an actual company providing real work opportunities and it is not "sheltered work." She noted that statistics show that there are 1,700 annual job openings for customer service positions in Colorado according to the U.S. Census Bureau. Ms. Antcil also testified that working with Expeditor may be feasible. Expeditor offers bridge work that involves updating customer information from billings or receipts. They are a bridge to other employment and provide on the job training support. After approximately three months depending on performance, they are put on the payroll. Ms. Antcil also testified regarding adaptive measures that could increase the Claimant's ability to sit at a computer screen. Ms. Anctil agrees with Dr. Zierck's testimony that eye fatigue after gazing at a computer for thirty minutes wouldn't necessarily mean that she would be limited to thirty minutes working at a computer. Ms. Antcil also testified that having the right computer screen size and decreasing the brightness would help, as would adjusting ambient noise and light and setting up the work station so that the Claimant could alternate positions. Use of a day planner is another compensatory measure that the Claimant uses. As a vocational rehabilitation specialist, Ms. Antcil testified that, if you're trying to find a job for a client, you definitely take into consideration those compensatory measures. When asked if she agreed with Dr. Zierk that "at home employment is the 'bottom of the barrel'," Ms. Anctil testified that she was shocked. She testified that she is "always shocked when a vocational professional refers to an occupation as bottom of the barrel because people are out there working, making a living, and it's kind of a slap in the face to the people who are out there."

CONCLUSORY FINDINGS OF FACT
Generally

206. A considerable amount of time over the multiple days of hearing was spent presenting lay testimony regarding the Claimant's pre-injury condition and lifestyle. Respondent did not challenge this testimony. Rather, Respondent has argued that, if anything this testimony demonstrates that the Claimant was high functioning neurocognitively prior to the subject claim and therefore would not fit in the category of patients who don't recover predictably (within 90 days) after sustaining an MTBI.

207. There was considerable discrepancy between earlier versions of the October 15, 2008 accident and versions reported later. It is found that the descriptions

of the injury the Claimant provided to Dr. Erin Woessner on October 16, 2008 and to Dr. Rick Artist on April 17, 2008 are likely the most accurate versions. The Claimant reported the incident to these doctors after the initial trauma of that day, but within a short time period after the accident. These two versions of Claimant's report of the injury are also consistent with each other. In reviewing and summarizing these reports, the ALJ finds that the Claimant was hit from behind by a turning vehicle as she crossed the street. The vehicle that hit the Claimant was turning left on red after complete stop which supports the fact that the Claimant was likely hit by a vehicle travelling at a lower speed, probably closer to the 5 mile per hour range. The Claimant experienced a direct hit on her right hip and her buttocks. The Claimant was knocked onto the hood of the car, the car brakes slammed, then the Claimant fell/slid onto the street. More likely than not, the Claimant did not hit or head or experience any loss of consciousness. To the extent that there was a loss of consciousness, it would have been brief.

208. It is noted by the ALJ that Respondent did not challenge the notion that it would not be necessary for the Claimant to strike her head in order to sustain an MTBI. However, regardless of whether she struck her head or not, the Respondent argues that if the Claimant did sustain an MTBI, it is on the "mildest" of the mild spectrum and would not account for the development of cascading subjective complaints over the years. In any event, the weight of the evidence is that the Claimant did not strike her head and she did not lose consciousness. However, regardless, it is found that the Claimant, more likely than not, did sustain a mild traumatic brain injury.

209. There are two groups of medical providers who have evaluated and/or treated the Claimant. Supporting the Claimant's contention that she is permanently and totally disabled are Drs. Gellrick, Torres, Entin and Schmitz, referred to as the "Camp A" medical providers. These providers generally provided ongoing treatment to the Claimant and argue that the Claimant is in a group of 10%-20% of patients with mild traumatic brain injury (MTBI) who don't get better in a predictable period of time (90 days). These opinions are inconsistent with what is prescribed in the Medical Treatment Guidelines (see below). The accepted science with regard to mild traumatic brain injuries is that symptoms are "worse at first" and that MTBI patients fully recover within ninety days. The Camp A physicians argue these two most basic MTBI concepts, regarding onset of symptoms and patterns of recovery are both inapplicable to the Claimant.

210. The second group of medical providers include Drs. Goldman, Lipkin, Kenneally, Roe, Wilson, Thwaites, Bernton, Reinhard and Weingarten and are referred to as the "Camp B" providers. They are generally evaluating medical providers who did not provide ongoing treatment to the Claimant. These Camp B providers subscribe to the MTG and generally agree that the Claimant is not an outlier or exception to the rule and she has sustained little to no loss of earning capacity and that she is employable.

211. The Claimant was present in person for testimony taken at the OAC on April 19, 2013, August 16, 2013, September 26, 2013 and November 22, 2013. In addition the Claimant was present for the deposition testimony of Dr. Schmitz on April

30, 2013, Drs. Gellrick and Entin on May 6, 2013, Dr. Torres on May 7, 2013, Dr. Thwaites on May 9, 2013, Drs. Bernton and Reinhard on May 10, 2013, and Dr. Zierk and Ms. Antcil on December 6, 2013. The Claimant was also present by phone for the testimony of Dr. Weingarten on May 13, 2013. In prosecuting this issue, the Claimant has demonstrated more of her ongoing capabilities than disabilities. She was in the witness stand testifying for a full day and two half day hearings. These hearings were stressful situations for the Claimant, where you would expect her symptoms to be at their worst. Nonetheless, she exhibited the ability to comprehend the questions being asked of her and to articulate intelligent answers. While she exhibited some intermittent stuttering, this did not interfere with her ability to answer questions in a cogent and understandable manner. Word finding issues were not overtly apparent.

212. Overall, the ALJ finds that the Claimant exhibited a great deal of endurance while testifying and being present at OAC hearings and being present at multiple depositions with medical testimony and discussion of complex issues. She was on time for hearings and depositions and her attendance and participation was reliable and consistent. The Claimant was present for three full days total of lay testimony, much of it her own testimony, ostensibly to support her contention that she is unable to earn wages in the same or other employment. However, in a way, her ability to conduct herself in the manner in which she did during the extended hearing time contradicts that very assertion. During testimony of over the four days of hearing at the OAC, the ALJ observed, and documented in notes, the Claimant's presentation. There are significant discrepancies in what the Claimant says she can do and what she has been shown to do during testimony presented at the hearing. Examples of this include:

- On the second day of testimony in the hearing, the Claimant was on the witness stand for a significant portion of the day. The Claimant did alter positions between sitting and standing several times and was noted to rub her hands together gently. The Claimant also occasionally rubbed her neck. On occasion, the Claimant complained of shooting pains and she rubbed her temples, however, the Claimant was able to continue participating in the hearing and did not leave the courtroom. With respect to stuttering, there was a brief period of time at approximately 9:40 AM when the Claimant was stuttering and having a bit of difficulty with testimony but this resolved quickly and she was able to respond to questions with only mild and intermittent stuttering afterwards. The first break was taken from 10:05 AM for approximately 15 minutes. After the break there was an interim witness and the Claimant was in the courtroom at counsel's table listening to the testimony until she resumed her testimony at approximately 11:20 AM. After having a break from testifying, the Claimant was initially observed to be stuttering more frequently than earlier but was able to testify and, as the testimony wore on, her speech became more and more fluid. At 12:10 PM, the Claimant testified that no one could tell how much pain she was in at that point and her head was "splitting" and her neck and back hurt. When asked why it did not appear that she was experiencing that much pain, the Claimant responded that

she didn't need to present with a scrunched up face and she didn't want to show the world she was in constant pain all the time. Thus, even at a time when the Claimant was complaining of a high level of pain, she continued to function and she was cognizant of how she presented to the public. This is contrary to her testimony and that of family and friends who testified that she would blurt things out and she couldn't help but engage in inappropriate social behaviors. In court, she clearly recognized the need to present herself with steady behavior and observe social norms and she was quite capable of doing this for an extended time period. When testifying in the afternoon of the first day, the Claimant was stuttering again, but she was able to talk and convey her point adequately and she often used her hands for emphasis. At one point shortly before 2:00 PM, the Claimant did become emotional and upset when recalling how she found out that she no longer had her job, and the manner in which this was conveyed to her which she clearly deemed to be very impersonal and a disregard for her feelings.

- On the third day of testimony, the Claimant's stuttering was worse when she began testifying at approximately 1:00 PM, but as she became more focused on the testimony, the stuttering subsided and her speech became more fluid over the course of the rest of the afternoon. Between 1:00PM and 1:30 PM, the Claimant alternated between standing and sitting several times and just before 2:00 PM the Claimant was observed standing and swaying slightly with her left hand held up to her neck on her left side. At approximately 2:40, the Claimant asked for a break. After testimony resumed again, the Claimant spend most of the rest of the afternoon sitting while she testified, with significantly less alteration in position between sitting and standing. After the break until the end of testimony on that day, the Claimant was not observed to stutter very often.
- On the fourth day of testimony, the Claimant alternated her position between sitting and standing more at the beginning of the hearing from 1:00 until the first break at 2:40 PM. She would sit for 5 to 15 minutes and then stand for 15-25 minutes at a time alternately. During this testimony, the ALJ observed the Claimant was speaking clearly with only very slight hesitation and/or stuttering and she did not appear to be having any significant word find problems. After returning from a 12 minute break in testimony at 2:52 PM, the Clamant sat and remained sitting while she testified until 4:13 PM when she stood again. During this time frame, just after 3:00 PM, the Claimant stated that she was having difficulty understanding questions and said her head was really hurting and she put her hands to her temples. She was, nevertheless, able to continue with testimony. At approximately 3:48 PM, the Claimant started to hold and press on her neck and at 4:13 she stood up again and remained standing until testimony concluded for the day. Although the Claimant verbally expressed that she was experiencing pain, specifically that her head was hurting, and she exhibited pain behaviors, she was able to continue testifying and was able to understand and respond to questioning.

- The Claimant testified that she had difficulty reading, and in particular, small print. However, it was clear from the testimony that she had read and reviewed many of the medical records in whole or in parts, including the voluminous reports from Drs. Weingarten, Bernton, Thwaites, Reinhard and Kenneally.
- The Claimant demonstrated a high functioning memory, recent and remote, at one time correcting her attorney regarding the chronology of treatment with Dr. Kenneally. She was able to provide an accurate work history with detailed job descriptions, even being able to recall remote military and real estate test scores. She remembered when she took all her meds and what they were for. The Claimant prepared and took notes with her to the witness stand to help jog her memory, but agreed that she was able to testify by and large from memory without using those notes.

The Medical Treatment Guidelines

213. The Claimant's primary argument is that under MTG C.6.a., she is in a category of 10%-20% of MTBI patients who do not recover within 90 days and may continue to report symptoms for several months or years. The Camp A providers opine that the Claimant fits into this patient class which they describe as "outliers." These providers do not address the remaining language contained in this Guideline section which provides in pertinent part:

> Deterioration over time after mild TBI is uncommon and in situations where patients have worsening complaints after mild TBI, other issues such as psychological or social stressors should be considered in the differential or other unidentified diagnosis.

214. There was persuasive testimony that the 10%-20% of people who don't follow the typical recovery pattern are patients with premorbid neurological vulnerability such as prior concussions, stroke and/or advanced age. Specifically, Drs. Reinhard, Bernton and Thwaites testified that when you are looking at the MTBI patients who do not recover in a predictable fashion, you are looking at patients with preexisting neurological conditions. The Claimant doesn't fall into this patient class as the overwhelming weight of the evidence establishes that prior to her injury on October 15, 2008, the Claimant was functioning at a high level cognitively, both at work and outside of work. Drs. Reinhard, Bernton and Thwaites also agree that delayed recovery can be found in patients at the upper end of the mild traumatic brain injury spectrum for those who have had retro grade amnesia or were in a post injury coma of ten or more minutes. However, these symptoms do not apply to the Claimant. MTG D.4.a. recommends consideration of neuropsychological testing patients at the upper end of the MTBI spectrum which would include a coma greater than ten minutes, post traumatic amnesia for greater than six hours, retrograde amnesia for events of more than thirty minutes before the injury and GCS of less than 15 at two hours post injury. As the medical records establish, none of these symptoms apply to the Claimant. Drs.

Thwaites, Reinhard and Bernton opine that, assuming the Claimant even had an MTBI, it would be in the mildest of the mild category.

215. The MTG provides at C.1.c.III. (page 6), that a patient with a more complicated mild traumatic brain injury demonstrates structural damage visualized on acute neuro-imagining which may result in a slower and incomplete recovery. No evidence, imaging or otherwise, has been presented demonstrating that the Claimant sustained any structural damage to her brain.

216. The Claimant recorded a 15 Glasgow Coma Score (GCS) with both the paramedics and at the emergency room. Drs. Gellrick, Entin and others have discounted this as a meaningless test. Dr. Bernton agreed that this is a gross test as to whether or not the Claimant had a minimal brain injury. However, when there is a situation in which a patient later states that she has gross defects that prevent her from functioning on the basis of a head injury years later, a GCS immediately following an accident is important and useful. Dr. Bernton's opinions are consistent with the MTG D.1.c.II. which provides that a "GCS performed in the field or the ER may aide in grading the severity of TBI."

217. The MTG D.1.d. provides that when diagnosing TBI and/or its severity, that:

> In addition to the individual's self-report, practitioners should attempt to obtain and review any external sources of data, including police reports, ambulance reports, emergency department records, eye witnesses reports, etc., the practitioner should utilize this information to establish or verify the probable degree of trauma involved in the incident and the consistency between these reports and current symptoms.

This is the "generally accepted and widely used practice" for obtaining a thorough history prescribed by the Guidelines (MTG D.1). This should be part of a thorough forensic investigation. The MTG doesn't square with the opinions of the Camp A providers who contend that early medical treatment/diagnostic testing is generally incompetent, that the early medical records are generally unreliable and that a GCS of 15 is meaningless.

Initial Emergency Medical Treatment Records

218. The only direct evidence presented by the Claimant regarding what did or did not take place with the EMTs and the ER personnel was her testimony and the testimony of her husband (although admittedly, he did not arrive until somewhat later). On the one hand the Claimant testified that she felt foggy and disoriented during this time and often could not recall what took place in the ER, while on the other hand, she testified that the right questions were not asked and the correct diagnostic testing were not administered in the ER. Her testimony in this regard is inconsistent and unsupported by the documentation contained in the medical records. The records show that the

Claimant was fully worked up and received the treatment one would expect from a Trauma I center. These medical records are a good indicator of the Claimant's condition at that time and there was no persuasive evidence presented to discount the information contained therein. The initial emergency medical treatment records are found to be reliable and adequately document the Claimant's condition and the treatment she received.

Early Medical Treatment

219. With the exception of headaches which were reported to have begun the morning after the subject accident, the early medical records from Kaiser and Exempla are consistent with what was reported at DHMC. The Claimant contends that symptoms first reported to Dr. Hnida on October 22, 2008 were previously missed because the Claimant was medicated. However, when the Claimant was seen by Dr. Artist at Exempla on October 17, 2008, she reported that she hadn't taken any Valium or Vicodin thus far that day.

220. On October 16, 2008, the Claimant reported to Dr. Woessner she sustained a direct hit on her right hip and behind, the she fell back onto car, the brakes slammed, then she was airborne and fell on the street. The Claimant told Dr. Woessner that she doesn't think she hit her head and that any loss of consciousness would have been brief. The Claimant did report that she had a headache that started at 7am the day after the accident. The Claimant described it as worse than her normal migraine. The Claimant specifically denied confusion, memory problems. As of the day after the accident, the Claimant appeared more concerned with physical issues such as back and neck pain. Even when Dr. Woessner recommended a head CT non-contrast scan to evaluate for a bleed, the Claimant and her husband refused and preferred to monitor closely.

221. Similarly, on October 17, 2008, the second day after the accident, the Claimant continued to deny any loss of consciousness and denied numbness or tingling in her upper extremities. At this point, the Claimant advised that her neck and her back were the most bothersome. She reported that she had a headache at the time of the examination, but not a "migraine type." On this day, Dr. Artist described the Claimant as an "alert, pleasant, healthy appearing female who appears to be fairly uncomfortable, sitting very stiffly and not moving all that much." The Claimant's main complaints were her neck and back and her right hip was not as bad. Dr. Artist also noted that the Claimant's right knee and ankle were stiff and sore. There was no bruising at this point. The Claimant denied numbness or tingling into her hands and upper extremities. Her range of motion was somewhat restricted for her neck and back and ankle. Dr. Artist assessed the Claimant with: "sprain right ankle, contusion and sprain right knee, contusion of ribs and low back, strain of the neck, strain of the back." At this initial worker's compensation medical evaluation, Dr. Artist advised that her symptoms were likely to resolve but "whether a couple more days, a couple weeks or a couple months is difficult to tell at this point." Three days later, on October 20, 2008, the Claimant

reported feeling a little bit better after the weekend. The Claimant reported that she was taking Motrin, Vicodin and Valium in order to resolve headaches she was getting.

222. Yet, by October 22, 2008, when the Claimant saw Dr. Dave Hnida, her reported symptoms increased and she now complained of dizziness, difficulty finding words, processing thoughts. She also reported that she still had neck and lumbar pain. The Claimant reported she was off medication except for ibuprofen. Although Dr. Hnida noted that the Claimant's mini mental status exam was normal, if at times slow and although he reported that the Claimant responded to questions such as her job description and what was done at physical therapy, he assessed the Claimant with a closed head injury and noted she should be off work. He referred her for a CT scan non-contrast of the head. This CT scan performed on October 24, 2008 did not demonstrate any traumatic or focal abnormality. There was no fracture, bleed or discrete brain lesion noted. By October 27, 2008, the Claimant reported her overall symptoms improved but the dizziness was worse. Dr. Artist recommended a neuropsychological evaluation, continued physical therapy and continued medications.

223. On November 10, 2008, the Claimant reported to Dr. Artist that she was trying to be more active but that she fatigues extremely easily. The Claimant's husband came with the Claimant to the visit and he reported that her reflexes and reaction time were markedly slowed and that the Claimant was having difficulty with speech and memory. The Claimant's headaches were better, not as severe, nor as often. The Claimant reported that she was not using Vicodin or Flexeril at all because they made her feel weird. The Claimant also reported dizziness at times for no good reason. Dr. Artist assessed the Claimant with a closed head injury, concussion, persistent symptoms and poor short term memory, neck and back strain-modestly improved and insomnia and headaches-improved. The Claimant's husband indicated that he would like the Claimant to see more specialists as it did not seem to him that the Claimant was getting better very rapidly. Dr. Artist cautioned that the Claimant's issues required time to resolve and perhaps some neuropsych cognitive therapy and continued physical therapy.

224. In the first month after her accident, the Claimant's symptoms at first appeared to be gradually improving and then as the original physical symptoms began to subside, the Claimant increasingly reported cognitive symptoms and new physical symptoms, such as dizziness. By the time the Claimant began to treat with Dr. Caroline Gellrick, the new symptoms were not resolved, so Dr. Gellrick began to refer the Claimant out for a considerable amount of diagnostic testing, including the neuropsychological testing. Now, the Claimant argues that the neuropsychological testing is not reliable in her case.

Neuropsychological Testing

225. The neuropsychological testing in this case has been problematic. The Claimant has undergone four separate batteries of neuropsychological testing in 2008, 2009, 2012 and 2013. In addition other treating and evaluating doctors have analyzed

and prepared opinions about the raw testing data. The conclusions are variable and, as Dr. Schmitz has pointed out, the doctors fall into two camps, one of which opines that there is nothing essentially wrong with the Claimant and that she is functional and able to return to work, the other which has concluded that the Claimant experiences ongoing cognitive, physical and emotional difficulties related to the October 15, 2009 injury.

226. In the November 12, 2008 neuropsychological evaluation report, it was noted that the Claimant was given two psychological tests to assess effort levels and symptom exaggeration. It was reported that, "In both tests, [the Claimant] presented with scores that were significantly below results observed in research samples of individuals with significant brain injuries. This type of profile is suggestive of an individual who is consciously exaggerating the extent and nature of a variety of clinical symptoms or cognitive impairment, and/or an individual who is not putting forth maximum effort." Taking her high level of anxiety into account, the results of the psychological evaluation were considered valid but it was noted that the Claimant's scores on many of the performance scales were estimated to be in the lower range or her usual or normal capabilities and did not represent the Claimant's maximum efforts such that the results were found to represent the "lower echelon" of the Claimant's capabilities. Due to the questions regarding effort, retesting in six months was recommended.

227. Dr. Kenneally administered a second neuropsychological assessment on September 15 & 17, 2009 a prepared a written report dated September 25, 2009. Relating to validity considerations, Dr. Kenneally noted that the Claimant's neuropsychological test results indicate a marked degree of variability that is atypical. This degree of variability in her test results is inconsistent with the pattern of test results seen in individuals with documented traumatic brain injury. Dr. Kenneally reported that the Claimant's test scores on the TOMM were below those seen in, "institutionalized elderly demented patients." Dr. Kenneally found her performance indicative of the intentional production of wrong answers and opined that failure at this level is actually a complex cognitive task requiring the patient to learn both the right and wrong answers to the test materials; and deciding in real time to provide the incorrect answers. Moreover, on other tests the Claimant performed at the mean or above average and given that the Claimant performed successfully on these tests, her failure on the simpler measures is inconsistent since the simpler tests cover items considered "building blocks" to the more complex cognitive tasks tested in areas where she performed better. Dr. Kenneally opined that the Claimant's current test results cannot be interpreted in standard fashion given her failure of validity measures, the marked degree of variability in her test scores and the stark contrast between her impaired test scores and her observed and self-reported level of daily functioning. Dr. Kenneally noted that individuals with documented traumatic brain injuries do not obtain this highly variable pattern of test results. Further, the Claimant's test scores on certain measures, if valid, would indicate that her level of impairment would make it impossible for her to sustain a conversation or independently dress or bathe herself on a daily basis. Dr. Kenneally noted that the testing did indicate that Claimant's depression and anxiety appear to be worsening and this may be having a negative impact on cognition, sleep, pain and recovery. She found that the Claimant's

test results “indicated a marked translation of psychological distress into physical symptomatology” and Dr. Kenneally advised the Claimant’s medical treaters to obtain objective measures of the Claimant’s pain symptom report when possible. Ultimately, Dr. Kenneally found “no objective neuropsychological test data to indicate that the Claimant has cognitive deficits resulting from her work injury on October 15, 2008. Dr. Kenneally’s opinions were credible, persuasive and are found as fact.

228. Dr. Schmitz performed another neuropsychological evaluation and prepared a written report dated November 26, 2012. Dr. Schmitz made a number of behavioral observations regarding the testing including his opinion that (1) the Claimant’s effort was suspect, (2) she displayed an attitude of uncaring and a notable lack of engagement, (3) on a test of fine motor coordination, at times she appeared to have placed the instrument correctly but then turned it to an incorrect position, (4) her performance on purported measures of effort was generally poor and strongly suggestive of her giving incomplete effort, (5) many of her performances on the clinical tests were at or below the 1st percentile and some of her scores had dropped from her previous testing in 2009, (6) her performance on the MMPI-2-RF was strongly indicative of the overreporting of somatic, cognitive, and memory complaints, and (7) in spite of being clearly aware of the importance and necessity of providing good effort on the current neuropsychological test battery, the Claimant’s performance was considerably less than optimal and suggestive of a non-cooperative approach to the assessment process. Yet regardless of these observations, Dr. Schmitz does not believe the Claimant is malingering in her condition. He opines that “fundamentally, [the Claimant] remains incapacitated from functioning effectively at her pre-accident level. As evidenced on the neuropsychological testing her cognitive functioning fluctuates on a daily or even minute by minute basis. She has developed a self-perception of being totally disabled, which clearly exacerbates any physical pain or cognitive difficulties she may be experiencing.” Dr. Schmitz acknowledges that the Claimant represents an “outlier” in her response to a traumatic event, but finds that “but for” the event of October 15, 2008, the Claimant would not be as functionally disabled as she has become. He went on to opine that it is unlikely that the Claimant would experience any considerable improvement in functioning with further treatment and he finds her condition permanent. Dr. Schmitz does concede that, unfortunately, as a result the validity concerns over the testing results, it is impossible to offer a definitive determination of the Claimant’s current level of neurocognitive functioning. He opined that while he found the Claimant did apparently sustain an actual physical injury (including a concussion) as a result of the original accident, it would appear that her “response” to this injury has been quite dramatic and it is likely that these non-organic factors are playing a substantial role in the maintenance of her ongoing complaints. At his deposition, Dr. Schmitz testified that the neuropsychological testing performed in his office and on the three other occasions with other providers merely shows that the Claimant is performing poorly, suggestive of poor effort, and inconsistent with what the Claimant was doing with Ms. Haddow. Dr. Schmitz testified that he finds that other factors are influencing her performance on the neuropsychological testing such as headache, speech problems, dizziness, emotional distress and sleep difficulties.

229. Dr. Thwaites performed a fourth Independent Neuropsychological Evaluation on March 8, 2013. Dr. Thwaites found that the Claimant performed in the significantly impaired range on a formal test of effort and motivation. Dr. Thwaites ultimately concluded that the Claimant's neurologic complaints across time are not associated with a concussion and her neuropsychological test data are not an accurate reflection of her abilities. He opines that she may have mild cognitive error, possibly based on her current medication regimen or based on psychiatric factors and pain. However, Dr. Thwaites concludes that, "we are without objective data that would indicate that she has cognitive impairment within a reasonable degree of probability, even though that is certainly a strong possibility." He finally notes that "it is safe to say that what we are seeing in her presentation does not make sense neurologically based on a minor concussion, a normal MRI, and what is known about her medical history. At his deposition, Dr. Thwaites further testified that when he was with the Claimant for two hours he did not see her lose her train of thought, she wasn't disimpulsive, disinhibitated, and he didn't notice any cognitive errors in his discussion with her. He saw no obvious cognitive problems at the conversational level. Based on the available information, Dr. Thwaites opined that there would be no reason the Claimant would be unable to sit at a computer screen for a sustained amount of time. Dr. Thwaites testified that there was not any objective evidence to suggest that the Claimant couldn't do her prior job from a cognitive perspective. Dr. Thwaites testified that he gave the Claimant the benefit of the doubt in diagnosing a concussion. He found that the early medical records in this case are important because, "there is a convergence of literature that suggests that cognitive symptoms and concussion symptoms are worst generally speaking closer to the time of the accident and improve across time." With this in mind, the records demonstrate that when the Claimant would have been at her worst from a cognitive perspective, she really wasn't displaying or reporting much in the way of cognitive symptomatology. Per Dr. Thwaites, the Claimant's presentation is unusual and not accurate from a neurologic perspective. Dr. Thwaites persuasively testified that he doesn't believe that what the Claimant is reporting and portraying is her true level of brain function. With regard to the validity testing, Dr. Thwaites noted that the Claimant scored worst than people with advanced severe Alzheimer's, people with severe traumatic brain injury, catastrophic brain injury, mental retardation. Dr. Thwaites does not believe it is plausible. While Dr. Thwaites did diagnose the Claimant with a mild traumatic brain injury, he disagrees with some of the Claimant's other medical providers who find that the Claimant continues to have neurogenic-based cognitive difficulties because of her concussion. Moreover, Dr. Thwaites opined that adding symptoms over time is not consistent with a mild traumatic brain injury. The ALJ finds the opinions of Dr. Thwaites to be credible and persuasive and they are found as fact.

230. The Claimant has argued that the neuropsychological testing performed in her case was not reliable and is invalid and that the evaluators, and in particular Mr. Broadhurst and Dr. Kenneally, did not consider confounding factors such as anxiety, depression, chronic pain and sleep deprivation. This is not consistent with the medical evidence and it would not explain why the Schmitz and Thwaites evaluations are invalid. In fact, Dr. Torres testifies that patient observation is a more reliable indication of a

traumatic brain injury than neuropsychological testing. The Respondents, on the other hand, point out the MTG provides:

> Neuropsychological assessments are generally accepted and widely used as a valuable component of the diagnosis and management of individuals with TBI. They include sensitive tests that are used to detect cognitive deficits, severity of impairment, and improvement over time.

231. In considering the most persuasive opinions and looking at the 4 separate batteries of neuropsychological testing as a whole, the ALJ determines that, to the extent that the Claimant's neuropsychological evaluations test results lacked validity, it is because she either exaggerated her symptoms or did not give full effort or both. The ALJ does not credit the Claimant's argument and Dr. Torres' opinion that the Claimant's exaggeration of symptoms and her failure to give good effort in neuropsychological testing is actually a symptom of a closed head injury.

The Claimant's Ability to Drive and Travel

232. Following her accident, the Claimant has been able to drive locally, including but not limited to, driving to medical appointments, 10-15 miles from her house. The Claimant has renewed her driver's license online and no driving limitations have been imposed by Spalding Rehabilitation or the Department of Motor Vehicles. At the hearing, the Respondent emphasized the Claimant's ability to drive, including the introduction of a street map and mileage reimbursement information to illustrate the Claimant's ability to drive distances ranging from 10-15 miles round trip to 20-26 miles round trip on a regular basis to attend medical appointments. This emphasis on driving is placed in the context of the MTG which describes driving at K.1. as:

> Independent driving is considered a complex activity of daily living. An individual's potential for safe driving is influenced by an intricate interaction of physical, cognitive, visual and behavioral components.

Driving is categorized in the Guidelines as an Instrumental vs. a Basic ADL. Instrumental ADLs are defined as activities that, "require higher level cognitive skills, including the ability to plan, execute and monitor performance, as well the ability to evaluate the information and make sound judgments." MTG I.2.a. and b.

233. In this context, Dr. Gellrick's February 26, 2009 clinic note is significant. When Dr. Artist last saw the Claimant on November 25, 2008, he reported that she was "unable to drive motor vehicles." Then, Dr. Gellrick imposed a "no driving" restriction when she initially saw the Claimant on December 8, 2008 and again on December 15, 2008. At no time prior to the February 26, 2009 evaluation did Dr. Gellrick lift the no driving restriction, nor did the Claimant report to Dr. Gellrick that she was driving; short distances or otherwise. The Claimant only disclosed that she was driving to Dr. Gellrick after surveillance video demonstrated her ability to drive. At that point, the Claimant reported to Dr. Gellrick that surveillance video showed her driving at times and she

drives short distances back and forth from the house. Dr. Gellrick reported the Claimant no longer had dizziness and with her headaches clearing she has been able to tolerate driving so Dr. Gellrick cleared the Claimant to drive ostensibly because she no longer had dizzy spells and her headaches were dissipating, clearing. However, the Claimant only disclosed that she was driving when surveillance video gave her no choice. Her driving capabilities have only increased and improved since that time. If the Claimant can drive short distances by virtue of no longer having dizziness and clearing headaches, the fact that she can now drive to medical appointments with Drs. Entin (Greenwood Village), Gellrick (Colorado and I-25), Torres (Cherry Creek), and Wolffe (Porter Hospital), shows that, contrary to her testimony, that dizziness and vertigo are no longer a problem which interferes with her ability to function. The Claimant began Botox treatments with Dr. Wolffe, post MMI, and has acknowledged that this treatment has decreased the intensity and duration of her headaches. This is inconsistent with the Claimant's testimony that she continues getting dizzy spells and has not gone a single day subsequent to her accident without a headache.

234. The surveillance video viewed by the ALJ demonstrated that the Claimant, in each instance of driving, was comfortable and capable of driving over time. Contrary to the Claimant's testimony, she drives the family minivan and drives in snow. She passed a driving evaluation test at Spaulding Rehab and renewed her license (online) with no restrictions of any kind, highway or otherwise. She has not had an accident or a moving violation (with the possible exception of a photo red light ticket). She drives her children around and has even taken out her daughter, who had her permit and was learning to drive, although the Claimant did testify that this made her nervous.

235. In addition to driving, the Claimant has been able to travel by air on her own to out of state destinations which include Kansas, Ohio and Virginia. She has traveled out of state on road trips with family members to destinations which include Kansas, Ohio and Mississippi and she has traveled longer distances with friends and family within Colorado.

236. Based on persuasive evidence to the contrary, largely related to the Claimant's ability to drive on a regular basis, and her ability to tolerate travel, the Claimant's testimony regarding the post-MMI severity and impact of her dizziness and headache symptoms is not credible. It is more likely than not that these symptoms are of a lower severity than she is reporting to her physicians and that they have less of an impact on the Claimant's ability to function and engage in activities of daily living that her hearing testimony would indicate.

Surveillance Video

237. A substantial amount of surveillance video from August 20, 2011 through December 7, 2011 has been submitted to the Court and reviewed by the ALJ. The videos do not demonstrate that the Claimant is significantly limited by any disability, whether it be physical, cognitive, vestibular, psychological or otherwise. In the surveillance video, the Claimant presents as a person who is able to interact with family,

friends and strangers. While the Claimant has argued that the video shows only selective times and highlights when the Claimant is having a good day and shows her only when she is functioning at a higher level, the ALJ finds that there was a significant amount of video taken over a number of days and, while the video fails to capture every waking moment of the Claimant, there is a substantial amount of footage from which reasonable inferences can be drawn.

238. The Claimant reported in March of 2013, continuing cervical, thoracic and lumbar spine symptoms with functional disabilities related to chronic pain, incapacitating headaches and numbness in her arms and right shoulder pain and limitations. None of this is observed in the surveillance. She reported to Pat Anctil that she has difficulty with depth perception, problems judging distances and banging into things and sometimes falls while walking. None of this is observed in the surveillance videos. Neurocognitive and psychological problems are difficult to videotape. However, at no time is the Claimant seen losing her balance or having to hold on to family, friends or inanimate objects to steady herself, other than holding a shopping cart while shopping (which does not appear to be a function of balance issues, but rather a normal grocery shopping behavior). In the Peach Festival video surveillance, the Claimant is seen walking through crowds, moving from a standing to a sitting position and vice-versa, while balancing multiple items using both upper extremities. She is not seen carrying and rubbing her stone, stuffed animals or any other objects nor is she seen wringing her hands as she did during the four days of hearing testimony.

239. Overall, the surveillance video presents the Claimant going about activities of daily living over several months in 2011 which contradicts the Claimant's stated abilities during testimony at the hearing. While the Claimant does not engage in any overly strenuous activities, she is regularly seen driving without difficulty, walking, bending, and picking up and carrying items and engaging in activities that do not correlate with the Claimant's descriptions of her physical and mental limitations. In videotapes of her activities for periods covering August 20, 2011 through December 7, 2011 the Claimant does not appear physically, cognitively, vestibularly, visually, psychologically or otherwise disabled. The Claimant does not appear to have any restrictions and she does not engage in any self-limiting behavior. The Claimant presents as a person able to interact without limitations or hesitation with friends, family and strangers. The Claimant appears to be animated and appropriate in her social interactions. The Claimant is seen at various times engaged in activities that are in excess of limitations assigned by medical providers and are in excess of the Claimant's subjective complaints as self-reported and/or testified to limitations. The Claimant is seen lifting, bending at the waist, crouching/squatting and reaching overhead with both arms. The Claimant is seen out in sunny weather without sunglasses, she demonstrates no balance problems, she exhibits fine motor skills, she is able to tolerate large groups of people and is able to navigate throughout crowds of people. She is able to drive and exhibits no problems with dizziness. From this, in concert with other persuasive evidence, the ALJ draws the reasonable inference that the Claimant has not accurately described her abilities and limitations during testimony at the hearing and to her treating and evaluating physicians. The ALJ finds that it is more likely than not that the Claimant

is able to engage in more activities, for longer durations, with fewer negative consequences, than she has represented in testimony and to her doctors.

Medical and Psychological Opinions Regarding the Claimant's Functional Limitations

240. The Claimant's ability to earn wages in the same or other employment is based in large part on whether she has limitations and what those limitations are.

241. The Camp A doctors include, Drs. Gellrick, Entin, Schmitz, Torres and Zierk. Dr. Gellrick initially assigned restrictions on March 15, 2011 when she and the Claimant completed a physical restrictions form provided by the Claimant's attorney. Those restrictions are no longer applicable. Dr. Gellrick has since modified those restrictions and, in her most recent opinion, at her July 24, 2013 supplemental deposition, Dr. Gellrick testified that "I don't know what she can do today" and recommended a repeat FCE. She agreed that her opinions of restrictions were guess work. Dr. Gellrick continues to maintain her opinion that the Claimant should be limited to no more than a 30 minute working at a computer at one sitting. On November 5, 2011, she reports, "Her work would not involve necessarily computer work because of the vestibular problems with ocular motor dysfunction that she still has" relying on Drs. Lipkin and Politzer. Yet, Dr. Lipkin reported on November 23, 2011 that from an otolaryngological basis, the claimant can return to sedentary and light duty work. Even if you credit Dr. Politzer's opinions (over those of Drs. Roe and Wilson), the claimant's limitation for working at a computer is two hours at a time, not 30 minutes. If you credit the opinions of Drs. Wilson and Roe, who are also both Gellrick referrals, the Claimant has no neurocognitive/visual limitations. Dr. Entin assigned a 10% impairment rating based on impairment of the complex integrated cerebral function, a curious rating in view of his deposition testimony that since all neuropsychological testing is invalid, there is no way to objectively quantify the Claimant's neurological dysfunction. In his opinion, the Claimant's primary problems are headaches and mental fatigue. He doesn't know if the Claimant could work up to 4 hours a day based on what the Claimant told him. He would defer to Dr. Lipkin, the otolaryngologist, on limitations attributable to vestibular problems, vertigo and dizziness. Dr. Schmitz' testimony and opinions are inconsistent. He admitted his bias with regard to the psychological diagnosis of malingering and factitious disorder. As was true with Dr. Gellrick, he misreads and relies on a faulty interpretation of whether the Claimant initially had objective neurological symptoms. Specifically, he testified to his reliance on and misconception of reported neurological symptoms of slurred speech, facial droop and incontinence of urine in the EMTs' report. In Dr. Schmitz' neurological testing evaluation report of November 26, he reported, "[the Claimant's] effort was suspect throughout much of the testing day. She displayed an attitude of uncaring and a notable lack of engagement…Her performance on purported measures of effort was generally poor and strongly suggestive of her giving incomplete effort." He further noted that some of the Claimant's scores had dropped from her previous testing in 2009. He also reported that the claimant performed, "very slowly during a test of fine motor coordination…" and, "At times she appeared to have placed the instrument correctly but then turned it to an incorrect position. Although it is clear

that the Claimant did not give full effort during the November 26, 2012 evaluation, as with the three other neuropsychological evaluations, Dr. Schmitz offers a multitude of excuses for the Claimant's behavior, some of which are not consistent with medical literature and the opinions of other more persuasive evaluators. The restrictions assigned by Dr. Torres are also not reliable. He completed a residual functional capacity statement, provided to him by the office of the Claimant's attorney on March 15, 2013. At his May 7, 2013 deposition, only seven weeks later, he significantly altered those restrictions, without basis. There is nothing in the record indicating that he saw the Claimant during this interim period of time. His explanation for his alteration of restrictions is that he does not like the forms provided by the attorney's office. The revisions set forth in his deposition testimony do not reflect independent opinions. Dr. Torres continued to use the same form to which he raised objections and simply changed his opinion regarding restrictions. He moves restriction severity from one category to another. Additionally, in view of the Claimant's multiple trips to Kansas, Ohio, Mississippi and Virginia, Dr. Torres' placement of the Claimant in the most severely restrictive category for travel, further exemplifies the unreliability of his opinions and assigned restrictions. Dr. Torres' diagnosis of post traumatic stress disorder is not shared by Dr. Entin or Dr. Weingarten. Dr. Torres disagrees that the Claimant has a pre-existing (Axis II) diagnoses of histrionic features. This is at odds with Dr. Entin, Dr. Weingarten and Dr. Zierck. Dr. Torres testifies that there is no mention in the EMT and ER records which would demonstrate a thorough observation relevant to the claimant's cognitive status. This testimony does not square with the information contained within those records or the MTG. Lack of dependability and inconsistency are offered by the Camp A providers, as a primary reasons why the Claimant would be unable to return to work. However, the Claimant's dependability has been consistently demonstrated by her ability to keep her medical appointments. Similarly, the claimant was able to attend the Peach Festival because she was, motivated to do so. Moreover, her attendance and participation in at multiple days of hearing and even more days of deposition testimony demonstrate the fallacy of this argument. As a psychologist, Dr. Zierck reported that the Claimant had a somatoform disorder which is an unconscious exaggeration of symptoms. Somatoform is a differential diagnosis for conscious exaggeration and Dr. Zierck's testing was consistent with symptom exaggeration. He opined that the testing demonstrates that the Claimant has become socially introverted and has little capacity to experience joy and pleasure. These characteristics are not seen anywhere in the surveillance video. Dr. Zierck testified that the two most significant vocational limitations are the Claimant's vestibular and ocular problems. However, once he was made aware of Dr. Lipkin's updated opinions, he agreed that the Claimant did not have any vestibular problems, vertigo or dizziness which would preclude her from returning to pre-injury occupations. He agreed that Dr. Lipkin's November 23, 2011 report put Dr. Lipkin in Camp B. Similarly, Dr. Zierck had not reviewed the reports from Drs. Roe and Wilson, both of whom agreed that the Claimant had no visual limitation to returning to work, whether it be brain related or otherwise. Dr. Zierck agrees that Dr. Politzer had only limited the Claimant from fixing her gaze on a computer screen or printed matter for longer than two hours without the need of resting her eyes. He agreed that while Dr. Politzer indicated that the Claimant's eyes may tend to "fatigue" after gazing at a computer screen or printed matter for more than 30

minutes, the bottom line limitation for sitting at a computer was two hours. Eye fatigue in and of itself would not preclude the Claimant from continuing to work at a computer screen or printed matter.

242. Considering the opinions of Drs. Kenneally, Goldman, Lipkin, Thwaites, Bernton, Weingarten, Reinhard, Wilson and Roe (Camp B), the Claimant has little to no limitations of any kind and is able to earn wages in the same or other employment. She can return to pre claim employment. Many of these Camp B physicians evaluated and/or treated the Claimant on referral from Drs. Artist or Gellrick. They are not traditional litigation-type Independent Medical Examinations. They include Drs. Goldman, Lipkin, Roe, Wilson and Kenneally. The Camp B IME reports and testimony are well-reasoned and in line with the Medical Treatment Guidelines and supported by authoritative scientific sources. Based on the totality of the evidence, the opinions of these Camp B providers are overall found by the ALJ to be more compelling and persuasive.

Ultimate Findings

243. There is considerable conflicting expert testimony and opinions regarding the extent of the Claimant's injuries, her limitations and her ability to earn wages in the same or other employment. As found, the Camp B medical providers, including Drs. Goldman, Kenneally, Lipkin, Thwaites, Bernton, Reinhard, Weingarten, Roe and Wilson, are found to be more persuasive, compelling and are afforded more weight than the opinions of the Camp A medical providers on issues which include, but are not limited to, the claimant's restrictions and employability. The Claimant's activities as shown in the surveillance video and as described in testimony, including but not limited to, her driving activities and post injury travel, are found to be more consistent with the opinions assigned by the Camp B providers.

244. With respect to the vocational rehabilitation expert opinions, the opinion of Ms. Patricia Antcil is found to be more persuasive than that of Dr. Zierk.

245. Considering and weighing all of the lay and expert testimony, the hearing submissions, including but not limited to, the surveillance video, it is found that the Claimant has not satisfied her burden of proving that she is unable to earn wages in the same or other employment.

CONCLUSIONS OF LAW

Generally

The purpose of the Workers' Compensation Act of Colorado (Act), C.R.S. §§ 8-40-101, *et seq.*, is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. C.R.S. §8-40-102(1). The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. C.R.S. § 8-43-201. A preponderance of the evidence is that which leads the trier-of-fact, after considering all

of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979) The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of respondents and a workers' compensation claim shall be decided on its merits. C.R.S. § 8-43-201.

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. See *Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); *Bodensieck v. Industrial Claim Appeals Office*, 183 P.3d 684 (Colo. App. 2008); *Kroupa v. Industrial Claim Appeals Office*, 53 P.3d 1192 (Colo. App. 2002).

The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

Permanent Total Disability

Permanent total disability, as defined in § 8-40-201(16.5), C.R.S., means an "employee is unable to earn any wage in the same or other employment." When the statute was amended in 1991, it established a strict definition of permanent total disability. The intention of the amendments was to create a real and non-illusory bright line rule for the determination whether a claimant has been rendered permanently and totally disabled. *Lobb v. Indus. Claim Appeals Off.*, 948 P.2d 115 (Colo. App. 1997). A claimant must also establish that the industrial injury was a significant causative factor by showing a direct causal relationship between the industrial injury and the permanent total disability. *Joslins Dry Goods Co. v. Indus. Claim App. Off*., 21 P.3d 866 (Colo. App. 2001)*; Seifried v. Industrial Commission,* 736 P.2d 1262 (Colo. App.1986).

It is the claimant's burden of proof to establish that she is permanently totally disabled by a preponderance of the evidence. The question of whether claimant has the ability to earn any wages is one of fact for resolution by the administrative law judge. *Best-Way Concrete Co. v. Baumgartner,* 908 P.2d 1194 (Colo. App. 1995). For purposes of permanent total disability, "any wages" means more than zero. *McKinney v. Indus. Claim Appeals Off.*, 894 P.2d 42 (Colo. App. 1995). In *McKinney* the Court held that the ability to earn wages in "any" amount is sufficient to disqualify a claimant from receiving permanent total disability benefits. It is not necessary that the claimant be able to return to previous employment. If wages can be earned in some modified, sedentary or part-time employment, a claimant is not permanently and totally disabled for the purpose of the statute. *See also Christie v. Coors Transportation*, 933 P.2d 1330 (Colo. 1997). Although, if the evidence establishes that a claimant is not physically able to sustain post-injury employment, or that such employment is unlikely to become

available to a claimant in the future in light of particular circumstances, an ALJ is not required to find a claimant is capable of earning wages. *Joslins,* supra; *Holly Nursing Care Center v. Industrial Claim Appeals Office, 992 P.2d 701, (Colo. App. 1999).*

The determination of whether a claimant is permanently and totally disabled is made on a case by case basis and varies according to the particular abilities and circumstances of the claimant. In determining whether a claimant is permanently totally disabled, the ALJ may consider various "human factors" such as mental capabilities, physical ability, education, vocational training, overall physical condition, former employment, and availability of work a claimant can perform within a commutable labor market. The overall objective is to determine whether employment exists that is reasonably available to a claimant under her particular circumstances. *Weld County School Dist. RE-12 v. Bymer*, 955 P.2d 550 (Colo. 1998).

A huge volume of testimony and documentary evidence was presented in this case and the reader is referred to the extensive and detailed findings of fact, and most especially the conclusory findings of fact, as set for the above, in lieu of redundant recitation of these facts here. Considering and weighing all of the lay and expert testimony, and the hearing submissions, including, but not limited to, the neuropsychological test results and interpretations, diagnostic imaging and testing, and the surveillance video, it is determined that the Claimant has failed to establish, by a preponderance of the evidence, that the Claimant's work injuries prevent her from earning a wage in her previous employment or any other employment. While the ALJ acknowledges that the Claimant suffers from deficits related to her October 15, 2008 injury which may negatively impact her ability to function and to work, the Claimant has sufficient residual function, ability, training and education to obtain and maintain continuous employment in at least a modified, part-time, sedentary position and such employment is available to the Claimant in her commutable labor market.

ORDER

It is therefore ordered that:

1. The Claimant has failed to establish that she is unable to earn any wages and has failed proven that she is entitled to receive permanent total disability benefits. The Claimant's claim for permanent total disability benefits is denied and dismissed with prejudice.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, Colorado, 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. (as amended, SB09-

070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

OFFICE OF ADMINISTRATIVE COURTS
STATE OF COLORADO

W.C. No. 4-784-196-12

FULL FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER GRANTING SUMMARY JUDGMENT IN FAVOR OF RESPONDENTS

IN THE MATTER OF THE WORKERS' COMPENSATION CLAIM OF:

Claimant,

v.

Employer,

and

Insurer/Respondents.

Hearing in the above-captioned matter is presently scheduled for June 18, 2015, 2015, in Denver, Colorado. On June 2, 2015, the respondents filed a Motion for Summary Judgment, which was rejected on the same date for failure to comply with Office of Administrative Court Rules of procedure (OACRP), Rule 17, 1 CCR 104-1. On June 4, 2015, the respondents filed an Amended Motion for Summary Judgment, in compliance with Rule 17. On June 12, 2015, the Self-Represented Claimant filed a Response to Respondents' Amended Motion for Summary Judgment, with at least 100 pages of documents that apparently go the merits of what has been previously adjudicated. On June 16, 2015, the Respondents' Amended Motion and the Claimant's Response were assigned to Edwin L. Felter, Jr., Administrative Law Judge (ALJ) for a ruling.

Hereinafter David Valdez shall be referred to as the "Claimant." Alstom, Inc. shall be referred to as the "Employer." All other parties shall be referred to by name.

ISSUE FOR SUMMARY JUDGMENT

The issue to be determined by this decision concerns whether there is a genuine issue of disputed material fact concerning whether the Claimant is barred from re-opening his workers' compensation claim when an ALJ previously determined, and the decision was upheld on appeal by the Industrial Claim Appeals Office (ICAO) and the Colorado Court of Appeals, that all of the Claimant's future medical conditions were unrelated to his January 9, 2009 work injury.

The Respondents bear the burden of proof, by a preponderance of the evidence.

FINDINGS OF FACT

Based on the undisputed evidence contained in the file, pleadings and exhibits, the ALJ makes the following Findings of Fact:

Preliminary Findings

1. The Claimant worked as a boilermaker for the Employer. While at work for the Employer on January 9, 2009, the Claimant suffered an admitted aggravation of his pre-existing condition when he fell. Specifically, he sustained admitted compensable aggravations to his neck, back and left shoulder.

2. In December of 2010, the Claimant's authorized treating physician (ATP), Mary F. Burgesser, M.D., placed him at maximum medical improvement (MMI) for the injuries he sustained in 2009. Dr. Burgesser was not a Level II accredited physician and, therefore, Mark Paz, M.D., performed an impairment rating.

3. The Claimant ultimately underwent a Division Independent medical Examination (DIME) with Kathy McCranie, M.D. The DIME physician agreed that the Claimant had reached MMI for his 2009 injuries in December of 2010. Dr. McCranie also provided the following causation determination:

> Based on the evaluation done today, I would agree that [Claimant] has reached maximum medical improvement. I would agree with the date of maximum medical improvement of 12/28/10. I would recommend that he work within the light work category due to his longstanding, chronic pain problems. I do not believe that there is any medical maintenance care required for his injury of 01/09/09, as all of his cervical and lumbar spine complaints, as well as his left shoulder complaints predated his work injury and there are no objective findings to indicate any change in his condition

post injury, any further follow up care should revert back to his only personal physician outside of the Workers' Compensation arena.

4. DIME Dr. McCranie placed the Claimant at MMI on December 28, 2010, with no permanent impairment, determining that any medical conditions were not causally related to the admitted injury after that date.

5. Despite making this definitive causation determination in favor of the Respondents, the DIME nevertheless performed a permanency evaluation with apportionment just to further illustrate that the opinion was correct. Such an evaluation was purely gratuitous. Dr. McCranie ultimately determined that claimant had a 0% impairment rating for the neck and low back and that although there could potentially be a 1% rating for the shoulder, however, she questioned how even that potential rating could be related to the work injury. The ALJ finds that Dr. McCranie's rating exercise was hypothetical in the workers' compensation context.

ALJ Walsh Decision

6. The Claimant did not accept the causation and other opinions provided by the DIME. As a result, a hearing was held in this matter before ALJ Donald Walsh on February 24, 2012. ALJ Walsh provided the following factual findings:

> * "The DIME physician noted that the claimant had returned to base line after the work injury and his ongoing problems were not causally related to the work injury.. . . Even though Dr. McCranie found that the Claimant's ongoing condition was not work-related, she nevertheless performed permanent impairment testing to see if there would be ratings after apportionment. The permanent impairment ratings were essentially 0% after properly performing apportionment."
>
> (ALJ Walsh's Fact Findings, #26 and #27).
>
> * "The ALJ finds the DIME physician's causation, MMI and PPD ratings to be persuasive and the Claimant failed to overcome these opinions by clear and convincing evidence.. . . The Claimant failed to prove an entitlement to ongoing maintenance medical benefits by a preponderance of evidence. Moreover, any treatment that the Claimant requires is causally related to these pre-existing conditions ***as the Claimant returned to his base line condition after the admitted work injury***."

(ALJ Walsh's Fact Findings #35 and #37) (emphasis supplied).

7. As a result, ALJ Walsh specifically made a finding that the Claimant had returned to his baseline condition ***and the ongoing medical conditions were not work-related***. ALJ Walsh also denied the Claimant's request for permanent disability benefits and/ or ongoing workers' compensation benefits.

Appeals of ALJ Walsh Decision

8. The Claimant appealed to the Industrial Claim Appeals Office (ICAO). ICAO affirmed the ruling of the ALJ. In its Order, ICAO held as follows:

> * "In her report, the DIME physician specifically states that "there are no objective findings to indicate any change in his condition post injury.". . . The ALJ interpreted this to mean that claimant returned to baseline from the January 2009 injury and his ongoing problems were not causally related…."

9. After reviewing ALJ Walsh's decision, ICAO specifically affirmed the causation determination made by the ALJ as follows:

> * "The evidence supports the ALJ's finding that the claimant's disabling condition is the result of the pre-existing condition rather than the January 9, 2009 injury and the entirety of the claimant's impairment is attributable to the prior injury.. . . the findings of the ALJ are abundantly supported by the record. Therefore, we are bound by those findings and are not persuaded that the ALJ committed reversible error in finding that the claimant failed to overcome the DIME physician's opinion of permanent impairment."

10. The Claimant subsequently appealed the matter to the Colorado Court of Appeals. In upholding the decisions of ICAO and ALJ Walsh, the Court of Appeals specifically made the following determination:

> "… the DIME physician opined that claimant had not sustained any permanent injuries as a result of the 2009 accident. Her conclusions were corroborated by the employer's retained medical expert. Employer's retained medical expert opined that no objective change in claimant's

> condition could be attributed to the 2009 work-related accident. He also expressly concurred with the DIME physician's methodology in calculating the impairment rating, agreed with the DIME physician's conclusion that claimant sustained a zero percent impairment rating for his 2009 injuries, and noted that the same result would be reached even if claimant's preexisting injuries were assigned a higher impairment rating. This corroborative evidence amply supports the ALJ's finding that the DIME physician's impairment rating was accurate and that claimant's ongoing need for medical care was not causally related to the 2009 accident." (Court of Appeals ruling page 6)

11. The Claimant did not appeal the decision of the Court of Appeals. As a result, the ALJ's original finding that the Claimant did not suffer any permanent injuries and his ongoing medical conditions were pre-existing is final.

Petition to Re-Open

12. On August 8, 2014, the Claimant filed a Petition to Re-Open his 2009, workers' compensation claim due to an alleged change in his medical condition.

13. The Claimant attached a medical report from Robert J. Greenhow, M.D., stating that the Claimant was seen for a follow up with regard to his left shoulder. Dr. Greenhow provided an addendum to his report which states that it was brought to his attention that Claimant's ongoing symptoms are related to an old work injury from 2009.

14. Subsequent to the Claimant filing his Petition to Re-open, he filed an Application for Hearing. In his Application, the Claimant stated that he objected to the Order closing his worker' compensation claim, the he has the legal right to overcome the DIME. In fact, the Claimant attempted to overcome the DIME of Dr. McCranie and ALJ Walsh determined that he failed to do so. ALJ Walsh's decision was affirmed by ICAO and the Court of Appeals. There was **no** timely motion for reconsideration or Petition for a Writ of Certiorari to the Supreme Court. Consequently, ALJ Walsh's decision that the Claimant failed to overcome the DIME of Dr. McCranie became final.

15. The Claimant also alleged that his permanent impairment rating should not have been apportioned with his prior impairment rating. And lastly, he alleges that he has suffered from a change in condition after his MMI date of December 28, 2010.

Ultimate Findings

16. There is no genuine issue of disputed material fact concerning the finally adjudicated fact that the Claimant's medical condition after his MMI date of December 28, 2010 is **not** causally related to the admitted injury of January 9, 2009, thus it follows that it has been finally adjudicated that there was no change in condition or worsening of the admitted work-related injury of January 9, 2009. In sum, there is no work-related matter to re-open.

17. The Claimant's Response to the Respondents' Amended Motion for Summary Judgment, although voluminous, does **not** set forth specific facts rebutting the fact that there has been a final adjudication that the Claimant's medical condition after his MMI date of December 28, 2010, was not causally related to the admitted injury of January 9, 2009.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

Summary Judgment

a. Pursuant to Office of Administrative Courts Rules of Procedure (OACP) Rule 17, 1 CCR 1101-3, "any party may file a motion for summary judgment seeking resolution of any endorsed issue for hearing." Summary judgment may be sought in a workers' compensation proceeding. *See Fera v. Indus. Claim Appeals Office,* 169 P.3d 231, 232 (Colo. App. 2007). The OAC Rule allows a party to support its Motion with affidavits, transcripts of testimony, medical reports, or employer records. A motion for summary judgment may be supported by pleadings, depositions, answers to interrogatories, and admissions on file. C.R.C.P. 56; *See also Nova v. Indus. Claim Appeals Office*, 754 P.2d 800 (Colo. App. 1988) [C.R.C.P. and C.R.E. apply insofar as they are not inconsistent with the procedural or statutory provisions of the Act]. As found, the Amended Motion for Summary Judgment and the Response thereto are supported by documents and/or affidavits.

b. Summary judgment is appropriate when the pleadings show that there is no genuine issue as to any material fact and that the moving party is entitled to judgment as a matter of law. C.R.C.P. 56(c); *Churchey v. Adolph Coors Co.*, 759 P.2d 1336 (Colo. 1988). This rule allows the parties to pierce the formal allegation of the pleadings and save the time and expense connected with trial when, as a matter of law, based on undisputed facts, one party could not prevail. See *Drake v. Tyner*, 914 P.2d 519 (Colo. Ct. App. 1996). As found, the Amended Motion, Response and attachments

show that there is no genuine issue of disputed material fact with respect to the concerning the finally adjudicated fact that the Claimant's medical condition after his MMI date of December 28, 2010 is **not** causally related to the admitted injury of January 9, 2009, thus it follows that there was no change in condition or worsening of the admitted work-related injury of January 9, 2009. In sum, there is no work-related matter to re-open.

c. Once the moving party shows specific facts probative of a right to judgment, it becomes necessary for the non-moving party to set forth facts showing that there is a genuine issue for hearing. *See Miller v. Van Newkirk*, 628 P.2d 143 (Colo. App. 1980). An adverse party may not rest upon the mere allegations or denials in its pleadings, but its response by affidavits or other means must set forth specific facts showing that there is a genuine issue of disputed material fact. C.R.C.P., Rule 56(e). Genuine issues of material fact cannot be manufactured and arguments alone will not preclude summary judgment; contentions must be supported. *See Bauer v. Southwest Denver Mental Health Center, Inc.*, 701 P.2d 114 (Colo. App. 1985). As found, the Claimant's Response to the Respondents' Amended Motion for Summary Judgment, although voluminous, does **not** set forth specific facts rebutting the fact that there has been a final adjudication that the Claimant's medical condition after his MMI date of December 28, 2010, was not causally related to the admitted injury of January 9, 2009, and there is not work-related matter that can be re-opened.

Burden of Proof

d. The burden of proof is generally placed on the party asserting the affirmative of a proposition. *Cowin & Co. v. Medina,* 860 P. 2d 535 (Colo. App. 1992). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark,* 197 Colo. 306, 592 P. 2d 792 (1979). *People v. M.A.,* 104 P. 3d 273 (Colo. App. 2004); *Hoster v. Weld County Bi-Products, Inc.,* W.C. No. 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. *Also see Ortiz v. Principi,* 274 F.3d 1361 (D.C. Cir. 2001). As found, there is no genuine issue of disputed material fact concerning the finally adjudicated fact that the Claimant's medical condition after his MMI date of December 28, 2010 is **not** causally related to the admitted injury of January 9, 2009, thus it follows that there was no change in condition or worsening of the admitted work-related injury of January 9, 2009. In sum, there is no work-related matter to re-open. Therefore, the Respondents have sustained their burden of proof by a preponderance of the evidence.

ORDER

IT IS, THEREFORE, ORDERED THAT:

A. Summary Judgment is hereby granted in the Respondents' favor, and the Claimant's petition to Re-Open is hereby denied and dismissed.

B. Any and all claims for additional workers' compensation benefits are hereby denied and dismissed.

C. The scheduled hearing of June 18,, 2015 is hereby vacated.

DATED this_____day of June 2015.

ISSUE

1. Is the intra-articular steroid injection as requested by Dr. Finn reasonable, necessary, and related to the claimant industrial injury of April 5, 2009?

FINDINGS OF FACT

1. The claimant sustained an admitted injury to her low back while employed with the respondent-employer on April 5, 2009.

2. Initially, the claimant treated with Dr. James Hubbard at Emergicare. Under Dr. Hubbard, the claimant received care to include medication and physical therapy. Dr. Hubbard also referred the claimant to Dr. Michael Sparr.

3. An MRI was performed on May 27, 2009, which revealed a small extruded disc herniation on the right at L5-S1 with indentation of the thecal sac but without nerve compression. There was also desiccated disc bulging at L4-5 with shallow annulus fibrosis tearing.

4. On June 11, 2009, the claimant was seen by Dr. Sparr for persistent low back pain. Physical examination revealed spasming in the left paralumbar musculature, limited lumbar range of motion in forward flexion, left sided lumbar pain, and pain on the left side with right and left lateral rotation. Dr. Sparr opined that the claimant's pain at this point appears to be discogenic related to the disc finding at L4-5 and L5-S1 including an annular tear and extruded fragment. Dr. Sparr recommended an epidural steroid injection (ESI).

5. On July 6, 2009, the claimant underwent an ESI at the L5-S1 level. Dr. Sparr's note of July 23, 2009 indicates that the claimant received no relief from the ESI.

6. The claimant was placed at maximum medical improvement (MMI) on October 2, 2009 with a 15% whole person impairment. On March 31, 2010, ALJ Bruce Friend entered an Order awarding the claimant maintenance medical care after MMI.

7. The claimant returned to Dr. Hubbard on May 6, 2010 at which time he

prescribed more pain medications.

8. The claimant was seen by Dr. John Reasoner on November 10, 2012 for continued low back pain. Dr. Reasoner diagnosed the claimant as having a chronic lumbar strain and prescribed medications. The claimant was seen at Emergicare and seen by Dr. Reasoner or Dr. Dean on December 15, 2012, December 18, 2012, February 20, 2012, and March 27, 2013. On each of these dates, the claimant was experiencing low back pain. Physical examination on these visits revealed tenderness of the low back with loss of range of motion. Dr. Reasoner prescribed medication and on February 20, 2013 gave the claimant an intramuscular injection into the right buttock, and prescribed a Lidoderm patch along with physical therapy.

9. The claimant had physical therapy from February 25, 2013 through March 20, 2013. The medical records show that while the claimant noticed decreased pain it never completely resolved. The claimant was given a TENS unit at the March 20, 2013 physical therapy session.

10. Because the claimant was still having ongoing symptoms in her low back, Dr. Reasoner on March 27, 2013 increased the claimant's Amitriptyline, changed the Ibuprofen to Relafen, and referred her to Dr. Finn for further maintenance care.

11. On January 7, 2014, the claimant was seen by Dr. Finn. At that time, the claimant was having low back pain left greater than right radiating to the hip, buttock, and along the back of the leg halfway to the knee with occasional lateral thigh and calf pain. Upon physical examination, Dr. Finn noted reduced range of motion in the lumbar spine and pain with extension as well as with extension in combination with rotation to either side. Dr. Finn also noted mild to moderate spasms in the left side of the lumbar spine. Dr. Finn's diagnoses were chronic lumbosacral spinal pain, posterior element component, and questionable discogenic component. Dr. Finn felt that some of the claimant's pain may be related to the posterior elements given her pain with facet loading and recommended the claimant undergo a diagnostic facet joint medial branch block and if that fails consider reimaging to rule out any further pathology.

12. On January 22, 2014, the claimant had bilateral L3, L4, and L5 facet joint medial branch blocks. The claimant returned back to Dr. Finn on January 31, 2014 and noted that she failed to have a diagnostic result although she had 24 hours of significant pain relief. Because of this, Dr. Finn recommended an MRI of the lumbar spine.

13. On February 22, 2014, the claimant had an MRI which revealed a small paracentral acute to subacute disc herniation at L3-4 displaced caudally causing severe

right lateral recess effacement with proximal L4 nerve root compression. The interpreting radiologist indicated that this finding was not present in the December 22, 2011 MRI. Dr. Finn in his note dated February 25, 2014 wrote that the MRI also revealed some facet arthropathy for which Dr. Finn recommended an intra-articular facet injection to see if this was the source of the pain.

14. The claimant returned back to Dr. Finn on May 1, 2014 without having had the intra-articular facet injection. Dr. Finn wrote in his office note of this date that while the MRI of February 22, 2014 revealed a new right-sided disc herniation with severe right side lateral recess effacement and proximal, he was not convinced that this new disc herniation is contributing to her symptoms. Dr. Finn opined that the claimant continues to demonstrate evidence of a posterior element component to her pain and that intra-articular corticosteroid injection would be a reasonable option for her. Dr. Finn also opined that her current complaints and physical findings are related to the April 5, 2009 injury and so is his recommended treatment.

15. The claimant testified that she injured her low back on April 5, 2009 and as a result had medical care under a variety of physicians including Dr. Hubbard at Emergicare, Dr. Michael Sparr, and Dr. Kenneth Finn. The claimant said that initially she had care to include medication and physical therapy but eventually ended up having epidural steroid injections which somewhat helped relieve symptoms. The claimant went on to testify that since being placed at MMI on October 2, 2009, she has continued to have pain and stiffness in her low back. The claimant testified that she returned back to Emergicare in May of 2010 because of her continued low back problems. The claimant said that insofar as her low back is concerned she has symptoms which wax and wane and these symptoms increase with prolonged sitting, standing, or walking. The claimant went on to testify that when her symptoms increase she takes medication and/or uses a heating pad in an attempt to reduce said symptoms.

16. Dr. Lloyd Thurston, at the request of the respondents, evaluated the claimant on May 9, 2012 and July 2, 2013. Dr. Thurston reviewed the claimant's medical records from Emergicare and Dr. Sparr. In his reports of the above referenced dates, Dr. Thurston opined that the claimant's present low back problems are not related to the April 5, 2009 work injury but are idiopathic partially due to genetic factors. Nonetheless, Dr. Thurston in his May 9, 2012 report recommended further medical treatment consisting of medications in the form of muscle relaxants, NSAIDS, and Tramadol or narcotic medication for comfort along with home exercises and core strengthening. Dr. Thurston did not feel ESI's would be beneficial.

17. In a Rule 16 Chart Review dated March 8, 2014. Dr. Thurston felt that the

inter-articular facet injection as recommended by Dr. Finn is not related to the admitted April 5, 2009 injury. Dr. Thurston bases this on his review of the May 27, 2009 MRI, the December 22, 2011 MRI, and the May 22, 2014 MRI. Dr. Thurston noted that the February 22, 2014 MRI revealed a small posterior paracentral acute to subacute disc herniation at L3-4 displaced caudally causing severe right lateral recess effacement with proximal L4 nerve root compression, which was not present in the 2009 and 2011 MRI's. Dr. Thurston wrote that this L3-4 disc herniation is consistent with the claimant's current right leg symptoms.

18. Dr. Thurston testified in accordance with his reports and chart review. Dr. Thurston reiterated his opinion that the lumbar epidural injections recommended by Dr. Finn were neither related to the industrial injury nor reasonable and necessary. Dr. Thurston felt that the DOWC Treatment Guidelines for repeat epidural injections are not met in light of the claimant's minimal response to the epidural injections given by Dr. Sparr in 2009. Dr. Thurston felt that the claimant's age and body habitus were major contributors to the claimant's symptom complex. Dr. Thurston admitted on cross examination that Dr. Finn was not requesting authorization for an epidural steroid injection but a facet injection which is designed to identify the pain generator and hopefully reduce pain symptoms. Finally, Dr. Thurston acknowledged that the DOWC Treatment Guidelines are not intended to limit post MMI care.

19. Dr. Finn testified by deposition in which he opined that the claimant's current complaints and physical findings in her low back are related to her April 5, 2009 work injury. Dr. Finn bases his opinion on a variety of factors including a paucity of medical evidence revealing any low back problems prior to the date of the injury, no indication of any reinjury subsequent to the date of the injury, and the fact that the claimant has had consistent low back problems since April 5, 2009. Dr. Finn does not believe that the new herniated disc revealed in the February 22, 2014 MRI is contributing to the claimant's symptoms since the herniation is on the right side at L3-4 which is on the opposite side of her primary complaint. In addition, with a disc herniation, the claimant would have pain bending forward which wasn't consistent with her examination. Dr. Finn found that the claimant had pain bending backwards which is consistent with facet mediated back pain. Dr. Finn went on to explain that the temporal relationship between the trauma and the onset of symptoms bolsters his opinion that the claimant's low back problems are related to the trauma as opposed to genetics, lifestyle or body habitus.

20. Dr. Finn further testified that the claimant did not have a typical response to the medial branch block that was done on January 22, 2014 in that there is usually a much more drastic reduction in pain within the first or second hour with a gradual

recurrence of pain over the subsequent four to five hours. According to Dr. Finn, the claimant's pain gradually lessened over the six hours post injection. However, Dr. Finn went on to testify that he has had other patients with similar results and that not everyone has a textbook response to the injections. Based on this, Dr. Finn believes that a one-time corticosteroid injection would be reasonable to try and provide the claimant with much longer pain relief.

21. Upon cross examination, Dr. Finn recognized that Dr. Thurston's records reveal that the claimant had a negative facet exam in 2013 and 2013. Dr. Finn was unable to explain why there were differences but indicated that facet pain can wax and wane. In addition medication can ameliorate facet pain. Finally, Dr. Finn testified that if the steroid injection he is recommending does not provide a reduction of pain, then the claimant's future treatment would likely consist of medication as recommended by Dr. Thurston along with an exercise program.

22. The ALJ finds Dr. Finn's analysis and opinions to be credible and more persuasive than medical evidence to the contrary.

23. The ALJ finds that the claimant has established that it is more likely than not that the treatment recommended by Dr. Finn is reasonable, necessary, and related to the claimant's industrial injury of April 5, 2009.

CONCLUSIONS OF LAW

1. The purpose of the Workers' Compensation Act of Colorado in §8-40-101, et. seq. C.R.S. (2013) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers without the necessity of litigation. See §8-40-102(1).

2. A worker's compensation case is decided upon its merits. See §8-43-102, C.R.S.

3. Facts in a workers' compensation case must be interpreted neutrally neither in favor of the rights of a claimant nor in favor of the rights of the respondents. See §8-43-201, C.R.S.

4. The Judges' factual findings concern only evidence that is dispositive of the issues involved: the Judge cannot address every piece of evidence that might lead

to a conflicting result. See *Magnetic Engineering, Inc. v. ICAO*, 5. P.3d 285 (Colo. App. 2000).

5. When determining credibility the fact finder should consider among other things the consistency or any inconsistencies of the witnesses testimony or actions; the reasonableness or unreasonableness (probability or improbability) of the testimony or actions; the motive of the witness: and whether the testimony would have been contradicted and bias, prejudiced, or in any. See *Impure Prudential Insurance Co. v. Coin*, 57 P.2d 1205 (1936).

6. The respondents are liable for medical treatment reasonably necessary to cure and relieve the employee of the effects of the injury. Section 8-42-101, C.R.S.; *Grover v Industrial Commission*, 759 P.2d 703 (Colo. 1988). The claimant must prove by a preponderance of the evidence his or her entitlement to benefits. The facts in a workers' compensation case are not interpreted liberally in favor of the claimant or respondents. Section 8-43-201 C.R.S.

7. A preponderance of the evidence is that which leads the trier of fact after considering the evidence to find that a fact is more probably true then not. *Page v. Clark*, 197 Colo. 706, 592 P.2d 792 (1979).

8. The claimant sustained an admitted injury to her low back on April 5, 2009. Initially the claimant received care to include medication, physical therapy, and an ESI at the L5-S1 level. This injection provided no relief. The claimant was eventually placed at MMI as of October 2, 2009 and given a 15% whole person impairment. Since reaching MMI, the claimant has continued to have ongoing low back pain for which she has received treatment consisting of medication, physical therapy, intramuscular injections, and a TENS unit.

9. Eventually, the claimant was referred to Dr. Finn. Based upon his evaluation, Dr. Finn felt that the claimant had a possible facet problem in the lumbar spine and recommended a diagnostic facet joint medial branch block which was done in January 22. 2014. According to Dr. Finn, the claimant received relief from the branch block but it was atypical. However, Dr. Finn testified that he has had other patients with similar results and not everyone has a textbook response to the injection. In addition, the claimant credibly testified that the medial branch block provided pain relief. Based on this, Dr. Finn believes that it is reasonable for the claimant to have the corticosteroid injection he recommends. If it doesn't work, the claimant will have exhausted her reasonable treatment options except for ongoing medication management.

10. It is recognized that Dr. Thurston believes that the claimant's present low back problems are not related to the work injury.

11. The ALJ concludes that the analysis and opinions of Dr. Finn are credible and entitled to greater weight than medical evidence and opinions to the contrary.

12. The ALJ concludes that the claimant has established by a preponderance of the evidence that her present back condition for which Dr. Finn is recommending a corticosteroid injection is related to the initial injury.

13. The ALJ concludes that the claimant has established by a preponderance of the evidence that the corticosteroid injection recommended by Dr. Finn is reasonable, necessary, and related to the April 5, 2009 industrial injury.

ORDER

It is therefore ordered that:

The respondent-insurer shall pay for the intra-articular steroid injection as recommended by Dr. Finn

All matters not determined herein, and not closed by operation of law, are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

STATE OF COLORADO
WORKERS' COMPENSATION NO. 4-825-435-06

ISSUES

I. The sole issue for determination is whether C.R.S. §8-42-107.5 may be applied to allow Respondents to suspend temporary total disability benefits, and take credit for permanent partial disability benefits previously paid prior to reopening, consistent with the decision announced by the Court of Appeals in *Donald B. Murphy Contractors v. ICAO,* 916 P.2d 611 (Colo.App. 1995).

FINDINGS OF FACT

Based upon the evidence presented at hearing and the parties' stipulation, the ALJ enters the following findings of fact:

1. Claimant's date of injury was September 30, 2009. (Clt. Ex. 8, Stipulation 1)

2. Claimant received temporary partial disability ("TPD") benefits and/or temporary total disability ("TTD") benefits intermittently from June 7, 2010 until April 4, 2012. (Clt. Ex. 8, Stipulation 2; Resp. Exs. C, E, H and L)

3. On April 5, 2012, the primary authorized treating physician, Dr. Michael Dallenbach, placed Claimant at maximum medical improvement ("MMI") with an impairment rating of 23% whole person for her cervical spine, and 8% scheduled impairment for her right shoulder. If combined, the whole person impairment rating would be 27%. Prior to reaching MMI, Claimant underwent a two-level fusion for her cervical spine which was authorized, related and reasonably necessary. (Clt. Ex. 8, Stipulation 3; Resp. Ex. B)

4. On April 17, 2012, Insurer filed a Final Admission of Liability ("FAL") accepting Dr. Dallenbach's impairment ratings, and admitting to permanent partial disability ("PPD") benefits in the total amount of $78,587.70. (Resp. Ex. C) The parties subsequently resolved a shoulder conversion issue, and a disfigurement issue, for a total of $7,500 (Resp. Ex. D); the $7,500 was not further broken down for PPD and disfigurement benefits. However, in a Stipulated Motion to Resolve Issues, signed by the parties and dated June 27, 2012, the parties agreed that this $7,500 was in addition to any previously admitted indemnity benefits, and constituted indemnity benefits for the purposes of the cap established by C.R.S. §8-42-107.5. (Clt. Ex. 8, Stipulation 3; Resp. Ex. D, bns 016, 020)

5. On July 9, 2012, Insurer filed a new FAL consistent with the stipulated motion

and order. (Resp. Ex. E) The FAL was otherwise unchanged from the prior FAL. Critical to the issue at hand, Claimant did not object to the July 9, 2012 FAL, and the claim closed on all issues, including MMI.

6. On July 13, 2012, Claimant filed a Request for Lump Sum Payment, seeking $50,000 in PPD benefits still owing be paid in a lump sum. (Resp. Ex. F, bn 037) Insurer honored this request, and on July 20, 2012, Insurer paid Claimant $50,000 in a lump sum, less the lump sum discount (Resp. Ex. L, bn 070); Insurer then filed a Lump Sum Calculation and Proof of Payment.1 (Resp. Ex. F, bn 038)

7. On September 9, 2012 Insurer filed a Final Payment Notice, documenting that as of that date, $78,587.70 in PPD benefits had been paid. (Resp. Ex. G) Claimant agrees that PPD benefits admitted to were paid in full. (Clt Ex. 8, Stipulation 5) The Final Payment Notice did not reference the $7,500 paid pursuant to the Stipulated Motion to Resolve Issues, and Order granting the same. (Resp. Ex. G)

8. On May 14, 2013 Claimant filed a Petition to Reopen, alleging a worsening of her condition. On September 5, 2013 Insurer filed a General Admission of Liability ("GAL") voluntarily reopening this claim, and authorizing Claimant to undergo a second cervical fusion. Insurer resumed payment of TTD benefits as of May 7, 2013. (Clt. Ex. 8, Stipulation 6)

9. Within the September 5, 2013 GAL, Insurer indicated that it would take credit for PPD previously paid, and it further noted that $86,087.70 represented the previous PPD awarded and paid. (Resp. Ex. H, bns 043, 045) This figure represents the admitted to amount of PPD ($78,587.70), and $7,500 paid pursuant to the June 2012 stipulation and order.

10. Claimant underwent surgery by the authorized surgeon, Dr. Michael Rauzzino on September 23, 2013. The surgery was authorized, related and reasonable and necessary. (Clt. Ex. 8, Stipulation 7)

11. Following the reopening, Respondents continued to pay TTD benefits, to the point that combined TPD, TTD and PPD benefits exceeded $150,000. (Resp. Ex. L)

12. On November 10, 2014, Respondents filed Respondents' Motion to Suspend Temporary Total Disability Benefits, seeking to suspend TTD benefits pursuant to *Donald B. Murphy Contractors v. ICAO*, 916 P.2d 611 (Colo.App. 1995) (Resp. Ex. I) On November 13, 2014, Claimant filed Claimant's Objection to Respondents' Motion to

---

1 Claimant requested two lump sums of PPD benefits. The first lump sum request was dated May 2, 2012 and requested $10,000.00. As noted, the second lump sum request was for $50,000.00 and was dated July 13, 2012. The lump sums were paid and included in the admitted $78,587.70 in PPD benefits paid. (Clt. Ex. 8, Stipulation 8)

Suspend Temporary Total Disability Benefits. (Resp. Ex. J) On November 24, 2014, ALJ Henk issued an Order denying Respondents' motion, without prejudice, and indicating Respondents had the right to set the issue for hearing. (Resp. Ex. K)

13. As of the date of this hearing, Claimant continued to receive TTD benefits because she was not at MMI. No authorized treating physician, including the primary authorized treating physician, Dr. Michael Dallenbach, had placed her at MMI as of the date of hearing. (Clt. Ex. 8, Stipulation 9; Resp. Ex. L)

14. The parties stipulated that as of the date of this hearing Claimant had received in excess of $150,000.00 in combined TTD, TPD and PPD benefits.**2** (Clt. Ex. 8, Stipulation 10)

15. The statutory limit of TPD, TTD and PPD benefits under C.R.S. §8-42-107.5 for Claimant's date of injury is $150,000. (Clt. Ex. 8, Stipulation 11; Resp. Ex. M) As such, as of the date of hearing, Claimant had received in excess of $30,000 in indemnity benefits beyond the $150,000 cap available under C.R.S. §8-42-107.5.

16. None of the provisions for termination of TPD and/or TTD benefits pursuant to C.R.S. §8-42-105(3) currently exist. (Clt. Ex. 8, Stipulation 12)

17. At this time, Respondents are not seeking to terminate TTD benefits, nor are Respondents seeking an order requiring Claimant to reimburse Respondents for any alleged overpayment. The sole issue for determination is whether C.R.S. §8-42-107.5 may be applied to allow Respondents to suspend TTD benefits while taking credit for PPD benefits previously paid, consistent with *Donald B. Murphy Contractors v. ICAO,* 916 P.2d. 611 (Colo. App. 1995). (Clt. Ex. 8, Stipulation 13)

18. The massage therapy recommended by Dr. Rauzzino in his report of March 31, 2015 is authorized, reasonable, necessary and related. (Clt. Ex. 8, Stipulation 14)

CONCLUSIONS OF LAW

Based upon the forgoing findings of fact, the ALJ draws the following conclusions of law:

A. As noted above, the issue for determination is whether, under principles announced in *Donald B. Murphy Contractors, Inc. v. Industrial Claim Appeals Office,* 916 P.2d 611 (Colo. App. 1995), Respondents are entitled to suspend payment of additional TTD benefits while taking credit for PPD benefits that Respondents paid in connection with their FAL dated July 9, 2012, in a case where Claimant has already received more than the statutory cap in combined temporary and PPD benefits under

2 According to Insurer's indemnity benefit printout, as of April 8, 2015, Claimant had received **$180,315.02** in combined TPD, TTD, and PPD benefits. (Resp. Ex. L)

C.R.S. §8-42-107.5. Based upon the evidence presented and the relevant legal authority, the ALJ concludes that Respondents are entitled to suspend TTD benefits while taking credit for PPD benefits previously paid in this case.

I. The Relevant Provision of the Act

B. The issue addressed here involves application of C.R.S. §8-42-107.5, and the impact of the principles of *Donald B. Murphy* to an upper cap case, following reopening of a claim for worsening of condition. In relevant part, C.R.S. §8-42-107.5 holds:

> "[n]o claimant whose impairment rating is twenty-five percent or less may receive more than seventy-five thousand dollars from combined in temporary disability payments and permanent partial disability payments. **No claimant whose impairment is greater than twenty-five percent may receive more than one hundred fifty thousand dollars from combined temporary disability payments and permanent partial disability payments**." (emphasis added)

II. The Donald B. Murphy Contractors and Reynal Decisions Announced by the Court of Appeals and Industrial Claims Panel

C. The principles articulated in *Donald B. Murphy* are dispositive to the issue before the court. In *Donald B. Murphy* the respondents sought to suspend TTD benefits under the following facts: (1) the claimant had been paid temporary disability benefits, (2) he then reached MMI, (3) he was provided an impairment rating of less than twenty-five percent whole person, (4) he was paid PPD benefits pursuant to that rating, (5) the combined temporary and PPD benefits paid at that point were capped at $60,000 (the lower cap of C.R.S. §8-42-107.5 or the date of injury for that claim), (6) the claim closed on MMI and PPD, subject only to reopening, (7) the claimant's condition worsened, surgery was required, and his claim was reopened, and (8) the claimant then sought additional TTD benefits which the respondents denied.

D. The respondents in *Donald B. Murphy* argued that no "post reopening" TTD benefits were owing because the claimant had already been paid combined temporary and PPD benefits to the lower cap established by the admitted to impairment rating. After that argument was rejected at the hearing level, and subsequently by ICAP, the respondents appealed to the Colorado Court of Appeals. On appeal, the respondents argued that if they must pay additional TTD benefits, they should be permitted to take credit for PPD benefits already paid, rather than ultimately having to seek to recover an overpayment from the claimant when permanent impairment was again established.

E. The Court of Appeals went through a statutory analysis wherein it considered the reopening statute and the legislative purpose of the statutory cap, concluding that "when further benefits are sought after the twenty-five percent or less limit of section 8-42-107.5 has been applied, the petitioners are entitled to offset any permanent partial benefits paid against temporary total disability benefits." *Donald B. Murphy* at p. 614.

F. In support of its' Order, the *Donald B. Murphy* Court noted that their resolution satisfied several listed principles: (1) it maintained the incentive to employers and insurers to settle or provide PPD benefits; (2) it required the claimant to allocate PPD benefits already paid towards his current inability to earn wages; (3) it eliminated the need for further proceedings where the respondents would need to seek to recover the overpayment created by paying benefits beyond the cap; and (4) it was consistent with the stated purpose of the Workers' Compensation Act to provide benefits to injured workers at a reasonable cost to employers, without the necessity of litigation.

G. After careful review of the evidence presented, the ALJ finds the case at hand to be factually consistent with *Donald B. Murphy*, and its stated principles. Here, as in *Donald B. Murphy*, claimant was paid temporary disability benefits, she was then placed at MMI, she received PPD benefits, and her claim closed, thus legally establishing MMI, and the applicable statutory cap (in this case, $150,000). The claim was subsequently reopened for a worsening of condition, TTD benefits were reinstituted, and the claimant received combined temporary disability benefits and PPD benefits beyond the applicable cap established at on the original MMI date.

H. The only difference between *Donald B. Murphy* and the instant case is that when MMI was originally established in the case at hand, the statutory cap established was the upper cap ($150,000), and not the lower cap. The ALJ agrees with Respondents that this is a distinction without a difference, as the holding in *Donald B. Murphy,* and the principles articulated by the Court of Appeals in support of its decision, hold true to "upper cap" cases as well. *See also Reynal v. Home Depot and American Home Assurance*, WC No. 4-585-674 (ICAO 9/13/11).

I. In *Reynal*, ICAP affirmed ALJ Mottram's order permitting the respondents to suspend payment of TTD benefits in an "upper cap" case factually similar to the case at hand. In *Reyna*l, the claimant had been paid temporary disability benefits, and PPD benefits pursuant to a final admission, and the issues of MMI and PPD were closed, as here, subject only to reopening. The claim was subsequently reopened, and TTD benefits were paid to the point that the combination of temporary disability benefits and PPD benefits exceeded the upper cap. The respondents then sought an order permitting the respondents to suspend further payment of TTD benefits, while talking credit for PPD benefits paid. The claimant argued TTD benefits must continue to be paid despite the fact he had been paid combined temporary and PPD benefits beyond the upper cap. ICAP rejected the claimant's arguments, finding *Donald B. Murphy* dispositive, even in upper cap situations.

J. In reaching their conclusion that *Donald B. Murphy* was dispositive, ICAP recognized that allowing respondents to cease paying TTD while taking credit for PPD could work a financial hardship on the claimant, but *Donald B. Murphy* could not be distinguished on the grounds that claimant was not at MMI following the reopening, or that the claimant had a chance to ultimately be determined permanently and totally disabled. Moreover, the ALJ is persuaded that the principles articulated by the Court of Appeals in *Donald B. Murphy* are even more pronounced in an upper cap case, such as *Reynal*, and the case at hand because in those situations where combined PPD and

temporary disability benefits have already been paid beyond the absolute maximum permitted by statute, the continued payment of TTD benefits without allowing credit for PPD benefits previously paid necessarily results in an overpayment - - potentially a massive overpayment of benefits to the claimant. Such unfair windfalls to Claimant represent added costs to respondents, and a stark defeat of the stated principle of the Act to provide injured workers with benefits they are entitled to at a fair cost to the respondents, and without the necessity of litigation. For these reasons, this ALJ finds *Donald B. Murphy* dispositive, and concludes that an order permitting Respondents to suspend payment of TTD benefits while taking credit for PPD benefits previously paid under the facts of this claim is warranted.

III. Claimant's Mistaken Reliance on C.R.S. §8-42-105(3)(a-d)

K. In Claimant's Objection to Respondents Motion to Suspend Temporary Total Disability Benefits and renewed in his post hearing position statement, Claimant argues that there is no factual basis under C.R.S. §8-42-105(3)(a-d) under which TTD can be terminated. Therefore, argues Claimant, TTD benefits must be continue despite the fact that Claimant has been paid indemnity benefits beyond the upper cap. Because Respondents are not seeking an order to terminate TTD benefits, the ALJ rejects this contention.

L. The Respondents here, as in *Donald B. Murphy*, and in *Reynal*, are not seeking to terminate TTD benefits. Respondents recognize and agree that they do not have a basis at this time to terminate TTD benefits under C.R.S. §8-42-105(3) (a-d). Instead, the Respondents, relying on *Donald B. Murphy*, are seeking an order to **suspend** TTD benefits while obtaining credit for PPD benefits already paid. Based upon the principals announced in *Donald B. Murphy*, the ALJ concludes that suspension of TTD benefits under the circumstances presented in the instant case is warranted. Because Respondents are not seeking a termination of TTD benefits, Claimant's argument that Respondents cannot terminate TTD benefits pursuant to C.R.S. §8-42-105(3)(a-d) is moot and rejected.

IV. Claimant's Mistaken Reliance on United Airlines v. ICAO

M. In her Objection to Respondents' Motion to Suspend Temporary Total Disability Benefits, Claimant, relying on *United Airlines v. ICAO*, 312 P.3d 235 (Colo. App. 2013), argued that since the statutory cap cannot be determined until Claimant reaches MMI, and Claimant is not currently at MMI, Respondents must continue to pay TTD benefits beyond the $150,000. Here, as in *Donald B. Murphy*, the claimant reached MMI, the claimant was provided a permanent impairment rating, the claimant was paid PPD benefits, and the claimant's claim closed on the issue of MMI. It is undisputed that here, as in *Donald B. Murphy*, MMI was legally established, and the claim closed, prior to reopening. It was under these circumstances that the *Donald P. Murphy* Court permitted a suspension of TTD.

N. By contrast, *United Airlines* dealt with a factually distinguishable situation. In

United Airlines, the claimant was paid temporary disability benefits beyond the first cap, at which time she was released to return to work. At that time, the clamant had been paid more than $22,000 beyond the first cap, and the respondents sought an order requiring the claimant to repay the difference which they claimed was an overpayment. The Court of Appeals concluded that the cap did not apply to benefits paid **before** the claimant reached MMI, and therefore it affirmed orders denying the respondents' request for repayment of TTD paid beyond the first cap.

O. The Court in *United Airlines* specifically found that *Donald B. Murphy* and *Rogan v. ICAO* 91 P.3d 414 (Colo.App 2003) did not require a different outcome, because in each of those cases, the claimant had reached MMI and had been paid a combination of both PPD and temporary disability benefits beyond the cap, whereas in *United Airlines*, the claimant was never at MMI, and she had not been paid any PPD benefits from which the respondents could take credit against TTD owing. Because *United Airlines* deals with a factually distinguishable situation, the ALJ concludes that Claimant's reliance on that case is misplaced and he is not persuaded to alter his conclusion that under the facts of the instant case Respondents are entitled to suspend TTD benefits and take credit for permanent partial disability benefits previously paid prior to reopening.

V. Laabs v. Integrated Communication Service and Pinnacol Assurance Decision

P. Recently, the ALJ dealt with another case presenting the question of whether Respondents were entitled to suspend TTD benefits and offset previously paid PPD. In the case of *Laabs v. Integrated Communication Service and Pinnacol*, W.C. No. 4-890-061-02 (ICAO 3/19/15), the undersigned ALJ issued an order granting the request. On appeal the Industrial Claims Appeals Panel ("ICAP") found that the statutory cap did not apply under the unique circumstances presented in that case. Because *Laabs* is factually distinguishable from the case at hand, and *Donald B. Murphy*, it does not change the ALJ's conclusion that Respondents can suspend TTD benefits and take credit for PPD benefits paid in this case.

Q. In *Laabs*, the claimant reached MMI, and was provided an impairment rating of 24% whole person. The respondents admitted to that rating, and began paying what they classified as PPD benefits. However, the claimant requested a DIME, and the DIME determined that the claimant was **never** at MMI. The respondents then reinstituted payment of TTD benefits, admitting that claimant was never at MMI in the first instance. Based upon this factual and procedural history, ICAP held that *Donald B. Murphy* was inapplicable, because unlike *Donald B. Murphy*, Mr. Laabs was never at MMI, so PPD benefits were never actually paid, and since PPD benefits were never paid, the respondents could not rely on *Donald B. Murphy* to take credit for PPD benefits previously paid. Again, the case at hand, and *Donald B. Murphy*, involve cases where the claimant reached MMI, was paid a combination of temporary and PPD benefits, the claimant's claim closed, only to later reopen for a worsening of condition. The claimants in those cases received combined PPD and temporary disability benefits beyond the statutory cap, and the respondents sought orders allowing them to suspend temporary benefits while taking credit for PPD benefits paid. A suspension of TTD

benefits while taking credit for PPD benefits is warranted under that scenario and permitted by the decision of the Court of Appeals in *Donald P. Murphy*. In *United Airlines* and *Laabs*, MMI was never legally established. Consequently, no cap was established, and PPD benefits were never paid. Therefore, the claimants were not paid more than the statutory cap in combined temporary and PPD benefits. As noted above, those cases are plainly distinguishable. Accordingly, under the principles enunciated in *Donald B. Murphy*, and for the reasons outlined above, Respondents request to suspend TTD benefits while taking credit for PPD paid is granted.

ORDER

IT IS THEREFORE ORDERED:

1. Respondents may suspend payment of TTD benefits, while taking credit for PPD benefits previously paid.

2. All matters not determined herein are reserved for future determination.

DATED: June 4, 2015

Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Drive, Suite 230
Colorado Springs, CO 80906

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

OFFICE OF ADMINISTRATIVE COURTS
STATE OF COLORADO
WORKERS' COMPENSATION NO. WC 4-871-989-02

ISSUES

- Whether Claimant proved by a preponderance of the evidence that a Sleep Number bed is a reasonable, necessary, and related medical benefit?

- Whether Claimant proved by a preponderance of the evidence that EMGs of his bilateral upper and lower extremities are reasonable, necessary, and related medical benefits?

- Whether Claimant proved by a preponderance of the evidence that observation of his home activities is a reasonable, necessary, and related medical benefit?

- Whether Claimant proved by a preponderance of the evidence that cervical and lumbar MRIs are reasonable, necessary, and related medical benefits?

- Whether Respondents proved by a preponderance of the evidence that Claimant directed his medical care?

SUMMARY OF DECISION

Claimant's ATP recommended a Sleep Number bed, an in-home evaluation of Claimant's activities of daily living, EMG studies, and MRI studies. Insurer denied the recommendations. This decision addresses whether the recommendations are reasonable, necessary, and related medical benefits, and concludes they are not.

FINDINGS OF FACT

Based upon the evidence presented at hearing, the Judge enters the following findings of fact:

1. Employer employed Claimant as a boiler inspector on November 17, 2011. Claimant was a passenger in a vehicle that his wife was driving to an inspection site. The vehicle was in was involved in a high-speed rollover motor vehicle accident ("MVA"). Claimant sustained injuries as a result of that accident.

2. Dr. Pineiro treated Claimant and supervised his care following the MVA.

Prior Back Problems

3. Claimant experienced an industrial injury in 2002 which resulted in back pain and tingling pain down the inside of his left leg. Claimant attributed his symptoms to driving, from April 2001 through August 2002, a company car that was too small for him. Claimant treated with chiropractic doctor Decklever three times a week from November 2004 through March 2005.

4. On January 31, 2008, Claimant complained of and medically treated with his private primary care physician, Andrew P. Stoddard, M.D., for low back pain with sciatica. Claimant's complaints arose after he began driving a small company car. On

February 20, 2008, Dr. Stoddard documented Claimant's lower extremity pain in the left leg, which caused tingling and trouble walking ("increased pain from left knee to toes with tingling of the toes."). Dr. Stoddard reported that five years prior, Claimant was evaluated for low back pain and had an MRI showing a broad based L-5 herniation with pressure on the S-1 nerve root. On February 20, 2008, Dr. Stoddard reported Claimant's pain was worse. He continued to treat Claimant for low back pain through March 31, 2008.

5. On November 11, 2011, six days before the MVA, Dr. Rosalinda Pineiro performed a Department of Transportation physical evaluation on Claimant. Claimant denied a history of low back pain.

History of Treatment

6. D. Scott Miner, M.D., treated Claimant in the emergency department at Good Samaritan Medical Center and reported that Claimant had rib fractures of ribs 9 and 10 and atrial fibrillation ("A-fib"). Claimant specifically denied neck pain, upper or lower extremity numbness or weakness, and back pain. Dr. Miner reported that Claimant had full musculoskeletal range of motion.

7. On November 19, 2011, Naveed Ismail, M.D. discharged Claimant, identifying Claimant's medical conditions as "rib fracture and a fib." "A-fib, MVA (motor vehicle accident), chest trauma, rib fracture" were listed as other problems.

8. On November 23, 2011, Claimant treated with Rosalinda Pineiro, M.D., at Concentra Medical Centers ("Concentra"). Dr. Pineiro is an authorized treating provider for the work related injuries. At that appointment, Claimant included an "L-5 herniation w/S1 nerve" in his medical history. He complained of broken ribs, A-fib, and a "spot in spine center of shoulder blades."

9. Claimant underwent a considerable amount of cardiac treatment after the MVA, including two "cardioversion" procedures. He also treated musculoskeletal injuries, including chiropractic care by Dr. Stults beginning on December 8, 2011.

10. On February 8, 2012, Jeffrey A. Wunder, M.D., a physiatrist at Concentra, reported that Claimant had a previous work related injury in 2002 to his low back, and had an MRI that revealed a disk protrusion at L5-S1. Dr. Wunder noted Claimant was reporting low back pain with an onset one month prior (six weeks post injury), spontaneous in onset. Dr. Wunder documented that "he has had some low back pain radiating into the left lower extremity to the lateral calf. He reported that these symptoms are exactly the same that he experienced in 2002 although not as severe at this time. He had no numbness or tingling in the left lower extremity." Dr. Wunder opined that Complaints were not related to the MVA and recommended Claimant start an exercise and stabilization program as he was overweight and "quite deconditioned."

11. Between February 2012 and June 2013, Dr. Pineiro, Dr. Wunder, and Claimant's cardiologists all reported Claimant's conditions were improving. Claimant successfully participated in physical therapy. Dr. Pineiro reduced his work restrictions.

12. Dr. Wunder discharged Claimant from his care on June 26, 2013, opining Claimant had no clear findings on physical examination and his pain appeared to be predominantly postural. Dr. Wunder recommended that the claimant focus on good

posture at all times.

13. As of July 25, 2013, Claimant's lifting and pushing restrictions per Dr. Pineiro were 50 pounds. However, Dr. Pineiro changed these on August 21, 2013, to no lifting or pushing over 40 pounds.

14. On September 11, 2013, Claimant saw Dr. Pineiro and complained of shoulder pain with no mention in her report of back pain. Claimant denied numbness or tingling and Dr. Pineiro diagnosed MVA, A-fib, and shoulder pain.

15. Kristin Mason, M.D., performed an eighteen-month Division IME, and issued a report dated September 26, 2013. She opined Claimant had not reached MMI and needed more treatment. Regarding relatedness, she opined: "Low back complaints similar to those in the past that appeared not particularly temporally related to the motor vehicle accident and are not considered to be related. I agree with Dr. Wunder."

16. On March 31, 2014, Dr. Pineiro reported Claimant had bilateral neck issues. She increased his work restrictions to "no activity" based on her concerns about Claimant's cardiovascular issues.

17. Claimant had a pacemaker implanted on May 6, 2014. He began cardio rehabilitation on July 3, 2014. He attended 10 cardio rehabilitation sessions with various therapists and exercise physiologists, all without reports of symptoms or concerns.

18. On July 18, 2014, Dr. Pineiro reported that Claimant "has improved low back pain and SI pain with treatment." Absent from her assessment were neurological or spinal problems. Despite her documentation of improved back pain and the lack of any back pain assessment, Dr. Pineiro wrote a script for "Sleep # bed for back pain after MVA."

19. On August 8, 2014, Dr. Pineiro recommended EMGs, MRIs, and an in-home evaluation of Claimant's activities of daily living. She reported, "Pt with radicular symptoms since accident evaluation to rule out radiculopathy…Pt who states he cannot do what he could do prior [to] accident. He also states he cannot do simple choirs [chores] around the home. I am requesting an evaluation of activities of daily living to document and see what he can and cannot do. . . . Pt has had back and cervical and shoulder issues with the start of this injury since he is more stable we will request EMG of bilateral lower extremities to rule out L4 and at [left] upper extremity to rule out a C6 radiculopathy." Dr. Pineiro reported, "He also is having bilateral numbness at ball of his feet since accident and Lt hand." She noted "C6 radicular symptoms" and "possible L4 bilateral radiculopathy." Her diagnosis included "radicular low back pain" and "cervical radiculopathy at C6."

Sleep Number Bed

20. Claimant contends that Dr. Pineiro's referral for a Sleep Number Bed is a reasonable, necessary, and related medical benefit.

21. Respondents contend that Claimant directed Dr. Pinero's referral for the bed in violation of C.R.S. section 8-43-503. Subsection (3) of that statute provides: "Employers, insurers, claimants, or their representatives shall not dictate to any

physician the type or duration of treatment or degree of physical impairment."

22. On direct examination, Dr. Pineiro testified inconsistently about when she and Claimant discussed her referral for a bed.

- Dr. Pineiro initially testified that she and Claimant discussed the bed before she prescribed it, but she could not remember when.

- On cross-examination, when asked how she came up with a referral for a Sleep Number bed, she responded, "I can't answer that question, because it's not documented and I can't recall."

- Dr. Pineiro finally testified that the first time she spoke with Claimant about a bed was on July 18, 2014, the day she prescribed it.

23. None of Dr. Pineiro's notes reflect discussion of a bed with Claimant.

24. Claimant testified that he and Dr. Pineiro discussed the need for a bed at the very end of his June 27, 2014 appointment. According to Claimant, Dr. Pineiro told him that "a bed was needed;" she cited the parameters that the bed be adjustable, adequate to relieve his pain, and "do the job that it should do." Claimant offered no persuasive evidence of what that "job" was.

25. Claimant testified that he agreed to research beds for Dr. Pineiro to consider. The extent of Claimant's research was visiting a Sleep Number bed store in Loveland, Colorado on July 7, 2014. There, he spoke with sales people, read marketing materials, and tried to provoke his shoulder and back pain on different beds. Claimant testified that later that day, he dropped off the marketing materials at Dr. Pineiro's office. He included a quote for an "i10" California King bed with two remote controls, a mattress pad, support pillows, pillow protectors, and sheet set. The total price was $11,582.95.

26. Although Claimant denied instructing or suggesting to Dr. Pineiro which bed to prescribe, he provided her materials on only one bed.

27. Claimant testified that he needed the i10 bed by referring to the marketing materials included in Exhibit 10, that the i10 was "the only bed on the market clinically proven to reduce back pain."

28. Claimant testified that his problem is getting up and out of bed, because he has to turn and twist; activities that cause low back pain. He offered no persuasive evidence of how a Sleep Number bed would eliminate his having to turn and twist when getting out of bed.

29. Dr. Pineiro testified that Claimant's condition was deteriorating, with increased complaints of back and shoulder pain. However, her testimony is contradicted by her report of the same date which does not indicate that Dr. Pineiro examined Claimant's back, and notes improved low back pain.

30. Dr. Pineiro's testimony about why she prescribed the bed evolved. Initially she testified that she and Claimant spoke about his back and shoulder pain and how a Sleep Number bed could help his condition. She later testified, "Because these beds move, I thought it would be a little better for him, for his activities of daily living, and for

comfort;" that the purpose of her recommendation was to help him with "all of his complaints." She identified the complaints as "some issues with his low back," and that he "was post-surgical with the afib and everything." She eventually limited the purpose of her recommendation to Claimant's "problems sitting up."

31. Dr. Pineiro's ultimate testimony is not supported by the medical records which contain no documentation of Claimant having trouble sitting up.

32. On July 25, 2014, Claimant's counsel sent a letter to Respondents' counsel enclosing the July 7, 2014 Sleep Number bed quote and Dr. Pineiro's script regarding the bed. Claimant's counsel requested that Respondents' counsel "please arrange for the purchase and delivery of the prescribed bed."

33. On July 29, 2014, Shane B. Rowan, M.D., one of Claimant's cardiologists, reported Claimant had excellent resolution of his A-fib symptoms following AV node ablation and a pacemaker. Dr. Rowan documented that Claimant was spending 10 minutes each on various exercise machines and that biking did not cause the claimant's heart rate to increase. Dr. Rowan did not provide Claimant with any physical restrictions.

34. Dr. Cebrian, Respondents' medical expert, opined that a Sleep Number bed was not medically reasonable or necessary to cure or relieve the effects of Claimant's condition, and therefore was not therapeutic. He also opined that a new bed will not do anything to improve a person's level of function.

35. Dr. Cebrian criticized Dr. Pineiro for not attempting to look at other issues related to Claimant's bed, such as what kind of bed he had and what else had been attempted to improve its function. He also criticized her for prescribing the bed without examining – or documenting the examination of – Claimant's back, especially because three weeks earlier Claimant reported pain of 1/10. Dr. Cebrian noted that the Sleep Number bed materials contained in Exhibit 10 did not refer to a legitimate medical study that supports the assertion that Sleep Number beds have a positive impact on back problems. He described the materials as a marketing device that would not be reliable in making a medical determination.

36. Dr. Pineiro testified that Claimant did not tell her to prescribe the bed or attempt to improperly influence her medical decision making, and that she used her independent medical judgment in doing so.

37. However in her nineteen years of practicing occupational medicine, she had never before prescribed a bed.

38. Dr. Pineiro testified that an evaluation of Claimant's ADLs would help her evaluate what type of bed Claimant needs.

39. She stated she was qualified to help Claimant pick a Sleep Number bed based on the proposed evaluation of his ADLs and her expertise as a family practitioner.

40. The ALJ finds it more likely than not that Dr. Pineiro's prescription for a Sleep Number bed was not medically reasonable or necessary to cure or relieve the effects of Claimant's condition.

41. The ALJ finds it more likely than not that Claimant suggested but did not dictate to Dr. Pineiro the type of treatment he wanted to receive. Such conduct is not statutorily proscribed.

Observation of ADLs

42. Claimant contends that observation of his home activities is a reasonable, necessary, and related medical benefit.

43. Claimant first reported problems with ADLs on June 24, 2014. Dr. Pineiro's notes of that visit document that Claimant's cardio condition was improving as expected, and his musculoskeletal complaints were minimal.

44. On August 8, 2014, Dr. Pineiro requested an evaluation of Claimant's ADLs at his home in response to Claimant's statements that he could not perform simple chores around the house.

45. Dr. Pineiro testified that she was worried about Claimant's ADLs "just because he has a cardiovascular condition." Dr. Pineiro acknowledged that she is not treating Claimant's cardiovascular condition and admitted that no cardiologist had recommended the evaluation.

46. Dr. Pineiro testified that Claimant "didn't have a job at that time, and his home was his job." She was unable to identify what validity criteria would be used during the evaluation. She did not contact Claimant's cardiologist regarding her concerns.

47. Dr. Pineiro testified an evaluation would be "the best way to assess how he's progressed." She did not acknowledge that much of the same information could be obtained by reviewing his physical therapy and cardio rehabilitation reports.

48. Dr. Pineiro did not recall talking to or consulting with any of Claimant's cardiologists. She had no knowledge of whether Claimant's cardiologist, Dr. Oldemeyer had placed Claimant on any restrictions. While she was aware Claimant was participating in cardio rehabilitation, she did not read notes of that therapy, nor did she recall requesting them.

49. Claimant testified he has difficulty with: mowing and edging his lawn, shoveling snow, maintaining the outside of his home, carrying a vacuum cleaner up stairs, and heavy scrubbing. He also identified difficulty shaving or standing for long periods to socialize. Dr. Cebrian testified that these are not activities of daily living because there are not done on a daily or regular basis.

50. Claimant testified that his wife will not let him do much at home, because "when they say 'no activity,' they mean 'no activity.'" And he had a "no activity" restriction.

51. Claimant testified that his doctor's no activity restriction meant he could not engage in activity that caused any pain. It was subjective and something that he could judge.

52. Dr. Cebrian reported that an evaluation of activities of daily living is not reasonable, necessary, or related to the November 17, 2011 MVA because Dr. Pineiro had not adequately documented Claimant's function as defined by basic activities of daily living and instrumental activities of daily living. Further, the medical records are inconsistent regarding Claimant's functional ability given that he underwent cardio

rehabilitation without any problems and Dr. Rowan reported that his A-fib had an excellent resolution of symptoms. There is no cardiac report or opinion that Claimant has failed the cardiac treatment provided to him.

53. Dr. Cebrian also explained that in-home evaluations are typically only prescribed for geriatric and brain injured patients.

54. The ALJ finds it more likely true than not that an in-home evaluation of Claimant's ADLs is not a reasonable, necessary, and related medical benefit.

EMG Studies

55. Claimant contends that EMGs of his left upper extremity and bilateral lower extremities are reasonable, necessary, and related medical benefits.

56. On August 8, 2014, Dr. Pineiro recommended electrodiagnostic testing of Claimant's bilateral upper and lower extremities because Claimant reported numbness and tingling in both upper extremities, and problems with weakness and pain in his lower extremities. Dr. Pineiro included "radicular low back pain" and "cervical radiculopathy at C6" as assessment issues.

57. Dr. Cebrian reported that EMGs are not medically reasonable, necessary and related to the November 17, 2011 MVA because they were ordered for medical conditions that are not related to the MVA, specifically Claimant's cervical spine and lumbar spine complaints.

58. J. Tashof Bernton, M.D., performed an independent medical examination of Claimant (not performed at the request of either party in the workers' compensation claim). On October 15, 2014, Dr. Bernton opined that an EMG/NCV is not related to the workers' compensation claim. Dr. Bernton also opined that Claimant's lumbar complaints were not related to the workers' compensation claim.

59. Dr. Pineiro was unable to opine whether Claimant's low back problems were related to his work injuries. She testified that she did not know the cause of his symptoms and therefore she could not have an opinion. She testified, "I would like a little bit more detail on the structural aspects of the back, and see if there is any change with regard to degeneration or any condition."

60. By that time, Dr. Wunder, a physiatrist in Dr. Pineiro's practice, and Dr. Mason, who performed Claimant's 18-month DIME, had each opined that Claimant's low back problems were not related. Claimant's low back problems were preexisting and not temporally related to the MVA.

61. After Insurer denied the studies, Clamant underwent EMG testing of the bilateral upper and lower extremities in October 2014 with the Veterans' Administration. Clamant requests repayment of his $50 co-pay.

62. Dr. Cebrian's November 17, 2014 report specifically opined that Claimant's lumbar spine complaints are independent, unrelated and incidental to the November 17, 2011 MVA. He opined that associated treatment related to the lumbar spine is not medically related to the MVA. Dr. Cebrian's opinion is consistent with those of Dr. Wunder, Dr. Mason, and Dr. Bernton.

63. The ALJ finds that Claimant has not sustained his burden of proving that the EMG studies were reasonable, necessary, and related medical benefits.

Cervical and Lumbar MRIs

64. Claimant contends that cervical and lumbar MRIs are reasonable, necessary, and related medical benefits.

65. The radiologist's impression of both EMG studies was, "This study is essentially normal with only some prolongation of H-reflexes. There is no evidence suggestive of neuropathy or radiculopathy."

66. On November 4, 2014, Dr. Pineiro reviewed the results of the October EMG testing and reported, "Pt due to his positive finding of the EMG I would like MRI of lumbar spine to see if the disk is causing left peroneal motor. Pt also has constant thumb numbness, a cervical MRI is also [warranted]."

67. Dr. Pineiro's recommendation for MRIs is inconsistent with the radiologist's findings of "no evidence suggestive of neuropathy or radiculopathy."

68. After Insurer denied the MRIs, Claimant had them performed at the Veterans' Administration hospital on January 29, 2015. He requests repayment of his $50 co-pay.

69. At hearing, Dr. Pineiro withdrew her recommendation of a cervical spine MRI. However, she recanted her withdrawal towards the end of her testimony. When asked to clarify whether she was recommending a cervical spine MRI, she testified:

> I would have to see – but, like, [Claimant], because it's almost been three weeks since I last seen him. And if his clinical picture in the visit says so, and I think it's indicated, I will recommend it. At this time, without seeing him, I don't feel confident, and I don't feel knowledgeable to do that determination at this time.

70. Dr. Pineiro testified she requested the lumbar MRI based on the EMG to rule out L4 radiculopathy. And, because the EMG showed a slight decrease in conduction velocity, she wanted to see the structure of Claimant's lumbar spine to see if anything was irritating his peroneal motor nerve. Again, this testimony is inconsistent with the EMG findings of no evidence suggestive of neuropathy or radiculopathy.

71. Dr. Cebrian testified in support of his opinion that Claimant's lumbar complaints are not related, that Claimant obtained a lumber MRI and was then evaluated by surgeon, Dr. Widdell in March 2015. Dr. Cebrian testified that Claimant's L5-S1 level had improved in relation to that disc when compared with an MRI taken 12 to 13 years prior, although there was natural degeneration in the facets.

72. Claimant had preexisting lumbar degenerative problems, and a preexisting disc herniation with an S1 radiculopathy. Thus, Dr. Cebrian testified, there was a lack of objective evidence, of any kind, that correlates Claimant's current lumbar condition to the MVA.

73. The ALJ finds that Claimant has not sustained his burden of proving that

the MRI studies were reasonable, necessary, and related medical benefits.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the Judge draws the following conclusions of law:

The purpose of the Workers' Compensation Act of Colorado (the "Act"), §§ 8-40-101, et seq., C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. § 8-40-102(1), C.R.S. The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. § 8-43-201(1), C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of respondents. § 8-42-201(1), C.R.S.

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005). A workers' compensation case is decided on its merits. Section 8-43-201, *supra*. The Judge's factual findings concern only evidence that is dispositive of the issues involved; the Judge has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *See Magnetic Engineering, Inc. v. ICAO,* 5 P.3d 385 (Colo. App. 2000).

Claimant contends that he is entitled to an EMG, MRI, Sleep Number bed, and evaluation of his activities of daily living related to the November 17, 2011 MVA. Respondents admit that Claimant sustained injuries in the MVA, including two broken ribs, but deny that the medical conditions leading to the recommendations for the EMG, MRI, Sleep Number bed, and evaluation of his activities of daily living are related to the MVA. Further, Respondents contend that even if Claimant's back pain is related to the MVA, Claimant's request for a Sleep Number bed will not cure and relieve the effects of the injury. Finally, Respondents contend that Claimant directed his medical care.

Claimant has obtained EMGs of his bilateral lower extremities and left upper extremity through the Veteran's Administration. Claimant has obtained MRIs of his cervical spine and low back through the Veteran's Administration. The medical benefits that Claimant is requesting and has not received are a new bed and someone to observe his activities of daily living in his home.

Claimant's neck and back complaints and symptoms of upper extremity and lower extremity numbness and tingling did not arise out of his employment or occur within the course and scope of employment. "For an injury to arise out of employment, the claimant must show a causal connection between the employment and injury such that the injury has its origins in the employee's work-related functions and is sufficiently

related to those functions to be considered part of the employment contract." *Madden v. Mountain West Fabricators*, 977 P.2d 861 (Colo. 1999). Claimant failed to prove that he suffered any disabling injury to his back, and specifically injury to his neck and low back on November 17, 2011, and failed to prove a causal connection between his physical complaints and the MVA.

As found, Claimant had a history of lumbar back pain. Additionally, Claimant did not report low back pain to his authorized treating physicians until over a month after the MVA and his complaints were consistent with his pre-existing complaints. Furthermore, Claimant did not consistently complain of cervical complaints until years after the MVA, and Dr. Pineiro testified at one point that she was no longer requesting a cervical MRI.

Finally, Claimant's reports of inability to perform ADLs are inconsistent with the medical reports of exercise and cardiac ability to perform such activities. "A person claiming benefits under workers' compensation is entitled to such medical benefits as are reasonably necessary to relieve the claimant from the effects of a work-related injury or illness." *Colorado Compensation Ins. Auth. v. Nofio*, 886 P.2d 714, 716 (Colo. 1994); *see also* C.R.S. § 8-42-101(1)(a). The request for a Sleep Number bed, EMG, MRI, and observation of ADLs are not reasonably necessary to relieve the claimant from the effects of a work-related injury or illness.

C.R.S. § 8-42-101(1)(a) provides, in pertinent part, that:

> Every employer, regardless of said employer's method of insurance, shall furnish such, medical . . . hospital, and surgical supplies, crutches, and apparatus as may reasonably be needed at the time of the injury or occupational disease and thereafter during the disability to cure and relieve the employee from the effects of the injury.

For the apparatus to be compensable, it must be "medical" in nature; "incidental" to obtaining necessary medical treatment, *see Kuziel v. Pet Fair, Inc.*, 931 P.2d 521 (Colo. App. 1996); and provide therapeutic relief from the effects of the injury. *Cheyenne County Nursing Home v. ICAO*, 892 P.2d 443 (Colo. App. 1995).

The Court of Appeals has narrowly construed C.R.S. § 8-42-101(1)(a) when determining whether a particular apparatus or service is medical in nature. *Major v. Auto Collisions Specialists*, W.C. No. 4-497-652 (Nov. 5, 2008), citing *Kuziel v. Pet Fair, Inc.*, supra. In the *Major* case, the claimant requested a reclining chair and a specific mattress, and a treating physician opined that the chair and mattress constituted a matter of medical necessity. *Major v. Auto Collisions Specialists*, W.C. No. 4-497-652 (Nov. 5, 2008). The ALJ concluded that although the reclining chair and king size mattress sought by the claimant might ease some aspects of his condition, the evidence failed to demonstrate that the apparatuses would provide therapeutic relief. *Id.*

In this case, Dr. Pineiro testified that she recommended an adjustable bed to facilitate Claimant getting in and out of bed. Such request does not evidence how a bed would provide therapeutic relief, and there is no persuasive medical evidence regarding how a bed will specifically provide Claimant therapeutic relief for his work-related conditions.

The Act expressly prohibits Claimant from dictating the care he receives from Dr. Pineiro. *See* § 8-43-503, C.R.S. (stating "employers, insurers, claimants, or their representatives shall not dictate to any physician the type or duration of treatment or degree of physical impairment"). A claimant is not permitted to issue orders or commands to their treating physician regarding the treatment to be given. *See Gianzero v. Wal-Mart Stores, Inc.* W.C. No. 4-669-749 (ICAO July 14, 2009); *see also York. v. Larchwood Inns*, W.C. No. 4-365-429 (ICAO November 7, 2002). Importantly, courts look to whether communications have the "intent or effect of dictating medical care." *Gianzero v. Wal-Mart Stores, Inc.* W.C. No. 4-669-749 (ICAO July 14, 2009). In determining whether a claimant dictated care, the courts look for evidence showing that a claimant: commanded, ordered, or directed the physician to take part in a specific course of conduct; influenced or compelled the physician to take a specific course of conduct, or; altered the course of treatment. *See Teegardin v. J.C. Penney Co.*, W.C. No 4-748-106-02 (ICAO January 17, 2014); *see also Gianzero v. Wal-Mart Stores, Inc.* W.C. No. 4-669-749 (ICAO July 14, 2009).

Many types of scenarios have been held not to be dictating care. The ALJ concludes Claimant's actions are indistinguishable. *See Provo v. Indus. Claim Appeals Office*, 66 P.3d 138, 144 (Colo. App. 2002) (*aff'd in part and rev'd in part on other issues by Dworkin, Chambers and Williams, P.C. v. Provo*, 81 P.3d 1053 (Colo. 2003) (holding that the respondent's counsel's advisement not to pay for ordered chiropractic treatment was not directing care); *Brodeur v. Am. Home Assurance Co.*, 169 P.3d 139, 144 (holding that an insurer's refusal to pay for proposed treatment did not constitute dictation of care); *Teegardin v. J.C. Penney Co.*, W.C. No 4-748-106-02 (ICAO January 17, 2014) (holding that an insurer sending correspondence to a referring physician indicating a referral would be denied because of missing work-relatedness details was not dictating care); *Gianzero v. Wal-Mart Stores, Inc.* W.C. No. 4-669-749 (ICAO July 14, 2009) (holding that it was not dictating care for an insurer to send an authorized treating physician another physician's report placing the claimant at MMI and asking whether the authorized treating physician agrees); *York. v. Larchwood Inns*, W.C. No. 4-365-429 (ICAO November 7, 2002) (holding that insurer did not dictate care when its counsel sent a letter to a DIME physician with background information regarding the claimant's medical history).

Here, Claimant shopped for a Sleep Number bed, a process he defined as performing research. He dropped off at Dr. Pineiro's office marketing materials he acquired from the Sleep Number bed store. Eleven days later, Dr. Pineiro prescribed an unspecified Sleep Number bed. Dr. Pineiro testified that she exercised her own independent judgment in prescribing a Sleep Number bed. Both Claimant and Dr. Pineiro testified that Claimant did not instruct or suggest to Dr. Pineiro which bed to prescribe. And although Claimant provided Dr. Pineiro a price quote for a specific bed, the ALJ concludes such conduct rises only to the level of a suggestion, and not to the level of dictation or ordering of treatment. Claimant's counsel's request -- that Respondents provide a Sleep Number i10 California King with sheets, pillows, two remote controls, etc. -- is not prohibited by statute because it was not directed to a physician.

ORDER

Based upon the foregoing findings of fact and conclusions of law, it is ordered:

1. Claimant's claim for a Sleep Number bed is denied, as is the claim for a new bed in general, which the claim was amended to during the hearing.

2. Respondents' claim of direction of medical care is denied.

3. Claimant's claim for EMGs of Claimant's bilateral upper and lower extremities is denied, as is reimbursement for same.

4. Claimant's claim for cervical and lumbar MRIs is denied, as is reimbursement for same.

5. Claimant's claim for observation of ADLs is denied.

DATED: June 8, 2015

ISSUES

I. Whether Claimant has established, by a preponderance of the evidence that she is unable to earn a wage in the same or other employment, and is therefore, permanently and totally disabled as a consequence of her December 5, 2011, industrial injury.

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. Claimant is a long time employee of Employer. She began working for Employer in February 1999.

2. Claimant was working as an all purpose clerk for Employer on December 5, 2011 when she sustained a compensable injury. On this date, she was working at the self-checkout desk when she went to help a customer that was accompanied by a service dog. As she turned to return to her desk after helping this customer, she tripped over the service dog sustaining injuries to her neck, her head, and her knees.

3. Claimant began treating with Dr. Daniel Peterson at Concentra the day after the incident on December 6, 2011. Approximately two weeks after her injury, Claimant was returned to work in a modified capacity. Dr. Peterson also referred Claimant to an orthopedist, Dr. Wiley Jinkins, on January 24, 2012 when it became evident that the condition of right her knee was not improving. He also referred Claimant for an MRI of her right knee.

4. The MRI was performed on January 24, 2012. The MRI revealed a radial tear of the posterior horn of the medial meniscus.

5. Dr. Jinkins first examined Claimant on January 31, 2012. On February 14, 2012, Dr. Jinkins recommended performing a patellar realignment procedure. Surgery was performed on March 8, 2012. Twelve days after the surgery, Claimant rated her pain at a level of 8 out of 10, despite taking pain medication as prescribed. She testified at hearing that the pain after the first surgery was "devastating" and that it was "just horrible." By May 22, 2012, Claimant experienced no improvement in her pain describing it as a level of 9 out of 10. According to Claimant, it felt like she just had surgery.

6. Claimant underwent a second surgery on September 20, 2012. On this date, Dr.

Jinkins performed an endoscopic debridement followed by endoscopic bone grafting of the proximal tibia. By October 24, 2012, Claimant described her pain as "better," but still rated it as a level of 6 out of 10. A third surgery, a hardware removal procedure was performed on January 10, 2013.

7. Dr. Jinkins indicated that Claimant's symptoms had not changed appreciably by April 1, 2013 so he performed the first of three hyaluronate injections to the knee on that date. Her pain level dropped to 4 out of 10 by April 10, 2013.

8. Dr. Jinkins' records from April 17 and May 1, 2013, indicate Claimant's pain dropped down to 2 out of 10 after the injections. The last injection was performed on April 17. Claimant disputes that her recorded pain levels dropped that appreciably. At hearing, Claimant testified that she does not recall her pain ever dropping below 5 out of 10.

9. Dr. Albert Hattem placed Claimant at MMI on May 14, 2013. Claimant indicated, at this time, that her pain levels were essentially unchanged despite multiple surgeries. Dr. Hattem provided a 23% extremity rating for the right knee. He stated that Claimant should comply with her permanent work restrictions to prevent aggravation of her condition. He stated she should not squat, crawl, or kneel, and that she should work within the sedentary category of work and be allowed to sit, stand, and walk as tolerated.

10. By July 31, 2013, Claimant's pain increased to 7 out of 10, suggesting that the benefit she experienced from the injections had worn off. Dr. Jinkins performed a follow-up examination on July 9, 2014 during which time Claimant's reported pain at a level of 8 out of 10. Dr. Jinkins noted that, "Overall, she is still significantly symptomatic and does have a pronounced limp." He explained that, in all probability, she is going to need a total knee replacement at some point in time.

11. Claimant underwent a Division Independent Medical Examination with Dr. Thomas Higginbotham on August 28, 2013. Dr. Higginbotham agreed Claimant had reached MMI, but stated that she is in need of chronic pain management. She explained to Dr. Higginbotham than her pain was worse than before and that she was experiencing "horrible, horrible pains."

12. Dr. Higginbotham opined that Claimant's right knee rating was 36% scheduled, and that she also had a 17% whole person rating to the lumbar spine. Claimant testified at hearing that it was her opinion that her altered gait from the knee injury is what was causing her back pain.

13. Claimant was terminated from her position on September 22, 2013, approximately 21 months following her industrial injury. Although she was unable to work following surgery for brief periods, Claimant returned to work for Employer in a modified duty capacity working up to eight hours per day in the 21 month time period, despite reported pain levels of five, six, seven and eight out of ten. Based upon the

evidence presented, the ALJ finds that Claimant has earned wages working full-time in a sedentary capacity despite complaints of pain up to seven to ten out of ten.

14. Upon request, Dr. Jinkins addressed Claimant's ability to work on July 22, 2014. According to Dr. Jenkins, Claimant was able to return to work in a sedentary capacity with no weight bearing until he was able to reevaluate her next month. After evaluation on August 6, 2014, Dr. Jinkins opined that, "[Claimant] is not working at the present time." "There is no light duty available to her and she is in enough discomfort that she is not able to work, even in a sedentary capacity." The ALJ infers from this note that Claimant subjectively reported to Dr. Jenkins that she could not work in a sedentary capacity secondary to her reported pain levels. On September 11, 2013, Dr. Jenkins noted that Claimant was "on 100% sedentary work restrictions.

15. Dr. Jinkins filled out a residual functional capacity questionnaire on January 27, 2015. It was his opinion that Claimant's work restrictions were, in part, as follows:

- Sitting up 8 hours per day. No standing or walking.
- Occasionally lifting up to 10 pounds. Never lifting more than 10 pounds.
- Never bending, squatting, crawling, climbing, stooping, crouching, or kneeling.
- Never driving automotive equipment for work.

16. Dr. Jinkins further indicated that because Claimant's pain was severe, it would preclude "activity precipitating the pain" including work activities. The ALJ rejects Claimant's suggestion that the note should be interpreted as precluding all "work activity." To the contrary, the note specifically indicates that Claimant would be precluded from work activities which precipitate pain.

17. Claimant underwent a vocational evaluation on February 27, 2014 with vocational experts Pat Anctil and Katie Montoya. Claimant indicated her subjective functional tolerances were, in part, as follows:

- Standing for up to 15 to 20 minutes
- No kneeling
- No squatting
- Bending to waist level
- Lifting no more than 8 pounds.

18. Ms. Anctil summarized in her initial report that Claimant's "skills and experience" included computer skills, touch typist, supervisory experience, training employees, cash handling, customer service, and operating office equipment. Claimant testified that she would use a computer "every now and then" while working for employer, but that she had no special training on computers and has no training on Excel or PowerPoint.

19. Ms. Anctil's report also indicates that Claimant prepared income taxes after high

school and that she intended to attend H&R Block's tax prep course in September of 2014.

20. Ms. Anctil concluded in her February 27, 2014 report that Claimant would be capable of earning a wage through potential occupations such as being a cashier or clerk in various fields, an insurance rep, a receptionist, an alarm operator, and a tax preparer.

21. In September 2014, Claimant enrolled in an H&R Block tax training course. The training program only lasted three to four hours per day, and an individual could sit or stand during the training as needed. There was no lifting involved, and Claimant could have used a cane or any other assistive device to help her complete the program.

22. Claimant testified that the training program was so difficult she had to go to the emergency room after attending only three sessions. Claimant testified that she stayed at the hospital all night.

23. Claimant did not submit any medical records at hearing supporting her allegation that she went to the emergency room in September 2014. Claimant also did not provide any documentation of this allegation to either Ms. Anctil or to Ms. Montoya. Additionally, Claimant did not report the incident to Dr. Jinkins at her next appointment with him.

24. The ALJ finds that Claimant's testimony that she went to the emergency room as a result of attending the H&R Block training program unconvincing and unreliable.

25. Claimant holds a National Certification Interior Design Qualified ("NCIDQ") certificate in interior design, and she has received formal and one-on-one training in the field. Claimant owns and operates a registered business, "Pretties", out of her home. Claimant is licensed to sell goods as a wholesaler, and she conducts her business by email and through a third-party website, Celebrityhomes.com. Shortly before her February 2014 meeting with Ms. Anctil, Claimant conducted a sale of home décor items out of her house in which she netted approximately $700.

26. Claimant has experience using fax machines, multi-line telephones, scanners, copiers and calculators. Claimant also uses a laptop at home and has been using laptops for roughly twenty years.

27. Claimant testified that her knee is in constant pain. There are never days that she is completely pain free, but there are days that she describes as "tolerable." Conversely, she also has days that are worse than others and she experiences a constant, throbbing, deep pain. She testified that on days like these, almost all she can do is get up and take a shower.

28. Video footage was taken of Claimant driving on February 25, 2015, February 27, 2015, and February 28, 2015. The video demonstrates Claimant shopping at the commissary for more than two hours. Based upon the video tape, the ALJ finds that

Claimant is capable of driving a car, repeatedly entering and exiting it, and standing for more than twenty (20) minutes. The video tape also demonstrates that Claimant is capable of washing her car with the use of a high pressure wand during which time she did not use a cane. On one day captured in the video footage, Claimant drove to three stores over a period of three-and-a-half hours. Based upon the video tape, the ALJ finds that Claimant is capable of walking outside without the need for a cane or other assistive device.

29. Ms. Anctil testified by deposition on April 17, 2015. She explained that, as of her first interview with Claimant in February of 2014, she was of the opinion that Claimant was capable of earning wages. It was her understanding that the restrictions in place through August 8, 2014, indicated Claimant was able to perform work in no more than a sedentary capacity.

30. Ms. Anctil identified thirty-four job positions Claimant could perform within her restrictions. Ms. Anctil concluded that Claimant still has access to sixty-four percent of the jobs she could have obtained prior to her work injury. Additionally, Ms. Anctil reported that there were more than one hundred occupations currently available to Claimant.

31. Katie Montoya issued her vocational assessment dated February 18, 2015. Ms. Montoya noted that, during her initial interview with Claimant in February of 2014, Claimant indicated she wanted to attend the H&R Block tax prep course and Claimant believed she could do it.

32. Ms. Montoya's February 2015 report documents her follow-up conversation with Claimant. Claimant expressed to her that she did in fact attend the H&R Block tax prep course, but was physically unable to complete the program due to her pain levels. "[Claimant] identified that her pain is worse and that she previously thought her pain would get better and it just has not. The difficulty she had with the H&R Program confirmed to her that she has an inability to return to work."

33. Katie Montoya noted in her report that Dr. Jinkins was of the opinion that Claimant's pain was severe enough to preclude all work activities. As noted above, the ALJ rejects this interpretation of Dr. Jinkins January 27, 2015 report. Ms. Montoya explained in her report that, at the time of the 2014 vocational interview, she thought the H&R Block course was a good plan for Claimant. However, "[Claimant] was unable to be successful in that program."

34. Ms. Montoya testified by deposition on April 3, 2015. She testified that Claimant could not return to her work with Employer because the lifting was too much and the position required more standing and walking than she is capable of. She testified that her physical restrictions would preclude her from performing all of her past relevant work.

35. Ms. Montoya testified that the issue of unscheduled absences is something that

comes up frequently in her line of work and that it is something she has analyzed. She explained that it varies by employer and that, generally, an employer will have less tolerance for a new employee than a tenured employee.

36. Ms. Montoya testified that, with a new employee, employers generally allow no more than two or three absences. "Any more than that would be an issue. Even that, on a prolonged basis, for a new employee is an issue." Ms. Montoya noted that Dr. Jinkins indicated Claimant's pain was "severe," which precluded all work activity; however, even if the pain was only "moderate" resulting in three to five absences per month, it would impact her ability to maintain any work. She also stated that employers are even less tolerating of absences during initial training programs because employees need to have the skills that are learned during the training on order to be able to perform the job.

37. Ms. Montoya stated that Claimant has no transferrable skills from her previous tax prep work because a lot has changed since she performed that job briefly thirty-five years ago.

38. Ms. Montoya ultimately concluded, "I think that the limitations, as noted by Dr. Jinkins, eliminate her ability to be able to maintain employment…." Based upon a totality of the evidence, including the video surveillance tape, the ALJ is not persuaded.

39. The ALJ finds the testimony and opinions of Ms. Anctil credible and more persuasive than the contrary opinions of Ms. Montoya.

40. The ALJ credits the testimony of Ms. Anctil regarding Claimant's vocational skills and employment prospects to find that Claimant is capable of sedentary work within the "semiskilled" and "skilled" employment categories and that Claimant is capable of earning a wage. Consequently, Claimant has failed to prove, by a preponderance of the evidence, that she is permanently totally disabled.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

A. In accordance with Section 8-43-215, C.R.S., this decision contains Specific Findings of Fact, Conclusions of Law, and an Order. In rendering this decision the ALJ has made credibility determinations, drawn plausible inferences from the record, and resolved essential conflicts in the evidence. See *Davison v. Industrial Claim Appeals Office*, 84 P.3d 1023 (Colo. 2004). This decision does not specifically address every item contained in the record; instead, incredible or implausible testimony or unpersuasive arguable inferences have been implicitly rejected. *Magnetic Engineering, Inc. v. Industrial Clam Appeals Office,* 5 P.3d 385(Colo. App. 2000).

B. The purpose of the "Workers' Compensation Act of Colorado" (hereinafter "Act")

is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. C.R.S. § 8-40-102(1). Generally, the claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence to find that a "contested fact is more probable than its nonexistence." *Page v. Clark*, 592 P.2d 792, 800 (Colo. 1979). Whether a claimant sustained his/her burden of proof is a factual question for resolution by the ALJ. *City of Durango v. Dunagan*, 939 P.2d 496 (Colo. App. 1997). The facts in a workers' compensation case must be interpreted neutrally; neither in favor of the rights of the claimant nor in favor of the rights of respondents and a workers' compensation claim shall be decided on its merits. *Section 8-43-201, C.R.S.* In this case, the undersigned ALJ concludes that claimant has failed to prove, by a preponderance of the evidence, that she meets the criteria of "permanent total disability" as that term is defined under the Act.

C. Under the applicable law, Ms. Smith is permanently and totally disabled if she is unable to "earn any wages in the same or other employment." *Section 8-40-201(16.5)(a), C.R.S.* The term "any wages" means more than zero wages. *See Lobb v. Industrial Claim Appeals Office,* 948 P.2d 115 (Colo. App. 1997); *McKinney v. Industrial Claim Appeals Office,* 894 P.2d 42 (Colo. App. 1995). In *McKinney*, the Court held that the ability to earn wages in "any" amount is sufficient to disqualify a claimant from receiving permanent total disability benefits. If wages can be earned in some modified, sedentary or part-time employment, a claimant is not permanently and totally disabled for purposes of the statute. See *also Christie v. Coors Transportation*, 933 P.2d 1330 (Colorado 1997).

D. Moreover, there is no requirement that Respondents must locate a specific job for a claimant to overcome a prima facie showing of permanent total disability. *Hennenberg v. Value-Rite Drugs, Inc.*, W.C. 4-148-050 (September 26, 1995); *Rencehausen v. City and County of Denver*, W.C. No. 4-110-764 (November 23, 1993); *Black v. City of La Junta Housing Authority*, W.C. No. 4-210-925 (December 1998); *Beavers v. Liberty Mutual Fire Ins. Co.*, W.C. No. 4-163-718 (January 13, 1996), aff'd., *Beavers v. Liberty Mutual Fire Ins. Co.*, (Colo. App. No. 96 CA0275, September 5, 1996)(not selected for publication); *Gomez v. Mei Regis*, W.C. No. 4-199-007 (September 21, 1998). To the contrary, a claimant fails to prove permanent total disability if the evidence establishes that it is more probable than not that he/she is capable of earning wages. *Duran v. MG Concrete Inc.*, W.C. No. 4-222-069 (September 17, 1998). As long as a claimant can perform any job, even part time, he/she is not permanently totally disabled. *Vigil v. Chet's Market*, W.C. No. 4-110-565 (February 9, 1995). Based upon the evidence presented, the ALJ is not persuaded that the restrictions assigned by Dr. Jenkins preclude her from earning a wage in sedentary positions. Claimant's primary argument for her contention that she is unable to work is based on her testimony that she is currently in too much pain to work. However, the ALJ finds this assertion contradicted by evidence presented at hearing including: a) the lack of solid medical evidence to support her current assertions of "severe" pain; b) Claimant earned wages in two different professions after the injury during a period of time when

she testified she was in severe pain; c) the physical activities Claimant demonstrated in the surveillance footage undermine her credibility regarding her complaints of pain; and d) Claimant's own testimony regarding what she is physically able to do. When determining whether a claimant is capable of earning wages, the ALJ must consider the claimant's unique "human factors", including age, education, work experience, overall physical/mental condition, the labor market where claimant resides and the availability of work within claimant's restrictions, among other things. *Weld County School Dist. RE-12 v. Bymer*, 955 P.2d 550 (Colo. 1998). Considering Claimant's unique "human factors", the ALJ is not convinced that she is incapable of earning any wages. Here, both vocational rehabilitation experts involved in this claim have explicitly stated that Claimant possesses the skills necessary to earn a wage in a sedentary capacity. The ALJ credits Ms. Anctil's testimony to find that Claimant retains access to better than 50% (64%) of the jobs she was capable of performing prior to her work injury and that more than one hundred occupations are currently available to Claimant. On the evidence presented, the ALJ is persuaded that the representative sampling of sedentary positions identified by Respondents' vocational expert as being within Claimant's physical/mental capabilities present a number of perspective job positions existing in the local labor market affording Claimant the opportunity to earn a wage. Furthermore, Claimant considers herself an intelligent person who is capable of learning new skills. She is proficient in using a laptop, has some training in secretarial work, and spent two years in a clerical position at the King Soopers pharmacy. Additionally, Claimant has experience in, an aptitude for, and a desire to perform tax preparation. Based upon the evidence presented, the ALJ concludes that she has failed to prove by a preponderance of the evidence that she is incapable of earning a wage.

ORDER

It is therefore ordered that:

1. Claimant's claim for permanent total disability benefits is denied and dismissed.

2. All matters not determined herein are reserved for future determination.

DATED: July 7, 2015

Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Drive, Suite 230
Colorado Springs, CO 80906

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service;

otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

OFFICE OF ADMINISTRATIVE COURTS
STATE OF COLORADO

W.C. No. 4-887-035-02

FULL FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

IN THE MATTER OF THE WORKERS' COMPENSATION CLAIM OF:

Claimant,

v.

Employer,

and

Insurer / Respondents.

Hearing in the above-captioned matter was held before Edwin L. Felter, Jr., Administrative Law Judge (ALJ), on May 21, 2015, in Denver, Colorado. The hearing was digitally recorded (reference: 5/21/15, Courtroom 1, beginning at 1:30 PM, and ending at 4:00 PM).

Claimant's Exhibits1 through 13 were admitted into evidence, without objection. Respondents' Exhibits A through M were admitted into evidence, without objection.

At the conclusion of the hearing, the ALJ ruled from the bench and referred preparation of a proposed decision to counsel for the Claimant, to be submitted electronically within 5 working days. On May 29, 2015, counsel for the Claimant requested an extension of time until June 3, 2015 within which to submit a proposed decision. Counsel for the Respondents had no objection. The Claimant submitted a proposed decision on June 3, 2015, and the Respondents submitted detailed objections thereto on June 5, 2015, at which time the matter was deemed submitted for decision.

ISSUES

The issues to be determined by this decision concern average weekly wage (AWW), based on multiple employments; and, temporary partial disability (TPD) and

temporary total disability (TTD) benefits from February 13, 2012, the date of the admitted injury, through May 5, 2014, the date of maximum medical improvement (MMI). Respondents designated the issue of an unemployment insurance (UI) benefit offset. The Respondents did **not** designate the issue of "responsibility for termination," nor was it an issue.

The Claimant bears the burden of proof, by preponderant evidence on all issues, with the exception of the UI offset, wherein the Respondents bear the burden of proof by a preponderance of the evidence.

FINDINGS OF FACT

Based on the evidence presented at hearing, the ALJ makes the following Findings of Fact:

Preliminary Findings

1. The Respondents admitted liability for injuries sustained by Claimant arising out of a slip and fall accident on February 13, 2012.

2. On July 24, 2014, the Respondents filed a Final Admission of Liability (FAL), admitting for zero temporary disability benefits; a maximum medical improvement (MMI) date of May 5, 2014; 14% whole person permanent medical impairment for a total of $5,852.56 (based on a lower AWW as a component of the formula), however, permanent disability was not designated as an issue nor was it an issue at the hearing, payable at the rate of $150 per week; $40,438.08 in medical benefits to date; and, for causally related and reasonably necessary post-MMI medical maintenance benefits.

3. The Claimant was working as a school bus driver at the time of her injury. Claimant testified that she was able to continue to work as a bus driver but had difficulty performing some of the lifting and reaching duties required of her employment. She continued to work for Employer until she was dismissed from employment on May 22, 2013. The reasons for the Claimant's dismissal are unclear. Suffice it to say, since temporary disability benefits are based on a strict temporary wage loss concept, the Employer, by terminating the Claimant's employment, increased her temporary wage loss.

Medical Status

4. After the admitted injury, the Employer sent the Claimant to Banner Health for treatment, where she was seen by Paulette Carpenter, FNP (Nurse Practitioner). According to the Claimant, Carpenter referred her for an orthopedic evaluation a few months after her injury. Claimant was seen by Robert Benz, M.D., an orthopedic surgeon. According to the Claimant, she was not seen by another physician

until she was seen by Adam Mackintosh, M.D., a Sterling physician, in August 2013. The Claimant denied having been seen by Jeff Bacon, M.D., at Banner Health. The Claimant was also referred to Kenneth Pettine, M.D., Usama Ghazi, D.O., and Gregory Reichhardt, M.D. All of these physicians were within the chain of authorized referrals and, therefore, authorized.

5. The Claimant's medical records from Banner Health reveal that the Claimant was treated by Paulette Carpenter, FPN throughout the course of her medical treatment. With the exception of the period from October 25, 2013 until November 17, 2013, FPN Carpenter indicated Claimant was able to return to full duty work. As found herein below, the ALJ infers and finds that Carpenter's "release to return to full duty work" was improvidently made, based on an inadequate grasp of all of the Claimant's circumstances. The Physician's Reports of Workers' Compensation Injury up until April 16, 2013 were signed by FPN Carpenter. The majority of reports beginning April 16, 2013 were signed or co-signed by Dr. Bacon (who had never seen the Claimant) or Dr. Mackintosh. With the aforementioned exception, all medical reports after April 16, 2013 indicated that the Claimant was able to return to full duty work. Although the Respondents, in lodging objections to the Claimant's proposed findings, rely on these reports to assert that the Claimant had medical full duty releases to return to work almost immediately after the admitted injury of February 13, 2012, the ALJ does not find these "full duty" releases **credible** because they are superseded by the opinions of more credible physicians, including Dr. Mackintosh himself, as found herein below.

6. Dr. Mackintosh testified by deposition on April 10, 2015. He first saw the Claimant in September 2013. He stated that Paulette Carpenter, FNP, provided primary care to Claimant prior to this date. Dr. Mackintosh began seeing the Claimant when nurse practitioners required a physician to sign off on treatment. Dr. Mackintosh stated that he felt the Claimant could perform the regular duties of a bus driver as he understood them to be, and that he was hesitant to place work-restrictions on patients that could impact their employment. Dr. Mackintosh stated that there were physical limitations that the Claimant should have avoided after her injury such as heavier lifting. Dr. Mackintosh did not disagree with the permanent restrictions provided by Dr. Reichhardt because that was Dr. Reichhardt's area of expertise. Dr. Mackintosh stated that the Claimant had medical incapacity after her date of injury and it would not have been unreasonable for the Claimant to have the permanent restrictions provided by Dr. Reichhardt in place from her date of injury until MMI. The ALJ infers and finds that Dr. Mackintosh deferred to Dr. Reichhardt on the issue of medical restrictions, and Dr. Reichhardt, as subsequently inferred and found herein, retrospectively restricted the Claimant to limitation of lifting, pushing, pulling and carrying up to 20 pounds occasionally, 10 pounds frequently. Limit bending and twisting at the waist to a rare basis four times per hours.

7. The Claimant was seen once by Dr. Benz on or about May 4, 2012 for orthopedic surgical evaluation. In addition to stating the opinion that the Claimant would

not benefit from surgical intervention, Dr. Benz indicated that the Claimant could return to her full duties as a bus driver. For the reasons stated in the findings herein below, the ALJ finds that subsequent medical opinions are more persuasive and credible and these opinions outweigh Dr. Benz's "full duty" release. Therefore, the ALJ does **not** find Dr. Benz's opinion in this regard credible.

8. The Claimant was seen by Kenneth A. Pettine, M.D., on or about March 1, 2013. Dr. Pettine was of the opinion that the Claimant was a candidate for a 2-level fusion procedure. Dr. Pettine also outlined a number of non-operative treatment options. Dr. Pettine stated the opinion that the Claimant should avoid heavy weight lifting, squats and dead lifts as well as extensive lifting, twisting, bending and stooping. The ALJ finds the opinions of Dr. Pettine to be more credible and persuasive than the opinions of Dr. Benz.

9. The Claimant underwent bilateral L4-5, bilateral L5-S1 facet joint intra-articular injections performed by Scott Hompland, D.O., on September 6, 2012 and December 6, 2012.

10. Claimant was seen by Usama Ghazi, D.O., on or about November 11, 2013. Dr. Ghazi recommended a course of treatment to begin with sacroiliac injections. Dr. Ghazi subsequently performed bilateral sacroiliac injections and a sacrococcygeal joint injection with some improvement. Dr. Ghazi noted that the Claimant was frustrated that her tailbone pain was precluding her from returning to her occupation as a trucker. Although Dr. Ghazi did not specifically comment on work-restrictions, this later evidence of the Claimant's level of function and intensity of treatment is persuasive evidence that she was unable to perform full duty work for the Employer.

11. The Claimant was placed at MMI by Dr. Reichhardt on May 5, 2014. Dr. Reichhardt issued a 10% whole person permanent impairment rating for Claimant's cervical spine and 11% whole person permanent impairment rating for Claimant's lumbar spine (later apportioned to 4%). Dr. Reichhardt recommended 3 years of maintenance treatment and provided permanent work-related restrictions of limited lifting, pushing, pulling and carrying to 20 pounds occasionally, 10 pounds frequently. Limit bending and twisting at the waist "to a rare basis four times per hours." Dr. Reichhardt deferred any opinion concerning the Claimant's temporary restrictions prior to MMI to the Claimant's authorized treating physicians. The ALJ infers and finds that Dr. Reichhardt's permanent work restrictions, at least, equate to her temporary restrictions before MMI. The opinions of Dr. Reichhardt are credible and persuasive. Additionally, Dr. Pettine had prescribed temporary restrictions of avoiding heavy weight lifting, squats and dead lifts as well as extensive lifting, twisting, bending and stooping. All of these restrictions would prevent the Claimant from performing the full range of her job duties with the Employer, with Stops, and with Quizno's.

12. Despite temporary restrictions implicitly prescribed by Dr. Pettine and Dr. Reichhardt, retrospectively, the Claimant continued working at her multiple employments in excess of those restrictions, however, the ALJ infers and finds that she was **not** able to adequately properly perform at any of her multiple jobs, thus she minimized her temporary wage loss. The ALJ infers and finds that based on the Claimant's undisputed testimony, she should not have been working, full duty, at any of her multiple employments unless she had been offered modified duties to accommodate those restrictions. She was **not** offered modified duties at any of her employments.

Multiple Employments as of Admitted Date of Injury

13. The Claimant's gross earnings from the Employer herein for 2011 (Claimant's Exhibit 7) amount to $10, 012.05 divided by 52 = $192.35 per week, as opposed to the admitted AWW of $156.76. This higher AWW would affect the formula for determining permanent medical impairment, however, permanency was **not** a designated issue.

14. On the date of her injury, the Claimant also worked as a driver for Stops Enterprises. She began working for Stops in the early part of 2011 and continued to work for Stops until approximately December 2012. Her job duties at Stops included driving patients to their medical appointments. The Claimant was able to do her job duties after her injury, but had some trouble with longer drives. Her employer stopped sending her assignments in December of 2012. The Claimant implies that the Employer stopped sending her assignments in December of 2012 because of her admitted injury. Regardless of why Stops stopped sending the Claimant assignments, her temporary wage loss increased as of January 1, 2013. Claimant's wage records from Stop Enterprises from July 5, 2011 until January 5, 2012 reveal gross earnings of $2,909.40 for this 185 day period. This would result in a weekly average of $110.09 ($2,909.40 /185 x 7) at Stops.

15. Also on the date of her admitted injury, the Claimant worked at The Reata Petroleum Corporation, which was a Quizno's sandwich shop located at a truck stop. Her job duties were as a sandwich maker. She started working for Quizno's in June 2011 until she stopped working on April 15, 2012. According to the Claimant, she stopped working at Quizno's because she could no longer handle the physical demands of working three (3) jobs. Claimant's employment records from Reata Petroleum Corporation indicate that Claimant started working for Quizno's on June 14, 2011. Her 2011 W-2 from Reata Petroleum (Quizno's) indicates that the Claimant earned $4,512.60 for the tax year of 2011. Based on 201 days from June 14, 2011 until December 31, 2011, these gross earnings would result in a weekly average of $157.16 at Quizno's.

Average Weekly Wage (AWW)

16. As of the admitted date of injury, the Claimant had three concurrent, multiple employments. The Claimant's gross earnings from the Employer herein for 2011 (Claimant's Exhibit 7) amounts to $10, 012.05 divided by 52 = $192.35 per week. Add $110.09 per week from Stops and $157.16 per week from Quizno's, and an overall AWW of $459.60 results. The ALJ hereby finds that the above described methodology for determining AWW from the Claimant's three multiple employments is the fairest and most objective way of determining the AWW herein. Therefore, the ALJ finds that the Claimant's AWW as of the date of injury was $459.60, which is the baseline from which temporary partial disability (TPD) should be measured, based on temporary wage loss.

Unemployment Insurance (UI) Benefit Offset

17. The Claimant received UI benefits of $129.00 every two weeks, or $64.50 per week, from June 1, 2013 until November 24, 2013 (Claimant's Exhibit 6).

Temporary Disability

18. From the date of the admitted injury of February 13, 2012 until the Claimant was terminated from employment by the Employer herein on May 22, 2013, she continued to earn $192.35 per week from the Employer herein. From February 13, 2012 through December 31, 2012, she continued working for Stops, earning an additional $110.09 per week. From February 13, 2012 through April 15, 2012, she also continued working for Quizno's at $157.16 per week. Consequently, the Claimant had **no** temporary wage loss from February 13, 2012 through April 15, 2012. From April 16, 2012 through December 31, 2012, the Claimant was sustaining a temporary wage loss of $302.44 ($459.60 - $157.16 = $302.44) during this period of time. From January 1, 2013 through May 22, 2013, the Claimant had lost her employment with Stops at $110.09 per week. Consequently, her temporary wage loss during this period of time was $459.60 - $110.09=$349.51 per week. From May 23, 2013 (the date of her termination by the Employer herein) until December 1, 2013, the Claimant was sustaining a 100% temporary wage loss, or a total wage loss of $459.60 per week.

18. In approximately December 2013, the Claimant started to work retail sales for Stage Stores. She continued to work at Stage Stores, averaging between 12-17 hours/week at $8.60 an hour, or an average of 15 hours per week, or $129.00 per week, until after she was placed at MMI on May 5, 2014. From December 2, 2013 through the date of MMI, May 5, 2014, the Claimant was sustaining a temporary wage loss of $330.60 per week ($459.60 - $129.00= $330.60).

Ultimate Findings

19. It is undisputed that Dr. Mackintosh deferred to Dr. Reichhardt on the Claimant's medical restrictions. As inferred and found herein above, Dr. Reichhardt's permanent medical restrictions were at least the Claimant's temporary restrictions after

the admitted injury of February 13, 2012. Also, Dr. Pettine imposed temporary restrictions that would have prevented the Claimant from performing the full range of her duties at her multiple employments. Nonetheless, the Claimant worked at her multiple employments despite her medical restrictions, but she could not perform adequately or properly at any of her multiple jobs. It would be irrational to infer that the Claimant's temporary restrictions before MMI, imposed by Dr. Reichhardt, were less than her permanent restrictions at MMI.

20. The ALJ finds the Claimant's testimony as a whole, credible and un-refuted. Her lay testimony establishes that she could **not** perform properly or adequately at any of her multiple jobs. Also, the ALJ finds the medical opinions of Dr. Pettine and Dr. Reichhardt concerning restrictions persuasive and credible. The ALJ finds the opinion of Dr. Benz lacking in credibility because it is contrary to the weight of the evidence.

21. Between conflicting medical opinions, the ALJ makes a rational choice to accept the opinions of Dr. Pettine, Dr. Reichhardt and Dr. Mackintosh's ultimate opinion (as found in paragraph 6 herein above), because they are based on substantial evidence, and to reject the opinion of Dr. Benz and FPN Carpenter.

22. The Claimant's AWW from her multiple employments on the date of injury is $459.60, which is the baseline measurement for TPD benefits.

23. From the date of injury, February 13, 2012 through April 15, 2012, the Claimant was working at all three multiple employments and sustained **no** temporary wage loss. As supported by the findings herein above, from April 16, 2012 through December 31, 2012, the Claimant was sustaining a temporary wage loss of $302.44 per week, which yields a TPD rate of $201.62 per week, or $28.80 per day. From January 1, 2013 through May 22, 2013, the date of her termination by the Employer herein, the Claimant was sustaining a temporary wage loss of $349.51 per week, which yields a TPD rate of $233.00 per week, or $33.29 per day. From May 23, 2013 through December 1, 2013, the Claimant was sustaining a 100% temporary wage loss, which yields a temporary total disability (TTD) benefit rate of $306.40 per week, or $43.77 per day. From December 2, 2013 (when the Claimant began employment with Stage Stops at an average of $129.00 per week) through May 4, 2014 the day before her MMI date, the Claimant was sustaining a temporary wage loss of$330.60 per week, which yields a TPD rate $220.40 per week, or $31.49 per day.

24. The Claimant received UI benefits of $129.00 every two weeks, or $64.50 per week, from June 1, 2013 until November 24, 2013 (Claimant's Exhibit 6).

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

Credibility

a. In deciding whether an injured worker has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Bodensleck v. Indus. Claim Appeals Office,* 183 P.3d 684 (Colo. App. 2008);*Kroupa v. Indus. Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002); *Rockwell International v. Turnbull,* 802 P.2d 1182, 1183 (Colo. App. 1990); *Penasquitos Village, Inc. v. NLRB*, 565 F.2d 1074 (9th Cir. 1977). The ALJ determines the credibility of the witnesses. A*renas v. Indus. Claim Appeals Office*, 8 P.3d 558 (Colo. App. 2000). The weight and credibility to be assigned evidence is a matter within the discretion of the ALJ. *Cordova v. Indus. Claim Appeals Office*, 55 P.3d 186 (Colo. App. 2002); *Youngs v. Indus. Claim Appeals Office,* 297 P.3d 964, **2012 COA 85.** The same principles concerning credibility determinations that apply to lay witnesses apply to expert witnesses as well. *See Burnham v. Grant,* 24 Colo. App. 131, 134 P. 254 (1913); *also see Heinicke v. Indus. Claim Appeals Office,* 197 P.3d 220 (Colo. App. 2008). The fact finder should consider, among other things, the consistency or inconsistency of a witness' testimony and/or actions; the reasonableness or unreasonableness (probability or improbability) of a witness' testimony and/or actions (this includes whether or not the expert opinions are adequately founded upon appropriate research); the motives of a witness; whether the testimony has been contradicted; and, bias, prejudice or interest. *See Prudential Ins. Co. v. Cline,* 98 Colo. 275, 57 P. 2d 1205 (1936); CJI, Civil, 3:16 (2005). The fact finder should consider an expert witness' special knowledge, training, experience or research (or lack thereof). *See Young v. Burke,* 139 Colo. 305, 338 P. 2d 284 (1959). The ALJ has broad discretion to determine the admissibility and/or weight of evidence based on an expert's knowledge, skill, experience, training and education. *See* S 8-43-210, C.R.S; *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P.2d 501 (Colo. App. 1995). As found, *See, Annotation, Comment: Credibility of Witness Giving Un-contradicted Testimony as Matter for Court or Jury,* 62 ALR 2d 1179, maintaining that the fact finder is not free to disregard un-contradicted testimony. As found, the Claimant's testimony as a whole, was credible and un-refuted. Also, as found, the medical opinions of Dr. Pettine and Dr. Reichhardt, concerning restrictions, were persuasive and credible. As further found, the opinion of Dr. Benz was lacking in credibility because it was contrary to the weight of the evidence. The ultimate medical opinions of Dr. Mackintosh, Dr. Pettine and Dr. Reichhardt on restrictions are essentially un-contradicted. *See, Annotation, Comment: Credibility of Witness Giving Un-contradicted Testimony as Matter for Court or Jury,* 62 ALR 2d 1179, maintaining that the fact finder is not free to disregard un-contradicted testimony.

Substantial Evidence

b. An ALJ's factual findings must be supported by substantial evidence in the record. *Paint Connection Plus v. Indus. Claim Appeals Office,* 240 P.3d 429 (Colo. App. 2010); *Leewaye v. Indus. Claim Appeals Office,* 178 P.3d 1254 (Colo. App. 2007); *Brownson-Rausin v. Indus. Claim Appeals Office,* 131 P.3d 1172 (Colo. App. 2005). *Also see Martinez v. Indus. Claim Appeals Office,* 176 P.3d 826 (Colo. App. 2007). Substantial evidence is "that quantum of probative evidence which a rational fact-finder would accept as adequate to support a conclusion, without regard to the existence of conflicting evidence." *Metro Moving & Storage Co.v. Gussert,* 914 P.2d 411 (Colo. App. 1995). Reasonable probability exists if a proposition is supported by **substantial evidence** which would warrant a reasonable belief in the existence of facts supporting a particular finding. *See F.R. Orr Construction v. Rinta,* 717 P.2d 965 (Colo. App. 1985). It is the sole province of the fact finder to weigh the evidence and resolve contradictions in the evidence. See *Pacesetter Corp. v. Collett,* 33 P. 3d 1230 (Colo. App. 2001). An ALJ's resolution on questions of fact must be upheld if supported by substantial evidence and plausible inferences drawn from the record. *Eller v. Indus. Claim Appeals Office,* 224 P.3d 397, 399-400 (Colo. App. 2009). As found, between conflicting medical opinions, the ALJ made a rational choice to accept the opinions of Dr. Pettine, Dr. Reichhardt and Dr. Mackintosh's ultimate opinion (as found in Finding No. 6 herein above), because they are based on substantial evidence, and to reject the opinion of Dr. Benz and FPN Carpenter.

Average Weekly Wage

c. Where an injured worker has arranged **multiple** employments to earn a living, and the injury precludes work altogether, or in one or more employments, a fair computation of the true AWW encompasses all employments. *St. Mary's Church & Mission v. Indus. Comm'n,* 735 P. 2d 902 (Colo. App. 1986); *Jefferson County Public Schools v. Dragoo,* 765 P.2d 636 (Colo. App. 1988); *Broadmoor Hotel v. Indus. Claim Appeals Office,* 939 P.2d 460 (Colo. App. 1996), *cert. denied* July 14, 1997. An AWW calculation is designed to compensate for temporary wage loss. *Pizza Hut v. Indus. Claim Appeals Office,* 18 P. 3d 867 (Colo. App. 2001). *See* § 8-42-102, C.R.S
An ALJ has the discretion to determine a claimant's AWW, based not only on the claimant's wage at the time of injury, but also on other relevant factors when the case's unique circumstances require, including a determination based on increased earnings and insurance costs at a subsequent employer. *Avalanche Industries, Inc. v. Clark,* 198 P.3d 589 (Colo. 2008). As found, a fair and objective determination of the Claimant's AWW from her multiple employments at the time of the admitted injury is $459.60, which is the baseline from which to measure temporary wage loss.

Temporary Disability

d. To establish entitlement to temporary disability benefits, a claimant must prove that the industrial injury has caused a "disability," and that he has suffered a wage

loss that, "to some degree," is the result of the industrial disability. § 8-42-103(1), C.R.S; *PDM Molding, Inc. v. Stanberg*, 898 P.2d 542 (Colo. 1995). When a temporarily disabled employee loses her employment for reasons which are not her responsibility, the causal relationship between the industrial injury and the wage loss necessarily continues. Disability from employment is established when the injured employee is unable to perform the usual job effectively or properly. *Jefferson Co. Schools v. Headrick*, 734 P.2d 659 (Colo. App.1986). This is true because the employee's restrictions presumably impair his opportunity to obtain employment at pre-injury wage levels. *Kiernan v. Roadway Package System*, W.C. No. 4-443-973 (ICAO, December 18, 2000). Claimant's termination in this case was not her fault but the result of undisclosed reasons. There is no statutory requirement that a claimant must present medical opinion evidence from of an attending physician to establish her physical disability. See *Lymburn v. Symbois Logic*, 952 P.2d 831 (Colo. App. 1997). Rather, the Claimant's testimony alone is sufficient to establish a temporary "disability." *Id*. As found, the Claimant worked at her multiple employments despite her medical restrictions, but she could not perform adequately or properly at any of her multiple jobs.

e. Once the prerequisites for TPD and/or TTD are met (*e.g.,* no release to return to full duty, MMI has not been reached, a temporary wage loss is occurring), modified employment is not made available, and there is no actual return to work, TPD and TTD benefits are designed to compensate for temporary wage loss. TTD benefits are designed to compensate for a 100% temporary wage loss. *See Eastman Kodak Co. v. Industrial Commission,* 725 P. 2d 107 (Colo. App. 1986); *City of Aurora v. Dortch,* 799 P. 2d 461 (Colo. App. 1990). As found, from the date of injury, February 13, 2012 through April 15, 2012, the Claimant was working at all three multiple employments and sustained **no** temporary wage loss. As supported by the findings herein above, from April 16, 2012 through December 31, 2012, the Claimant was sustaining a temporary wage loss of $302.44 per week, which yields a TPD rate of $201.62 per week, or $28.80 per day. From January 1, 2013 through May 22, 2013, the date of her termination by the Employer herein, the Claimant was sustaining a temporary wage loss of $349.51 per week, which yields a TPD rate of $233.00 per week, or $33.29 per day. From May 23, 2013 through December 1, 2013, the Claimant was sustaining a 100% temporary wage loss, which yields a temporary total disability (TTD) benefit rate of $306.40 per week, or $43.77 per day. From December 2, 2013 (when the Claimant began employment with Stage Stops at an average of $129.00 per week) through May 4, 2014 the day before her MMI date, the Claimant was sustaining a temporary wage loss of$330.60 per week, which yields a TPD rate $220.40 per week, or $31.49 per day.

Unemployment Insurance Benefit Offset

f. Section 8-42-103 (1) (f), C.R.S., provides for a 100% offset for UI benefits. As found, the Claimant received UI benefits of $129.00 every two weeks, or $64.50 per week, from June 1, 2013 until November 24, 2013, and the Respondents are entitled to an offset of $64.50 per week during this period of time.

Burden of Proof

g. The injured worker has the burden of proof, by a preponderance of the evidence, of establishing entitlement to benefits. §§ 8-43-201 and 8-43-210, C.R.S. *See City of Boulder v. Streeb,* 706 P. 2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals Office,* 12 P. 3d 844 (Colo. App. 2000); *Lutz v. Indus. Claim Appeals Office,* 24 P.3d 29 (Colo. App. 2000). *Kieckhafer v. Indus. Claim Appeals.Office*, 284 P.3d 202, 205 (Colo. App. 2012). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark,* 197 Colo. 306, 592 P. 2d 792 (1979). *People v. M.A.,* 104 P. 3d 273 (Colo. App. 2004); *Hoster v. Weld County Bi-Products, Inc.,* W.C. No. 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. *Also see Ortiz v. Principi,* 274 F.3d 1361 (D.C. Cir. 2001). "Preponderance" means "the existence of a contested fact is more probable than its nonexistence." *Indus. Claim Appeals Office v. Jones*, 688 P.2d 1116 (Colo. 1984). As found, the Claimant has sustained her burden with respect to an increased AWW and temporary disability benefits through the date of MMI, May 5, 2014.

ORDER

IT IS, THEREFORE, ORDERED THAT:

A. The Claimant's average weekly wage is hereby re-established at 4459.60.

B. Any and all claims for temporary disability benefits from February 13, 2012 through April 15, 2012, are hereby denied and dismissed.

C. From April 16, 2012 through December 31, 2012, both dates inclusive, a total of 260 days, Respondents shall pay the Claimant , temporary partial disability benefits at rate of $201.62 per week, or $28.80 per day, in the aggregate subtotal amount of $7,488.00, which is payable retroactively and forthwith. From January 1, 2013 through May 22, 2013 (the date of the Claimant's termination by the Employer herein), a subtotal of 142 days, the Respondents shall pay the Claimant temporary partial disability benefits at the rate of $233.00 per week, or $33.29 per day, in the aggregate amount of $4,727.18, which is payable retroactively and forthwith. From May 23, 2013 through May 31, 2013, both dates inclusive, a subtotal of 9 days, the Respondents shall pay the Claimant temporary total disability benefits at the rate of $306.40 per week, or $43.77 per day, in the aggregate subtotal amount of $393.94, which is payable retroactively and forthwith. From June 1, 2013 through November 24, 2013, both dates inclusive, a subtotal of 177 days, the Respondents shall pay the Claimant temporary total disability benefits of $306.40 per week less the UI offset of $64.50 per week, in the net amount of $241.90 per week, or $34.56 per day, in the

aggregate amount of $6,177.12, which is payable retroactively and forthwith. From November 25, 2013 through December 1, 2013, both dates inclusive, a subtotal of 7 days, the Respondents shall pay the Claimant temporary total disability benefits (with no offset) at the rate of $306.40 per week, or $43.77 per day, in the aggregate subtotal amount of $306.39, which is payable retroactively and forthwith. From December 2, 2013 (when the Claimant began employment with Stage Stops at an average of $129.00 per week) through the day before the maximum medical improvement date, May 4, 2014, both dates inclusive, a subtotal of 154 days, the Respondents shall pay the Claimant temporary partial disability benefits at the rate of $220.40 per week, or $31.49 per day, in the aggregate subtotal amount of $4,849.46, which is payable retroactively sand forthwith. In sum, the respondents shall pay the Claimant a grand total of $23,635.70 in net retroactive temporary partial and temporary total disability benefits, including the 100% unemployment insurance benefit offset, through the date of maximum medical improvement, retroactively and forthwith.

D. the Respondents shall pay the Claimant statutory interest at the rate of eight percent (8%) per annum on all amounts of indemnity benefits due and not paid when due.

E. Any and all issues not determined herein are reserved for future decision.

DATED this_____day of June 2015.

Court Clerk

Wc.ord

ISSUES

1. Whether the respondents are providing reasonable, necessary, and related medical care to the claimant to cure and relieve her from the effects of her occupational disease.

2. Whether the overpayment alleged by the respondents in their last Final Admission dated December 19, 2014 is accurate.

3. Whether the claimant is owed interest on temporary total disability benefits owed for the period of February 13, 2015 to the date payment was issued by the respondents, May 21, 2015.

STIPULATIONS

1. The parties have stipulated and agreed that the claimant is no longer at maximum medical improvement (MMI) and the respondents have filed a revised general admission admitting for ongoing temporary total disability (TTD) benefits beginning February 13, 2015.

FINDINGS OF FACT

1. The claimant suffered an admitted injury on December 1, 2011. The claimant was placed at maximum medical improvement (MMI) by authorized treating physician Dr. Albert Hattem on August 21, 2014 and assigned a permanent impairment rating. Dr. Hattem did not recommend maintenance treatment. The respondents filed a final admission of liability consistent with Dr. Hattem's impairment rating and claimed an overpayment of $2,158.66.

2. The claimant objected to the final admission of liability and requested a Division Independent Medical Examination (DIME). The DIME was performed by Dr. Miguel Castrejon on November 19, 2014. Dr. Castrejon agreed that the claimant was at MMI as determined by Dr. Hattem. However, Dr. Castrejon recommended that the

claimant undergo additional diagnostic testing as maintenance treatment to either rule out or confirm the diagnosis of chronic regional pain syndrome (CRPS).

3. The respondents filed a final admission for liability on December 19, 2014 consistent with Dr. Castrejon's impairment rating and once again did not admit for maintenance medical benefits. The respondents claimed an overpayment of $3,837.62.

4. Consistent with a referral from Dr. Hattem, the respondents authorized the additional diagnostic testing recommended by Dr. Castrejon.

5. The additional diagnostic testing was positive for the presence of CRPS and the claimant followed up with Dr. Hattem on March 17, 2015. At this evaluation, Dr. Hattem referred the claimant to Dr. Shimon Blau for consideration of a sympathetic block to definitively rule out CRPS. Dr. Hattem also prescribed the claimant 300 mg tablets of Gabapentin 90 tablets, no refills, and did not recommend any other treatment at that time. The claimant's appointment with Dr. Blau was scheduled for May 4, 2015 as this was apparently the earliest available appointment.

6. The appointment with Dr. Blau did proceed on May 4, 2015 and Dr. Blau recommended proceeding with sympathetic blocks. No testimony was presented concerning when the report from Dr. Blau was sent or received by the respondents. However, the report contains a fax time stamp from Rockrimmon Concentra CS of 9:11 a.m. on May 12, 2015. Therefore, it is most likely that the report was faxed at this date and time. The claimant testified that she was notified on May 21, 2015 that the blocks had been authorized. Accordingly, the blocks were timely authorized.

7. The DIME examiner did mention consideration of additional treatment that may include anti-depressive medication, psychological support, and chronic pain management if the claimant was not at MMI. To date, Dr. Hattem has not prescribed any of these treatments and has not yet expressly opined that the claimant is not at MMI despite the stipulation of the parties.

8. No other specific treatment has been requested to date by Dr. Hattem, Dr. Blau or any other authorized treating physician that the respondents have not yet authorized.

9. The claimant has failed to prove that respondents have denied any treatment requested by any authorized treating physician.

10. The claimant was sent an indemnity check for $839.48 for the period December 27, 2013 through January 9, 2014. The claimant did not cash this check but

returned it to the respondent-insurer. The respondent-insurer did not give the claimant credit for this returned check when calculating its FAL of December 19, 2014.

11. The claimant was sent two other checks, each for $839.48, which she cashed but then reimbursed the respondent-insurer by way of a cashier's check made out to the respondent-insurer in the amount of $1,678.96. The respondent-insurer did not give the claimant credit for this reimbursement check when calculating its FAL of December 19, 2014.

12. The ALJ finds that the respondent-insurer paid the claimant $14,977.96 in indemnity benefits up through the filing of the Final Admission of Liability (FAL) on December 19, 2014.

13. Based upon the FAL the respondent-insurer was responsible for paying $15,944.92, which includes a disfigurement award of $1,000.00.

14. The ALJ finds that as of the date of the FAL on December 19, 2014 the respondent-insurer owed the claimant $966.96.

15. The ALJ finds that the respondent-insurer miscalculated the overpayment stated in the FAL of December 19, 2014 and that in actuality they had underpaid the claimant by $966.96.

16. The claimant, per the stipulation of the p[arties, is no longer at MMI as of February 13, 2015. The respondents agree that the claimant was entitled to temporary total disability benefits beginning on that date.

17. Based upon the proffer of counsel the claimant was not paid TTD for the period beginning February 13, 2015 until May 21, 2105.

18. The ALJ finds that the respondent-insurer is liable for interest of 8% on amounts due and not paid when required including the TTD beginning with February 13, 2015 and the underpayment from the FAL of December 19, 2014.

19. The ALJ finds that the claimant has failed to establish that it is more likely than not that the respondents are not providing reasonable, necessary, and related medical care for the claimant through her authorized providers.

20. The ALJ finds that the claimant has established that it is more likely than not that the overpayment stated on the December 19, 2014 FAL is incorrect and in fact there is an underpayment of $966.96.

21. The ALJ finds that the claimant has established that it is more likely than not that the respondent-insurer owes the claimant interest at 8% on amounts not paid when due including the underpayment of $966.96 and owed but unpaid TTD beginning with February 13, 2015 until paid.

CONCLUSIONS OF LAW

1. A DIME physician's determination is binding with respect to MMI, impairment, causation and apportionment. Such an opinion must be overcome by clear and convincing evidence. However, a DIME physician is not a treating physician. The DIME physician's treatment recommendations have no binding effect. Once a DIME physician determines a claimant is either at MMI or not at MMI and recommends treatment, the claimant returns to the treating physician and treatment is once again left to the sound discretion of the treating physician. Here, claimant has requested "a blanket order" entitling her to all of the specific treatment recommendations of an independent medical examiner even though no authorized treating provider has requested authorization of any of the treatment at issue. Claimant has offered no legal authority to support such a request. Moreover, the facts do not support this request as Dr. Castrejon only opined that the treatment "may" include the items at issue. He did not state that the treatment shall, should, or must include the items for which claimant is seeking authorization.

2. Case law clearly holds that even after a DIME, claimant bears the burden of proving entitlement to any specific treatment and respondents retain the right to dispute the reasonableness and medical necessity of any specific benefit. *Crowe v. Better Alternative, Inc.,* W.C. 648-372, (February 2, 2007); *See Snyder v. Industrial Claim Appeals Office, 942* P.2d 1337, 1339 (Colo. App. 1997). Respondents' right to challenge specific medical benefits includes those recommended by DIME physicians and a recommendation is not *de facto* reasonable and necessary simply because the DIME doctor recommended it as something that *may* be necessary to bring claimant to MMI.

3. The ALJ concludes that the claimant has failed to establish by a preponderance of the evidence that she is not receiving reasonable, necessary, and related medical care through her authorized providers to cure and relieve her from the effects of her occupational disease.

4. Whether the respondent-insurer erred in calculating the appropriate amounts stated in the FAL is a mathematical calculation based upon the underlying facts of the claimant's periods of disability, her permanent partial disability, and her disfigurement award.

5. The parties do not dispute the periods of disability as stated in the FAL. The ALJ calculates the ultimate amounts based upon the FAL of December 19, 2015 as the previous FAL even if in error is no longer relevant.

6. As found above, the ALJ concludes that the respondent-insurer erred in the calculation of the overpayment stated on the December 19, 2015 FAL because they failed to credit the claimant with the repayment of amounts made by the claimant by returning a check in the amount of $839.48 that was un-negotiated and by sending a cashier's check in the amount of $1,678.96.

7. The ALJ concludes that the claimant has established by a preponderance of the evidence that the respondent-insurer underpaid the claimant in the amount of $966.96 as of the date of the December 19, 2014 FAL.

8. The statute on interest, section 8-43-410(2), C.R.S. states that interest at eight percent per annum is due upon all sums not paid by either the date fixed by the director or administrative law judge, or the date the employer or insurance carrier became aware of an injury, whichever date is later.

9. The ALJ concludes that the claimant has established by a preponderance of the evidence that the respondent-insurer is responsible for payment of interest at the rate of 8% on all amounts due but unpaid per the statute.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The claimant's request for a general order concerning provision of medical benefits to the claimant is denied and dismissed.

2. The respondent-insurer shall pay the claimant $966.96 for the underpayment based upon the December 19, 2015 FAL.

3. The respondent-insurer shall pay interest to the claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

4. All matters not determined herein, and not closed by operation of law, are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. Colorado Springs, CO 80906

OFFICE OF ADMINISTRATIVE COURTS
STATE OF COLORADO

W.C. No. 4-900-242-02

FULL FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

IN THE MATTER OF THE WORKERS' COMPENSATION CLAIM OF:

Claimant,

v.

Employer,

and

Third Party Administrator (TPA),

Insurer/ Respondents.

Hearing in the above-captioned matter was held before Edwin L. Felter, Jr., Administrative Law Judge (ALJ), on April 15, 2015, in Denver, Colorado. The hearing was digitally recorded (reference: 4/15/15, Courtroom 1, beginning at 8:30 AM, and ending at 10:00 AM).

Respondents' Exhibits A through E were admitted into evidence, without objection. The Claimant relied on the Respondents' Exhibits.

At the conclusion of the hearing, the ALJ established the deadline of April 27, 2015 within which the Claimant should file a written transcript of the evidentiary deposition of Thomas Mann, M.D. (hereinafter referred to as "Mann Depo.," followed by a page number), which was filed on April 24, 2015, and a briefing schedule. The Claimant's opening brief was filed on May 13, 2015. The Respondents' answer brief was filed on May 21, 2015. The Claimant was given 2 working days after the answer brief within which to file a reply brief, if any, or no later than May 26. No timely reply brief having been filed, the matter was deemed submitted for decision on May 27, 2015.

ISSUE

The sole issue to be determined by this decision concerns the causal relatedness (to the admitted right knee injury of June 19, 2012) of the total right knee replacement recommended by orthopedic surgeon, Thomas Mann, M.D.

FINDINGS OF FACT

Based on the evidence presented at hearing, the ALJ makes the following Findings of Fact:

Previous Decision by ALJ Richard Lamphere: January 22, 2014

1. The Claimant claimed that on June 19, 2012, she aggravated a pre-existing degenerative condition in her right knee and lumbar spine in an accident that occurred during the course and scope of her employment with the Employer herein. She requested treatment for those injuries, including surgery on her right knee and injection of the right L5-S1 facet joint and the right greater trochanteric bursa. The Respondent admitted the occurrence of a work-related "incident" on June 19, 2012, but denied that the need for the treatment requested was due to the "incident" of June 19, 2012. Moreover, the Respondent asserted that any need for further treatment was solely related to pre-existing degenerative conditions.

2. Following a hearing on December 11, 2013, before ALJ Lamphere, the issues were determined in favor of the Claimant and adversely to the Respondent. ALJ Lamphere found that, "Claimant has proved by a preponderance of the evidence that she suffered a slip and fall as reported on June 19, 2012, striking her right knee and left back on the floor of employer." (Findings of Fact and Conclusions of Law and Order, January 22, 2014, hereinafter "Lamphere Decision").

3. ALJ Lamphere reviewed the medical records and reports of David Orgel, M.D., who treated the Claimant at Concentra, and John Tobey, M.D., a physiatrist who treated her at Spine West. ALJ Lampere noted that "Dr. Orgel and Dr. Tobey have stated that the most likely explanation for Claimant's right knee condition is an **aggravation of her pre-existing arthritic condition resulting from the reported June 19, 2012, incident"** (emphasis supplied) [Lamphere Decision]. ALJ Lamphere also reviewed the medical records and deposition testimony of Allison Fall, M.D., who performed an independent medical examination (IME) of the Claimant at Respondent's request. Dr. Fall was of the opinion that the Claimant's reported incident of June 19, 2012, did not result in an aggravation of her pre-existing arthritic condition.

4. ALJ Lamphere found that "the opinions of Drs. Mann, Orgel and Tobey

regarding aggravation of pre-existing osteoarthritis as an explanation for Claimant's right knee condition are more persuasive that the contrary opinions of Dr. Fall. The Claimant has proven by a preponderance of the evidence that she suffered a compensable aggravation of her pre-existing condition when she slipped and fell on June 19, 2012 and that this aggravation has result in disability and that the need for treatment, including surgery, is related to this aggravation" (Lamphere Decision). ALJ Lamphere also found that the record failed to demonstrate any right knee pain or treatment prior to June 19, 2012, and that the lack of such evidence further supported the finding that the Claimant's pre-existing degenerative condition of her right knee was aggravated by the accident of June 19, 2012 (Lamphere Decision).

5. ALJ Lamphere made the following Conclusion of Law: "In this case, the totality of the evidence supports the conclusion that Claimant suffered from a latent pre-existing osteoarthritis in the right knee which manifested after Claimant struck her right knee on the floor after slipping in water while performing her work duties... As found, the Claimant has proven by a preponderance of the evidence that she suffered a compensable aggravation of her pre-existing condition when she slipped and fell on June 19, 2012, and that this aggravation has resulted in disability and that the need for treatment, including surgery, is related to this aggravation" (Lamphere Decision). ALJ Lamphere therefore ordered that "Respondents shall pay for all medical expenses to cure and relieve Claimant from the effects of her industrial injury, including, but not limited to, right knee surgery, as recommended by Dr. Mann, a right L5-S1 facet injection and a right greater trochenteric bursa injection, as recommended by Dr. Tobey (Lamphere Decision).

6. The Claimant was seen by Thomas Mann, M.D. on October 2, 2012, for an orthopedic consult. He recommended arthroscopic surgery to address the meniscal pathology, chondral debris and the small loose body noted. Authorization for the surgery was denied by the Respondent.

7. On December 5, 2012, the Claimant was seen again by David Orgel, M.D. Dr. Orgel noted her to walk with an antalgic gait. He assessed a low back strain and right knee pain with large meniscal tear following a fall. He stated in his note, "I am unsure why there has been such a delay in getting her knee surgery approved." On January 22, 2014, ALJ Lamphere ordered the Respondent to provide the requested surgery.

Evidentiary Deposition of Thomas Mann, M.D., Re: Recommended Total Right Knee Replacement

8. Dr. Mann is an orthopedic surgeon. He routinely operates on knees and examines knees as part of his orthopedic practice (Mann Depo., p. 4). He has a subspecialty in Sports Medicine and Arthroscopic Surgery (Mann Depo., p. 4).

9. Dr. Mann first saw the Claimant on October 2, 2012, following an MRI (magnetic resonance imaging) which was taken on September 28, 2012 (Mann Depo., p. 6). The MRI showed a large complex degenerative flap medial mensicus tear with extrusion and medial compartment arthrosis. Medical compartment arthrosis means there is arthritis in the medial or midline part of the knee (Mann Depo., p. 7). Because of the size of the tear, Dr. Mann recommended arthroscopic surgery to remove the unstable portion of the meniscus.

10. Dr. Mann next saw the Claimant on February 11, 2014. It had been a couple of years since he last saw her (Mann Depo., pp. 7-8). He did repeat radiographs to see what, if anything had changed in the intermediate time. When he saw the new x-rays and saw that the Claimant's medial compartment had now basically totally collapsed, he **changed** his opinion; he didn't think arthroscopic surgery would be effective (Mann Depo., p. 8, lines 6-11). According to his note, Dr. Mann recommended symptomatic treatment for the knee and anticipated that long-term relief would require a knee replacement (Mann Depo., p. 9, lines 4-7). Dr. Mann indicated that the knee replacement was likely not relatable to the aggravating injury in June, 2012 (Mann Depo., p. 9, lines 7-9). He indicated that normally he would think that the need for a knee replacement would not be related to a work-related accident (Mann Depo., p. 9, lines 11-25).

11. Dr. Mann saw the Claimant again on May 8, 2014 He performed a physical examination and found that the Claimant's knee was in varus, meaning that it was bowed in and had some laxity with it and that she was tender along the medial joint line. Dr. Mann did not find varus in his first examination in October, 2012 (Mann Depo., p. 10, lines 17-24). In his opinion, the most likely cause of the varus was the loss of cartilage on the medial side of the knee, the cartilage being both the articulate cartilage and the meniscal cartilage (Mann Depo., p. 11, lines 5-10). Imaging studies now showed nearly complete loss of the medial compartment (Mann Depo., p. 11, lines 11-15).

12. Between the time when Dr. Mann first saw the Claimant on October 2, 2012, and his last physical examination of the Claimant on November 11, 2014, physical findings showed deterioration in her condition (Mann Depo., p. 12, lines 11-20). Dr. Mann observed that it appeared that the Claimant had lost 20 degrees of extension and 5 degrees of flexion; her alignment went more into varus, or more bow-legged (Mann Depo., p. 12, lines 20-25). Dr. Mann identified Claimant's Deposition Exhibit No. 2 as radiographs of both the Claimant's knees looking from an anterior-posterior view taken on October 2, 2012 (Mann Depo., p. 13, lines 8-14). The format of Exhibit 2 is a printed negative on a white piece of paper (Mann Depo., p. 13, lines 15-21). Dr. Mann identified Claimant's Deposition Exhibit No. 3 as a similar photo of a radiograph printed on white paper and dated November 11, 2014. Mann Deposition Exhibits 2 and 3 are x-rays of both the left and right knee taken simultaneously while bearing weight (Mann Depo., p. 14, lines 5-9).

13. According to Dr. Mann, Mann Deposition Exhibit No. 2 showed degenerative changes in both the right knee and the left knee with narrowing of the medical compartment. There was possibly a bit more joint space in the left knee than in the right knee (Mann Depo., p. 14, lines 10-21). Dr. Mann then compared the changes shown on Exhibit 3 to the earlier x-rays on Exhibit 2. He stated that Mann Deposition Exhibit 3 "demonstrates almost complete loss of the medial compartment with complete varus on the radiograph, the changes on the left knee also show some degenerative changes, but not as advanced as the right" (Mann Depo., p.14, lines 22-25; p. 15, lines 1-9).

14. As of October 2, 2012, the Claimant had osteoarthritis or degenerative joint disease in both knees (Mann Depo., p. 15, lines 12-18). According to Dr. Mann, in the absence of the trauma sustained to the Claimant's right knee on June 19, 2012, he would expect symmetrical progression of the arthritis: "You expect both knees to kind of progress similarly" (Mann Depo., p. 15, lines 22-25; p. 16, lines 1-8). Looking at exhibit 3, the arthritis in [Claimant's] right knee appears to have progressed much more rapidly on the right than on the left" (Mann Depo., p. 16, lines 9-13).

15. Dr. Mann was then asked the following hypothetical question with the following response:

Q.

"Assume that [Claimant] was asymptomatic in her right knee prior to June 19, 2012, assume that there is no history of a prior injury to her right knee and no history of prior medical treatment of her right knee before June 19, 2012, and assume further that there has not been any traumatic injury to her right knee since June 19, 2012. Do you have an opinion to a medical probability as to the most probable cause of the acceleration in the progression of arthritis in the right knee as compared to the left knee since June 19, 2012?"

A.

"I would assume that the - - if she had a documented injury that seemed to happen at that time and if it progressed like this, then that's where I think it would have had a probability of contributing – or causing or being the main cause of this accelerated progression." (Mann Depo., p. 16, lines 14-25; p. 17, lines 1-5).

16. On November 11, 2014, Dr. Mann recommended a knee replacement as long-term care of [Claimant's] right knee (Mann Depo., p. 17, lines 6-10). In Dr. Mann's opinion, the progression of the arthritis that he saw in radiographs was likely related to

the aggravation caused by her work-related trauma of June 19, 2012 (Mann Depo., p. 17, lines 11-17). The ALJ finds that Dr. Mann has expressed an opinion, to a reasonable degree of medical probability, that the recommended total right knee replacement is proximately, causally related to the admitted right knee injury of June 19, 2012.

17. Dr. Mann acknowledged that in his note of February 11, 2014, he indicated that long-term relief "will require a knee replacement, which is likely not directly attributable to the aggravating injury of June, 2012", while following his evaluation and x-rays of November 11, 2014, he indicated that in his opinion, "it is more likely than not that the fall significantly impacted her progression of arthritis (Mann Depo., p. 17, lines 18-25; p. 18, lines 1-5). Dr. Mann acknowledged that this was a change of opinion (Mann Depo., p. 18, lines 6-7). Dr. Mann explained the change in his opinion as follows:

Q.

"Can you explain to us how you came to the change of opinion?"

A.

"I guess, you know, my normal opinion was based on the fact that typically when we see injuries like this common, and usually arthritis is arthritis, and someone hurts themselves and they blame their injury on their arthritis. But we know from radiographs that people have arthritis that maybe is not symptomatic and then they have an injury that flares it up, but it's usually not the cause.

And that is what I initially thought after reviewing the case because that's the typical approach. And it's - -you know, arthritis is a multifactorial problem.

But I guess **my opinion changed when I really studied the progression, and it just did not fall in the typical progression of arthritis that I typically see.** And knowing that **she had this injury that led to a meniscal tear that likely then just allowed more rapid progression** (emphasis supplied) is where, if I looked at her over the course of that two and a half years or that time course, I thought that it likely did contribute.

And I still think it's multifactorial, it's not the only cause. But it became, it seems, the sort of the nidus of her rapid progression, and that - - , and so I think it's still a difficult case, but that's - - I think if there is absence any other injuries or any other change, and that it was the - - I tried to make an objective determination based on the accelerated wear I saw in the right knee versus the left knee, which **I don't typically see that significant a change or asymmetrical change without**

some sort of new injury or problem" (emphasis supplied) [Mann Depo., p. 18, lines 8-25; p. 19, lines 1-14].

18. A knee replacement is not part of Dr. Mann's routine practice. He recommended another surgeon to do it. (Mann Depo., p. 20, lines 9-14). He recommended his partner, who shares overhead expense; but he would not receive any direct compensation from the surgery (Mann Depo., p. 20, lines 15-18).

19. Dr. Mann concluded that the arthroscopic surgery he had recommended on October 2, 2012, was no longer a reasonable treatment option due to the progression of the Claimant's arthritis. He recommended symptomatic treatment for the knee and anticipated that "long term relief will require a knee replacement which is not directly relatable to the aggravating injury of June of 2012." (Respondent's Exhibit B).

20. Dr. Mann saw the Claimant again on May 8, 2014. He states the following in his clinical note of that date: "Unfortunately she had underlying arthritis, but it was aggravated by the trauma and now **we can see some progression of the arthritis of the right knee at an increased pace than the left knee** (emphasis supplied)**...** Long-term for pain and limitations is likely a knee replacement, but as noted she had some underlying arthritis prior to the injury. **The injury has just progressed the problem more rapidly** (emphasis supplied)**"** [Respondent's Exhibit B).

Mark Failinger, M.D.

21. The report of Dr. Failinger, who also evaluated the Claimant on March 15, 2015, at Respondent's request, provides further documentation of the extent to which the Claimant's knee condition has deteriorated since her injury. Dr. Failinger states that the Claimant "has a **very antalgic gait with a bent knee and signicant varus** (emphasis supplied) is noted to the right knee. Her **range of motion is extremely poor** (emphasis supplied). She goes from 30 degrees lacking full extension to approximately 60 degrees of flexion." (Respondent's Exhibit E). Dr. Failinger went on to conclude that, "Given that presentation, what I have reviewed in the medical records, her ambulatory status, and her description of pain, **she does appear to be a candidate for a total knee replacement as the only likely possibility of regaining some functionality and a better ambulatory status** (emphasis supplied). She is quite limited here and it is very difficult for most patients to walk with a flexion contracture of 30 degrees, which she appears to have from the limited examination she allowed me to perform." After reaching this conclusion, Dr. Failinger stated, "This appears to be the classic case of exacerbation of a severe preexisting generative joint disease." He then stated the opinion that "it is with a low probability that any new significant pathology was created by the fall, such as a major meniscus tear or worsening of her arthritis."

22. With respect to the latter opinion, the ALJ finds that Dr. Failinger was under the misimpression that the Claimant did not sustain a direct blow to her knee in her fall. Dr. Failinger specifically stated, "I have not seen the films." This is significant, because Dr. Mann's opinion that there has been a significant exacerbation and acceleration of the Claimant's arthritis **is based specifically on a comparison of x-rays** (emphasis supplied)**.**

Respondent's Independent Medical Examiner (IME) Douglas Scott, M.D.

23. Dr. Scott IS board-certified in occupational medicine. . After Dr. Mann prepared his March 25, 2015, report, Dr. Scott reviewed the records of Dr. Mann from February, 2014, and May, 2014, Dr. Chan's impairment rating and Dr. Failinger's report from March 2015.

24. According to Dr. Scott, the MRI of September 28, 2012, demonstrated a large, complex degenerative flap area of the anterior horn, body and posterior horn of the medial meniscus, which he believed were attributable to the June 19, 2012 injury. In Dr. Scott's opinion, the MRI findings not attributable to the injury included "severe arthrosis of the medial compartment, full thickness chondral loss throughout the anterior posterior weight-bearing medial thermal (*sic*) condyle and tibial plateau; degeneration and fraying of the posterior root of the lateral meniscus; Grade 3/4 chondral loss along the lateral patella femoral joint and median eminence of the patella; and the small to moderate joint effusion with synovitis.

25. According to Dr. Scott, arthrosis is essentially the loss of cartilage overlying the femur in the tibial plateau. Dr. Scott attributed this to a long-standing degenerative process. It is not an acute finding, according to Dr. Scott. In Dr. Scott's opinion, the injury of June 19, 2012, did not aggravate or accelerate the radiologist's findings in Number 2 of the MRI report of September 28, 2012. There was also degeneration of the lateral meniscus which pre-existed the accident, according to Dr. Scott. He testified that there was also, under Finding No. 5 in the MRI report of September 28, 2012, small to moderate joint effusion synovitis; this could be related, in his opinion, to osteoarthritis or to the meniscal tear.

26. Dr. Scott noted that there was a tear, disruption, or evulsion of the medial lateral meniscus which occurred as a result of trauma to the menisci from shearing, torsion or an impact injury in the flexed position. In Dr. Scott's opinion, the June 19, 2012, trauma did not accelerate the progression of the Claimant's underlying arthritic condition in the knee.

27. In Dr. Scott's opinion, the June 19, 2012, trauma did not cause the Claimant's pre-existing, but asymptomatic arthritis to become symptomatic. This opinion is contrary to ALJ Lamphere's Finding of Fact in his decision of January 24, 2014. ALJ Lamphere's finding, which was not appealed, is *res judicata* on this fact.

28. On cross-examination, Dr. Scott admitted that he had not reviewed any actual x-rays or imaging studies before writing his IME report; he did review the MRI report of September, 2012, Dr. Mann's x-ray report of September 2, 2012, and Dr. Mann's x-ray report of November 11, 2014. Dr. Scott stated that he would agree with Dr. Failinger and Dr. Mann that the appropriate treatment for the Claimant would be a total knee replacement (Hearing Transcript, p. 39, lines 2-25; p. 40, lines 1-20).

29. On cross-examination, Dr. Scott agreed that a review of the x-ray of the Claimant's knee taken on October 2, 2012, with the x-ray taken on November 11, 2104, would be necessary to determine if there had been some medial compartment loss or narrowing of the medial compartment. Dr. Scott agreed that a comparison of the October 2, 2012, x-ray taken by Dr. Mann with the x-ray taken by Dr. Mann on November 11, 2014, showed a narrowing of the medial compartment space. Dr. Scott also agreed that it could be inferred that the x-rays showed objective evidence of the progression of arthritis following trauma. Dr. Scott indicated that it was his opinion that the Claimant, at the time of her accident of June 19, 2012, had osteoarthritis in both the left knee and the right knee. He admitted that in reaching his opinions, he had made no comparison of the progression of the arthritis in the left knee with the progression of arthritis in the right knee.

30. On cross-examination, Dr. Scott indicated that if one knee has altered biomechanics, the degeneration of arthritis in that knee might accelerate more rapidly than in the other knee. Dr. Scott agreed that the Claimant had altered biomechanics in her right knee due to a large complex degenerative flap tear involving the anterior horn, body and posterior horn to the medial mensicus related to her work-related injury of June 19, 2012. Dr. Scott agreed that an individual with a meniscus tear is at risk for developing osteoarthritis down the line. Dr. Scott agreed that the delay of 14 months between the time that Dr. Mann recommended surgery until the time the Claimant was able to obtain an Order authorizing the surgery may have contributed to the progression of arthritis in her right knee.

Colorado Medical Treatment Guidelines (MTG), Rule 17, Workers' Compensation Rules of Procedure (WCRP), 7 CCR 1101-3

31. The MTG for Lower Extremity Injury, effective September 1, 2009, note on page 60 that knee meniscus injury, *e.g.* a tear, disruption, or avulsion of the medial or lateral meniscus, occurs occupationally as a result of trauma to the menisci from rotational shearing, torsion, and/or **impact injuries while in a flexed position** (emphasis supplied)**.**

32. The MTG note on page 47 that to establish the occupational relationship of aggravated knee osteoarthritis the provider must establish a change in the patient's baseline condition and a relationship to work activities including but not limited to

physical activities such as repetitive kneeling or crawling, squatting and climbing, or heavy lifting. The MTG also note that **another causative factor for aggravated osteoarthritis to consider is previous meniscus damage which predisposes a joint to degenerative changes** (emphasis supplied)**.** To establish that previous trauma causes joint degenerative changes, however, the prior injury should be at least two years from the presentation of new complaints and **there should be a significant increase of pathology on the affected side compared to the original imaging and/or to the opposite un-injured side or extremity** (emphasis supplied).**"**

Ultimate Findings

33. Dr. Mann's opinion that there has been a significant progression of post-traumatic degeneration of the Claimant's right knee since her accident of June 19, 2012, is supported by x-rays and her medical records. Dr. Mann's opinion that such progression was more likely than not caused by the trauma of her accident is credible, logical, and consistent with the evidentiary standards contained in the MTG.

34. While Dr. Mann was inconsistent in expressing his opinion he ultimately reached the right answer. It is otherwise difficult to explain the dramatic deterioration in Claimant's right knee condition in such a short time based only on speculation concerning a normal progression of arthritis. To accept the "natural progression" theory, the ALJ would be required to believe that some extraordinary, unknown factor intervened to aggravate and accelerate the Claimant's right knee degeneration more quickly and seriously than the left knee degeneration. When dealing in the realm of reasonable probabilities, the ALJ infers and finds that it is more reasonably probable that the admitted trauma of June 19, 2012, is the known factor that aggravated and accelerated the need for a total replacement of the right knee.

35. The ALJ finds the ultimate opinion of Dr. Mann on causality (concerning the need for a total right knee replacement) more persuasive and credible than the opinion of IME Dr. Scott for the following reasons: Dr. Mann, an orthopedic surgeon who has dealt extensively with knees, has more specific expertise concerning knee surgery than Dr. Scott; Dr. Mann's ultimate opinion is more consistent with the totality of the evidence and plausible inferences to be drawn there from; and, Dr. Mann has dealt more extensively with the Claimant's medical case than Dr. Scott.

36. Between conflicting medical opinions, the ALJ makes a rational choice to accept the ultimate opinion of Dr. Mann concerning the causal relatedness of the total right knee replacement, and to reject the opinion of IME Dr. Scott.

37. The Claimant has proven, by a preponderance of the evidence that the Claimant's present need for a total right knee replacement has been proximately caused by an aggravation and acceleration of the admitted, compensable right knee injury of June 19, 2012.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact, the ALJ makes the following Conclusions of Law:

Credibility

a. In deciding whether an injured worker has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Bodensleck v. Indus. Claim Appeals Office,* 183 P.3d 684 (Colo. App. 2008);*Kroupa v. Indus. Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002); *Rockwell International v. Turnbull,* 802 P.2d 1182, 1183 (Colo. App. 1990); *Penasquitos Village, Inc. v. NLRB*, 565 F.2d 1074 (9th Cir. 1977). The ALJ determines the credibility of the witnesses. A*renas v. Indus. Claim Appeals Office*, 8 P.3d 558 (Colo. App. 2000). The weight and credibility to be assigned evidence is a matter within the discretion of the ALJ. *Cordova v. Indus. Claim Appeals Office*, 55 P.3d 186 (Colo. App. 2002); *Youngs v. Indus. Claim Appeals Office,* 297 P.3d 964, **2012 COA 85.** The same principles concerning credibility determinations that apply to lay witnesses apply to expert witnesses as well. *See Burnham v. Grant,* 24 Colo. App. 131, 134 P. 254 (1913); *also see Heinicke v. Indus. Claim Appeals Office,* 197 P.3d 220 (Colo. App. 2008). The fact finder should consider, among other things, the consistency or inconsistency of a witness' testimony and/or actions; the reasonableness or unreasonableness (probability or improbability) of a witness' testimony and/or actions (this includes whether or not the expert opinions are adequately founded upon appropriate research); the motives of a witness; whether the testimony has been contradicted; and, bias, prejudice or interest. *See Prudential Ins. Co. v. Cline,* 98 Colo. 275, 57 P. 2d 1205 (1936); CJI, Civil, 3:16 (2005). The fact finder should consider an expert witness' special knowledge, training, experience or research (or lack thereof). *See Young v. Burke,* 139 Colo. 305, 338 P. 2d 284 (1959). The ALJ has broad discretion to determine the admissibility and/or weight of evidence based on an expert's knowledge, skill, experience, training and education. *See* S 8-43-210, C.R.S; *One Hour Cleaners v. Indus. Claim Appeals Office,* 914 P.2d 501 (Colo. App. 1995). As found, the ultimate opinion of Dr. Mann on causality (concerning the need for a total right knee replacement) was more persuasive and credible than the opinion of IME Dr. Scott for the following reasons: Dr. Mann, an orthopedic surgeon who has dealt extensively with knees, has more specific expertise concerning knee surgery than Dr. Scott; Dr. Mann's ultimate opinion is more consistent with the totality of the evidence and plausible inferences to be drawn there from; and, Dr. Mann has dealt more extensively with the Claimant's medical case than Dr. Scott.

Substantial Evidence

b. An ALJ's factual findings must be supported by substantial evidence in the record. *Paint Connection Plus v. Indus. Claim Appeals Office,* 240 P.3d 429 (Colo. App. 2010); *Leewaye v. Indus. Claim Appeals Office,* 178 P.3d 1254 (Colo. App. 2007); *Brownson-Rausin v. Indus. Claim Appeals Office,* 131 P.3d 1172 (Colo. App. 2005). *Also see Martinez v. Indus. Claim Appeals Office,* 176 P.3d 826 (Colo. App. 2007). Substantial evidence is "that quantum of probative evidence which a rational fact-finder would accept as adequate to support a conclusion, without regard to the existence of conflicting evidence." *Metro Moving & Storage Co.v. Gussert,* 914 P.2d 411 (Colo. App. 1995). Reasonable probability exists if a proposition is supported by **substantial evidence** which would warrant a reasonable belief in the existence of facts supporting a particular finding. *See F.R. Orr Construction v. Rinta,* 717 P.2d 965 (Colo. App. 1985). It is the sole province of the fact finder to weigh the evidence and resolve contradictions in the evidence. See *Pacesetter Corp. v. Collett,* 33 P. 3d 1230 (Colo. App. 2001). An ALJ's resolution on questions of fact must be upheld if supported by substantial evidence and plausible inferences drawn from the record. *Eller v. Indus. Claim Appeals Office,* 224 P.3d 397, 399-400 (Colo. App. 2009). As found, between conflicting medical opinions, the ALJ made a rational choice to accept the ultimate opinion of Dr. Mann concerning the causal relatedness of the total right knee replacement, and to reject the opinion of IME Dr. Scott.

Causal Relatedness of Present need for Total Right Knee Replacement

c. In order to prove that an industrial injury was the proximate cause of the need for medical treatment, an injured worker must prove a causal nexus between the need for treatment and the work-related injury. *Singleton v. Kenya Corp.,* 961 P.2d 571 (Colo. App. 1998). It is for the ALJ, as the fact-finder, to determine whether a need for medical treatment is caused by the industrial injury, or some other intervening injury. *F.R. Orr Construction v. Rinta*, 717 P.2d 965 (Colo. App. 1985). Respondents are liable for the "direct and natural consequences" of a work-related injury, including consequential injuries caused by the original compensable injury. *See Travelers Ins. Co. v. Savio*, 806 P.2d 1258 (Colo. 1985). The chain of causation, however, can be broken by the occurrence of an independent intervening injury. *See* 1 A. *Larson, Workers' Compensation Law,* section 13.00 (1997). As found, the Claimant has established that the present need for a total right knee replacement is directly and proximately linked to the original, admitted right knee injury of June 19, 2012.

Burden of Proof

d. The injured worker has the burden of proof, by a preponderance of the evidence, of establishing the compensability of an industrial injury and entitlement to benefits. §§ 8-43-201 and 8-43-210, C.R.S. *See City of Boulder v. Streeb,* 706 P. 2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals Office,* 12 P. 3d 844 (Colo. App. 2000); *Lutz v. Indus. Claim Appeals Office,* 24 P.3d 29 (Colo. App. 2000). *Kieckhafer*

v. Indus. Claim Appeals.Office, 284 P.3d 202, 205 (Colo. App. 2012). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark,* 197 Colo. 306, 592 P. 2d 792 (1979). *People v. M.A.,* 104 P. 3d 273 (Colo. App. 2004); *Hoster v. Weld County Bi-Products, Inc.,* W.C. No. 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. *Also see Ortiz v. Principi,* 274 F.3d 1361 (D.C. Cir. 2001). "Preponderance" means "the existence of a contested fact is more probable than its nonexistence." *Indus. Claim Appeals Office v. Jones*, 688 P.2d 1116 (Colo. 1984). As found, the Claimant has satisfied her burden with respect to the causal relatedness of the present need for a total right knee replacement.

ORDER

IT IS, THEREFORE, ORDERED THAT:

A. The Respondent shall pay the costs of all medical treatment for the Claimant's admitted right knee injury of June 19, 2012, including the costs of the total right knee replacement, subject to the Division of Workers' Compensation Medical Fee Schedule.

B. Any and all issues not determined herein are reserved for future decision.

DATED this_____day of June 2015.

ISSUES

Whether Claimant has overcome the Division Independent Medical Examination (DIME) physician's opinion of maximum medical improvement (MMI) and 0% whole person permanent impairment by clear and convincing evidence.

Whether Claimant is entitled to temporary indemnity benefits from June 17, 2014 and ongoing.

Whether the medical treatment recommended by Dr. Healey and Dr. Lichtenberg is reasonable, necessary, and causally related to Claimant's October 6, 2012 work injury.

FINDINGS OF FACT

1. Claimant is a 42 year-old female who worked for Employer as a line cook from 2008 until her date of injury.

2. On October 6, 2012, close to 1:30 a.m., Claimant was cleaning in Employer's kitchen underneath the "line." The "line" is a long metal shelf or counter, approximately five feet tall. Claimant was cleaning under the counter when she raised her head and hit her head on the underside of the "line." Claimant fell backwards, landing on her buttocks and back. Claimant did not lose consciousness.

3. After the incident, Claimant worked the remainder of her shift, between 30 minutes and 90 minutes (varied reports provided by Claimant). She then drove herself home and did not appear confused or disoriented when speaking with her husband after arriving home.

4. Later that day, Claimant sought treatment at approximately 1:00 p.m. at NextCare Urgent Center. *See* Exhibits S, 14.

5. At NextCare, Claimant was evaluated by Debra Salter, M.D. Claimant reported that she hit the top of her head and fell backward at work with no loss of consciousness. Claimant reported she had a moderate headache and pain in the sacrum and coccyx. Dr. Salter noted an unremarkable exam and diagnosed buttock contusion and headache. *See* Exhibits S, 14.

6. Dr. Salter requested and Claimant underwent X-rays of her lumbar spine that showed normal age related degenerative changes. The X-rays showed moderate

degenerative spondylosis of the lumbar spine and multi-level degenerative disc space narrowing, most severe at L4-L5 and L5-S1. No compression fracture or spondylolisthesis was found. *See* Exhibits S, 14.

7. On October 8, 2012 Claimant returned to NextCare and was evaluated by PA-C Marzena Kaczmarczyk. Claimant reported her head pain was getting worse and reported dizziness and double vision. Claimant was sent directly to the emergency department at the Medical Center of Aurora due to her reported symptoms. At the emergency department, Claimant underwent a head CT scan that was negative. *See* Exhibits S, 14.

8. Claimant was evaluated by various providers at NextCare from October 11, 2012 through November 28, 2012. Claimant subjectively reported continued back pain and headache pain that was not improving. Claimant's gait was noted to be normal throughout treatment. Claimant initially reported no radiation of her back pain, and later radiation into her right leg. Claimant's head, ears, eyes, nose, and throat (HEENT) examinations were all normal throughout treatment. Claimant was referred for a neurological examination and was referred to a Level II provider for management. *See* Exhibits S, 14.

9. On December 17, 2012, Braden Reiter, D.O. took over Claimant's care and became her authorized treating provider (ATP).

10. Respondents admitted liability for the October 6, 2012 incident and Respondents have paid for extensive medical treatment and diagnostic testing following the incident.

11. Approximately one month after taking over Claimant's care, Dr. Reiter referred Claimant for psychiatric treatment. Dr. Reiter also noted at that time that he had a guarded prognosis for Claimant's recovery due to multiple issues where her subjective complaints were beyond objective findings. Dr. Reiter believed there were some secondary gain issues, but noted he would continue to work through the specialists' evaluations. *See* Exhibits F, 13.

12. Despite his concern in January of 2013 of secondary gain issues, Dr. Reiter referred Claimant to multiple specialists for evaluation. Based on subjective complaints Claimant reported, the specialists to whom Claimant was referred ordered and performed significant testing to rule out possible conditions.

13. The testing included: CT of her orbits that was normal; MRI of her lumbar spine that showed normal age related mild degenerative disc disease; MRI of her cervical spine that showed normal and minimal age related degenerative changes; MRI of the brain that was normal; and EMG and nerve testing that was normal and showed no evidence of cervical radiculopathy. *See* Exhibits F, 13.

14. Dr. Reiter also referred Claimant for a neurological evaluation. *See* Exhibits F, 13.

15. On January 2, 2013 Claimant was evaluated by Lynn Parry, M.D. Dr. Parry opined based on Claimant's subjective reports that Claimant most likely had suffered a vestibular concussion. Dr. Parry sent Claimant for vestibular testing which showed no abnormalities or evidence of vestibular injury and showed no perilymph fistula. Dr. Perry found no other neurological abnormalities. *See* Exhibits L, 22.

16. On January 21, 2013 Claimant underwent a psychological pain evaluation performed by Rebecca Hawkins, Ph.D. Claimant was assisted by a Spanish language interpreter. Testing performed by Dr. Hawkins suggested Claimant was over reporting and exaggerating her somatic memory and cognitive complaints. Dr. Hawkins opined that symptom magnification could be interfering with Claimant's recovery and that Claimant's presentation was not consistent with the natural history of concussive or mild traumatic brain injury. Dr. Hawkins indicated she wished to rule out malingering versus factitious disorder, but unless there was clear evidence of either, opined that the Claimant would benefit from a course of individual cognitive- behavioral therapy and biofeedback. *See* Exhibits K, 18.

17. Claimant underwent six psychotherapy sessions with Dr. Hawkins but did not yield any subjective or objective benefit from the sessions. Dr. Hawkins did not recommended additional psychotherapy sessions. Dr. Hawkins also opined that transferring care to a different psychologist would not result in further improvement or benefit. *See* Exhibits K, 18.

18. On April 15, 2013 Claimant underwent an Independent Medical Evaluation (IME) performed by Lawrence Lesnak, D.O. Claimant reported to Dr. Lesnak that Dr. Reiter had recently hit her head three times and made her dizzy. She also reported that Dr. Perry told her recently that she had a fracture in her hip. The medical records do not support Claimant's statements. *See* Exhibits B, 9.

19. On examination, Dr. Lesnak noted Claimant exhibited diffuse pain behaviors and non-physiologic findings. She exhibited diffuse entire body cog wheeling, exhibited an inability to stand or walk without assistance from her husband, and appeared to volitionally shake her entire body. Dr. Lesnak noted that examination was difficult at best due to Claimant's unwillingness to participate. When performing rotator cuff testing, Claimant appeared to volitionally almost fall off the stool. Dr. Lesnak opined that Claimant's total body shaking during evaluation made no sense from an anatomic or physiologic standpoint. *See* Exhibits B, 9.

20. Dr. Lesnak opined that Claimant suffered a fairly trivial incident at work with minor initial symptoms and objective findings that dramatically worsened and became much more diffuse within a month or so. Dr. Lesnak opined that Claimant now had a multitude of subjective complaints without any objective findings. Dr. Lesnak opined that Claimant exhibited extensive and diffuse pain behaviors and non-

physiological findings throughout the examination and that a psychological evaluation suggested factitious disorder or malingering. Dr. Lesnak noted despite numerous tests and treatment, Claimant subjectively reported that her symptoms had worsened. *See* Exhibits B, 9.

21. Dr. Lesnak opined that no further diagnostic testing or interventional treatments whatsoever would be necessary or related to the occupational injury. Dr. Lesnak opined that Claimant's subjective complaints were completely unreliable. Therefore, he opined that any recommended treatment or further testing must be based on objective findings and opined that currently Claimant had no objective findings that correlated with her ongoing symptomatology or that were related to the occupational injury. Dr. Lesnak opined that Claimant was clearly at maximum medical improvement (MMI) and that she qualified for no permanent functional impairment related to her injury. *See* Exhibits B, 9.

22. Dr. Lesnak testified by deposition consistent with his IME report. Dr. Lesnak opined that Claimant had progressive, bizarre symptoms that could not be explained even after numerous diagnostic tests. Dr. Lesnak opined that even someone with a severe neurological disorder would not present in the way Claimant presented. He opined that the bump of Claimant's head at work, as she described, was a fairly trivial event while changing positions and standing up a few inches striking an object that didn't move. He opined that the bump of the head was not enough to cause intracranial trauma. He further opined that Claimant's facial swelling on the left, and excessive tearing of her left eye does not make sense as caused by the work injury because there was no soft-tissue injury to the face, vascular compromise, lymphatic compromise, ocular problem, or brain-stem problem caused by the bump to her head.

23. Dr. Lesnak's opinions are found credible and persuasive. His opinions are consistent with other evaluating physicians and are supported by the lack of objective findings that would be consistent with the mechanism of injury Claimant described.

24. On April 22, 2013 Claimant underwent an IME with Stephen A. Moe, M.D. Dr. Moe opined that somatization and excessive illness behavior contributed significantly to the physical symptoms that Claimant attributes to the work injury. Dr. Moe further opined that Claimant's somatization and excessive illness behavior were not caused by the work injury. *See* Exhibits C, 10.

25. Dr. Moe testified by deposition consistent with his IME report. Dr. Moe opined that Claimant's escalation of symptoms was inconsistent with post-concussive syndrome, where symptoms will typically present within hours to days. Dr. Moe further opined that the symptoms of trigeminal autonomic cephalgia (TAC) did not present until approximately five weeks after the work injury, that it was unclear if TAC was work related, and that Dr. Lichtenberg had jumped to a conclusion that TAC was work related and had caused Claimant to have a litany of conditions that were thus also related to the work injury. Dr. Moe further opined that even if TAC were work related, TAC could

only explain some of Claimant's symptoms and not the majority of the progressive bizarre symptoms that she displayed, and that Dr. Lichtenberg was incorrect in attributing all of her bizarre and progressive symptoms to the work injury or to TAC.

26. Dr. Moe's opinions are also found credible and persuasive, are supported by the medical records, and are consistent with several other treating providers.

27. On May 29, 2013 Claimant was evaluated by neurologist Jon Scott, M.D. Claimant reported to Dr. Scott symptoms including memory decline, confusion, reading problems, headaches, depression, insomnia, fatigue, weakness, double vision, blurred vision, speech difficulty, balance problems, shaking and tremors, gait problems, dizziness, numbness, tingling, neck pain, arm pain, back pain, leg pain, bladder incontinence, constipation, and leg swelling. Dr. Scott opined that Claimants level of injury would not cause her subjective and diffuse neurological symptoms. Dr. Scott recommended against further neurologic workup and opined that Claimant's symptoms were not related to the work incident. *See* Exhibits A, J.

28. On June 24, 2013 Claimant underwent an IME with Alan Lichtenberg, M.D. Dr. Lichtenberg made the following work related injury diagnoses: abnormal diagnostics of EMG/NCV of the upper extremities showing evidence of mild bilateral cervical paraspinal muscles compatible with early root irritation; abnormal lumbar spine x-rays showing moderate degenerative spondylosis with disc space narrowing at multiple levels, most severe at L4-5 and L5-S1; post concussion syndrome; post traumatic chronic daily mixed muscle tension and migraine headaches; medication overuse headaches; trigeminal autonomic cephalgia; conversion disorder; astasia-abasia; permanent aggravation of pre-existing lumbar spine degenerative disease; TMJ symptoms due to headache and trigeminal autonomic cephalgia. Dr. Lichtenberg opined that Claimant was not at MMI for the work injury. *See* Exhibit 8.

29. On August 26, 2013 Claimant underwent a Neurologic IME with Marc Treihaft, M.D. Dr. Treihaft gave an impression of concussion with post-concussive syndrome and short-acting unilateral neuralgiform headache with conjunctival injection and tearing. Dr. Treihaft also opined that Claimant had a non-physiologic examination. Dr. Treihaft recommended carotid ultrasound testing to rule out dissection, which Claimant underwent and was negative. Dr. Triehaft noted that Claimant's headaches were improving and did not recommend any further headache treatment, but noted a referral to a headache clinic could be completed if the headaches did not continue to improve. Dr. Triehaft did not perform a causation analysis. *See* Exhibits D, 23.

30. On March 19, 2014 Claimant was evaluated by neurologist Richard Steig, M.D. Dr. Steig opined that Claimant had vascular headaches with some evidence of autonomic dysfunction in the left facial area and conversion or factitious disorder. Dr. Steig opined that there were no physical injuries that resulted from Claimant's work injury in October of 2012. He noted Claimant had undergone very thorough evaluations by multiple specialists with the only objective findings being unrelated imaging and unrelated left Horner's syndrome. He opined the left Horner's syndrome went along

with the diagnosis of vascular headaches and autonomic dysfunction in the left facial area, which was not work related. He recommended Claimant follow up with Dr. Treihaft for treatment of the non-work related vascular headaches and autonomic dysfunction. He opined that Claimant had no physical impairment and was at MMI for the October 2012 injury. *See* Exhibits I, 27.

31. Dr. Steig opined that the constellation of Claimant's symptoms, reviewed with the nature of injury and significant absence of objective findings lended credence to the psychiatric diagnosis of factitious disorder and/or conversion disorder. Dr. Steig opined that further physical testing and treatment would only solidify Claimant's problems. *See* Exhibits I, 27.

32. On June 17, 2014, Dr. Reiter opined that Claimant was at MMI with zero percent impairment. *See* Exhibits F, 13.

33. On June 18, 2014 Claimant underwent an additional neurological evaluation with Alexander Zimmer, M.D. Dr. Zimmer gave an impression of closed head injury in October 2012 that resulted in concussion and post concussion headache syndrome. Dr. Zimmer opined that the intermittent left facial pain with tearing in the left eye was consistent with TAC and opined that this type of facial pain is usually idiopathic. Dr. Zimmer opined that several of Claimant's symptoms including tremulousness, gait abnormalities, and dramatic loss of position sense noted on examination may be on a psychosomatic basis. *See* Exhibits G, 26.

34. On July 14, 2014 Claimant underwent an additional neurological evaluation with Patrick Bushard, M.D. Dr. Bushard opined that Claimant's motor findings and weakness appeared to be if not completely, at least partially psychosomatic in nature given the physical exam findings. He opined that her headaches appeared to be posttraumatic headache with superimposed TAC versus cluster headache. *See* Exhibit 28.

35. On September 19, 2014 Alan Lichtenberg, M.D. performed a medical record review of this case. Dr. Lichtenberg made the following work related injury diagnoses: abnormal diagnostics of EMG/NCV of the upper extremities showing evidence of mild bilateral cervical paraspinal muscles compatible with early root irritation; abnormal lumbar spine x-rays showing moderate degenerative spondylosis with disc space narrowing at multiple levels, most severe at L4-5 and L5-S1; post concussion syndrome; post traumatic chronic daily mixed muscle tension and migraine headaches; medication overuse headaches; trigeminal autonomic cephalgia; conversion disorder; astasia-abasia; permanent aggravation of pre-existing lumbar spine degenerative disease; TMJ symptoms due to headache and trigeminal autonomic cephalgia. Dr. Lichtenberg opined that the October 6, 2012 injury was the proximate cause of all the above diagnoses. *See* Exhibit 8.

36. Dr. Lichtenberg disagreed with the opinions of Dr. Steig and believed Dr. Steig missed the diagnosis of permanent aggravation of pre-existing cervical and

lumbar spondylosis, and was incorrect on a zero permanent impairment rating. Dr. Lichtenberg also disagreed with the opinions of Dr. Reiter and believed Dr. Reiter was incorrect on a zero permanent impairment rating. *See* Exhibit 8.

37. Dr. Lichtenberg opined that Claimant was not at MMI and that Claimant should have further treatment including acupuncture, injection in the lower occipital trigger point at least twice, other injections for spinal pain, a repeat cervical MRI, mental and behavioral counseling by a Spanish speaking female, and referral to a headache clinic. *See* Exhibit 8.

38. Dr. Lichtenberg opined that any provider who states that Claimant should receive no permanent impairment rating is absolutely incorrect. Dr. Lichtenberg opined that Claimant qualified for post-concussion headaches, mental and behavioral disorders, and permanent aggravation of pre-existing cervical lumbar spine disease. *See* Exhibit 8.

39. Dr. Lichtenberg's opinions are a difference of opinion from Dr. Dillon, Dr. Lesnak, Dr. Reiter, Dr. Moe, Dr. Scott, and Dr. Steig. Dr. Lichtenberg's opinions are not found as credible or persuasive as several opinions by other treating physicians who opine that Claimant's injury was more trivial in nature and would not cause the extent of her complaints or symptoms.

40. On November 20, 2014 Jade Dillon, M.D. performed a Division Independent Medical Examination (DIME). Dr. Dillon opined that Claimant reached MMI on June 17, 2014 and that Claimant had a 0% permanent impairment rating as a result of the October 6, 2012 work injury. *See* Exhibits A, 6.

41. At the DIME evaluation, Dr. Dillon reviewed multiple medical records and diagnostic tests including those from several neurologists. Dr. Dillon noted Claimant's continued multiple complaints including constant daily headaches, pain behind her left eyes, redness and watering of the eye, and diffuse all over body pain. *See* Exhibits A, 6.

42. Dr. Dillon agreed with Dr. Reiter as to the date of MMI. Dr. Dillon also agreed with Dr. Steig's opinion that Claimant had vascular headaches with some evidence of autonomic dysfunction in the left facial area. Dr. Dillon agreed with Dr. Steig that the vascular headaches and autonomic dysfunction were not work related. Dr. Dillon opined, similar to Dr. Lesnak and Dr. Scott, that it was not reasonable given the nature and degree of the head injury suffered at work, that Claimant would have such severe unremitting symptoms, unimproved after two years. She also agreed that there was an element of conversion or factitious disorder affecting all symptoms. Dr. Dillon opined that Claimant's headaches and autonomic dysfunction in the left facial area was not a ratable condition and was not work related. *See* Exhibits A, 6.

43. Dr. Dillon opined that Claimant's neck, low back, and lower extremity symptoms showed only subjective complaints with no correlation on diagnostic imaging.

Dr. Dillon opined that complaints in these areas represented at least a gross symptom magnification if not a frank factitious disorder. Dr. Dillon opined that there was no ratable condition for any of these pain complaints. *See* Exhibits A, 6.

44. Dr. Dillon opined that Claimant's shoulder complaints were not related to the work injury in October of 2012. She opined that there was no injury to the shoulders at the time of the occupational injury and that the symptoms appear to be part of the total body pain syndrome. Dr. Dillon opined there was no ratable condition for the shoulders. *See* Exhibits A, 6.

45. Dr. Dillon opined that Claimant's TMJ complaints were not related to the work injury in October of 2012. She opined that the onset of symptoms of TMJ were subsequent to the injury and further opined that there was no TMJ abnormality as Claimant's intra-incisor opening was 35 mm on examination which is considered normal per clinical guidelines. Dr. Dillon opined there was no ratable condition for TMJ. *See* Exhibits A, 6.

46. Dr. Dillon opined that Claimant's visual complaints were not related to the work injury in October of 2012, and additionally, that there was no identifiable abnormality of the eyes shown by testing, and that there was no ratable condition for vision abnormality. *See* Exhibits A, 6.

47. Dr. Dillon's opinions are found credible and persuasive. Dr. Dillon issued her opinions after a total review of the medical records and her opinions are supported by the opinions of Dr. Lesnak, Dr. Moe, Dr. Steig, Dr. Scott and Dr. Reiter. It is not clear that Dr. Dillon erred in her opinions, especially given the support by multiple other treating physicians.

48. On December 31, 2014 Respondents filed a Final Admission of Liability (FAL) consistent with DIME physician Dr. Dillon's report. The FAL admitted for a 0% permanent impairment rating, and provided that Claimant had reached MMI on June 17, 2014. *See* Exhibit 5.

49. On January 15, 2015 Edwin Healey, M.D. performed an examination of Claimant, and provided a provisional impairment rating along with a review of Claimant's case. Dr. Healy noted Claimant reported 10/10 pain to him at examination and he noted Claimant's subjective report of severe debilitating pain. Dr. Healey opined that Claimant was not at MMI and that she needed evaluation and treatment recommended by Dr. Ghazi and Dr. Lichtenberg. Dr. Healey opined that Claimant had post-traumatic headaches caused by her head and neck trauma that she sustained at work on October 6, 2012. He provided a provisional impairment rating of 45% whole person for episodic neurological disorder of such severity as to interfere moderately with the activities of daily living. *See* Exhibit 7.

50. Dr. Healey opined that Claimant's current work related diagnoses were: status post concussion with brief loss of consciousness and post concussive syndrome

manifested by complaints of mild cognitive dysfunction, vertigo, imbalance, and chronic headaches; intermittent left-sided Horner's syndrome with ptosis, increased sweating on the left side of the fact, and conjunctival redness and eye tearing; left occipital nerve neuralgia/neuritis as a cause of post traumatic headaches and trigeminal vascular autonomic cephalgia, rule left C2-C3 facet arthropathy as a cause of her headaches and occipital neuritis; chronic cerviocobrachial myofascial pain with associated autonomic dysfunction; adjustment disorder with depression and anxiety; chronic daily headaches with muscle tension and vascular components; and chronic throacoloumbar pain and coccydynia. *See* Exhibit 7.

51. Dr. Healey noted that Claimant appeared to have a significant psychological overlay, presenting with non-phsysiologic neurological findings including astasia/abasia. He recommended further treatment that included, amongst other things, left C2-C3 facet blocks, and evaluation and treatment with a female Spanish speaking psychologist. *See* Exhibit 7.

52. Dr. Healey offered an opinion that differed from Dr. Dillon. However, Dr. Healey did not address Dr. Dillon's DIME report and Dr. Healey did not opine as to how Dr. Dillon erred in her permanent impairment or MMI assessment.

53. Although many physicians have noted symptoms in Claimant's left eye and cheek area that are consistent TAC, Claimant has presented insufficient evidence to show by clear and convincing evidence that TAC is causally related to her work incident.

54. Claimant is not found credible or persuasive. Claimant initially reported symptoms following her work injury that dramatically increased after approximately one month of treatment without an objective explanation for the increase. This presentation is inconsistent with post concussive syndrome as noted by Dr. Moe and Dr. Hawkins. Further, multiple physicians have opined that Claimant has non-physiological exams and/or psychosomatic findings including: Dr. Lesnak, Dr. Moe, Dr. Hawkins, Dr. Triehaft, Dr. Bushard, Dr. Zimmer, Dr. Ghazi, Dr. Steig, and Dr. Healey. Claimant has exaggerated symptoms on many occasions. Her subjective reports thus cannot be relied upon to any degree of certainty.

CONCLUSIONS OF LAW

Generally

The purpose of the Workers' Compensation Act of Colorado, §§ 8-40-101, *et seq.*, C.R.S. (2013), is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. *See* § 8-40-102(1), C.R.S. (2014). The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. *See* § 8-43-201, C.R.S. (2013). A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979).

Assessing weight, credibility, and sufficiency of evidence in Workers' Compensation proceeding is exclusive domain of administrative law judge. *University Park Care Center v. Industrial Claim Appeals Office*, 43 P.3d 637 (Colo. App. 2001). Even if other evidence in the record may have supported a contrary inference, it is for the ALJ to resolve conflicts in the evidence, make credibility determinations, and draw plausible inferences from the evidence. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. See *Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); *Bodensieck v. Industrial Claim Appeals Office*, 183 P.3d 684 (Colo. App. 2008); *Kroupa v. Industrial Claim Appeals Office*, 53 P.3d 1192 (Colo. App. 2002).

The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

Overcoming the DIME physician's opinions

A DIME physician's findings of MMI, causation, and impairment are binding on the parties unless overcome by "clear and convincing evidence." § 8-42-107(8)(b)(III), C.R.S.; *Peregoy v. Indus. Claim Appeals Office*, 87 P.3d 261, 263 (Colo. App. 2004). "Clear and convincing evidence" is evidence that demonstrates it is "highly probable" that the Division IME physician's opinions are incorrect. *Qual-Med, Inc. v. Indus. Claim Appeals Office*, 961 P.2d 590, 592 (Colo. App. 1998). In other words, to overcome a Division IME physician's opinion, "there must be evidence establishing that the Division IME physician's determination is incorrect and this evidence must be unmistakable and free from serious or substantial doubt." *Adams v. Sealy, Inc*., W.C. No. 4-476-254 (I.C.A.O., Oct. 4, 2001). The mere difference of medical opinion does not constitute clear and convincing evidence to overcome the opinion of the Division IME physician. *Javalera v. Monte Vista Head Start, Inc*., W.C. Nos. 4-532-166 & 4-523-097 (I.C.A.O., July 19, 2004); *see also Shultz v. Anheuser Busch, Inc*., W.C. No. 4-380-560 (I.C.A.O., Nov. 17, 2000). Whether or not a party overcomes the Division IME is a question of fact for determination by the ALJ. § 8-43-301(8), C.R.S.; *Wackenhut Corp. v. Indus. Claim Appeals Office*, 17 P.3d 202 (Colo. App. 2000).

As a matter of diagnosis the assessment of permanent medical impairment inherently requires the DIME physician to identify and evaluate all losses that result from the injury. *Mosley v. Industrial Claim Appeals Office,* 78 P.3d 1150 (Colo. App. 2003). Consequently, a DIME physician's finding that a causal relationship does or does not exist between an injury and a particular impairment must be overcome by clear and convincing evidence. *Cordova v. Industrial Claim Appeals Office,* 55 P.3d 186

(Colo. App. 2002); *Qual-Med, Inc. v. Industrial Claim Appeals Office,* 961 P.2d 590 (Colo. App. 1998).

Here, Claimant has failed to meet her burden to show by clear and convincing evidence that DIME physician Dr. Dillon erred by finding Claimant at MMI and finding that Claimant suffered no permanent impairment causally related to the work injury. After review of voluminous medical records, diagnostic testing, and multiple physicians' opinions and treatments Dr. Dillon opined that Claimant had no impairment related to the October 2012 work injury. Although Claimant suffers from likely TAC, Dr. Dillon was able to review the reports of multiple neurologists, some who believed TAC to be work related and some who believed TAC was not work related. Dr. Dillon, after review, determined and opined that Claimant did not suffer from any condition related to her October 2012 work injury. In doing so, Dr. Dillon agreed with some of the physicians who opined similarly. Dr. Moe thought it was unclear as to whether TAC was work related. Dr. Lesnak and Dr. Scott reviewed the trivial nature of the bump to Claimant's head at work and opined that such a bump would not cause such significant symptoms as Claimant was presenting with and opined that Claimant's symptoms were not related to the work injury. Dr. Steig opined that although Claimant had headaches that were vascular in nature with evidence of left autonomic dysfunction and possible Horner's syndrome, the headaches and autonomic dysfunction were not causally related to the work injury. The opinions of Dr. Moe, Dr. Lesnak, and Dr. Scott support the DIME physician's opinion.

Claimant argues and points to various places in the medical records that show support for a diagnosis of TAC. The ALJ agrees that these records exist and that Claimant may have TAC. However, even if Claimant suffers from TAC, Claimant has failed to show a causal connection between her TAC and her work injury by clear and convincing evidence. Neither Dr. Healey nor Dr. Lichtenberg have persuasively opined as to how Dr. Dillon erred in assigning zero impairment rating. Although Dr. Healey and Dr. Lichtenberg clearly disagree with Dr. Dillon, their opinions are merely a difference of opinion as to what complaints or what conditions are causally related to the work injury. The ALJ concludes that the more persuasive opinions, as a whole, come from Dr. Reiter, Dr. Lesnak, Dr. Hawkins, Dr. Steig, and DIME physician Dr. Dillon that Claimant is at MMI for the October 2012 injury, that Claimant suffered no permanent impairment as a result of the work injury, and that the mechanism of injury would not cause such diffuse neurologic complaints. As noted by neurologist Dr. Zimmer, TAC is a condition that is usually idiopathic with unknown causes. Dr. Dillon concurred with Dr. Steig's opinion that Claimant's vascular headaches and left sided autonomic symptoms were not work related. It is clear from a review of the evidence and the many physician opinions in this case that it is difficult to identify what causes TAC, difficult to diagnose TAC, and unclear as to whether TAC or a different variety of autonomic dysfunction is Claimant's true diagnosis. The eventual diagnosis of TAC by some physicians in this case and the diagnostic testing was greatly complicated by Claimant's presentation with other exaggerated and non-explainable symptoms. Here, Claimant has shown that several physicians disagree with whether or not her mechanism of injury could cause TAC. However, she has not shown more than this difference in opinion. Claimant has

therefore not met her burden by clear and convincing evidence to show the DIME physician's opinions were clearly erroneous and the DIME physician's opinions have not been overcome.

Further, as found above, Claimant is not a credible witness. Her subjective reporting cannot be relied upon to any degree of certainty. Claimant over-reports, magnifies, and intentionally displays symptoms that have do not have any objective basis. These exaggerated or false symptoms include volitional shaking during examination, volitional cog-wheeling during examination, purporting to almost fall off a stool during examination, and numerous whole body complaints that are inconsistent with significant diagnostic testing. Claimant also reported that her ATP hit her on the head, that she cannot walk without assistance, and that a neurologist told her she had a broken hip which is not supported by the medical records. Throughout the treatment of the claim, Claimant has presented with numerous inconsistencies noted by multiple physicians. Therefore, although Claimant may indeed suffer from headaches and/or TAC, Claimant's testimony that the TAC related symptoms began shortly after the work injury also cannot be relied upon. The physicians who have opined that TAC is work related do so in part based on Claimant's subjective description of injury, description of symptoms, and Claimant's subjective report of when the onset of TAC symptoms began. Although objective support (facial swelling, left eye tearing) for TAC exists, the correlation between TAC and her work injury is based in part upon her reporting which cannot be found reliable in light of her credibility.

The opinion of DIME physician Dr. Dillon that Claimant is at MMI with no permanent impairment rating for the following conditions is also found persuasive and has not been overcome by clear and convincing evidence: Claimant's neck complaints; Claimant's low back complaints; Claimant's lower extremity complaints; Claimant's shoulder complaints; Claimant's TMJ complaints; Claimant's visual complaints; and psychological impairment. The diagnostic imaging pertaining to the above complaints has not shown any objective findings that are abnormal or that could be causally linked to Claimant's work injury. Claimant has not shown that any additional treatment is likely to improve any of the above conditions and has not shown that DIME physician Dr. Dillon erred by finding her at MMI with no permanent impairment for any of these conditions.

Temporary Total Disability

Temporary disability benefits are based on a worker's lost or impaired earning power and are designed to protect against actual loss of earnings as a result of an industrial injury. *Univ. Park Holiday Inn/Winegardner & Hammons, Inc. v. Brien*, 868 P.2d 1164 (Colo. App. 1994). To receive temporary disability benefits, a claimant must establish a causal connection between the injury and the loss of wages. § 8-43-103(1)(a), C.R.S.. Once a claimant attains MMI, she is no longer entitled to temporary indemnity. *Id.* The claimant bears the burden to prove any entitlement to temporary disability benefits. *Lymburn v. Symbios Logic*, 952 P.2d 831 (Colo. App. 1997).

As found, the claimant reached MMI on June 17, 2014 and she has failed to overcome DIME physician Dr. Dillon's opinion of MMI. As such, the claimant has failed to prove that she is entitled to temporary total disability benefits from June 17, 2014 and ongoing.

Medical Benefits

Respondents are liable to provide such medical treatment "as may reasonably be needed at the time of the injury or occupational disease and thereafter during the disability to cure and relieve the employee of the effects of the injury." Section 8-42-101(1)(a), C.R.S. Colorado courts have ruled that the need for medical treatment may extend beyond the point of MMI where the claimant presents substantial evidence that future medical treatment will be reasonably necessary to relieve the effects of the injury or prevent further deterioration of her condition. *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988); *Stollmeyer v. Industrial Claim Appeals Office,* 916 P.2d 609 (Colo. App. 1995).

Claimant requests ongoing psychological and diagnostic/therapeutic treatment as recommended by Dr. Healey and Dr. Lichtenberg. This treatment was recommended to get Claimant to MMI. However, as found above, Claimant was at MMI as of June 17, 2014 and requires no further treatment to reach MMI status. Therefore, the requested treatment aimed at getting her to MMI is not found reasonable or necessary. The more persuasive opinion is that no further treatment is necessary for Claimant to reach MMI for any work related condition. Therefore, the medical care recommended by Dr. Healey and Dr. Lichtenberg including but not limited to psychological treatment with a Spanish speaking psychologist, and further diagnostic testing and injections is not reasonable, necessary, or causally related to Claimant's work injury.

ORDER

It is therefore ordered that:

1. Claimant has failed to overcome the DIME physician's opinion that she reached MMI for her October 6, 2012 work injury on June 17, 2014 by clear and convincing evidence.

2. Claimant has failed to overcome the DIME physician's opinion that she suffers from a 0% permanent impairment rating as a result of her October 6, 2012 work injury by clear and convincing evidence.

3. As Claimant reached MMI on June 17, 2014 she is not entitled to temporary indemnity benefits from June 17, 2014 and ongoing.

4. Claimant is not entitled to the medical treatment recommended by Dr. Healey and Dr. Lichtenberg and the treatment recommended is not reasonable, necessary, or causally related to Claimant's October 6, 2012 work injury.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: June 5, 2015

ISSUE

Whether Claimant has demonstrated by a preponderance of the evidence that neuropsychological testing and cognitive therapy in Spanish are reasonable, necessary and causally related to her admitted industrial injuries.

FINDINGS OF FACT

1. Claimant worked for Employer caring for residents in an Alzheimer's facility. She suffered three independent work-related injuries during the course and scope of her employment with Employer. On September 18, 2012 Claimant slipped and fell in an area where air freshener had been sprayed. Claimant struck her head and the right side of her body in the fall. On November 18, 2012 a resident grabbed and violently shook Claimant. Finally, on December 2, 2012 a resident punched, hit and shook Claimant. All three incidents were consolidated for purposes of hearing. As a result of the accidents Claimant has reported headaches, memory loss and dizziness

2. After initially obtaining emergency medical care Claimant received treatment from Authorized Treating Physician (ATP) Franklin Shih, M.D. on January 2, 2013. Claimant reported "headaches and memory problems as her primary concern" as well as a variety of musculoskeletal complaints. Dr. Shih noted that, although Claimant reported significant problems with attention, concentration and learning, it was unlikely that ongoing cognitive deficits were related to her industrial injuries. However, he remarked that if Claimant's cognitive complaints continued he might want her to visit a neuropsychologist.

3. Claimant subsequently returned to Dr. Shih for an examination. He noted Claimant's continuing memory concerns. However, Dr. Shih stated that ongoing memory complaints would be quite atypical and he "would not expect any significant cognitive sequeale in relationship to her fall."

4. Claimant transferred her medical care to ATP W. Rafer Leach, M.D. On January 16, 2013 Claimant visited Dr. Leach for an examination. Dr. Leach diagnosed Claimant with a concussion, a posttraumatic headache, postconcussion syndrome and vertigo. He requested x-rays, physical therapy, chiropractic care, vestibular therapy, injections in the SI joint and a neurological evaluation.

5. Claimant subsequently received neurological treatment with J. Bradley Gibson, M.D. After reviewing Claimant's diagnostic studies he summarized that Claimant suffered from postconcussive syndrome manifested by cognitive dysfunction and associated personality changes. On August 13, 2014 Dr. Gibson discharged Claimant from care because "there is nothing else that I have to offer her from a

neurologic standpoint at this time." Claimant continued to complain of headaches, post concussive symptoms, dizziness and chronic myofascial pain syndrome.

6. On August 5, 2014 Claimant underwent an independent medical examination with Lawrence Lesnak, M.D. Dr. Lesnak concluded that there were no objective findings to support Claimant subjective symptoms. He also determined that a CT scan and brain MRI/MRAs did not correlate with her subjective complaints. Moreover, it was medically inconsistent for Claimant's symptoms from a cerebral concussion or mild closed head injury to have worsened five or six weeks after her injury. Finally, Claimant failed to exhibit signs of improvement over a two year course of treatment. Dr. Lesnak thus concluded that Claimant had reached Maximum Medical Improvement (MMI) without any objective injury. He recommended pain psychology counseling as part of a medical maintenance regimen.

7. On August 11, 2014 and September 8, 2014 clinical psychologist Dennis A. Helffenstein, Ph.D. interviewed Claimant. Claimant had been referred for neuropsychological screening. However, Dr. Helffenstein did not undertake the testing because Claimant suffered a high level of chronic pain, significant fatigue and depression. He noted that the preceding factors would negatively impact Claimant's performance on the neuropsychological screening. Dr. Helffenstein explained:

> [a]t some point in the future, when and if [Claimant's] pain, depression and fatigue are under better control, I would advise against neuropsychological testing utilizing the English language. If at some point formal testing is required to document her cognitive status, it would be possible to administer the testing utilizing a translator. An alternate possibility would be to find a Spanish-speaking neuropsychologist who can administer the testing in her native language.

Dr. Helffenstein also noted that he agreed with Dr. Leach that Claimant warranted cognitive rehabilitation services.

8. On October 16, 2014 Claimant underwent a psychological evaluation with Lupe Ledezma, Ph.D. Dr. Ledezma concluded that Claimant's psychological diagnoses of Major Depression and Generalized Anxiety were related to her industrial injuries. She recommended "neuropsychological testing in Spanish to determine the presence of a neurocognitive disorder and provide treatment recommendations." Dr. Ledezma also remarked that "[i]t is possible that cognitive retraining may be beneficial in improving her ability to learn how to compensate for her cognitive issues."

9. On November 10, 2014 Claimant returned to Dr. Ledezma for an evaluation. Dr. Ledezma reiterated her request for a neuropsychological battery in Spanish and a course of cognitive retraining to address Claimant's complaints.

10. On December 8, 2014 Dr. Lesnak conducted a review of Dr. Ledezma's records. He commented that Claimant's underlying psychosocial factors were influencing her recovery and Claimant did not suffer any physiologic or anatomic

conditions from the industrial injuries. Moreover, Dr. Lesnak explained that cognitive retraining was not warranted because Claimant did not have any symptoms related to a closed head injury and there were no intracranial abnormalities noted in multiple imaging studies.

11. On December 12, 2014 Dr. Ledezma responded to a letter from Respondents' counsel. Dr. Ledezma maintained that neuropsychological testing and cognitive therapy would be reasonable, necessary and related to Claimant's industrial injuries. She explained that Claimant's psychological state had improved but she continued to complain of neurocognitive symptoms.

12. Claimant testified at the hearing in this matter. She remarked that she continues to experience memory problems, balance concerns, dizziness, confusion, headaches and motor control issues on the right side of her body.

13. On April 27, 2015 Dr. Lesnak testified through a post-hearing evidentiary deposition in this matter. He maintained that Claimant's subjective reports are not supported by the medical records. Dr. Lesnak explained that Claimant initially improved following her September 19, 2012 industrial injury but her symptoms began to worsen after October 24, 2012 without explanation. He remarked that the preceding chronology was inconsistent with the typical head injury because symptoms are generally worse at the outset but improve over time. Dr. Lesnak commented that Dr. Shih shared his concerns regarding inconsistent subjective complaints based on the mechanism of injury. He determined that neuropsychological testing would not provide additional information because Claimant simply suffered a mild closed head injury and there are a number of psychosocial factors impacting her condition. Dr. Lesnak stated that cognitive therapy was not warranted because Claimant did not suffer a severe head injury and she has no documented objective findings of a cognitive deficiency. He summarized that neuropsychological testing and cognitive therapy did not constitute reasonable, necessary and related treatment because Claimant did not exhibit evidence of a cognitive deficit or underlying brain disturbance.

14. Dr. Lesnak clarified that neither the November 18, 2012 nor the December 2, 2012 events was responsible for Claimant's worsening condition. Dr. Lesnak noted that Claimant reported worsening symptoms before either event and shaking an adult would not cause a brain injury. He also commented that Claimant had not mentioned either event during his evaluation and the medical records did not reflect that the events caused any aggravation or worsening of symptoms.

15. Claimant has demonstrated that it is more probably true than not that neuropsychological testing and cognitive therapy in Spanish are reasonable, necessary and causally related to her admitted industrial injuries. Subsequent to her industrial injuries Claimant reported headaches, memory concerns and other cognitive deficits. Claimant consistently maintained her complaints during the course of medical treatment. In January 2013 Dr. Leach diagnosed Claimant with a concussion, a posttraumatic headache, postconcussion syndrome and vertigo. He requested x-rays, physical therapy, chiropractic care, vestibular therapy, injections in the SI joint and a

neurological evaluation. By summer 2014 psychologist Dr. Helffenstein could not undertake neuropsychological testing of Claimant because of her high level of chronic pain, significant fatigue and depression. However, he recommended neuropsychological testing in Spanish when her symptoms improved. Dr. Helffenstein also noted that he agreed with Dr. Leach that Claimant warranted cognitive rehabilitation services. Finally, by December 12, 2014 Dr. Ledezma persuasively maintained that neuropsychological testing and cognitive therapy in Spanish would be reasonable, necessary and related to Claimant's industrial injuries. She explained that Claimant's psychological state had improved but she continued to complain of neurocognitive symptoms.

16. In contrast, Dr. Lesnak determined that neuropsychological testing would not provide additional information because Claimant simply suffered a mild closed head injury and there are a number of psychosocial factors impacting her condition. Dr. Lesnak stated that cognitive therapy was not warranted because Claimant did not suffer a severe head injury and she has no documented objective findings of a cognitive deficiency. He summarized that neuropsychological testing and cognitive therapy did not constitute reasonable, necessary and related treatment because Claimant did not exhibit evidence of a cognitive deficit or underlying brain disturbance. However, the overwhelming evidence from psychologists and other authorized medical providers reveals that neuropsychological testing and cognitive therapy in Spanish would be reasonable, necessary and related to Claimant's industrial injuries. Claimant's psychological state has improved but she continues to complain of neurocognitive symptoms. Accordingly, Claimant's need for neuropsychological testing and cognitive therapy in Spanish is reasonable, necessary and causally related to her admitted industrial injuries.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" (Act) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. §8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. §8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979); *People v. M.A.*, 104 P.3d 273, 275 (Colo. App. 2004). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. §8-43-201, C.R.S. A Workers' Compensation case is decided on its merits. §8-43-201, C.R.S.

2. The Judge's factual findings concern only evidence that is dispositive of the issues involved; the Judge has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *See Magnetic Engineering, Inc. v. ICAO,* 5 P.3d 385, 389 (Colo. App. 2000).

3. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2007).

4. Respondents are liable for authorized medical treatment that is reasonable and necessary to cure or relieve the effects of an industrial injury. §8-42-101(1)(a), C.R.S.; *Colorado Comp. Ins. Auth. v. Nofio*, 886 P.2d 714, 716 (Colo. 1994). A preexisting condition or susceptibility to injury does not disqualify a claim if the employment aggravates, accelerates, or combines with the preexisting condition to produce a need for medical treatment. *Duncan v. Industrial Claim Appeals Office,* 107 P.3d 999, 1001 (Colo. App. 2004). The determination of whether a particular treatment modality is reasonable and necessary to treat an industrial injury is a factual determination for the ALJ. *In re of Parker*, W.C. No. 4-517-537 (ICAP, May 31, 2006); *In re Frazier,* W.C. No. 3-920-202 (ICAP, Nov. 13, 2000).

5. As found, Claimant has demonstrated that it is more probably true than not that neuropsychological testing and cognitive therapy in Spanish are reasonable, necessary and causally related to her admitted industrial injuries. Subsequent to her industrial injuries Claimant reported headaches, memory concerns and other cognitive deficits. Claimant consistently maintained her complaints during the course of medical treatment. In January 2013 Dr. Leach diagnosed Claimant with a concussion, a posttraumatic headache, postconcussion syndrome and vertigo. He requested x-rays, physical therapy, chiropractic care, vestibular therapy, injections in the SI joint and a neurological evaluation. By summer 2014 psychologist Dr. Helffenstein could not undertake neuropsychological testing of Claimant because of her high level of chronic pain, significant fatigue and depression. However, he recommended neuropsychological testing in Spanish when her symptoms improved. Dr. Helffenstein also noted that he agreed with Dr. Leach that Claimant warranted cognitive rehabilitation services. Finally, by December 12, 2014 Dr. Ledezma persuasively maintained that neuropsychological testing and cognitive therapy in Spanish would be reasonable, necessary and related to Claimant's industrial injuries. She explained that Claimant's psychological state had improved but she continued to complain of neurocognitive symptoms.

6. As found, in contrast, Dr. Lesnak determined that neuropsychological testing would not provide additional information because Claimant simply suffered a mild closed head injury and there are a number of psychosocial factors impacting her condition. Dr. Lesnak stated that cognitive therapy was not warranted because Claimant did not suffer a severe head injury and she has no documented objective findings of a cognitive deficiency. He summarized that neuropsychological testing and cognitive therapy did not constitute reasonable, necessary and related treatment because Claimant did not exhibit evidence of a cognitive deficit or underlying brain disturbance. However, the overwhelming evidence from psychologists and other authorized medical providers reveals that neuropsychological testing and cognitive

therapy in Spanish would be reasonable, necessary and related to Claimant's industrial injuries. Claimant's psychological state has improved but she continues to complain of neurocognitive symptoms. Accordingly, Claimant's need for neuropsychological testing and cognitive therapy in Spanish is reasonable, necessary and causally related to her admitted industrial injuries.

ORDER

Based upon the preceding findings of fact and conclusions of law, the Judge enters the following order:

Claimant's need for neuropsychological testing and cognitive therapy in Spanish is reasonable, necessary and causally related to her admitted industrial injuries.

If you are a party dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. *For statutory reference, see section 8-43-301(2), C.R.S. (as amended, SB09-070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a form for a petition to review at http://www.colorado.gov/dpa/oac/forms-WC.htm.*

WORKERS' COMPENSATION NO. WC 4-916-050-02

ISSUE

- Whether Claimant has demonstrated by a preponderance of the evidence that his low back and lower extremity condition is related to the subject accident of February 22, 2013.

FINDINGS OF FACT

Based upon the evidence presented at hearing, the Judge enters the following findings of fact:

1. Claimant was born on November 24, 1959. He was hired by Employer as a detailer on January 23, 2012.

2. Claimant sustained an admitted left upper extremity injury on February 22, 2013 when he slipped in the company parking lot striking his left elbow and landing on his back. Claimant recalled that he was in the parking lot and the next thing he knew he was looking up at the sky. The first thing Claimant remembered was left arm pain.

3. Shortly after the fall, Employer drove Claimant to the Boulder Medical Center, where he was seen by Dr. Michael Kosta. Dr. Kosta reported that Claimant slipped on ice, fell backwards and landed on his left elbow. Claimant reported pain and swelling in his left elbow but no other areas of pain, including the shoulder, wrist, legs or buttocks. Dr. Kosta assessed Claimant with an elbow contusion, prescribed Norco, and returned him to work. Records of the visit do not indicate that Dr. Kosta evaluated Claimant's back. Dr. Kosta noted that if Claimant's symptoms persisted, he might need to see an orthopedist for a tendon rupture. Claimant was instructed to seek immediate medical attention if his condition worsened in any way after his initial evaluation. Claimant did not seek additional medical care before his next evaluation with Dr. Kosta on February 25, 2013.

4. Claimant's wife, Alicia Higareda, testified that on the night of February 22, 2013 she observed bruising on Claimant's back, mostly on the left side, with a completely swollen and deformed left arm. Ms. Higareda's testimony is not supported by contemporaneous medical documentation.

5. Claimant testified that on February 23, 2013, he woke with pain in his left arm, left shoulder, neck, and back. Claimant testified that he could not get out of bed and had to call out to his wife for help. Claimant testified that he hurt everywhere, including his back, but his left arm bothered him the most.

6. On February 25, 2013 Claimant returned to Dr. Kosta. Dr. Kosta noted that the swelling in Claimant's hand had improved and that Claimant's posterior elbow and proximal forearm were bruised but improved. Claimant reported that he hurt all over. Dr. Kosta did not report any bruising on Claimant's back.

7. On February 26, 2013, Claimant was referred to Dr. Robert Koch, specifically for his left elbow injury. Dr. Koch did not evaluate Claimant's back. Dr. Koch recommended a course of conservative care related to Claimant's left elbow.

8. Dr. Kosta referred Claimant to Pinnacle Physical Therapy for treatment, which began on February 27, 2013. Claimant participated in twelve physical therapy sessions between February 27, 2013 and April 11, 2013. The Pinnacle records contain no report of an injury, symptomology or treatment plan for a low back or lower extremity condition. Kristy Bennett, the therapist, reported Claimant had a sore and painful left shoulder, neck and wrist after falling on ice at work. She reported, "he fell backward and must have broken his fall primarily with the left elbow." She reported that Claimant's neck was stiff due to immobilizing the left arm and left elbow but that Claimant's "Pain levels are Ø if he keeps the hand in the pocket while he is doing light duties at work." Claimant was noted to have a history of right hip bursitis with an exaggerated frontal plane gait. Claimant testified that the focus of his treatment in physical therapy was to rehabilitate his ruptured triceps tendon. Physical therapy did not include treatment of Claimant's back.

9. Claimant spoke to Kendra Welton, Insurer's adjuster, on March 1, 2013. He told her that he fell on his left elbow and that he also had some general soreness through his neck and back which had improved.

10. Claimant's wife testified that on March 11, 2013, she helped Claimant fill out a "Workers Compensation Accident Information Request." Specifically, paragraph 6, asked Claimant to describe the exact area(s) of his body that were injured. Claimant listed left arm, shoulder and elbow, swelling and pain, the whole arm has bruising (dark), shoulder, back . . . . Apparently Claimant's answer was continued onto the back of the form, which was not copied or entered into evidence, thus rendering the word "back" ambiguous, because it is not clear from context whether back was used as a noun or an adjective.

11. Claimant returned to work on February 25, 2013 and worked without interruption until April 11, 2013. During that time, his job duties were limited due to his arm.

12. Claimant's supervisor, Roger Antillon, testified initially that prior to Claimant's injury, Claimant discussed knee, hip, and back problems – old sports injuries – that kept Claimant from working as a mechanic. He also testified that Claimant had a slight limp before the accident; similar to the limp Mr. Antillon observed when he saw Claimant at the first day of hearing. But on further questioning, Mr. Antillon testified that Claimant never complained about his back prior to the accident, only his hip. He further testified that between February 25 and April 11, Claimant did not complain about his back, nor did Mr. Antillon observe anything new or different about Claimant's back. However, on cross examination, Mr. Antillon was asked: "And you testified that he – prior to the incident of February 22, 2013, he complained about back problems?" Mr. Antillon answered equivocally: "We talked about back – about – just injuries in general."

13. Dr. Koch, an orthopedist, performed a left elbow triceps tendon repair on May 1, 2013. He followed Claimant from April 12, 2013 through May 5, 2013. Dr. Koch did not report any low back or lower extremity complaints or symptomology during this

period of time. In his report of April 12, 2013, Dr. Koch reported that Claimant fell directly on his elbow.

14. Claimant's attorneys referred him to Dr. Sander Orent, who became Claimant's authorized treating physician on June 12, 2013. In his initial evaluation report, Dr. Orent reported that Claimant injured other structures of his body that had not been addressed. He reported, "He injured his left shoulder in the course and scope of the fall and he injured his thoracic and cervical spines. He also complains of a sensation of pain running from the greater trochanter of the femur down to the mid-portion of the thigh in both legs." He diagnosed "cervical and thoracic strains unaddressed" and "possible nerve impingement, from surgical positioning, possibly causing symptoms in the lateral femoral cutaneous nerve." The ALJ notes that this report does not refer to problems in Claimant's lumbar spine.

15. Dr. Koch's triceps tendon repair failed and on August 19, 2013, Dr. Conyers performed a repeat triceps tendon reattachment procedure.

16. Dr. Orent saw Claimant in follow-up on September 24, 2013. He reported:

- ever since [Claimant's] first surgery, he has had radiating pain basically from the lateral thigh down to the knee on both sides.
- When I compress the area right around the greater trochanteric bursa, I can produce the pain and numbness that he experiences down the lateral aspect of the leg.
- This sounds very much to be a lateral femoral cutaneous nerve syndrome, again, possibly because of the compression during the initial surgery.
- The patient is quite clear that these symptoms started at the time of the first surgery.

17. On November 9, 2013 Claimant had a lumbar MRI. The radiologist, Dr. Tivorsak's, impression was moderate to severe degenerative disease at L5-S1, with a broad annular bulge and moderate to severe degenerative disc disease in the remainder of the lumbar spine without central canal narrowing or significant nerve root compression.

18. Claimant endorsed Dr. Sander Orent as an expert in occupational medicine and he provided medical opinions regarding Claimant's injuries and requests for treatment of the lumbar spine. Dr. Orent testified based on his knowledge of the medical treatment guidelines and personal knowledge of Claimant and his injuries.

19. Dr. Orent testified that during his initial examination, Claimant arrived in extremis with a very badly damaged left arm. While immediate attention was directed at Claimant's left arm, Claimant "complained about his shoulder hurting; he complained of his back injury, his neck, and his thoracic spine; and then he described this numbness that he had in the front part of both legs starting at about the groin and going distally to that."

20. Dr. Orent testified that it is common for the most severe injury to not only take the patient's primary attention, but the provider's primary attention. By far the greatest concern in this case initially was Claimant's elbow.

21. On November 12, 2013, Dr. Orent reported that the lumbar MRI did not define anything that would clearly explain Claimant's symptomology.

22. Dr. Orent noted difficulty differentiating between radiculopathic and localized pain. He reported Claimant's lumbar MRI showed extensive degenerative changes. Dr. Orent recommended an epidural steroid injection for diagnostic purposes and noted Claimant's positive straight leg raise. On November 19, 2013, Dr. Orent reported that Dr. Wernick performed an injection, which was non-diagnostic for lateral femoral cutaneous nerve compression.

23. On December 4, 2013, in a "SAMMS CONFERENCE NOTE", Dr. Orent reported that causality of the low back was a gray area and that the severity of Claimant's left upper extremity condition may have eclipsed some of Claimant's back symptoms. He reported that when he initially saw Claimant, he thought Claimant had a thoracolumbar strain and that it may be that Claimant had a small herniated disc at L1-2, which could easily be part of the thoracic strain. He recommended an ESI at L1-2.

24. Dr. Orent testified that Claimant's degenerative disc disease was age-appropriate degeneration. Dr. Orent testified that if degenerative disc disease such as Claimant's is asymptomatic until an event like the fall, that the degeneration made him more susceptible to injury.

25. On March 18, 2014, Dr. Orent, contrary to his November 12, 2013 progress note, reported, based on the November 9, 2013 MRI, that he thought the source of Claimant's back symptomology was at L5-S1 where there was a broad annular bulge. He reported, "it only began hurting at the time of the incident and has gotten progressively worse."

26. On April 17, 2014, Dr. Carlos Cebrian performed a Respondents' independent medical examination on Claimant. Dr. Cebrian completed a records review noting in his May 27, 2014 report that, "outside of the unsurprising complaint of his 'body hurt all over' on 2/25/13, there were no complaints related to the lumbar spine or paresthesias in his legs documented until he saw Dr. Orent on 6/12/13. . . Despite multiple injections, medications and evaluations, it is still not clear from the medical records that [Claimant's] medical providers know what the cause of [Claimant's] leg symptoms is." Dr. Cebrian opined that Claimant's current symptoms were "related to lumbar degenerative disc disease and bilateral femoral cutaneous neuropathy and that the need for treatments are independent, unrelated and incidental to the incident of February 22, 2013 or the result of anything that may or may not have happened during Claimant's May 1, 2013 surgery."

27. Dr. Cebrian recommended weight loss and that Claimant undergo an EMG/NCS of his lower extremities outside of the workers' compensation system. Dr. Cebrian opined that lumbar spine surgery was not indicated at that time. He based his causation opinion on (1) Claimant not having lumbar spine complaints until over three months after the incident and (2) his opinion that Claimant's initial complaints were

related to parasthesias in his legs and not specifically the lumbar spine pain. In Dr. Cebrian's opinion, if Claimant had injured his back at the time of the subject accident, "the reasonable expectation would be that the symptoms would have been present within a day or two and continued for the next several months if they were caused by the slip and fall."

28. Dr. Orent testified regarding the spontaneous degenerative injury, and opined that two independent diseases occurring during the same time frame "just doesn't meet the rules of Occam's razor." He testified that the probable cause for the back injury was the fall. Dr. Orent testified that to postulate as the Respondents do that Claimant suddenly developed bilateral nerve impingement in his groin for no reason at all unrelated to the fall would not make sense. (11/24/2015 Hearing Pg. 77)

29. On July 14, 2014, Dr. Kosta reported his clinic notes did not indicate Claimant mentioning any injury other than the left upper extremity at the time he evaluated Claimant and that his "usual and customary questioning during the taking of history always includes allowing any other injury to be expressed other than the symptoms and the main complaints." Dr. Kosta pointed out that he specifically asked Claimant about his wrists, legs and buttocks. Dr. Kosta reported that he physically examined Claimant from his clavicle to his fingers. Dr. Kosta reported that while Dr. Orent had initially diagnosed a lateral femoral cutaneous nerve syndrome, Claimant did not report low back pain until November 5, 2013. Dr. Kosta agreed with Dr. Cebrian's assessment and opinions. Dr. Kosta opined that Claimant's subsequent low back and lower extremity complaints were not related to the February 22, 2013 accident. (R.S. 54-68).

30. On September 30, 2014, Dr. Orent reported that but for Claimant's lumbar spine condition, he was at maximum medical improvement.

31. Dr. Sander Orent testified at the November 24, 2014 hearing. According to Dr. Orent, the mechanism of Claimant's low back condition was that he fell directly on his spine. Dr. Orent acknowledged that Claimant had degenerative disc disease. Dr. Orent testified "if a patient is asymptomatic at the time of the event, then irrespective of what the images show, if the symptoms then arise out of the event, then in my view it may have made him more susceptible to injury." Dr. Orent testified regarding the spontaneous degenerative injury, and opined that two independent diseases occurring during the same time frame "just doesn't meet the rules of Occam's razor." He testified that the probable cause for the back injury was the fall. Dr. Orent testified that to postulate as Respondents do that Claimant suddenly developed bilateral nerve impingement in his groin for no reason at all unrelated to the fall would not make sense.

32. Dr. Orent's opinion on causality is less persuasive because the evidence supports that Claimant fell onto his elbow, and not directly onto his back.

33. According to Dr. Orent, diagnosing the source of Claimant's low back problems was "challenging." He initially thought Claimant's symptoms were due to the way he was positioned during his triceps tendon repair on May 1, 2013. His current diagnosis is lumbar radiculopathy. Dr. Orent admitted that Claimant reported his lower extremity symptoms started, "immediately post operatively to the triceps tendon surgery." His initial diagnosis of a femoral cutaneous nerve impingement syndrome was

based on the history given to him by Claimant that Claimant's lower extremity symptoms started immediately after the surgery. Dr. Orent first diagnosed lumbar radiculopathy on November 13, 2013. The first time Claimant reported to Dr. Orent that he had lumbar pain beginning on the date of injury, was on November 13, 2013. Dr. Orent had reported on September 24, 2013 that he could produce pain and numbness down the lateral aspect of Claimant's thigh when he compressed the trochanteric bursa (femur). This is not a test a doctor would use to diagnose lumbar radiculopathy. Dr. Orent agreed that there was nothing on the November 9, 2013 lumbar MRI which would be clearly diagnostic of a lumbar radiculopathy. He agreed that there was no encroachment or nerve root impingement. Dr. Orent had Claimant undergo an ESI, which was also non diagnostic for lumbar radiculopathy. Dr. Orent acknowledged that after Claimant underwent two diagnostic tests, a lumbar MRI and a lumbar ESI, both of which were non diagnostic for lumbar radiculopathy, he nonetheless changed his opinion that Claimant did not have a lumbar radiculopathy to an opinion that Claimant did have a lumbar radiculopathy.

34. Respondents called Dr. Carlos Cebrian, at the April 13, 2015 hearing to testify that Claimant did not sustain a related back injury. Dr. Cebrian is a board certified family practitioner, a Level II Examiner with the Division of Workers' Compensation, and has practiced occupational medicine exclusively and full-time since 2000. Dr. Cebrian testified that the history Claimant provided was not consistent with Dr. Cebrian's records review. Claimant reported to Dr. Cebrian that he had back symptoms beginning shortly after the subject accident, during the weekend after the subject accident his back was black and blue, and he could not get out of bed without assistance. That Claimant told Insurer's adjuster on March 1, 2013 that his back and neck were sore but that those symptoms improved is consistent with Dr. Cebrian's opinion on causation.

35. Claimant's report of back bruising was inconsistent with Dr. Kosta's records of February 22 and 25, 2015 which bore no indication that Claimant had bruising or contusions of the back, neck or any part of the spine. Nothing in Dr. Koch's records supports the presence of a low back condition or low back complaints, or lower extremity complaints of any kind. The description of Claimant's accident, that he fell directly on his elbow, would not be consistent with a fall directly on the spine. Dr. Kosta's report indicated that Claimant hit his elbow first, which would take the brunt of the impact. After hitting his elbow, gravity would carry Claimant down and he would hit his back, but his back would not be the primary point of impact. It is reasonable to expect that when a person falls, he or she will have aching and pains in different areas of the body which would be consistent with what Claimant reported to Dr. Kosta on February 25, 2013.

36. Kristy Bennett's physical therapy reports do not document low back or lower extremity symptoms. Had Claimant reported low back or lower extremity symptomology to Ms. Bennett, one would expect to see that in her reports. Notably, Claimant reported a pain level of zero in his left upper extremity if he kept his hand in his pocket when he was doing light duty work five days after his fall. This is inconsistent with Claimant's argument that pain from his arm was so severe that it was masking his back pain. If, as Claimant states, the therapist was going to treat Claimant's left upper

extremity and then address the low back later on, one would expect to see that documented.

37. Dr. Cebrian agreed with Dr. Orent's ultimate diagnosis of lumbar radiculopathy at L5-S1.

38. Dr. Orent was able to replicate Claimant's symptoms by tapping on his trochanteric bursa, which is diagnostic of a lateral femoral cutaneous nerve issue but non diagnostic for lumbar radiculopathy. Subsequently, when Dr. Orent ordered the MRI, it showed multi-level degenerative disc disease at multiple levels with some foraminal stenosis but nothing that explained Claimant's symptoms.

39. Dr. Cebrian agreed with Dr. Orent's original opinion that nothing in the November 9, 2013 lumbar MRI explained Claimant's lumbar and lower extremity symptomology. Claimant did not have a positive straight leg test which could be diagnostic for lumbar radiculopathy, until November 19, 2013. The November 9, 2013 lumbar MRI did not show nerve root impingement but did show a broad annular bulge at L5-S1, which is unrelated to Claimant's February 22 fall and is consistent with degenerative changes which would not have been aggravated by the fall, eight and one half months earlier. Claimant's November 9, 2013 lumbar MRI is typical of what one would see in a 59 year old man.

40. Dr. Cebrian agreed with Dr. Orent that L5-S1 injections performed by Dr. Wernick on January 9 and February 19, 2014 were non diagnostic for lumbar radiculopathy. The diagnostic test that Dr. Orent did to recreate the lateral femoral cutaneous nerve irritation, tapping the bursa, was not indicative of radiculopathy at L5 or S1. Dr. Cebrian opined Claimant did have some lateral femoral cutaneous nerve irritation at that time. However, it would not be medically plausible that Claimant's positioning during his elbow surgery would have caused his lateral femoral cutaneous nerve irritation.

41. Dr. Cebrian's ultimate opinion is that Claimant's lumbar spine symptoms and lower leg symptoms are not related to the February 22, 2013 injury. The bases for his opinion is:

- when you look at all the records, the first documentation related to back or leg was on June 12, 2013.
- Dr. Orent diagnosed a lateral femoral cutaneous nerve irritation, which developed immediately after the May 1, 2013 surgery, however, the mechanism of that condition would not be consistent with that surgical procedure.
- Claimant's early complaints were not consistent with or specific to a lumbar radiculopathy.
- There was a significant delay in Claimant's symptoms.

Dr. Cebrian agreed with Dr. Orent that the fall could have potentially led to an injury, but there were no complaints early on. There were no complaints with his back, upper legs or lower legs for several months and with that kind of diagnosis, the reasonable expectation would be that there would have been a complaint much earlier than what was documented by Dr. Orent.

42. Based on the totality of the evidence, the ALJ finds Dr. Cebrian's opinions on causation to be more consistent with the mechanics of Claimant's injury, the inconsistent reports of the timing of Claimant's back problems, and complaints, and delay in diagnosis of radicular radiculopathy.

43. The ALJ finds that Claimant has failed to establish by a preponderance of the evidence that his low back and lower extremity condition is related to the February 22, 2013 accident. The ALJ finds the opinions of Drs. Cebrian and Kosta more persuasive than those of Dr. Orent on issues of medical causation and relatedness.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the Judge draws the following conclusions of law:

The purpose of the "Workers' Compensation Act of Colorado" (Act) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. §8-40-102(1), C.R.S. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. §8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979); *People v. M.A.*, 104 P.3d 273, 275 (Colo. App. 2004). The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. §8-43-201, C.R.S. A Workers' Compensation case is decided on its merits. §8-43-201, C.R.S.

The Judge's factual findings concern only evidence that is dispositive of the issues involved; the Judge has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *See Magnetic Engineering, Inc. v. ICAO,* 5 P.3d 385, 389 (Colo. App. 2000).

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2007).

For an injury to be compensable under the Act, it must "arise out of" and "occur within the course and scope" of employment. *Price v. Industrial Claim Appeals Office*, 919 P.2d 207, 210 (Colo. 1996). Proof of causation is a threshold requirement that an injured employee must establish by a preponderance of the evidence before any compensation is awarded. §8-41-301(1)(c) C.R.S.; *Faulkner v. Industrial Claim Appeals Office,*12 P.3d 844, 846 (Colo. App. 2000). The question of causation is generally one of fact for determination by the ALJ. Proof of causation is a threshold standard that the Claimant must establish by a preponderance of the evidence §8-42-101 C.R.S. *Faulkner,* at 846.

An injury or condition arises out of employment if "there is a causal connection between the duties of employment and the injuries suffered." *Deterts v.Times Pub. Co.*, 38 Colo. App. 48, 552 P.2d 1033 (1976). The Claimant must establish by a preponderance of the evidence that there is a causal connection between his accident of February 22, 2013 and his lumbar condition. *Ringsby Trucklines, Inc. v. Industrial Commission*, 491 P.2d 106 (Colo. App. 1971). Reasonable probability exists if the proposition is supported by substantial evidence, which would warrant a reasonable belief in the existence of facts supporting a particular finding. *F. R. Ore Construction v. Rinta*, 717 P.2d 965 (Colo. App. 1985).

As found, Claimant has failed to prove by a preponderance of the evidence that he sustained a compensable low back injury related to his work accident of February 22, 2013. It is undisputed at this time that Claimant's low back condition and complaints are due to a lumbar radiculopathy at L5-S1. The ALJ finds the testimony of Drs. Cebrian and Kosta, that the Claimant's L5-S1 radiculopathy is the result of underlying, unrelated degenerative disc disease that has progressed over time and which is unrelated to the Claimant's work accident, to be persuasive. Consistent with Dr. Cebrian's opinions and compelling is the fact that there is no documentation of a low back condition in the early medical records from Dr. Kosta, Dr. Koch or from Pinnacle Physical Therapy.

Dr. Orent diagnosed a lateral femoral cutaneous nerve condition on June 22, 2013, based on his diagnostic testing and Claimant's testimony that the onset of lower extremity symptoms started on May 1, 2013, when he had elbow surgery with Dr. Koch. That reported history is inconsistent with the history later reported to Dr. Orent on March 18, 2014, that Claimant's low back began hurting at the time of the accident and has gotten progressively worse. The lack of documentation of a low back condition in the early medical records, coupled with the inconsistent history regarding the onset of symptoms, persuades the undersigned ALJ that Claimant has not met his burden and compels an Order denying and dismissing his claim for benefits associated with his low back condition.

ORDER

Based upon the foregoing findings of fact and conclusions of law, the Judge enters the following order:

1. Claimant's lumbar condition is not related to his February 22, 2013 accident and, consequently, all claims for compensation and benefits related to this condition are denied and dismissed.

2. Any issues not resolved in this Order are reserved for future determination.

If you are dissatisfied with the Judge's Order, you may file a Petition to Review the Order with the Denver Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, Colorado, 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the Order, as indicated on certificate of mailing or service; otherwise, the Judge's Order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the Order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. ***For statutory reference, see section 8-43-301(2), C.R.S. (as amended, SB09-070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.***

DATED: June 22, 2015

Kimberly B. Turnbow
Administrative Law Judge
Office of Administrative Courts
1525 Sherman St., 4th Floor
Denver, CO 80203

ISSUES

The issues presented for determination are:

- Has Claimant proven by a preponderance of the evidence that the scheduled impairment rating for his upper extremity should be converted to whole person?
- Whether Respondent overcame the DIME physician's opinion regarding impairment by a preponderance of the evidence?
- What is Claimant's average weekly wage?
- What is Claimant's disfigurement and his award?

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ makes the following findings of fact:

1. On July 29, 2008, Claimant underwent a non-work-related right total shoulder arthroplasty ("TSA"). A medical record dated November 3, 2008 notes Claimant was doing well with excellent motion and continued strengthening.

2. Respondents presented no medical documentation of Claimant's shoulder condition from November 3, 2008 through April 30, 2013.

3. On April 30, 2013, Claimant, a 56 year old male, injured his right shoulder while performing his work activities for Employer.

4. That same day, he presented to Arbor Occupational Medicine where Dr. Sharon Walker evaluated him. Claimant disclosed his 2008 TSA to Dr. Walker and reported he could not describe any limitations, did not notice any difficulties with working out, and did not perceive a reduced range of motion or any pain.

> When asked how his shoulder has been since the total replacement, he states it has been limited, but he cannot really tell me how it is limited. He states he probably has some decreased strength a little bit, but he does go to the gym and does not notice any problem. He thinks probably his range of motion has been limited a little bit, but it has not been noticeable. He has no pain associated with the shoulder prior to this injury. He denies any direct trauma with this [earlier] event.

Dr. Walker concluded, "It is medically probable that [all of] the patient's complaints are the result of [his] job." Given this conclusion, the ALJ infers that Dr. Walker's medical opinion was that Claimant's specific inability to perceive any limitations was more

significant than his general comments, couched in terms of "probably" having limitations.

5. At the hearing, Claimant disagreed with Respondents' counsel's suggestion that Claimant had limitations. Claimant did not recall the conversation with Dr. Walker.

6. Dr. Walker referred Claimant to physical therapy. And when his condition did not significantly improve, she referred Claimant to orthopedic surgeon Dr. Armodios Hatzidakis.

7. Dr. Hatzidakis initially saw Claimant on June 18, 2013. When asked about the condition of his shoulder following his 2008 TSA, Claimant reported "his shoulder did return to 100% normal." Dr. Hatzidakis noted that Claimant's function had returned to normal.

8. Claimant testified that he was not impaired prior to his work injury. He testified that before his 2013 injury, "Nothing bothered me before." Claimant's testimony was consistent with his reports to Drs. Walker and Hatzidakis, and their medical reports.

9. Claimant testified that currently he is unable to care for his lawn and garden, has difficulty with household chores, and can no longer use hand tools. He testified that he had none of those difficulties before his 2013 injury.

10. Claimant testified that before the 2013 injury, he was an exercise fanatic – bicycling daily, lifting his maximum amounts of weight, and working with a trainer twice a week at the gym where he was a member. Since the injury, he has had to cut back on his exercise regimen.

11. Claimant testified he currently feels pain in his right shoulder, up through and across his neck, and down into his back. Claimant's post-revision records document consistent pain complaints; however they are not necessarily located beyond Claimant's shoulder. The ALJ credits Claimant's testimony regarding his current pain status as credible and credits such testimony over the lack of documentation during periods of treatment.

12. On August 7, 2013, Dr. Hatzidakis performed a TSA on Claimant's right shoulder. Because this was the second TSA on that shoulder, it is referred to as a revision.

13. Between November 12, 2013 and January 20, 2013, Claimant reported to Drs. Walker and Hatzidakis that writing and keyboarding increased his right shoulder pain. Claimant advised Dr. Walker that he was doing better after his vacation when he was not using his right arm.

14. On January 20, 2014, Claimant reported to Arbor Occupational that he was unable to use his right arm behind his back.

15. Claimant underwent rehabilitation therapies after his revision TSA including physical therapy, acupuncture, dry needling, functional taping, and intramuscular stimulation. Dr. Gridley performed these therapies between February 12, 2014 and April 16, 2014. Dr. Gridley noted contracture of Claimant's right pectoral girdle, and focused his treatments on Claimant's pectoral region, scapularthoracic

musculature, deltoid, latissimus, teres major and minor, pectoralis minor, rhomboid, levator, and trapezius. During the course of Claimant's treatment Dr Gridley noted "Ropey, tight, and tender muscles at the anterior deltoid, pectoralis minor, and trapezius." Dr. Gridley released Claimant from his care on April 16, 2014. His final report noted limitations with internal and external rotation, consistent with the [revision] arthroplasty."

16. On February 27, 2014, Dr. Jeff Raschbacher, Claimant's then-authorized treating physician (ATP) at Arbor, noted Claimant was progressing but had continued weakness and was using one Oxycodone per day. Acupuncture and therapy were continued. On March 21, 2014 Dr. Raschbacher discontinued Claimant's pool therapy, but continued his land-based physical therapy, and treatments with Dr. Gridley. On April 10, 2014 Dr. Raschbacher continued Claimant on his home exercise program.

17. Dr. Raschbacher placed Claimant at maximum medical improvement (MMI) on April 24, 2014. He noted "no neck tenderness or trapezius tenderness." Dr. Raschbacher rated Claimant's impairment at 36% of the upper extremity, converted to 22% of the whole person. His impairment rating consisted of 30% for diagnosis based impairment for the revision TSA, and 9% for loss of range of motion.

18. Insurer requested Dr. Raschbacher revisit his impairment rating in light of Claimant's initial TSA. In an "Incidental Chart Note" dated May 12, 2014, Dr. Raschbacher apportioned Claimant's rating by backing out the 30% rating for the diagnosis based impairment. He opined Claimant's upper extremity impairment was 6%, which was converted to 4% whole person. The ALJ finds that the revised 6% was a clerical error and should have been the original 9% for loss of range of motion. No persuasive evidence supports a finding that Dr. Raschbacher considered whether Claimant's 2008 TSA was independently disabling on the date of the work injury, as Dr. Raschbacher did not discuss it in his revised rating. He also recommended that the parties check with Dr. Mueller, the medical director of the Division of Workers' Compensation, regarding whether to include the diagnosis based impairment rating.

19. On May 28, 2014 Respondents filed a Final Admission of Liability based on Dr. Raschbacher's second impairment rating.

20. On August 7, 2014, Claimant returned to Dr. Hatzidakis complaining of continued pain in his right shoulder. Even though Claimant's last few evaluations with Dr. Gridley and Dr. Raschbacher revealed essentially no pain, Claimant advised that he believed he was discharged prematurely. Dr. Hatzidakis recommended Claimant increase his strengthening activity. On September 30, 2014, Claimant returned to Dr. Hatzidakis complaining of anterior shoulder pain, along with ongoing numbness and tingling into his fingers. Dr. Hatzidakis assessed Claimant with a painful and dysfunctional right shoulder with a possible ongoing low grade infection.

21. On September 15, 2014 Dr. Christopher Ryan performed a records review, obtained a history from Claimant, and examined him. Dr. Ryan reported Claimant was "doing functionally quite well" following his 2008 arthroplasty. Dr. Ryan noted that Claimant's shoulder had deteriorated dramatically since being placed at MMI, "He has effectively no internal rotation, and significant limitation in flexion, abduction, and adduction. Mild atrophy is noted in the deltoid and rotator cuff musculature." Dr.

Ryan opined that Dr. Raschbacher erred by apportioning the 2008 TSA out from Claimant's rating. He explained that apportionment is only appropriate "when an employee has a non-work-related previous permanent medical impairment to the same body part that has been identified, treated, and, at the time of the subsequent compensable injury, is independently disabling." Dr. Ryan concluded: "There is no evidence to show that [Claimant's] non-work-related previous shoulder arthroplasty was independently disabling. Therefore, the impairment rating should not be apportioned."

22. On October 15, 2014, Dr. Stephen Scheper conducted a division independent medical examination (DIME) on Claimant. Dr. Scheper was asked to consider MMI, permanent impairment rating, and apportionment. He reviewed Claimant's medical records, obtained a history from Claimant, and examined Claimant. Claimant's history includes "total shoulder arthroplasty 2008 – after which he did very well without continued pain or functional impairment." On physical exam, Dr. Scheper noted Claimant's right shoulder was depressed with significant scapular protraction; his deltoid, supraspinatus, and infraspinatus were mildly atrophied; and there were trigger points in Claimant's right upper trapezius and rhomboid major.

- **MMI**: Dr. Scheper opined that MMI on April 24, 2014 was reasonable.
- **Permanent Impairment Rating**: Dr. Scheper rated Claimant according to the AMA Guides to the Evaluation of Permanent Impairment, 3rd edition revised. Using Chapter 3 Table 19, Dr. Scheper gave Claimant a 30% upper extremity rating for implant arthroplasty of the shoulder. Dr. Scheper used Figures 38, 41, and 44 to rate Claimant's range of motion deficiencies which combined yielded a 13% range of motion impairment. Dr. Scheper combined the 13% for range of motion impairment with the 30% for arthroplasty, arriving at a 39% upper extremity impairment, which converts to a 23% whole person.
- **Apportionment**: Dr. Scheper agreed with Dr. Ryan that Claimant's arthroplasty from 2008 was not a disabling condition and therefore should not be considered. He remarked, "The claimant had done very well for 5 years after his arthroplasty prior to the injury in question."

23. In November 2014, Respondents challenged the DIME and filed an application for hearing.

24. At the hearing Dr. Barton Goldman testified as Respondents' expert in physical medicine and rehabilitation. Dr. Goldman reviewed Claimant's medical records from February 21, 2007 through October 30, 2014. Dr. Goldman did not examine Claimant, although he testified that physically evaluating a claimant is "certainly preferable."

25. Dr. Goldman issued a report dated February 10, 2015 in which he opined:

- Claimant had a preexisting diagnosis based impairment under the *Guides* of 30% for his 2008 TSA.
- While he had no documentation to support his opinion, he was certain that Claimant had preexisting range of motion deficits.

- Dr. Walker's report of Claimant's "limitations" – which Claimant could not perceive and only "probably" had – "would certainly meet criteria from the Guides perspective of activities of daily living restrictions or limitations."
- Existing reports support the medical likelihood of preexisting "independent disability."
- Claimant did not sustain a functional impairment to a body part not otherwise compensated by the scheduled disabilities.

26. Dr. Goldman testified that a doctor doing an impairment rating for a revision TSA should either not include it in his rating; or include it, but then back it out because it was preexisting. He testified that diagnosis based ratings are given because the authors of the Guides assume that "somewhere down the road" the person will have "a lot more problems than somebody who never had a shoulder replaced."

27. Dr. Goldman acknowledged that Claimant had atrophy of his shoulder musculature, including his anterior and middle deltoid, the posterior cuff musculature at the infraspinatus, and teres major and minor. Dr. Goldman acknowledged that such atrophy was associated with weakness, and acknowledged the atrophy would affect Claimant's ability to use, move, and stabilize his right arm. Dr. Goldman agreed the affected shoulder musculature attaches to the upper back area or the chest area.

28. Dr. Goldman testified that Claimant's 2008 TSA de facto would have rendered Claimant independently disabled. He clarified that while it might be "very mild," that it was "just about unheard of" for an arthroplasty patient not to have some limited range of motion. He testified that it would be medically improbable not to have at least some mild limitations that would increase over time. Dr. Goldman testified that a doctor generally will not release a TSA patient without restrictions of a medium work capacity, and would strongly advise against overhead activity, impact loading, and martial arts.

29. Dr. Goldman opined that Dr. Raschbacher's second impairment rating was correct in terms of the diagnosis based impairment and that Dr. Scheper, the DIME doctor, was incorrect in his handling of the diagnosis based disability.

30. Dr. Goldman acknowledged that he currently teaches doctors to "take into consideration if a condition is independently disabling at the time of the new work-related injury." However, he did not do so here. Rather, he applied a non-rebutable presumption that a patient who had a TSA had to be independently disabled. Rather than weighing Claimant's testimony that he perceived no physical limitations prior to his work-related injury and the multiple medical records in agreement, Dr. Goldman simply presumed Claimant was independently disabled.

31. Dr. Goldman noted that Claimant's testimony of no disability following the original 2008 arthroplasty was solely subjective. The ALJ credits Claimant's testimony over the unidentified study relied on by Dr. Goldman.

32. The ALJ finds that much of Dr. Goldman's testimony misses the mark. The crux issue here is whether Claimant's non-work-related injury was independently disabling to Claimant at the time of the current work-related injury. The Guides define

"disability" as "assessed by nonmedical means, [disability] is an alteration of an individual's capacity to meet personal, social, or occupational demands." Dr. Goldman's opinions address alleged limitations, not disability. The ALJ finds that Dr. Goldman's opinions do not support that Claimant was independently disabled by his non-work injury at the time of his work-related injury.

33. The ALJ finds Dr. Goldman's reasoning to be circular. And finds his opinions to be inconsistent with "Apportionment of Impairment" guidelines, admitted into evidence as Respondents' exhibit AA, which allows for claimants who have previous non-work-related injuries which are identified and treated to not be disabled.

34. Dr. Goldman showed an inherent bias against Claimant.

- Dr. Goldman admitted he was hired by Respondents "to help defend [Claimant's] claim for workers' compensation benefits" – in other words, he viewed his role to be that of an advocate.
- Dr. Goldman's comments in his record review show inherent bias against Claimant. For example, while Dr. Walker reported that Claimant felt best on vacation because he was resting his shoulder, Dr. Goldman offered the following unsupported commentary: "The subjective improvements noted when on vacation indicate a substantial stress component contributing to the patient's perceived pain and disability at this time. Also, the context of this claim versus the patient's prior shoulder surgeries is likely having an unconscious impact in terms of perceived outcome and even unconscious victimization phenomena that are common within disability systems."
- Dr. Goldman accuses Claimant to be acting for secondary gain, although no medical record documents any instance of Claimant exhibiting pain behaviors, magnifying his symptoms, malingering, etc.

35. Dr. Goldman's report contained inaccuracies that diminished his credibility.

- Dr. Goldman's report omitted Dr. Hatzidakis' note that "Claimant returned to 100% normal" following his 2008 TSA. When Claimant's counsel asked him about the omission, Dr. Goldman suggested the omission was of no consequence.
- Dr. Goldman reported Claimant was 62" tall and obese. There is no indication in the medical records to support this. Rather, the record supports a finding that Claimant is 72" tall with proportionate height and weight.
- Dr Goldman assumed without support that Claimant was de-conditioned. Dr. Goldman's assumption was contradicted by persuasive evidence that (1) Dr. Gridley noted Claimant was "well-developed for his age," and (2) Claimant testified that before his work injury he was an "exercise fanatic," bicycling daily, lifting maximum amounts of weight, and working out twice weekly with a personal trainer.
- Dr. Goldman inaccurately noted the date of Claimant's revision surgery.

- Dr. Goldman adopted Dr. Raschbacher's miscalculation of Claimant's range of motion limitation rating when the diagnosis based rating was backed out of his original calculation.

36. Dr. Hatzidakis testified as an expert in the diagnosis and treatment of orthopedic conditions by pre-hearing deposition dated March 10, 2015. He testified that Claimant's report that his shoulder had returned to 100% post the 2008 TSA would indicate that Claimant did not have any disability form the 2008 surgery. He testified that Claimant did not have any symptoms before the April 30 accident.

37. Dr. Hatzidakis testified that he could not contrast the extent of damage to Claimant's musculature from his accident on April 30, 2013, with the condition of his arm prior to that. The ALJ infers from his testimony that such a contrast could not be made.

38. Dr. Hatzidakis noted Claimant's documented difficulty with computer work, keyboarding, and writing. He explained that all of Claimant's shoulder musculature would be implicated in those tasks, including "muscles that attach from the back to the scapula." He also identified the deltoid and the pectoralis, muscles that attach to the chest. Dr. Hatzidakis, referring to Dr. Ryan's report, testified that the muscles Dr. Ryan identified as being functionally involved also attached to Claimant's chest and back.

39. Dr. Hatzidakis testified that he examined Claimant's cervical spine during Claimant's May 22 visit because Claimant continued to have complaints of pain in that area.

40. With respect to limitations form Claimant's 2008 TSA, Dr. Hatzidakis testified that "There are patients who feel like they return to 100%, they feel like it goes back to really good motion. That younger older age group, the people between 55 and 65, tend to do really well because they still have really good musculature and heal well." The ALJ finds this testimony supports Claimant's reports of being unable to perceive any limitations after his 2008 surgery, and his reports of having returned to 100% prior to his injury.

Conversion to Whole Person

41. Claimant seeks to convert his scheduled impairment rating to a whole person rating. To do so, Claimant must establish by a preponderance of the evidence that he sustained functional impairment to a part of the body off the schedule.

42. The ALJ finds Claimant's injury has affected physiological structures beyond the arm at the shoulder, and determines the situs of the functional impairment extends through Claimant' chest and back. Thus, the loss is not one listed on the schedule of disabilities.

43. Based on the totality of the evidence, the ALJ finds it more likely than not that Claimant sustained functional impairment not limited to his upper extremity and that conversion of his impairment rating to a whole person rating is proper.

DIME Impairment Rating

44. Respondent seeks to overcome the DIME physician's opinion regarding impairment. They are required to do so by a preponderance of the evidence.

45. Dr. Scheper, the DIME doctor, opined Claimant's previous arthroplasty was not an independently disabling condition.

46. Dr. Scheper's opinion is supported by those of Dr. Walker, Dr. Hatzidakis, Dr. Raschbacher, and Dr. Ryan, all of whom determined that Claimant was not independently disabled at the time of his work injury.

47. Respondents offered no persuasive prior medical documentation of impairment, range of motion limitations, or restrictions.

48. Dr. Goldman acknowledged inferentially that Claimant's disability did not necessarily exist at the time of his work related injury. He testified: "If you meet one of these diagnosis based criteria, the authors are assuming that somewhere down the road, it may be five years, it may be twenty years, you're going to have a lot more problems than somebody who never had their shoulder replaced."

49. Dr. Goldman opined, contrary to the other doctors, that at the time of Claimant's work related injury, Claimant was independently disabled by his 2008 TSA. The basis for his opinion was that everyone who has a TSA is disabled.

50. This opinion is less persuasive than that of all of the other doctors because it is not based on the more credible actual evidence presented in this case. And it is inconsistent with the Guides and Impairment Rating Tips which recognize and account for the possibility that a claimant could experience a previous, non-work related injury that is identified and treated, yet does not cause a patient to be disabled.

51. The ALJ also finds Dr. Goldman's opinions less persuasive than those of the other doctors because he showed an inherent bias against Claimant, his credibility is diminished by inaccuracies in his report, and he performed only a records review while acknowledging that a physical examination of Claimant would have been preferable.

52. The ALJ finds Dr. Scheper's opinions are consistent with the Guides and Tips; the opinions of Drs. Walker, Hatzidakis, Raschbacher, and Ryan; medical documentation; and Claimant's credible testimony. The ALJ credits the opinions of Dr. Scheper as more credible and persuasive that those of Dr. Goldman.

53. The ALJ finds Respondents have not overcome DIME Dr. Scheper's opinion regarding impairment.

54. Based on the totality of the evidence, the ALJ finds it more likely than not that Dr. Scheper's whole person rating of 23% is proper.

Average Weekly Wage

55. Claimant seeks a determination of his average weekly wage. The correct method of calculating Claimant's AWW would be to divide Claimant's gross yearly wages for the contract period and divide that number by 52 weeks. Claimant's employment contract was from July 1, 2012 through June 30, 2013. The AWW is calculated based on the wages earned during the contract period. Further, while Claimant did not work during various periods of the contract period, Respondent continued to pay benefits, including health insurance, through the entirety of the contract, even during summer months. This evidence supports the finding that Claimant

was under contract during this entire period. Accordingly, with a pay rate of $5447.68 per month, Claimant earned $65,372.16 for the contract period which equals an AWW of $1,257.16.

Disfigurement

56. During the hearing, the ALJ observed a seven inch-long keloidal scar with visible suture marks resulting from his revision surgery.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

The purpose of the Workers' Compensation Act of Colorado (Act), §§8-40-101, *et seq.*, C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. Generally, the claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201(1), C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the claimant nor in favor of the rights of respondents. Section 8-43-201(1).

When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005). A Workers' Compensation case is decided on its merits. Section 8-43-201(1). The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions.

Conversion to Whole Person

A claimant is limited to scheduled disability benefits if the claimant suffers an "injury or injuries" described on the schedule. Section 8-42-107(1)(a). If the claimant's "injury or injuries" are not the schedule, the claimant is entitled to whole person benefits. Section 8-42-107(1)(b). "The term 'injury' as used in Section 8-42-107(1)(a) refers to the situs of the functional impairment, meaning the part of the body that sustained the ultimate loss, and not necessarily the situs of the injury itself." *Kolar v. ICAO*, 122 P.3d 1075, 1076 (Colo. App. 2005). The Colorado Court of Appeals has held that depending on the particular facts of the claim, damage to structures of the "shoulders" may or may not reflect a "functional impairment" which is enumerated on the schedule of disabilities. *Walker v. Jim Fouco Motor Company*, 942 P.2d 1390 (Colo. App. 1997).

Here, Claimant sustained a physical injury to the muscles supporting and surrounding his shoulder joint which resulted in a loss of range of motion. The ALJ

credits Claimant's testimony that he currently feels pain in his right shoulder up through and across his neck and down into his back. The muscles which cause his pain were documented by Dr. Hatzidakis as causing Claimant chronic cervical pain. Additionally, Dr. Hatzidakis and Dr. Gridley treated musculature in Claimant's chest and back which control Claimant's ability to do computer work, writing, and keyboarding. These include the rotator cuff, the deltoid, and the pectoralis. Dr. Gridley treated Claimant's deltoid and rotator cuff muscles which are very important to power the shoulder and help position the arm in space. Dr. Scheper also noted Claimant's deltoids, supraspinatus, and infraspinatus were atrophied, which would cause weakness, and that there were trigger points in Claimant's upper trapezius and rhomboid major.

Thus, the ALJ concludes that the situs of Claimant's functional impairment and pain extends beyond the glenohumeral joint and into muscles of his neck, chest and back warranting a whole person impairment rating.

DIME Impairment Rating

The ALJ concludes Respondents were not required to overcome by clear and convincing evidence the DIME physician's opinion that the pre-existing TSA was "independently disabling." The ALJ further concludes that a preponderance of the evidence establishes the pre-existing impairment was not "independently disabling" at the time of the April 30, 2013 injury. Therefore, apportionment of the impairment rating is not proper and Claimant is entitled to PPD benefits based on the Dime doctor's 23% whole person impairment. Because Claimant underwent a DIME, the ALJ must first determine whether the impairment is a scheduled injury or non-scheduled one. Whether the Claimant sustained functional impairment to a part of the body off the schedule is a factual question. See *Warthen v. ICAO,* 100 P.3d. 581 (Colo. App. 2004).

Section 8-42-104(5)(b) provides that in cases of permanent medical impairment "the employee's award or settlement shall be reduced:"

> (b) When an employee has a nonwork-related previous permanent medical impairment to the same body part that has been identified, treated, and, at the time of the subsequent compensable injury was independently disabling. The percentage of the nonwork-related permanent medical impairment existing at the time of the subsequent injury to the same body part shall be deducted from the permanent medical impairment rating for the same body part.

Application of § 8-42-104(5)(b) to the facts of this case requires the ALJ to interpret the meaning of the term "independently disabling. " The ALJ notes that neither party cited any current cases that interpret the term. The ALJ is also required to determine whether a DIME physician's opinion that a prior medical impairment was not "independently disabling" must be overcome by clear and convincing evidence.

A court should effect the legislative intent of a statute by first looking to the "plain and ordinary meaning" of the language used in the statute. If the meaning is ambiguous

or unclear the court may look to other aides to interpretation including the legislative history, the context in which the legislation was adopted and the consequences of various interpretations. *See Weld County School District RE-12*, 955 P.2d 550 (Colo. 1998); *Henderson v. RSI, Inc.*, 824 P.2d 91 (Colo. App. 1991).

When the General Assembly amends a statute a presumption arises that the legislature intended to change the law as it existed prior to the amendment. *Arenas v. Industrial Claim Appeals Office,* 8 P.3d 558 (Colo. App. 2000). There is also a presumption that the General Assembly was cognizant of judicial precedents addressing the subject matter of the inquiry. *Weld County School District RE-12, supra.*

Section 8-42-104(5)(b) was adopted in 2008 and became effective on July 1 of that year. For the period July 1, 1999 to July 1, 2008 § 8-42-104(2)(b), C.R.S., provided that when benefits were awarded pursuant to "section 8-42-107, an award of benefits for an injury shall exclude any previous impairment to the same body part." Section 8-42-104(2)(c) stated that this apportionment applied to awards of permanent partial disability. Prior to July 1, 1999 § 8-42-104(2), C.R.S., provided that in cases of "previous disability" the disability for a "subsequent injury" was to be determined by "computing the percentage of the entire disability and deducting therefrom the percentage of the previous disability as it existed at the time of the subsequent injury." This provision expressly applied to awards of permanent partial disability."

In *Askew v. Industrial Claim Appeals Office*, 927 P.2d 1333 (Colo. 1996) the court interpreted the meaning of the term "previous disability" as that term was used in the pre-1999 version of § 8-42-104(2). The court observed that the Act did not define the term "previous disability." However the court stated that § 8-42-107(8)(c), C.R.S., requires the use of the AMA Guides when determining impairment and that the rating of impairment "necessarily includes the decision to apportion such impairment." The court then observed that the AMA Guides define the term "impairment" as "an alteration of an individual's health status that is assessed by medical means." In contrast, the AMA Guides state that "disability" is assessed by nonmedical means and is "an alteration of an individual's capacity to meet personal, social, or occupational demands." The court emphasized that under the AMA Guides "a person who is impaired is not necessarily disabled." *Id.* at 1337.

In *Askew* the respondents sought to apportion an impairment rating for a back injury based on a pre-existing degenerative back condition. However, the facts demonstrated that prior to the industrial injury the degenerative back condition was asymptomatic and did not hinder the claimant's ability to meet any demands. The court reasoned that under the "plain language of § 8-42-104(2)" apportionment was improper. It reasoned that the claimant's preexisting degenerative condition may have been an "impairment" under the AMA Guides, but it was not a "disability" because it did not limit his capacity "to meet the demands of life's activities." *Id.* at 1337; *see also Lambert & Sons, Inc. v. Industrial Claim Appeals Office,* 984 P.2d 656 (Colo. App. 1998).

Later, in *Public Service Co. v. Industrial Claim Appeals Office*, 40 P.3d 68 (Colo. App. 2001) the court applied the *Askew* analysis to affirm a denial of apportionment

based on a prior industrial impairment that was not disabling at the time of the subsequent industrial injury. Significantly, the court determined that under the *Askew* decision the "apportionment principles triggered under § 8-42-104(2) do not concern causation, but instead pertain to the status of a claimant's preexisting impairment." Specifically the court was required to determine if the pre-existing impairment rose to the level of a disability that continued to affect the claimant at the time of the subsequent injury. Moreover, the *Public Service* court ruled that the question of whether prior impairment was "disabling" at the time of the subsequent injury presented a question of fact for the ALJ to determine under the preponderance of the evidence standard, and the ALJ was not required to give any "presumptive weight" to the DIME physician's opinion on this issue.

As noted above, the General Assembly amended § 8-42-104(2) effective July 1, 1999. The legislature deleted any reference to the term "disability" and provided an award of PPD benefits was to exclude "previous impairment to the same body part." In *Martinez v. Industrial Claim Appeals Office, supra*, the court of appeals held that the statutory change rendered immaterial the distinction between "the type of apportionment authorized under former § 8-42-104(2) and the type of apportionment required by the AMA Guides as part of the rating process." The court stated that under the July 1, 1999 version of the statute apportionment constituted a "pure medical determination, which when made by the DIME physician is subject to the clear and convincing standard of § 8-42-107(8)." 176 P.3d at 828.

Section 8-42-104 was again amended in 2008 to include the provisions of subsection (5)(b). Subsection (5)(b) conditions apportionment of "nonwork-related previous permanent medical impairment" on a finding that the previous medical impairment was "independently disabling" at the time of the subsequent industrial injury. The ALJ concludes that the 2008 adoption of subsection (5)(b) evidences the General Assembly's intent to alter the law of apportionment as it existed from July 1, 1999 to July 1, 2008, by reincorporating into the statue the requirement that a previous medical impairment be "disabling" at the time of the subsequent industrial injury.

The ALJ further concludes that when the General Assembly used the term "independently disabling" in subsection (5)(b) it did so with full cognizance of the *Askew* decision and its progeny. Specifically, the ALJ infers the legislature was aware that *Askew* held the plain and ordinary meaning of the phrase "previous disability" referred to "an alteration of an individual's capacity to meet personal, social, or occupational demands" as determined by nonmedical means. Consequently, the ALJ infers that in 2008 when the General Assembly reinserted the term "disabling" into subsection (5)(b) its intent was to condition apportionment of pre-existing non work-related medical impairment on a finding that such impairment limited the claimant's capacity to meet personal, social or occupational demands at the time of the subsequent industrial injury. Moreover, the General Assembly intended to legislatively repeal the holding in *Martinez v. Industrial Claim Appeals Office, supra* that apportionment is strictly a "medical determination" and the DIME physician's opinion on apportionment must be overcome by clear and convincing evidence. Rather, use of the term "disability" in subsection (5)(b) signals an intent to readopt the *Askew* court's view that, as provided in the AMA

Guides, the existence of "disability" is determined by nonmedical means. Further the ALJ infers the General Assembly intended to adopt the *Public Service Co.* court's view that the existence of "disability" is determined under the preponderance of the evidence standard and the DIME physician's opinion is not entitled to any "presumptive weight" on this issue.

The ALJ further concludes that the foregoing analysis is consistent with WCRP 12-3(A) and (B). WCRP 12-3(A) pertains to injuries "prior to July 1, 2008" and states the rating physician "shall apportion any preexisting medical impairment, whether work-related or non work-related, from a work-related injury or occupational disease using the" AMA Guides.

In contrast WCRP 12-3(B) applies to dates of injury "on or after July 1, 2008" and states the rating physician "may provide an opinion on apportionment of any preexisting work related or non work-related permanent impairment to the same body part" using the AMA Guides where "medical records or other objective evidence substantiate preexisting impairment." The rule also provides that if the rating physician apportions based on a prior non work-related impairment the physician "must provide an opinion as to whether the previous medical impairment was identified, treated and independently disabling at the time of the work-related injury that is being rated." Significantly, WCRP 12-3(B)(1) states the "effect of the Physician's apportionment determination is limited to the provisions in section 8-42-104."

The ALJ infers from WCRP 12-3(B)(1) that the rule reflects a recognition by the Director of the DOWC that the legal "effect" of a rating physician's opinions concerning apportionment, including an opinion concerning whether a previous impairment was independently disabling at the time of the subsequent industrial injury, can have no more legal consequence than is contemplated by § 8-42-104. As determined above, the ALJ concludes that § 8-42-104(5)(b) contemplates that a DIME physician's opinion concerning whether or not prior medical impairment was "independently disabling" at the time of the industrial injury is not entitled to "presumptive weight" and is of no greater legal consequence than any other physician's opinion on this subject.

A preponderance of the credible and persuasive evidence establishes that Claimant's 39% upper extremity impairment rating cannot be apportioned based on his pre-injury condition because the prior condition was probably not "independently disabling" at the time of the April 30, 2013 injury. As determined, the credible and persuasive evidence establishes Claimant's condition prior to the injury was probably not "independently disabling." Claimant's credible testimony, as corroborated by the history he gave to various medical providers, establishes that by April 30, 2013 he had returned to work at full duty, without any documented restrictions, perceivable limitations, or pain; and was engaged in a vigorous exercise program. Although Dr. Raschbacher opined, after prompting by Insurer, that Claimant's 2008 TSA required him to deduct the 30% diagnosis related impairment, that opinion is not persuasive. Dr. Goldman's opinion that Claimant's impairment rating should be apportioned also is not persuasive for the reasons stated.

The specific issue determined here is that apportionment of the DIME physician's overall rating based on Claimant's pre-existing non work-related medical impairment is not proper under § 8-42-104(5)(b) because the prior impairment was not proven, by a preponderance of the evidence, to be "independently disabling" at the time of the April 30, 2013 injury. Therefore, Claimant is entitled to PPD benefits based on the DIME physician's overall rating of 23% whole person impairment without apportionment.

Average Weekly Wage

Section 8-42-102(2), C.R.S., requires the ALJ to calculate Claimant's AWW based on his earnings at the time of injury as measured by Claimant's monthly, weekly, daily, hourly or other earnings. This section establishes the so-called "default" method for calculating the AWW. The overall objective in calculating the AWW is to arrive at a fair approximation of the claimant's wage loss and diminished earning capacity. *Campbell v. IBM Corp., supra.*

Claimant contends he is entitled to the maximum average weekly wage by calculating his gross wages for the school year and dividing that amount by ten months. This is not the most accurate determination. Claimant testified he was under contract for one year with Employer and remained an employee of Employer for the 12 month period. He received payment in the form of one-twelfth of his annual salary and health benefits during the two summer months. Because Claimant received salary and benefits during each of the twelve months, it is most fair and accurate to calculate the average weekly wage by taking Claimant's gross wages for the contract year and dividing by 12 months, the length of the contract. The ALJ concludes that the correct average weekly wage is $1,257.16.

Disfigurement

The ALJ finds and concludes that as a result of Claimant's April 30, 2013, work injury, Claimant has a visible disfigurement to the body consisting of a seven inch-long keloidal scar with visible suture marks. Claimant has sustained a serious permanent disfigurement to areas of the body normally exposed to public view, which entitles Claimant to additional compensation. Section 8-42-108 (1), C.R.S.

The ALJ orders that Insurer shall pay Claimant $2,100 for that disfigurement. Insurer shall be given credit for any amount previously paid for disfigurement in connection with this claim.

ORDER

Based upon the foregoing findings of fact and conclusions of law, the ALJ enters the following order:

1. Insurer shall pay Claimant interest at the rate of 8% per annum on compensation benefits not paid when due.

2. Insurer shall pay Claimant PPD benefits in accordance with the statutory formula based on a 23% whole person impairment.

4. Insurer shall pay Claimant compensatory benefits based on an average weekly wage of $1,257.16

5. Insurer shall pay Claimant $2,100 for his disfigurement. Insurer shall be given credit for any amount previously paid for disfigurement in connection with this claim.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: June 12, 2015

/s/ Kimberly Turnbow
Kimberly B. Turnbow
Administrative Law Judge
Office of Administrative Courts
1525 Sherman St., 4th Floor
Denver, CO 80203

ISSUES

- Whether Claimant has established, by a preponderance of the evidence, that his scheduled upper extremity impairment rating should be converted to a whole person impairment rating.

- Whether Claimant has proven, by a preponderance of the evidence, that his portion of his health insurance premium should be considered in the calculation of his Average Weekly Wage (hereinafter "AWW") and, if so, the appropriate method of calculating the revised AWW.

- Whether Claimant is entitled to additional temporary disability benefits based upon an adjustment to his AWW.

FINDINGS OF FACT

Based upon the evidence presented at hearing, the ALJ enters the following findings of fact:

1. Claimant sustained a work-related left shoulder injury on January 3, 2011 while working as a residential driver on a single man trash collection route. On this date, Claimant was dumping a rolling "toter" filled with heavy garbage when he felt a painful pop in his left shoulder.

2. An MRI performed November 4, 2011 demonstrated a full thickness tear of the supraspinatus tendon at its insertion with retraction of the torn fibers, but without muscle belly atrophy. Claimant attempted, but ultimately failed conservative care. Consequently, he underwent surgery with Dr. Ronald Royce on March 13, 2014. During the arthroscopic procedure, Claimant was discovered to have a prominent subacromial bone spur prompting Dr. Royce to perform a subacromial decompression, followed by removal of 5 mm of bone from the anteroinferior portion of the acromion. Arthroscopic evaluation also revealed "prominent hypertrophy and spurring of the distal clavicle" which Dr. Royce elected to remediate by performing a distal clavicle resection to include removal of 11 mm of bone from the distal acromioclavicular joint.

3. Claimant was referred for post surgical rehabilitative care following his March 13, 2014 arthroscopy. Approximately eight months later, Claimant was placed at MMI by his primary authorized treating physician (ATP), Dr. Daniel Peterson on November 4,

2014. Dr. Peterson assigned a 20% scheduled upper extremity impairment rating, which converts to 12% whole person impairment.

4. Prior to being placed at MMI, Respondents referred Claimant to Dr. Ridings for an independent medical examination (IME) on September 29, 2014. Following this examination, Dr. Ridings opined that Claimant was approaching MMI. Dr. Ridings projected that Claimant would reach MMI at the end of October; however, he indicated that he would "defer" to Dr. Peterson should he assign an earlier date of MMI during Claimant's October 22, 2014 follow-up appointment. Dr. Ridings also assigned an "advisory" impairment rating of 19% upper extremity, which converts to 11% whole person impairment. Finally Dr. Ridings opined that Claimant's symptoms and examination did not qualify him for any additional impairment for the cervical spine.

5. Upon careful inspection of Dr. Ridings' impairment rating report, the ALJ finds that Dr. Ridings utilized the same methodology as did Dr. Peterson to compute Claimant's impairment, including the decision to assign 10% scheduled impairment for Claimant's distal clavicle resection. The only difference between the impairment ratings of Dr. Ridings and Dr. Peterson is a slight variation in the range of motion measurements of the shoulder.

6. At the IME with Dr. Ridings, Claimant reported persistent pain in the superior aspect of the left shoulder, specifically in the upper trapezius and extending laterally to the mid cervical region. He also complained of "discomfort", i.e. 2/10 pain at rest and more intense 5/10 pain with use of the left shoulder. Claimant described increased pain with prolonged posturing of the left arm when in any position other than at his side. He also reported that his left arm "goes to sleep" if he sleeps with his shoulder elevated. Finally, he reported weakness of the arm at shoulder level but none distally.

7. Respondents admitted liability for the 20% scheduled impairment assigned by Dr. Peterson. A Final Admission of Liability (FAL) was filed on November 25, 2014. In response, Claimant filed an Application for Hearing and amended the same on December 31, 2014. Claimant endorsed conversion of his scheduled upper extremity impairment rating to impairment of the whole person and requested a determination of his AWW related to termination of his health insurance benefit as issues for hearing.

8. At hearing, Claimant testified that he experiences pain and stiffness on the top of his shoulder that refers laterally to the bottom of his neck with additional pain traveling into his upper back. Claimant described the pain as a discomfort that he works through. Although Claimant testified that he currently has no formal work restrictions, he complained of a 60% reduction in the strength of his left shoulder. Moreover, while the testimony of Fred Kiger confirms that Claimant has returned to work approximately 45 hours per week, Claimant lost his residential trash collection route and is currently working a recycle pick-up route which he testified is "considerably lighter" than picking up trash every day.

9. Claimant testified to having constant neck pain and stiffness. He described this as a "crook" in his neck which limits this range of motion. According to Claimant, he has

difficulty looking over his left shoulder to use his mirrors while driving his trash truck. Claimant testified that he does not feel pain while performing arm curls or other exercises/activities requiring the use of his arms below shoulder level. He is able to care for his children, including a two year old, whom he lifts and plays with. He assists with household chores such as vacuuming and cutting a "little bit of grass here and there." However, anytime Claimant lifts too much above his head he feels clicking and popping pain in his neck.

10. Claimant's medical records from Concentra Medical Centers contain the following references:

- November 4, 2014: "Chief Complaint: The patient presents today with pain in left shoulder and neck." "Review of Systems-Musculoskeletal: "joint pain, muscle pain, back pain, neck pain, joint stiffness, muscle weakness and night pain, but no joint swelling.

- September 22, 2014: "EE c/o some neck stiffness." "Neck pain." "Trouble sleeping at night. "Wakes up with a crook in his neck." "Tenderness … AC joint, bicipital groove, trapezius muscle and supraspinatus muscle"

- May 30, 2014: "The patient presents with complaints of neck pain (left side)." "Sleep is off pt states, uncomfortable for pt to sleep."

- Included in the pain diagrams completed at Concentra wherein Claimant was asked to identify the area of his body where he felt sensations are diagrams dated 7/25/14 and 7/29/13. The ALJ finds these diagrams to depict pain that encompasses the area of the posterior left shoulder between the shoulder and the neck.

11. Based on the aforementioned medical records, the ALJ finds Claimant's testimony regarding his ongoing pain and functional limitation beyond the left shoulder consistent, credible and convincing. While Claimant can work and otherwise engage in child care activities, the ALJ finds the performance of Claimant's current work for Employer and lifting his two year old to require bending his arms at the elbows rather than reaching and lifting overhead. Moreover, vacuuming and cutting the grass are activities performed with the arms below shoulder level. Consequently, the ALJ finds Claimant's ability to engage in the aforementioned activities has no bearing on whether he has functional impairment beyond the arm at the shoulder.

12. Dr. Ridings was offered and accepted as a Level II accredited expert in physical medicine and rehabilitation (PM&R) at hearing. Dr. Ridings testified that the AMA guides allow for impairment of the shoulder to include range of motion loss as well as additional "add on" impairments for crepitus, severe arthritis and/or distal claviculectomies. Dr. Ridings testified that neither he nor Dr. Peterson provided Claimant with an additional rating beyond that provided for shoulder range of motion loss and the impairment for the distal clavicle resection.

13. Dr. Ridings testified that the clavicle "extends from the sternum . . . across to the acromion" where it forms the acromial clavicular (AC) joint "directly in front of the glenohumeral joint. According to Dr. Ridings, the clavicle "has some role in the stability of the shoulder joint particularly as it attaches at the AC joint. Dr. Ridings testified that the clavicle is part of the shoulder and he "would not call it a bone." The ALJ finds that Dr. Ridings probably misspoke when he testified that the clavicle was not a bone based upon the March 13, 2014 operative report of Dr. Royce, an orthopedic specialist, indicating that 11 mm of "bone" was removed from the AC joint region during the distal clavicle resection. Based on Dr. Ridings' testimony that the AC joint is directly in front of the glenohumeral joint, the ALJ infers and finds that the AC joint is located on the front of the body but medial (more towards the center of the body) to the glenohumeral joint in the sagittal plane. Consequently, the ALJ finds that the AC joint and the clavicle are anatomic structures beyond the glenohumeral joint and not part of the arm itself.

14. Based on the evidence presented, the ALJ finds that Claimant suffers from pain extending from the top of the shoulder, into the upper trapezius and cervical musculature. Following his IME, Dr. Ridings documented that "[Claimant's] primary left shoulder pain is in the superior aspect of the shoulder, pointing to the left upper trapezius, extending up to the mid-cervical region laterally." Dr. Ridings' physical examination confirmed that "[Claimant] has tenderness from the base of the left neck across the left upper trapezius to the point of the shoulder" and that "the upper trapezius on the left does have increased myofascial tone." More probably than not, the residuals from Claimant's full thickness supraspinatus tear in addition to his subacrominal decompression and distal clavicle resection are causing referred pain and weakness into the adjacent scapular and cervical musculature. This is consistent with Claimant's hearing testimony and the content of the medical records submitted into evidence. The top of the shoulder as well as the cervical and upper scapular musculature are not part of the "arm." Furthermore, on the evidence presented, the ALJ finds that Claimant's referred pain, stiffness and weakness limits the function of his neck and upper back rather than his arm.

15. The preponderance of the persuasive evidence presented demonstrates that Claimant's permanent impairment extends beyond his left arm. Accordingly, the ALJ finds that conversion of Claimant's scheduled impairment to impairment of the whole person is warranted in this case.

16. At the time of his injury, and thereafter until March 9, 2014, Claimant and his dependents were covered by the Employer's group health insurance plan. Both Claimant and Employer contributed a portion of the monthly health insurance premium. Claimant's portion was deducted from his regular paychecks. When Claimant was taken off work after surgery on March 13, 2014 and placed on TTD, he could not afford to pay his portion of the health insurance premium which was previously paid through payroll deduction. Consequently, Claimant testified that he stopped paying his share of the health insurance premium. Wage records submitted at hearing substantiate that Claimant Employer stopped receiving Claimant's insurance premium payment.

17. Employer sent Claimant several notices beginning May 10, 2014, informing him of his overdue balance for his portion of the health insurance premium. Claimant also received notices in June and July of 2014. The notices informed Claimant that his health insurance would be canceled if he did not pay the accrued balance. The most recent notice, dated July 10, 2014, indicated that a minimum payment of $2,890.36 had to be received by 07-17-2014 to avoid cancellation of coverage. Claimant testified that he was never able to catch up on the past-due insurance premiums. Based upon the evidence presented, the ALJ finds that Claimant's health insurance coverage was canceled due to his failure to pay his portion of the total premium cost.

18. Dora Akers, Employers' Human Resources Manager, testified that Claimant's local "site" continued to "pay" Employer's portion of the health insurance premium throughout the period Claimant was out of work receiving TTD. Ms. Akers explained that the local site paid the corporate parent for the Employers portion of the health insurance premium. Wage records submitted into evidence reflect that Employer continued to pay for their portion of Claimant's health insurance premium without interruption from January 3, 2014 through March 27, 2015.[1] Ms. Akers testified that Employer did not send Claimant a COBRA notice informing him that he was eligible for COBRA due to non-payment.

19. Respondents have admitted to an AWW of $985.00 exclusive of the value of Claimant's health insurance premium. Based upon the evidence presented, Claimant's portion of the health insurance premium was $154 per week when the controversy concerning whether inclusion of his health insurance premium should be considered in the calculation of his AWW. Conversely, Employer's portion was $221.53 per week.

20. Claimant has failed to prove by a preponderance of the evidence, that he is entitled to an increase in his average weekly wage and TTD rate.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the ALJ draws the following conclusions of law:

I.

General Legal Principals

A. The purpose of the Workers' Compensation Act of Colorado (Act), C.R.S. §§ 8-40-101, et seq., C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. *C.R.S. § 8-40-102(1).* Claimant has the burden of proving entitlement to benefits by a preponderance of the evidence. *C.R.S. § 8-43-201*. A

[1] The records submitted indicate that Employer paid $221.53 weekly from 1/3/14 through 1/9/15 for what Ms. Akers testified was the premium cost for Claimant's health insurance. Beginning 1/16/15 the cost increased to $236.54, which amount was paid by Employer through 3/27/15.

preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally; neither in favor of the rights of the claimant nor in favor of the rights of respondents and a workers' compensation claim shall be decided on its merits. *C.R.S. § 8-43-201*.

B. In deciding whether a claimant has met the burden of proof, the ALJ is empowered to resolve conflicts in evidence, make credibility determinations, determine the weight to be accorded to testimony, and draw plausible inferences from the evidence. *See, Brodensleck v. Industrial Claim Appeals Office*, 183 P.3d 684 (Colo. App. 2008); *Kroupa v. Industrial Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002); *Rockwell International v. Turnbull*, 802 P.2d 1182, 1183 (Colo. App. 1990). In determining credibility, the ALJ, acting as fact finder, should consider, among other things, the consistency or inconsistency of a witness's testimony and/or actions; the reasonableness or unreasonableness of a witness's testimony and/or actions; the motives of a witness; whether the testimony has been contradicted and, bias, prejudice or interest. *See, Prudential Ins. Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936). The fact finder is also charged with considering an expert witness's special knowledge, training, experience, or research in a particular field. *See, Young v. Burke*, 139 Colo. 305, 338 P.2d 284 (1959).

C. In accordance with section 8-43-215, C.R.S., this decision contains Specific Findings of Fact, Conclusions of Law and an Order. In rendering this decision the ALJ has made credibility determinations, drawn plausible inferences from the record, and resolved essential conflicts in the evidence. See *Davison v. Industrial Claim Appeals Office*, 84 P.3d 1023 (Colo. 2004). This decision does not address every item contained in the record; instead, incredible or implausible testimony or unpersuasive arguable inferences have been implicitly rejected. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000).

II.

Conversion of Claimant's Scheduled Impairment

D. When a claimant's injury is listed on the schedule of disabilities, the award for that injury is limited to a scheduled disability award. *Section 8-42-107(1)(a), C.R.S.* However, a claimant may establish that his/her injury has resulted in "functional impairment" beyond the schedule enumerated in C.R.S. §8-42-107(2)(a); thus, entitling him/her to "conversion" of the scheduled impairment to impairment of the whole person. This is true because the term "injury" as used in § 8-42-107(1)(a)-(b), C.R.S., refers to the part or parts of the body which have been impaired or disabled, not the situs of the injury itself or the medical reason for the ultimate loss. *Walker v. Jim Fucco Motor Co,* 942 P.2d 1390 (Colo. App. 1997); *see also Strauch v. PSL Swedish Healthcare System,* 917 P.2d 366 (Colo. App. 1996). In the case of a shoulder injury, the question is whether the claimant has sustained functional impairment beyond the arm at the

shoulder. *Langton v. Rocky Mountain Health Care Corp*., 937 P. 2d 883 (Colo. App. 1996); *Strauch v. PSL Swedish Healthcare System, supra.*

E. "Functional impairment" is distinct from physical (medical) impairment under the AMA Guidelines and as noted above, the site of functional impairment is not necessarily the site of the injury itself. The site of functional impairment is that part of the body which has been impaired or *disabled*. *Strauch, supra*. Physical impairment relates to an individual's health status as assessed by medical means. Disability or "functional impairment", on the other hand, pertains to a person's ability to meet personal, social, or occupational demands, and is assessed by non-medical means. Consequently, physical impairment may or may not cause "functional impairment" or disability. *Lambert & Sons, Inc. v. Industrial Claim Appeals Office, 984 P.2d 656, 658 (Colo. App. 1998).* Physical impairment becomes a disability only when the medical condition limits the claimant's capacity to meet the demands of life's activities. *Lambert & Sons, Inc. v. Industrial Claim Appeals Office, supra at 658.*

F. It is true, as Claimant points out, that "functional impairment" need not take any particular form. *See Nichols v. LaFarge Construction, W.C. No. 4-743-367 (October 7,2009); Aligaze v. Colorado Cab Co., W.C. No. 4-705-940 (April 29, 2009); Martinez v. Albertson's LLC, W.C. No. 4-692-947 (June 30, 2008).* Moreover, as noted by Claimant "referred pain from the primary situs of the industrial injury may establish proof of functional impairment to the whole person." *Hernandez v. Photronics, Inc., W.C. No. 4-390-943 (July 8, 2005); Latshaw v. Baker Hughes, Inc*., W.C. No. 4-842-705 (ICAO, December 17, 2013). Nonetheless, *s*ymptoms of pain do not automatically rise to the level of a functional impairment. To the contrary, the undersigned concludes that there must be evidence that such pain limits or interferes with Claimant's ability to use a portion of his body to be considered functional impairment. See *Mader v. Popejoy Construction Co., Inc.*, W.C. No. 4-198-489 (August 9, 1996), aff'd *Popejoy Construction Co., Inc.,* (Colo. App. No. 96CA1508, February 13, 1997)(not selected for publication)(claimant sustained functional impairment of the whole person where back pain impaired use of the arm). In order to determine whether permanent disability should be compensated as physical impairment on the schedule or as impairment of the whole person, the issue is not whether the claimant has pain, but whether the injury has impacted part of the claimant's body which limits his "capacity to meet personal, social and occupational demands." *Askew v. Industrial Claim Appeals Office, 927 P.2d 1333 (Colo. 1996).* Consequently, an injury to the structures which make up the shoulder may or may not result in functional impairment beyond the arm at the shoulder. *Walker* v*. Jim Fucco Motor Co, supra; Strauch v. PSL Swedish Healthcare System, supra; Langton v. Rocky Mountain Health Care Corp., supra.*

G. In this case, the ALJ agrees with Claimant that the persuasive evidence warrants conversion of his scheduled impairment to impairment of the whole person. As found, both the AC joint and the distal clavicle are structures beyond the "arm." Consequently, the subacromial decompression and distal clavicle resection, which permanently altered these anatomical structures, were performed above the glenohumeral joint and therefore, above the "arm." *See, e.g., Martinez v. Albertson's LLC*, W.C. No. 4-692-947 (ICAO, June 30, 2008)(finding that subacromial decompression was done at the

acromion and the coracoacromial ligament to relieve the impingement, which was related to the scapular structures above the level of the glenohumeral joint"); *Velasquez v. UPS*, W.C. No. 4-573-459 (ICAO, April 13, 2006) (finding that distal clavicle resections are proximal to the glenohumeral joint and therefore, on the trunk of the body). Furthermore, the consistent and convincing evidence establishes that Claimant suffers from pain, stiffness and weakness on the top of the shoulder, in the musculature of the upper back, including the upper trapezius and the cervical musculature which affects his sleep, limits his ability to perform activity above shoulder level and interferes with his ability to turn his head, particularly when driving his route. In concluding that Claimant is entitled to conversion of his scheduled impairment to impairment of the whole person, the ALJ finds the opinion of the Industrial Claim Appeals Panel in *Steinhauser v. Azco, Inc.*, W.C. No. 4-808-991 (ICAO, January 11, 2012) and *Franks v. Gordon Sign Co.*, W.C. No. 4-180-076 (ICAO, March 27, 1986) instructive. In *Steinhauser,* the Panel affirmed the conclusion of the ALJ that pain and muscle spasm in scapular and trapezial musculature warranted whole person impairment. Similarly, in *Franks* pain affecting the trapezius and difficulty sleeping on injured side supported the ALJ's finding of whole person impairment. On the evidence presented, the ALJ concludes that the instant case is analogous to *Steinhauser* and *Franks*. Accordingly, the ALJ concludes that Claimant has proven by a preponderance of the evidence that he sustained a "functional impairment" of bodily function not listed on the scheduled of disabilities which warrants conversion of his scheduled impairment to whole person impairment.

III.

Average Weekly Wage

H. AWW is calculated based upon the monthly, weekly, daily, hourly, or other compensation which the injured employee was receiving at the time of the injury in accordance with C.R.S. § 8-42-102. The overall purpose of the average weekly wage (AWW) statute is to arrive at a fair approximation of Claimant's wage loss and diminished earning capacity resulting from the industrial injury. *See Campbell v. IBM Corp., 867 P.2d 77 (Colo. App. 1993); National Fruit Prod. v. Crespin, 952 P.2d 1207 (Colo. App. 1997).* Sections 8-42-102 (3) and (5) (b), give the ALJ discretion to determine an AWW that will fairly reflect loss of earning capacity. *R.J.S. Painting v. Industrial Commission of State*, 732 P.2d 239 (Colo. App. 1986).

I. C.R.S § 8-40-201(19)(b), provides: The term "wages" includes the amount of the employee's cost of continuing the employer's group health insurance plan, and, upon termination of the continuation, the employee's cost of conversion to a similar or lesser insurance plan…. ***If, after the injury, the employer continues to pay any advantage of fringe benefit specifically enumerated in this subsection (19), including the cost of health insurance coverage of the cost of the conversion of health insurance coverage, that advantage or benefits shall not be included in the determination of the employee's wages so long as the employer continues to make payment*** (emphasis added).

J. The Court in *Midboe v. Industrial Claim Appeals Office,* 88 P.3d 643 (Colo.App.2003), construed the definition of "wages" to exclude healthcare benefits when an employer continued to contribute to the insurance premium. The claimant in *Midboe* suffered a substantial injury at work, but he continued to work for his employer after the injury. As a result, the employer continued to pay its share of the claimant's health insurance premium while the claimant paid his share. *Id*. When calculating the claimant's benefits, the ALJ concluded that the claimant's premium payments should be included in his average weekly wage. However, the ICAO reversed. It held that when an employer continues to pay health insurance benefits, the average weekly wage should not include either the employee's or the employer's contribution to the health insurance premium because the "wages" statute explicitly bars such inclusion. Specifically, the ICAO relied on the last sentence of § 8–40–201(19)(b), which states, "If, after the injury, the employer continues to pay ... the cost of health insurance coverage ... such advantage or benefit shall not be included in the determination of the employee's wages so long as the employer continues to make such payment."

K. In *Industrial Claim Appeals Office v. Ray*, 145 P.3d 661 (Colo. 2006), the Colorado Supreme Court granted certiorari to resolve a conflict between the court of appeals decisions in *Midboe* and *Ray.* In overruling Midboe to the extent it was inconsistent with the decision reached in Ray, the Court clarified as follows: "The narrow issue in *Midboe* was simply whether the amount a claimant pays as his share of the premium for group health and dental insurance coverage must be included in the calculation of his average weekly wage when the employer continues to pay its share of the premium. In *Ray* the issue decided was whether C.R.S. § 8-40-201(19)(b) required claimants who lost their jobs to purchase continuing or converted health insurance under the Consolidated Omnibus Budget Reconciliation Act (COBRA) of 1985 in order for their average weekly wage to be increased by the cost of continued health insurance. The Court's holding in *Ray* that C.R.S. § 8-40-201(19)(b) does not require a claimant to purchase continuing coverage or convert to a similar plan does not resolve the question presented here, which is whether Claimant's share of the premium for continued coverage should be included in the average weekly wage when the employer continues to pay its share. The Court in *Ray* expressly stated that the answer to this question is in the negative.

L. Additionally, in *Laura Plute v. Home Depot,* W.C. No. 4-631-629 (ICAO, January 16, 2007) a hearing was held on the "sole issue of whether the claimant's average weekly wage should be increased by the amount of her health insurance premiums." The issue presented to the ALJ in *Pulte* was whether a temporarily disabled Claimant was entitled to an increase in her average weekly wage by the amount of her portion of the health insurance plan premium, where the employer and claimant continued to pay the health insurance premium after claimant was placed on an unpaid leave of absence, and coverage under the plan continued. The ALJ found that the claimant was not "put to any additional expense in order to continue her coverage. Consequently, the ALJ concluded that the claimant's cost of continuing coverage under the health insurance plan during the leave of absence should not be included in her average weekly wage. Relying on their decision in *Salas v. NCR Corp*., W.C. No. 4-166-217 (ICAO, March 26,

1996), and *Midboe*, *supra* the Panel affirmed the ALJ. In *Salas,* claimant was provided with group health insurance coverage. Similar to the instant case, employer paid a portion of the total cost of the group health insurance premium. Claimant was then placed on long term disability, but the employer continued to pay its portion of the premium. Nonetheless, the ALJ concluded that claimant's AWW should include employer's portion of the premium. The Panel reversed stating that the "unambiguous effect of the statute is to exclude from the wage calculation the cost of health insurance if the employer continues to pay its share of the cost after the injury." In reversing, the Panel concluded that the plain and ordinary meaning of the term "any" as used in § 8-40-201(19)(b) meant "one, some, every, or all without specification." *Salas, supra* citing *The American Heritage College Dictionary* (Third Edition 1993). Accordingly, the Panel concluded that "if the employer continues to pay 'some' of the cost of the claimant's health insurance, health insurance is excluded from the average weekly wage calculation until the employer discontinues payment."

M. Claimant argues that *Pulte* and *Salas* are factually distinguishable from the instant case, because there is no proof that the Employer continued to "pay" their portion of the health insurance premium in the sense of actually making premium payments to the health insurance carrier and because, contrary to the situation in Pulte and Salas, Claimant's coverage in this case was canceled for nonpayment. Regarding continued payment by Employer of their potion of the health insurance premium, Claimant asserts that the evidence established simply that Claimant's local site continued to "pay" the corporate parent in an accounting sense. In so doing, Claimant argues that Employer was merely transferring money from one of its accounts to another. Concerning continued coverage, Claimant argues that, unlike the circumstances in *Pulte* and *Salas* his health insurance was not continued since he was unable to pay his portion of the premium and his insurance was canceled. Accordingly, Claimant argues that Employer did not continue to "pay" for his coverage, because the coverage was no longer in effect. Based upon the evidence presented, the ALJ is not persuaded. The ALJ concludes that Respondents established at hearing that they continued to pay their portion of the health insurance plan premium and that the coverage was cancelled because Claimant failed to pay his portion of the premium not vice versa. Because Employer continued to pay "some" of the cost of Claimant's health insurance, the ALJ concludes that C.R.S. § 8-40-201(19)(b), in addition to the decisions announced in *Midboe, Salas* and *Pulte* support a conclusion that Claimant is not entitled to an increase in his average weekly wage.

IV.

Adjustment of TTD benefits

N. Because the Court concludes that Claimant is not entitled to an increase in his AWW based on the cost of his health insurance, the ALJ concludes that he is not entitled to an adjustment in TTD benefits for the admitted period of TTD extending from March 10, 2014 to November 3, 2014.

ORDER

It is therefore ordered that:

1. Claimant's left upper extremity scheduled impairment rating of 20% is converted to 12% whole person impairment.

2. Insurer shall pay permanent partial disability benefits consistent with a 12% whole person disability rating pursuant to C.R.S. § 8-42-107(8)(d).

3. Claimant's request for an increase in his AWW is denied and dismissed as Respondents continued paying their portion of the insurance premium. Consequently, Claimant's request for an adjustment in his TTD rate is also denied and dismissed.

4. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

5. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

Colorado Springs, CO 80906

ISSUES

The issue for determination is whether the claimant's left lower extremity scheduled rating of 25% should be converted to a whole person rating of 10%.

FINDINGS OF FACT

1. The claimant is a police patrol officer for the respondent-employer and has been employed by the respondent-employer for 17 years.

2. In this position the claimant needs to be physically active while engaged in making arrests and various other police activities.

3. The claimant additionally participates as soldier in the Army Reserves where he is a platoon Sergeant in a Military Police unit. He has been involved in Army activities for almost 20 years.

4. In 2010 the claimant was deployed to Afghanistan with the Army. Prior to his deployment eh claimant had no low back problems and was physically active with no restrictions.

5. In addition to his normal police duties the claimant was also a member of the police department's SWAT unit and would also work out on his own while off duty.

6. Upon the claimant's return from Afghanistan he returned to his full duties with the respondent-employer without any restrictions.

7. On August 16, 2012 the claimant sustained a compensable on-the-job injury to his left knee.

8. The claimant had surgery for this injury and shortly thereafter returned to modified light duty. The claimant ultimately transitioned back to full duty.

9. The claimant reached maximum medical improvement (MMI) for this injury on June 18, 2013. The claimant was given an impairment rating of 14% for the left lower extremity and was released to full duty with no permanent restrictions.

10. On November 22, 2013 the claimant again suffered a compensable industrial injury to his left knee when he slipped on ice while getting into his patrol car.

11. The claimant sustained a complex tear of the posterior horn of the medial meniscus and tearing of the lateral meniscus with an intact ACL graft. The claimant underwent surgery for this second knee injury on December 26, 2013.

12. The claimant reached MMI for this second injury on April 15, 2014.

13. Subsequent to the MMI finding the claimant underwent a division independent medical examination conducted by Jeffrey Jenks, MD.

14. Dr. Jenks determined the claimant sustained a 25% left lower extremity permanent impairment after applying apportionment for his first knee injury. This rating converts to a 10% whole person rating.

15. Dr. Jenks noted that the claimant

16. continues with intermittent left knee pain. He has a lot of pain in the lateral aspect of his left knee. This occurs particularly with running and prolonged standing. At times his knee swells and can become quite stiff. He complains of constant numbness along the lateral aspect of his left knee.

17. The claimant had no significant issues while he was on light duty. When the claimant transitioned back to full duty in the March/April 2014 timeframe the claimant's range of motion deficit affected the way he walked and by extension the way he has to run. The claimant's activities vary from day to day and he cannot predict when or what will affect the functioning of his knee.

18. When the claimant's knee hurts it affects his low back and his back gets stiff.

19. Specifically, when the claimant is running he gets low back pain and aching. This did not occur prior to his injury of November 22, 2103. The claimant states that he has flare-ups approximately 6 times a month.

20. When the claimant has flare-ups it also affects how long he can stand.

21. The claimant's condition has also had an effect upon his military status as he now is under a running profile and is not allowed to run.

22. The ALJ finds the claimant to be credible.

23. The ALJ finds that the claimant has established that it is more likely than not that the situs of the claimant's functional loss extends beyond the lower left extremity and into his low back as well as the functioning of his entire body as it relates to running.

CONCLUSIONS OF LAW

1. The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. Section 8-40-102(1), C.R.S.

2. A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-42-101, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark,* 197 Colo. 306, 592 P.2d 792 (1979).

3. The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. Section 8-43-201, C.R.S. A Workers' Compensation case is decided on its merits. Section 8-43-201, C.R.S.

4. The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that might lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. ICAO,* 5 P.3d 385 (Colo. App. 2000).

5. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of the witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2007).

6. The question of whether the claimant sustained a loss of a leg at a hip joint within the meaning of Section 8-42-107(2)(w), C.R.S. or a whole person medical impairment compensable under Section 8-42-107(8)(c), C.R.S. is one of fact for determination by the ALJ. In resolving this question the ALJ must determine the situs of

the claimant's functional impairment, and the situs of the functional impairment is not necessarily the situs of the injury itself. *See Langton v. Rocky Mountain Health Care Corp.* 937 P.2d 883 (Colo.App. 1996); *Staunch v. PSL Swedish Healthcare System*, 917 P.2d 366 (Colo.App. 1996).

7. The "loss of a leg at the hip joint" is on the schedule of injuries listed under Section 8-42-107 (2)(w), C.R.S. Depending on the particular facts of the claim, damage to the structures of the leg may or may not reflect a functional impairment which is enumerated on the schedule of injuries under Section 8-42-107 (2), C.R.S.

8. An impairment rating issued under the AMA Guides is relevant, but not dispositive of whether the claimant sustained a functional impairment beyond the schedule. *Staunch v. PSL Swedish Healthcare System, supra.* Further, pain and discomfort, which limits the claimant's ability to use a portion of the body, may be considered functional impairment for purposes of determining whether an injury is on or off the schedule. *See Vargas v. Excel Corp., W. C. NO. 4-551-161 (April 21, 2005).* Functional impairment of the leg beyond the "leg at the hip joint" is probative evidence of whole person impairment.

9. As found above, the ALJ concludes that the claimant's testimony was credible and supported by the medical record.

10. The ALJ concludes as found above, that as a result of his work-related injury the claimant has functional impairment of the leg, and the claimant has functional impairment in areas beyond the leg. As a result of his work-related injury, the claimant has functional impairment that is located beyond the leg; it is located in the low back and in the entire body as it relates to the claimant's ability to run. As a result of his work-related injuries the claimant's functional impairment is not limited to the leg at the hip joint.

11. The ALJ concludes that the claimant has established by a preponderance of the evidence that his lower extremity impairment rating should be converted to a whole person impairment rating.

12. The ALJ concludes that the claimant suffered 10% permanent impairment of the whole person.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The respondent shall pay the claimant permanent partial disability benefits based upon a 10% whole person impairment rating.

2. The respondent shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

3. All matters not determined herein, and not closed by operation of law, are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATE: June 15, 2015

/s/ original signed by:
Donald E. Walsh
Administrative Law Judge
Office of Administrative Courts
1259 Lake Plaza Drive, Suite 230
Colorado Springs, CO 80906

ISSUES

1. Whether the claimant has established by clear and convincing evidence that she is not at maximum medical improvement (MMI) for her May 7, 2013 compensable injury.

2. If the claimant is at MMI, whether the claimant has overcome the impairment rating by the Division IME, Dr. McFadden by clear and convincing evidence.

FINDINGS OF FACT

1. The claimant works as a food server and bus aide for the respondent-employer.

2. On May 7, 2013, the claimant sustained a low back strain while twisting and unhooking a student from a seatbelt who was restrained in a bus.

3. On May 24, 2013, the claimant was seen at CCOM by Kenneth Ginsburg, P.A., an authorized provider, who, after taking a history and evaluating claimant, assessed a right sacroiliac strain. The claimant was prescribed medication and referred for chiropractic care.

4. On June 3, 2013, the claimant returned to CCOM, where the records document the following: "Her pain is localized to her right buttocks and there is no radiation to her leg or paresthesia or numbness in her leg."

5. Dr. Terrence Lakin, D.O., an authorized treating physician, evaluated the claimant on June 4, 2013. Dr. Lakin took a history from the claimant, performed a physical examination, and diagnosed a low back strain, right sacroliitis, and a right hip strain.

6. Dr. Lakin ordered an X-ray and MRI of the low back and hip, prescribed medications and a home exercise program, and issued temporary work restrictions. The claimant rated her pain an 8 out of a 10 at that time.

7. The claimant was seen by Dr. Lakin on June 20, 2013, where "she is improved greatly and is not using a walker now. She walks relatively comfortable. She still complains of a catch in her hip."

8. With respect to MRI's, Dr. Lakin noted: "Lumbar shows some L5-S1 disc herniation and crowding of right and left S1 nerves and multilevel mild degenerative changes. She does not have exhibit any significant lumbar issues." (Id.). Dr. Lakin diagnosed WC sacroiliitis, right, and a right hip strain.

9. On July 8, 2013, the claimant was seen by Dr. Charles Hanson, M.D., who took an initial history, evaluated the claimant, and stated: "Presently, the patient complains of fairly constant sharp pain in her right upper buttocks area. The pain is intensified by standing and ambulation. Quiet rest, use of heat, ice and flexeril provides only partial benefit. She has had no radicular leg pain, leg paresthesias, leg weakness or sphincter problems." The claimant began physical therapy in mid-July.

10. On September 17, 2013, the claimant underwent a right SI joint injection with Dr. Finn. The claimant had 90% improvement from the SI injection.

11. Dr. Caughfield performed EMG studies on October 10, 2013, and noted that there was "no evidence of radicular or peripheral nerve entrapment, but he also noted that [the claimant] had bilateral peroneal motor nerve slowing, likely due to foot trauma."

12. On October 16, 2013, Dr. Floyd Ring, M.D., performed a physician advisor review based on a request for an epidural injection at L5-S1. Dr. Ring noted that the MRI "shows evidence of an L5-S1 disc herniation; however, there is no evidence of any nerve root compression or canal stenosis. She was also referred for EMG studies. These were performed on 10/10/13. They showed no evidence of lumbar radiculopathy or peripheral nerve entrapment."

13. Dr. Ring went on to state: "Based upon the fact that the patient has had 90% improvement of her pain complaints following the SI injection this would point more towards a pain generator in that area." Dr. Ring noted that the EMGs and MRIs did not support the need for an epidural injection. He recommended denying the L5-S1 injections and continuing to have therapy that addresses the SI joint.

14. Dr. Lakin also noted that when considering the EMG results that "she has no evidence of lumbar radiculopathy or peripheral nerve entrapment syndromes."

15. The claimant was released without work restrictions on October 29, 2013.

16. On October 30, 2013, Dr. Lakin placed the claimant at maximum medical improvement, without permanent impairment. The claimant's conditions were noted to be improved, and Dr. Lakin states she is doing very well "after her injections by Dr. Finn in the SI joint." Dr. Lakin goes on to state: "She has significant degenerative changes. She has L5-S1 herniated disc with left SI nerve impingement. Degenerative disc disease at multiple levels in her right hip appears like a degenerative tear in the labrum. It does not seem medically likely that both of these injuries were done by her mechanism of injury. She concurs with closing case and returning to full duties."

17. Dr. Lakin stated that the claimant is free to pursue treatment for nonoccupational degenerative changes, and highly encouraged her to work at conditioning and weight loss."

18. The claimant returned to Dr. Finn on October 31, 2013, who administered a right L5-S1 epidural injection. The claimant did not get any relief from the L5-S1 injection.

19. The respondents filed a final admission of liability on October 31, 2013, reflecting $16,988.23 paid in medical benefits, to date.

20. The claimant objected to the final admission of liability and began the Division Independent Medical Examination process.

21. On January 21, 2014, the claimant is seen by Dr. Lakin who notes that her condition has deteriorated and now includes in her diagnoses radiculopathy, muscle weakness, and loss of strength.

22. On January 30, 2014, the claimant returned to Dr. Lakin, who noted lumbar pain with radiculopathy, and an overall increase in pain complaints. Dr. Lakin states: "I have reservations of this [her industrial injury of May 7, 2013] MOI [mechanism of injury] causing L5-S1 disk bulging, and now with advancement of DDD with L3-4 bulge, DDD of right hip labrum with cam defect, she did improve and closed case, then on vacation in Mexico while walking has exacerbation or advancement of symptoms." At this point Dr. Lakin recommended an IME be performed to sort out her causation issues. He also referred the claimant to Dr. Sung for a surgical evaluation.

23. On February 25, 2014, Dr. Jeffery Raschbacher, M.D., performed a physician advisor review. In relevant part, Dr. Raschbacher states: "[t]he medical record indicates that she had a non-work related event, while on vacation. The treating physician, Dr. Lakin, requested an IME. It appears reasonable to conclude that with a non-work-related aggravation that further care should not be on the basis of her workers' compensation injury claim but rather outside of work, as it appears the aggravating event was fairly clearly not work-related." Dr. Raschbacher felt that it would still, however, be reasonable to obtain an IME.

24. On June 9, 2014, Dr. Elizabeth Bisgard, M.D. performed an IME, and issued a report.

25. Dr. Bisgard indicated that the claimant's pain reporting was not consistent with her presentation, and subsequently noted that the ATP, Dr. Lakin, noted this same inconsistency. ("On January 29, 2014, Dr. Lakin reevaluated [the claimant], noting that she was complaining of 10/10 pain and was using a walker but that she appeared to be in no acute distress.")

26. Dr. Bisgard stated that "the initial injury, which involved an SI strain, has now evolved into lumbar radicular pain, which is not consistent with her mechanism of injury or the EMG/NCV." She went on to note that the claimant has well documented degenerative disease in the lumbar spine and hip which, in addition to her obesity and deconditioning, is more likely than not the cause of her worsening condition and objective findings on the MRI.

27. Dr. Bisgard documented via report as follows:

a.) [The claimant] was treated for unrelated right plantar fasciitis and placed in a cast which in and of itself can lead to gait disturbance and SIJ dysfunction, unrelated to her work injury.

b.) [The claimant] was appropriately treated for her SIJ dysfunction related to the unbuckling the child from the harness. I agree with Dr. Ring that with 90% relief after the SIJ injection in September 2013, the likely pain generator was the SIJ and not the lumbar spine. Her symptoms improved and she was appropriately placed at MMI by Dr. Lakin.

c.) I am very concerned by her pain behaviors and nonphysiologic findings, which indicate that there may be a significant somatoform component to her reported pain. She has a preexisting history of depression.

d.) [The claimant] has an undisputed issue with morbid obesity, as well as significant underlying degenerative joint disease in her hip and degenerative disc disease in her back, which clearly predated her work injury and were not aggravated or accelerated by that injury. Her back symptoms were not consistent with her MRI findings, and they substantially worsened after her vacation to Mexico.

e.) [The claimant's] subjective reporting is not reliable or consistent.

28. Lee McFadden, M.D., was selected to perform the Division Independent Medical Examination (DIME), which took place on October 9, 2014. Dr. McFadden examined the claimant and reviewed all the medical records associated with her claim.

29. Dr. McFadden issued a DIME report on October 29, 2014.

30. Dr. McFadden diagnosed the following in his DIME report:

a.) SI joint inflammation, related, on a more probable than not basis, to the industrial injury of May 7, 2013.

b.) Chronic low back pain, unrelated, on a more probable than not basis to the underlying industrial injury May 7, 2013.

c.) Diffuse axial spine spondylosis and degenerative disc disease, pre-existing and unrelated to the industrial injury May 7, 2013, on a more probable than not basis. Neither temporarily nor permanently aggravated by the

industrial injury of May 7, 2013.

d.) Morbid obesity, pre-existing and unrelated to the industrial injury of May 7, 2013.

31. With respect to the issue of maximum medical improvement (MMI), Dr. McFadden states:

> I opine that the claimant has reached maximum medical improvement with regard to her industrial injury of May 7, 2013. Her industrial injury was a relatively innocuous event where she sustained a temporary aggravation or sprain of her right sacroiliac joint. Her low back evaluation was relatively benign at the time of her initial evaluation after her industrial injury of May 7, 2013 and she responded to a sacroiliac joint injection with approximate 90% relief of symptoms. She has had an intervening fall as well as exacerbation of her low back symptoms while vacationing since her industrial injury. She had reached maximum medical improvement and was returned to work without permanent impairment or workplace limitations by Dr. Lakin on October 30, 2013. I agree with this assessment.

32. With respect to the claimant's pain complaints, Dr. McFadden states:

> The claimant currently presents with pain out of proportion to objective findings primarily related to her axial spine. Her axial spine radiographs demonstrate chronic degenerative changes that have not, on a more probable than not basis, been either temporarily or permanently aggravated by her industrial injury of May 7, 2014. Her physical examination had significant pain behaviors and pain out of proportion to objective findings limiting the reproducibility and accuracy of any subjectively impacted measures such as range of motion or strength. Despite the inaccuracy and lack of reproducibility of her objective measures, this is a moot point regarding this evaluation as I opine that she has not sustained any permanent partial impairment with regard to her lumbar spine related to her industrial injury of May 7, 2013.

33. Dr. McFadden concluded his DIME report by noting:

> Her current symptom complex likely represents a combination of natural progression of disease process (diffuse spondlyosis and degenerative disk disease), the impact of morbid obesity on the stresses placed on her skeleton, and chronic pain.
>
> She has no focal findings related to her sacroiliac joint and I do not opine that she would require any further treatment to maintain maximum improvement for her transient SI joint aggravation sustained on May 7, 2013.

34. Dr. Timothy Hall testified at the hearing.

35. Dr. Hall opined as follows:

a.) Dr. Bess's assessment of the claimant was L5-S1 right sided degenerative disk herniation.

b.) Dr. Bess recommended a right sided L5-S1 laminotomy, discectomy, lateral recess decompression, and foraminotomy.

c.) Based on his understanding of the claim, he attributes Dr. Bess's assessment and recommendation for disk surgery to her May 7, 2013, industrial injury.

d.) The claimant was not treating for back problems prior to May 7, 2013.

e.) The claimant did not have any psychiatric history prior to May 7, 2013.

f.) The claimant consistently reported shooting radicular leg pain that has been getting progressively worse, since May 7, 2013.

g.) That he spent "about 20 minutes" reviewing the medical records in this matter, and formed his opinion based on the claimant's subjective history, and the records he reviewed.

36. It is not clear what, if any, records Dr. Bess relied on in forming his surgical opinion, and/or to what extent he relied on the claimant's subjective reporting of her history of injury and symptoms, in forming his opinion.

37. The post-hearing deposition of Dr. Elizabeth Bisgard, M.D., was taken on May 22, 2015.

38. Dr. Bisgard opined as follows:

a.) The claimant's symptoms do not correlate with her MRI findings.

b.) The claimant's symptoms were consistent with right sacroiliitis dysfunction following the May 7, 2013 injury.

c.) The claimant's MRI findings show that she had degenerative changes consistent with age related progression, and that this finding is not uncommon in individuals of her age group.

d.) A herniated disk does not explain her symptoms following the May 7, 2013 industrial injury. Rather, they are more indicative of a SI joint problem.

e.) If the claimant had a symptomatic herniated disk immediately following the industrial injury, we would see far more sensory changes in the S1 distribution, more leg symptoms, more diminished reflexes and strength along the muscles.

f.) The SI injection done by Dr. Finn on September 17, 2013,

provided claimant 90% relief. If the SI joint was not the pain generator and not the issue, she wouldn't have gotten that significant relief. The SI injection confirms that this is a SI joint issue and not a disk issue.

g.) Dr. Hall makes no mention in his testimony anything about her two subsequent intervening events.

h.) She has reviewed the records and agrees that the claimant was appropriately placed at MMI without permanent impairment by the ATP, Dr. Lakin.

i.) She has reviewed the DIME report and agrees with Dr. McFadden that the claimant was appropriately placed at MMI without permanent impairment.

j.) Dr. Hall is incorrect in stating that the claimant was consistently reporting pain shooting into her legs from May 7, 2013. On the contrary, the claimant was not reporting pain shooting into her legs from May 7, 2013. Rather, the claimant reported pain shooting into her legs months later, and after she had two intervening events, including her trip to Mexico where she had an increase in symptoms. Moreover, her condition had improved significantly at the time she was placed at MMI, and later deteriorated.

k.) That she spent three hours reading the detailed medical records. The 20 minutes that Dr. Hall spent to review all of these records, is not an adequate time to get a thorough understanding of this case. Dr. Hall's opinion is based on an inaccurate and/or incomplete understanding of the medical records.

l.) That the claimant had non-physiologic findings, which were also documented by the treating physician, as well as the DIME physician.

m.) Dr. Hall was incorrect in stating that the claimant did not have any psychiatric history. The records demonstrate that the claimant did in fact have a psychiatric history going back 12 years. The claimant was taking medication (Prozac) for this condition.

n.) The claimant's two intervening events, more likely than not, are responsible for her current symptoms, and that the claimant had subjective symptoms that do not match up with her objective findings.

39. The ALJ finds that Dr. Hall's analysis and opinions only rise to the level of establishing a difference of opinion and do not show any clearly erroneous analysis or opinions of the DIME physician Dr. McFadden.

40. The ALJ finds that the opinions of Dr. Bisgard, Dr. Lakin, and Dr. McFadden are more credible and persuasive than medical opinions to the contrary.

41. The totality of the documentary evidence and diagnostic testing is more reliable than the claimant's testimony.

42. The claimant is noted to have non-physiologic findings by the ATP Dr. Lakin, the DIME Dr. McFadden, and the IME Dr. Bisgard.

43. The ALJ finds that the claimant has failed to prove that Dr. McFadden was clearly in error when he opined that the claimant was at MMI on October 30, 2013.

44. The ALJ finds that the claimant has failed to prove that Dr. McFadden was clearly in error when he opined that the claimant suffered no permanent impairment.

CONCLUSIONS OF LAW

1. The purpose of the Workers' Compensation Act of Colorado in §8-40-101, et. seq. C.R.S. (2013) is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers without the necessity of litigation. See §8-40-102(1).

2. A worker's compensation case is decided upon its merits. See §8-43-102, C.R.S.

3. Facts in a workers' compensation case must be interpreted neutrally neither in favor of the rights of a claimant nor in favor of the rights of the respondents. See §8-43-201, C.R.S.

4. The Judges' factual findings concern only evidence that is dispositive of the issues involved: the Judge cannot address every piece of evidence that might lead to a conflicting result. See *Magnetic Engineering, Inc. v. ICAO*, 5. P.3d 285 (Colo. App. 2000).

5. When determining credibility the fact finder should consider among other things the consistency or any inconsistencies of the witnesses testimony or actions; the reasonableness or unreasonableness (probability or improbability) of the testimony or actions; the motive of the witness: and whether the testimony would have been contradicted and bias, prejudiced, or in any. See *Impure Prudential Insurance Co. v. Coin*, 57 P.2d 1205 (1936)

6. The findings of a Division Independent Medical Examiner (DIME) may be overcome only by clear and convincing evidence. § 8-42-107(8)(c), C.R.S. "Clear and convincing" evidence is stronger than a preponderance, is unmistakable, and is free from serious or substantial doubt. *Martinez v. Triangle Sheet Metal, Inc.* (W.C. 4-595-741, ICAO October 8, 2008), *citing Dilco v. Koltnow,* 613 P.2d 318 (1980). A mere

difference of medical opinions is insufficient. *Medina-Weber v. Denver Public Schools* (W.C. 4-782-625, ICAO May 24, 2010).

7. The question whether a party has overcome the DIME by clear and convincing evidence is one of fact for the ALJ's determination. *Metro Moving and Storage Co. v. Gussert,* 914 P.2d 411 (Colo. App. 1995). "[A] mere difference of medical opinion does not constitute clear and convincing evidence that the DIME physician's opinion is incorrect or in error." *Patterson v. Comfort Dental East Aurora*, (W.C. No. 4-874-745-01, ICAO February 14, 2014); *See also Javalera v. Monte Vista Head Start, Inc.,* (W.C. No. 4-532-166, ICAO July 19, 2004); *Gonzales v. Browning Industries of Colorado*, (W.C. No. 4-350-356, ICAO March 22, 2000).

8. As found above, the ALJ concludes that the medical opinions of the DIME physician, Dr. McFadden, have not been overcome by clear and convincing evidence, as Dr. Hall's opinions only amount to a difference of opinion.

9. The ALJ concludes that the claimant has failed to establish by clear and convincing evidence that the DIME physician, Dr. McFadden was clearly wrong when he assessed the claimant to be at MMI on October 30, 2013.

10. The ALJ concludes that the claimant has failed to establish by clear and convincing evidence that the DIME physician, Dr. McFadden was clearly wrong when he assessed that the claimant suffered no permanent impairment as a result of her industrial injury of May 7, 2013.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The claimant's challenge to the DIME with respect to MMI and impairment is denied and dismissed.

2. All matters not determined herein, and not closed by operation of law, are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

- Did Claimant prove by a preponderance of the evidence that her lumbar spine problems are related to her claim, and that lumbar-directed injections are reasonable, necessary, or related to her claim?

- Did Claimant prove by a preponderance of the evidence that platelet-rich plasma ("PRP") injections and/or stem-cell injections are reasonable, necessary, or related to her claim?

FINDINGS OF FACT

Based upon the evidence presented at hearing, the judge enters the following findings of fact:

1. Claimant is a 59 year old former employee of Employer. On November 14, 2013, she stood up from her chair and fell on her right hip after her foot was caught in the chair. Brandon Reiter, D.O. evaluated Claimant at HealthOne that day. Claimant complained of pain in her hip and difficulty with weight-bearing. There is no reference to low back pain. X-rays of Claimant's hip were negative. Dr. Reiter diagnosed a right hip strain.

2. On November 20, 2013, Claimant began physical therapy at HealthOne. Claimant's pain complaint was noted to be located in the right hip. Claimant made no recorded complaints as to her back. Treatment is only noted to have been directed to Claimant's right hip.

3. On November 21, 2013, Claimant continued to complain to Dr. Reiter of pain across her hip, into her thigh, and also radiating to her right knee. There is no discussion of back pain. On November 27, 2013, Claimant continued to report severe right hip pain at physical therapy. Therapy was directed to Claimant's right hip, hamstring, quad and IT band.

4. On December 2, 2013, Cheryl Parent, PT noted for the first time Claimant complained of back pain. Despite characterizing the complaints as "continued pain in the right hip, buttock, and back," therapy is noted to actually be directed to the lumbar spine for the first time.

5. On December 16, 2013, Dr. Reiter referred claimant for an MRI of the right hip due to her continued complaints of right hip pain. Dr. Reiter commented on December 30, 2013, that the MRI showed a displaced right femoral neck fracture with some degenerative changes. He referred Claimant to an orthopedist, Michael Hewitt, M.D. On January 6, 2014, Dr. Reiter noted Dr. Hewitt wanted Claimant to stay off her leg and was hopeful the hip would heal on its own without surgery.

6. On February 24, 2014 Claimant complained to Dr. Reiter of tingling and needle sensations in her lateral hip and buttock region on the right side. Dr. Reiter noted Dr. Hewitt had recommended Claimant start physical therapy or pool therapy and that she try to wean off crutches.

7. On March 3, 2014, Dr. Reiter noted for the first time that Claimant complained of pain in her right lumbar paraspinal muscles with decreased range of motion in her lumbar spine. This was on Claimant's tenth visit with Dr. Reiter. Dr. Reiter did not analyze or opine whether he felt Claimant's low back pain was work-related. Claimant also complained of pain in her right hip. Dr. Reiter referred her to pool therapy.

8. On March 27, 2014, Claimant reported continuing spasms in her hip and back to Dr. Reiter. He noted that Dr. Hewitt recently again had recommended continued pool therapy and weaning off crutches. Dr. Reiter referred Claimant for a lumbar MRI on April 10, 2014.

9. The lumbar MRI occurred on April 18, 2014. It showed scoliosis, mild spondylosis, a protrusion at L2-3 resulting in mild left inferior foraminal stenosis, a bulging annulus at L3-4 which was combing with arthritis resulting in stenosis, a foraminal protrusion and annular fissure at L4-5 with mild stenosis, and arthritis at L5-S1. On April 24, 2014, Dr. Reiter noted reviewing the MRI and referred Claimant for a physiatry evaluation with Dr. Usama Ghazi.

10. Dr. Ghazi first evaluated Claimant on April 30, 2014. Dr. Ghazi noted Claimant had a healing right hip fracture, had been referred to pool therapy which caused increased buttock pain that radiated into her lower extremity, and still had pain complaints over her hip, lateral thigh, and radiating pain down her leg. Dr. Ghazi performed an ultrasound which revealed evidence of bursitis with fluid in the subgluteal/trochanteric bursa and fluid around the gluteus medius tendon. Dr. Ghazi diagnosed a right-sided trochanteric and gluteal bursitis, right-sided iliopsoas tendinitis, right-sided lateral femoral cutaneous neuralgia/meralgia paresthetica, and right-sided SI joint pain with piriformis syndrome. Dr. Ghazi referred Claimant for osteophathic treatment and acupuncture, he prescribed Gabapentin and a topical compounding ointment, and he noted bursa injections may be indicated in the future.

11. On June 10, 2014, Dr. Ghazi noted Claimant could not tolerate NSAIDs and had allergies which precluded attempting steroid injections. She had pain over the hip and lower back with tightness at the iliotibial band. He prescribed massage therapy and continued physical and pool therapy.

12. As of August 26, 2014, Dr. Ghazi recommended anesthetic only injections without steroids. Dr. Ghazi noted that, other than the anesthetic-only injections, her "only options" would be PRP injections which Dr. Ghazi noted would require multiple injections and cause post-injection flares of pain "that might be cruel and unusual to have her go through that many injections with increased discomfort." Despite saying PRP and anesthetic-only injections were her only options; he then discussed amniotic stem cell injections as another, more expensive, option. He noted such injections "have been used in studies on inflammatory conditions such as knee arthritis," and he had used them in his clinic.

13. On October 14, 2014 Dr. Ghazi's office requested authorization for two stem cell injections, at an apparent cost of $7,000 per injection. In a letter to Dr. Reiter dated October 15, 2014, Dr. Ghazi recommended the stem cell injections to the trochanteric bursa and gluteal bursa in conjunction with his finding that she had fluid on her ultrasound in that area. He then for the first time noted that, "If all else fails, we can try diagnostic medial branch blocks with anesthetic only and then pursue the rhizotomy from the right side for the lumbar facets and sacroiliac joint." Dr. Ghazi does not appear to have analyzed the relatedness of the back complaints in his treatment notes, nor does he reference any conclusion that he felt the complaints were related.

14. Dr. James Lindberg, M.D. performed a DOWC Rule 16 review of the request for prior authorization of the stem cell injections and issued a report dated October 20, 2014. Dr. Lindberg noted that stem cell injections and PRP injections were not recognized treatments in the *Medical Treatment Guidelines*. He also pointed out that Claimant's continued pain raised some concern as to the presence of nonunion or avascular necrosis, and a repeat MRI should first be done before performing any additional therapies.

15. Dr. Ghazi noted reviewing Dr. Lindberg's recommendation for denial on October 29, 2014. On that date, he documented that Claimant complained of her low back at L4-5 and L5-S1 being her most painful body part, which is expanded from his initial diagnosis of SI pain only. Dr. Ghazi recommended injections into the L4-L5 and L5-S1 facet joints. The ALJ notes that just the appointment before, Dr. Ghazi referred to the medial branch blocks as a potential "last ditch" option if all else failed. While it is not clear to the ALJ why branch blocks to treat a back condition would be a last ditch effort if hip injections failed, Dr. Ghazi shifted course and recommended the branch blocks before completing his pursuit of the hip injections. Dr. Ghazi noted his disagreement with Dr. Lindberg's opinion. He stated Claimant's limited treatment options were stem cell injections or PRP injections. He did state, though, that he would follow-through with Dr. Lindberg's recommendation for a repeat MRI.

16. On October 30, 2014, Dr. Ghazi submitted a request for authorization of L4-L5 and L5-S1 facet injections without steroid or dye. Dr. Lindberg reviewed the requests for authorization and recommended denial of the injections because no MRI had been done to determine the existence of lumbar pathology. He also noted in reference to the hip recommendations that the repeat hip MRI and not yet been done, and a local injection of anesthetic into the bursa had not been done as a diagnostic tool.

17. On November 14, 2014 Claimant's right hip MRI occurred. The MRI was read as normal. Dr. Ghazi next evaluated Claimant on November 26, 2014. He noted the normal MRI findings were "interesting" since he had found fluid in the trochanteric and gluteal bursa during his prior ultrasound examination. Dr. Ghazi administered the anesthetic-only injection into the bursa. He also noted following through with Dr. Lindberg's recommendation to order the lumbar MRI. However, he stated he would proceed with the medial branch blocks once the lumbar spine MRI was completed, without showing any regard to whether the results would affect his opinion. He also stated he would request authorization for the stem cell injections into the trochanteric and gluteal bursa as well once the lumbar MRI was completed. The ALJ notes he

apparently planned to do so without first receiving any report of the effect over time of the anesthetic-only injection.

18. The lumbar MRI occurred on December 11, 2014 and was compared MRI with her April 18, 2014 MRI. The latter showed moderate lumbar scoliosis, normal soft tissues, and no changes since the April 2014 MRI at all levels. The impression was a stable moderate scoliosis with degenerative disc and joint changes and a mild dural sac indentation.

19. On December 19, 2014, Claimant reported to Dr. Ghazi that she received 100% relief from the anesthetic injection for 10 hours. Dr. Ghazi again recommended the stem cell injections. PRP injections were again listed as an alternative treatment option, but he preferred stem cell injections due to the probable lack of a painful inflammatory response. Dr. Ghazi stated Claimant's lumbar MRI showed "facet arthrosis without severe stenosis" and he reiterated his request for lumbar facet injections. He submitted the request for authorization of the stem cells on December 22, 2014.

20. Dr. Lindberg reviewed the new requests on December 26, 2014. He noted the MRI of the hip showed no abnormalities. He stated there was considerable doubt as to whether the stem cell injections, and also possibly PRP injections, would be effective and they were not included in the treatment guidelines. He recommended both be denied, and he recommended a course of specific therapy for IT band stretching and hip muscle strengthening as a better alternative. Dr. Lindberg also noted not having the lumbar MRI results to review, but he felt the injections should continue to be denied until the MRI results could be reviewed by a spine specialist.

21. On January 22, 2015, Dr. Ghazi recommended physical therapy to stretch the iliotibial band and strengthen the hip muscle, but he felt physical therapy had already been attempted without success. He also expressed surprise that Dr. Lindberg had not been able to review the lumbar MRI. He felt his clinical exam was sufficient to diagnosis facet joint pain and the medial branch blocks were indicated regardless of the MRI results.

22. On March 17, 2015, on behalf of Respondents, Dr. Jeffrey Wunder, M.D. performed an IME of Claimant to evaluate the question of both treatment for the hip and the lumbar spine. Claimant described her cumulative pain complaints as 7/10, both on average and at that time. She described her right hip pain and buttock pain as worse than her low back pain. On physical examination, Dr. Wunder identified several non-organic findings. He noted Claimant reported right lumbosacral pain with facet loading to the left and right which "would not be consistent with isolated right-sided facet joint pain." He also noted Claimant had "strong Waddell findings. She had overactive pain behavior . . . diffuse skin tenderness, increased pain with rotation at the knees, and discrepant straight leg raising," as well as a "non-physiologic sensory examination."

23. Dr. Wunder concluded that Claimant's positive response to the anesthetic injection into her bursa indicated she had soft tissue pain which extended into her buttock, trochanter, inguinal ligament, and medial thigh, and there was no intra-articular pain generator. He stated "the only treatment for this would be physical therapy, which has not been extremely successful." He agreed with Dr. Lindberg's recommendation

that Dr. Ghazi's request for use of stem cell or PRP injections should be denied. He also agreed with Dr. Lindberg's recommendation for additional, specifically directed, physical therapy by a therapist experienced in soft tissue gluteal pain, but he was not confident she would receive much additional benefit.

24. Dr. Wunder stated Claimant's lumbar complaints were not likely related to the work-injury. He noted Claimant had undergone multiple physician and physical therapy treatments after the accident without first reporting low back pain. He noted the mechanism of injury would have led to a tissue injury which in turn would have generated an inflammatory pain response within 72 hours. He stated Claimant's reports of lumbar pain first at physical therapy on December 2, 2013, and then to Dr. Reiter for the first time in March 2014, did not establish her symptoms were related to the incident.

25. Dr. Wunder stated he felt Dr. Ghazi's request for medical branch blocks was moot due to the relatedness issue, but he also noted he felt Claimant had a poor prognosis for any treatment, for reasons including her "prominent" Waddell findings. He specifically noted he could not elicit specific facet loading response in relation to the medial branch blocks request, as she had no specific pain produced by facet loading maneuvers on physical examination.

26. On March 23, 2015 Dr. Ghazi evaluated Claimant. He noted Dr. Wunder's recommendation that all treatment other than physical therapy be denied. He expressed support with starting the physical therapy.

27. On April 16, 2015, Dr. Reiter noted Claimant had started physical therapy and dry needling. She had improving range of motion in her right hip in flexion and external rotation with continued pain complaints.

28. Claimant testified at hearing. Claimant testified she hurt initially in her right hip. She also testified that she hurt from the beginning from above her waist into her leg, as well as pain in her mid-back, buttocks, and hip. When asked when she noticed pain beyond the hip, Claimant testified the "concern was ongoing" and she could not pinpoint her pain. Claimant testified she wanted the injections to obtain relief and to help her regain functionality to perform everyday activities. When asked by her counsel about Dr. Ghazi's statements about the concerns he had proceeding with the outlined treatment, Claimant testified "I wasn't aware of anything like what was announced here this morning." She also testified Dr. Ghazi had not told her the PRP treatment could be considered "cruel and unusual" treatment, and she "absolutely [had] never heard that."

29. Dr. Lindberg testified that Claimant's initial injury was a non-displaced neck fracture of the right hip, which healed itself non-operatively, and there were no remaining abnormalities noted in Claimant's most recent November 2014 MRI. He testified Claimant's current pain generator was likely a soft tissue contusion and scarring with a probable element of greater trochanteric bursitis. He explained that when Claimant fell, she likely contused the skin, the fat, her iliotibial band (explained as the band which connects the pelvic crest to the top of the femur), and her bursa (explained as a sliding sack that lets tissues move over each other). However, the November 2014 MRI showed no bursa abnormalities.

30. Dr. Lindberg discussed that an MRI is very sensitive to finding fluid in a bursa. He testified it was possible the fluid seen on Dr. Ghazi's April 2014 ultrasound had resolved itself, which would represent an objective improvement in Claimant's condition. He also testified Dr. Ghazi's recommendations have become more invasive in the same time period as that improvement was seen. Dr. Lindberg testified there was no objective evidence to correlate Claimant's subjective level of complaints, although her complaints of pain in general were an objective finding of continued symptoms.

31. Dr. Lindberg testified the request for stem cell injections and/or PRP injections was not reasonable and necessary treatment. He testified Claimant's successful diagnostic response to the anesthetic only injection to the bursa was not an indicator of success for the requested injections. Significantly, Dr. Lindberg noted Dr. Ghazi had recommended stem cell injections and PRP injections even before the pain generator was identified through the diagnostic injection which he, Dr. Lindberg, had recommended. He testified Dr. Ghazi's recommendation for the injections before identifying the pain generator had been "putting the cart before the horse."

32. He further testified stem cell injections were investigative and experimental, and there were no peer review studies that show Claimant would receive a positive response from the treatment. As to PRP injections, he testified those are also investigational and experimental treatment, and are not considered a standard treatment for a hip bursitis. He testified he recently received from his surgical partner a report that the American Academy of Orthopedic Medicine had recently discussed that additional studies are still needed to determine when and where to use these treatments. He testified he was not aware of any studies that show clinical effectiveness for injecting stem cells or PRP to treat greater trochanteric bursitis. He also testified he was familiar with the Division of Workers' Compensation *Medical Treatment Guidelines*, and neither type of injection was considered accepted treatment under the *Guidelines*. He did not believe either injection was appropriate treatment in any circumstance other than a controlled study group.

33. Dr. Lindberg testified the most important treatment for a greater trochanteric bursitis is stretching the iliotibial band and strengthening the hip muscles, which he has recommended in this claim. He noted both he and Dr. Wunder came to the same conclusions as to Claimant's diagnosis and treatment recommendations for the hip. Dr. Lindberg discussed the non-physiological findings identified by Dr. Wunder on examination. He noted the type of non-physiological findings were those associated with a patient trying to convince a physician she was in pain, and they were red flags and indicators that Claimant would not receive much benefit from any further treatment.

34. The ALJ finds that Claimant did not prove by a preponderance of the evidence that the stem cell or PRP injections constitute reasonable and necessary treatment for her hip condition. Dr. Lindberg persuasively opined that both stem cell and PRP injections are not reasonable and necessary treatment for Claimant's complaints. Dr. Lindberg explained that medical literature contained no support in clinical trials for the proposition that the injections would provide a benefit. Dr. Lindberg and Dr. Wunder were in agreement that no further invasive treatment was needed for Claimant's hip condition other than IT band stretching and hip muscle strengthening.

35. The ALJ finds that Claimant did not prove by a preponderance of the evidence that her lumbar spine complaints are causally related to the November 14, 2013 claim, and also did not prove by a preponderance of the evidence that further lumbar-directed care is reasonable or necessary. Dr. Wunder documented the delay in complaints relating to the low back relative to the expected timeframe for such complaints to arise. Regardless of causation, the ALJ further finds that the lumbar medial branch blocks are also not reasonable and necessary medical treatment based upon Claimant's non-physiological findings and the prognosis of Dr. Wunder that she would likely not receive a verifiable benefit from the injections. Dr. Wunder's opinion that no further care was needed for Claimant's lumbar spine, in conjunction with his findings of prominent Waddell findings and non-specific facet maneuvers, is credible and persuasive.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the Judge draws the following conclusions of law:

The purpose of the "Workers' Compensation Act of Colorado" is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of any litigation. § 8-40-102(1), C.R.S. The facts in a Workers' Compensation case are not interpreted liberally in favor of either the rights of the injured worker or the rights of the employer. § 8-43-201, C.R.S.

The ALJ's factual findings concern only evidence that is dispositive of the issues involved; the ALJ has not addressed every piece of evidence that may lead to a conflicting conclusion and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5 P.3d 385 (Colo. App. 2000).

A claimant in a Workers' Compensation claim has the burden of proving entitlement to benefits by a preponderance of the evidence. § 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). In deciding whether an injured worker has met the burden of proof, the ALJ is empowered "to resolve conflicts in the evidence, make credibility determinations, determine the weight to be accorded to expert testimony, and draw plausible inferences from the evidence." *See Kroupa v. Indus. Claim Appeals Office*, 53 P.3d 1192, 1197 (Colo. App. 2002). The weight and credibility to be assigned evidence is a matter within the discretion of the ALJ. *Cordova v. Indus. Claim Appeals Office*, 55 P.3d 186 (Colo. App. 2002).

Respondents are required to provide medical benefits reasonably necessary to cure or relieve the effects of the industrial injury. § 8-42-101(1), C.R.S. (2014); *Snyder v. ICAO*, 942 P.2d 1337 (Colo. App. 1997). The question of whether the need for treatment is causally-related to an industrial injury is one of fact. *Wal-Mart Stores, Inc. v. Industrial Claims Office*, 989 P.2d 251 (Colo. App. 1999). Similarly, the question of

whether medical treatment is reasonable and necessary to cure or relieve the effects of an industrial injury is one of fact. *Kroupa*, 53 P.3d at 1197.

When evaluating the issue of causation and reasonable and necessary medical care the ALJ may consider the provisions of the Colorado *Medical Treatment Guidelines* because they represent the accepted standards of practice in workers' compensation cases and were adopted pursuant to an express grant of statutory authority. However, the *Medical Treatment Guidelines* are not dispositive, and the ALJ need not give them more weight than she determines they are entitled to in light of the totality of the evidence. *See Cahill v. Patty Jewett Golf Course*, W.C. No. 4-729-518 (ICAO, February 23, 2009).

Stem Cell and/or PRP Injections are not Reasonable or Necessary Treatment for Claimant's Right Hip Injury.

The first issue for the ALJ's determination is whether Claimant proved by a preponderance of the evidence that the stem cell or PRP injections recommended by Dr. Ghazi constitute reasonable or necessary treatment for her hip condition. Claimant has failed to meet her burden in this regard.

Dr. Lindberg persuasively testified that both types of injections were investigative and experimental, and there were no peer review studies that show that Claimant would receive a positive response from the treatment. He testified he was not aware of any studies that show clinical effectiveness for stem cell injections or PRP injections to treat greater trochanteric bursitis. Dr. Ghazi's treatment recommendations did not dispute this contention, in that he noted only that he used these types of injections in his practice and they had been used in studies on inflammatory conditions such as knee arthritis. He does not state they have been proven clinically effective, only that they had been used in clinical studies treating a different body part. To the contrary, Dr. Lindberg noted they had been studied, they had not been proven effective, and the American Academy of Orthopedic Medicine had recently determined more studies were needed to determine their efficacy.

Also relevant to the ALJ's consideration is Dr. Lindberg's testimony that neither type of injection was considered accepted treatment under the *Medical Treatment Guidelines.* While the ALJ understands that the *Medical Treatment Guidelines* are not dispositive, they are instructive as to standards of care and accepted medical practice. In conjunction with Dr. Lindberg's testimony as to the still uncertain results from clinical studies of stem cell and PRP injections, their absence as an accepted treatment method in the *Medical Treatment Guidelines* is further evidence that the injections would not constitute accepted reasonable and necessary treatment for Claimant's condition.

The ALJ notes the documented course of Dr. Ghazi's treatment recommendations calls into question the reliability of his recommendations and whether they serve the Claimant's best interests. Of concern, Claimant expressed surprise and a level of fear at being presented with Dr. Ghazi's stated opinion in his notes that PRP injections would constitute "cruel and unusual" treatment due to the likely inflammatory response. She testified she was not aware he had characterized the treatment in that manner, which calls into question the level of communication at which Dr. Ghazi has

engaged Claimant to communicate the actual risks and benefits of his treatment recommendations. The ALJ also credits Dr. Lindberg's testimony that Dr. Ghazi prematurely recommended the injections, even before performing a diagnostic injection to accurately identify a pain generator, which calls into question the underlying basis for the treatment recommendation.

The ALJ further credits the opinions of both Dr. Lindberg and Dr. Wunder that the identification of the pain generator as the greater trochanteric bursa without findings on MRI only required specifically directed physical therapy to stretch the iliotibial band and strengthen the hip muscles. It appears that therapy only recently began, but as of April 16, 2015, Dr. Reiter noted Claimant had improving range of motion. Although Claimant's pain complaints have remained steady, Dr. Lindberg credibly testified the difference between her April 2014 ultrasound and November 2014 MRI possibly represented an improvement in her condition. Conversely, Dr. Ghazi's treatment recommendations have become inexplicably more invasive over that timeframe even after it was confirmed Claimant had no remaining fluid in her bursa, which had originally been one of Dr. Ghazi's primary stated reasons for attempting the injections.

Claimant failed to prove by a preponderance of the evidence that stem cell injections or PRP injections are reasonable and necessary treatment for her hip condition in general, and especially in light of the fact that Claimant has not completed the recommended course of conservative treatment that was agreed upon by both Dr. Lindberg and Dr. Wunder, and ordered by Dr. Ghazi.

Claimant's Lumbar Condition is not Causally Related to this Claim, and the L4-L5, L5-S1 Medial Branch Blocks are Not Reasonable or Necessary Treatment.

The second issue for the ALJ's determination is whether Claimant's lumbar complaints are related to this claim, and if so, whether the L4-L5, L5-S1 medial branch blocks constitute reasonable and necessary treatment. Claimant has failed to meet her burden in either regard.

As to causation, the ALJ notes the first mention of lumbar back pain first arises approximately three weeks after the date of injury in physical therapy notes. Perhaps more instructive, Dr. Reiter did not document any complaints of back pain until almost four months after the injury. In addition, Claimant testified at hearing that her pain was in her mid-back region, not her lumbar region. The ALJ finds credible Dr. Wunder's opinion that Claimant should have felt associated pain in her back within 72 hours of the incident, but it is not reflected in the records that Claimant complained to her treating physician of such pain for almost four months. Although Claimant vaguely testified she had severe pain all over after the fall and she could not pinpoint her pain, the treatment notes document specific pain complaints to different parts once the lumbar pain complaints arise in the records even while she has continued to complain of severe pain. Her pain complaints to her back and hip, once documented, have been distinct with different treatment recommendations for each.

The ALJ also notes that none of the treating physicians in this claim have engaged in any analysis of relatedness, nor is there a medical opinion in evidence contrary to Dr. Wunder's stating the lumbar pain is a related condition. It has simply

been documented and conservatively treated since Claimant's complaints arose. The only evidence in support of Claimant's argument is her subjective complaints.

Claimant's subjective complaints in her lumbar spine appear to have expanded, initially in April 2014 to lead to a diagnosis of SI joint pain by Dr. Ghazi and then months later to include additional higher levels of the lumbar spine. However, the comparison MRI showed her lumbar spine pathology had not changed at all between the MRIs of April 18, 2014 and December 11, 2014. Claimant's expanding complaints so far in time from the date of injury support the conclusion that her low back complaints are not related to the claim. Moreover, Claimant's reliability as a subjective reporter of symptoms is also called into question by Dr. Wunder's finding of multiple "prominent" Waddell signs which Dr. Lindberg testified would be indicative of a patient trying to convince her physician that she was having pain. As found, Claimant has not met her burden of proof to show her lumbar symptoms are causally related to this claim.

Secondarily, the ALJ finds that Claimant has not met her burden in proving the medial branch blocks are reasonable and necessary treatment even if her lumbar complaints were related. The ALJ notes that, as he did with Claimant's hip condition, Dr. Ghazi recommended the medial branch blocks before requesting a current MRI to determine her pathology. He stated in his notes that an MRI was unnecessary based upon his clinical findings alone. However, Dr. Ghazi originally only diagnosed SI joint pain based on his clinical exam on April 30, 2014. He later noted Claimant's back complaints expanded to higher levels, despite objective evidence of no change in her spinal pathology between that April 30, 2014 and December 11, 2014. The ALJ determines Dr. Ghazi's clinical examination is insufficient to identify an injury other than to treat subjective complaints of pain.

As earlier noted, Dr. Lindberg credibly testified and Dr. Wunder credibly documented that there were concerns with Claimant's reliability as a subjective reporter of symptoms. Dr. Wunder noted in general that the extent of "prominent" Waddell findings he documented indicated a poor prognosis for any treatment, including the medial branch blocks. Significantly, Dr. Ghazi discussed reviewing these findings with Claimant, and he provided no counter-argument to Dr. Wunder's findings, nor did he dispute the presence of Waddell findings. Dr. Wunder's opinion in this regard appears to be unchallenged. The ALJ credits Dr. Wunder's findings and opinions. Lumbar medial branch blocks are not reasonable or necessary and Claimant's request for same is denied.

ORDER

Based upon the foregoing findings of fact and conclusions of law, the Judge enters the following order:

1. Claimant's claim for right hip stem cell and/or PRP injections are denied as Claimant has failed to prove that this care is reasonable or necessary treatment for this claim.

2. Claimant has failed to prove that her lumbar symptoms are causally related to this claim, or that the L4-L5 and L5-S1 medical branch blocks are reasonable, necessary, or related treatment to this claim.

DATED: June 18, 2015

/s/ Kimberly Turnbow
Kimberly B. Turnbow
Administrative Law Judge
Office of Administrative Courts
1525 Sherman St., 4th Floor
Denver, CO 80203

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUES

The issues to be determined are compensability, medical benefits, and whether or not Claimant was an employee of Respondent-Employer or an independent contractor on October 29, 2013.

STIPULATION

Prior to the examination of witnesses, the parties reached the following stipulation:

If Claimant's claim is found compensable and if he is entitled to temporary total disability ("TTD") benefits, those benefits should be paid for the period between October 30, 2013 to February 12, 2014.

FINDINGS OF FACT

Based upon the evidence presented at hearing, the Judge enters the following findings of fact:

Background

1. The employer named in this claim is Natural Resources Group, Inc. (hereinafter "NRG") NRG was established in 2000 and in 2010 acquired Energy, Oil and Gas, Inc. (hereinafter "EOG") through an asset purchase.

2. Dwayne Bacon was affiliated with EOG and owned assets in a gas field located in an area close to Claimant's residence. Mr. Bacon's assets were among those NRG purchased in 2010. After the purchase of his assets, Mr. Bacon became an employee of NRG.

3. Gas produced from wells around Claimant's residence is piped to and consolidated at a storage facility known as the Garcia Gas Plant.

4. In September 2008 Claimant was approached by Mr. Bacon and asked if he would be interested in working as a "pumper" for EOG. Pumpers monitor gas wells to ensure that they are staying in production. A pumper's duties include checking the various valves, pipes, compressors and pressure gauges on the equipment used in extracting gas from the ground and pumping it to the Garcia Plant. In addition, pumpers maintain and fix any equipment necessary to keep the well

in production. At the end of the month, Claimant would fill out a log book documenting meter readings for the various wells in the field and sent them along with the hours he worked to Mr. Bacon.

5. Claimant testified that Mr. Bacon "hired" him; however, he presented no evidence of a contract demonstrating the employer-employee relationship he asserts was formed at this time.

6. At the time he was approached in 2008, Claimant informed Mr. Bacon that he knew nothing about the gas business.[1] According to Claimant, Mr. Bacon told him that he would teach him. Mr. Bacon provided training in the form of an overview of how the equipment worked and what to do when common problems arose. Claimant accepted Mr. Bacon's offer and began working for EOG in 2008.

7. Claimant was paid $15.00/hour for his work with EOG. His wages were paid directly by Mr. Bacon and in his name.

8. At first, Claimant relied heavily on Mr. Bacon to trouble shoot the various problems that would arise in the field given his lack of knowledge; however, as his knowledge improved, Claimant was able to rely less on Mr. Bacon for day to day operations. Nonetheless, due to his experience level, Claimant would occasionally require direction and assistance from Mr. Bacon on special problems and repairs which occasionally arose in the field. On these occasions, Mr. Bacon would come down to the field, take control of the situation and direct Claimant in completing the job or repairs required to keep the well in operation. In the alternative, Mr. Bacon would make arrangements for a contractor to come in and assist Claimant to assure that the work was done correctly and on time. This arrangement between Claimant and Mr. Bacon continued after NRG acquired EOG.

9. Based upon the totality of the evidence, the ALJ finds that Claimant was an employee of EOG. Although Claimant did not apply or interview with Mr. Bacon and there is no contract for hire, the ALJ is persuaded that Mr. Bacon "hired" Claimant who was under his control and direction from 2008 until EOG was acquired by NRG in 2010.

10. Claimant continued to perform work for NRG in the capacity of a pumper between 2010 and October 29, 2013 when he sustained injuries to his right hip.

The October 29, 2013 Injury

11. On October 29, 2013, Claimant was working at the Garcia plant as a pumper. While off loading water from a gas storage tank, Claimant turned to check a cooling unit. As he turned, he tripped over an exposed pipe at ground level. Claimant fell, fracturing his right hip.

[1] Claimant had previously worked as a brand inspector for the State Board of Stock Inspectors for thirty (30) years and had retired from this position.

12. After Claimant fell, he was able to get to his truck with the use of a crutch fashioned from a piece of pipe. Claimant then drove approximately two miles to his house. Once at his house Claimant was taken by his wife to Mt. San Rafael Hospital in Trinidad for evaluation. CT scan was obtained which demonstrated findings consistent with intertrochanteric fracture of the right hip.

13. After being examined by the physicians at Mt. San Rafael Hospital, Claimant was transported by ambulance to St. Mary Corwin Hospital where he was evaluated by orthopedic surgeon Dr. Charles Hanson. Dr. Hanson diagnosed Claimant with a post fall related acute right hip injury resulting in a closed, simple, oblique right hip intertrochanteric fracture.

14. On October 30, 2013, Claimant had surgery under Dr. Hanson consisting of an open reduction internal fixation of the right hip. Post surgical care consisted of exercise, medication and follow up visits with Dr. Hanson.

15. Claimant received treatment from the following providers: Trinidad Ambulance Service, Mt. San Rafael Hospital, St. Mary Corwin Hospital, Charles A. Hanson, M.D. and providers at the Hanson Clinic.

16. The ALJ finds the imaging studies and examination of Dr. Hanson performed within hours of Claimant's trip and fall to contain objective evidence of right hip fracture consistent with the stated mechanism of injury as testified to by Claimant. The ALJ finds more probably than not, that Claimant fractured his right hip when he fell to the ground after tripping on an exposed pipe while attempting to check a cooling unit on a storage tank at the Garcia plant.

17. Claimant has proven by a preponderance of the evidence that he sustained a compensable injury while performing work for NRG.

18. Claimant was unable to perform the usual functions of his job from October 29, 2013 through October 12, 2014 when Dr. Hanson released him to full duty without restriction. No modified duty offers were extended to Claimant during this time. Consequently, Claimant experienced a complete loss of wages as is disabled within the meaning of the law and entitled to temporary total disability (TTD) benefits.

19. Claimant filed a Worker's Claim for Compensation on January 13, 2014. Respondents filed a Notice of Contest on March 6, 2014 denying the claim on the grounds that Claimant was an independent contractor and not an employee of NRG.

Independent Contractor Status

20. Claimant testified that he became an employee of NRG after it acquired EOG

when he was told by Mr. Bacon that "we're going to change this [EOG] over to another company" and that "we're just go ahead and leave you on as an employee." When EOG was acquired by NRG, Mr. Bacon advised Claimant he would get a raise to $20.00 per hour. As found, Claimant continued to rely on Mr. Bacon for assistance and direction following the acquisition of EOG by NRG. The two communicated frequently regarding the condition of the wells and work/repairs that Claimant felt were beyond his capabilities. Claimant testified that he considered Mr. Bacon to be his "boss" or "supervisor" after EOG was acquired by NRG. Consequently, the Judge finds that Claimant remained under Mr. Bacon's control and following NRG's acquisition of EOG.

21. As with EOG, Claimant continued to keep track of his hours and submit them monthly to NRG. NRG continued to pay Claimant by the hour by issuing Claimant a check for the hours submitted in Claimant's name.

22. NRG did not keep track of the hours Claimant worked or require any verification of the hours Claimant asserted he worked; instead, Claimant determined the number of hours he worked each week and wrote down the number in his "little log book." There were no requirements dictating when he needed to submit his monthly hours, in what detail, or in what form.

23. Claimant never entered into a written contact with Respondent-Employer to provide services on a fixed or contract rate. Rather, Paul Laird who is the C.E.O of Respondent-Employer testified that when NRG acquired EOG, Claimant continued working at the Garcia Plant without interruption as he had previously under EOG.

24. Claimant admitted he never filled out an employment application with NRG, never interviewed for a position with NRG, never visited NRG's office, and never filled out any tax documents for NRG to withhold taxes from his pay. However, NRG issued Claimant a 1099 form only for the 2011 tax year.

25. The ALJ finds that the relationship between Claimant and Dwayne Bacon did not fundamentally change and that Claimant was still performing the duties of a pumper under the control and direction of Mr. Bacon, as "operations Manager" for NRG following the acquisition of EOG by NRG in 2010 up to the date of his October 29, 2013 trip and fall.

26. The ALJ also finds no credible evidence establishing that Claimant was directed by Mr. Bacon to contact human resources at NRG to clarify his employment status after NRG acquired EOG. The ALJ finds Claimant's testimony that Mr. Bacon informed him he was being kept on as an employee of NRG credible and persuasive. More probably than not, Claimant relied on the representations of Mr. Bacon and his raise to $20.00/hour to conclude that he was NRG's employee after EOG was acquired. Consequently, the ALJ finds there would be no reason for Claimant to contact anyone from NRG or visit their office to complete a job application, interview for a position and/or complete tax documents.

27. Accordingly, the ALJ finds Respondents' assertion that Claimant is not an employee of NRG based upon the fact that Claimant did not go through NRG's hiring process unconvincing.

28. Claimant and his wife have owned and worked a small 170 acre cattle ranch for years. At the time Claimant was working for NRG, he was also maintaining his ranch. By the time of hearing, Claimant only had ten (10) head of cattle on the ranch due to the drop in price for beef.

29. Claimant testified that no employee of NRG ever told him he could not own or operate his ranch, and Mr. Laird testified that he had no problem with Claimant working on his ranch.

30. Other than his cattle ranch, there was no credible evidence that Claimant worked for anyone else other than Respondent-Employer.

31. The ALJ finds Claimant's work tending cattle on his small ranch to constitute an avocational interest, i.e. a hobby as opposed to a vocational pursuit.

32. As found above, Claimant received some basic training from Mr. Bacon when he first started working as a pumper in 2008. The remainder of his knowledge was learned on the job and through the continued direction/assistance of Mr. Bacon when necessary. Claimant admitted that, after his "initial" training, at EOG he received no additional training from NRG.

33. Employer provided some of the tools to perform his job but Claimant also provided some of his own tools. Claimant testified that it was easier to use his own tools than to have Respondent-Employer provide the tools as he lived a short distance away and had ready access to his tools. There were times when Claimant needed special equipment, like a pressure washer and a back hoe, to complete essential tasks associated with his job. On these occasions, Claimant would talk to Mr. Bacon and get permission to use his own equipment and charge a rental fee to Respondent-Employer. Other times, Respondent- Employer would simply provide the equipment.

34. Employer paid Claimant mileage and provided him with a hard hat, hearing protection and eye protection. Claimant would use his own cell phone at times but Mr. Laird testified that Respondent-Employer provided a cell phone at the Garcia plant for Claimant's use.

35. On occasion, well upkeep required specific parts, like oil filters, pipe fittings, and valves to remain in production. On these occasions, Claimant went to a store called "C & M" and purchased them. Claimant then sent Mr. Bacon an invoice for the cost, which Mr. Bacon paid. Later while Claimant was working for EOG, Mr. Bacon provided Claimant a credit card number to use to purchase these parts. When NRG acquired EOG, NRG set up its own an account at the store. After this, Claimant would go to the store, order the materials, and the store would send the bill directly to NRG. Thus, after

NRG acquired EOG, Claimant did not pay for any well site materials, directly or indirectly.

36. Claimant testified that he went to the well site every day – weather permitting for four years – starting in September 2008 until he was injured in October 2013. He stated that he was not accompanied when he went to the well, and that for the vast majority of the time as outlined above there was no one assisting him: he performed the work himself.

37. Claimant testified he had no set schedule and was able to check the meters at any time he chose. Claimant acknowledged that there was no time clock he was required to use to document his hours and that NRG did not set a number of hours he could or should work.

38. Paul Laird, the C.E.O of NRG testified at hearing. Mr. Laird has worked in the oil and gas industry for more than thirty years. His responsibilities as C.E.O include overseeing the operations of the company and reporting to the board of directors.

39. Mr. Laird testified that, at the time NRG acquired EOG, NRG had only three employees: himself, Mr. Bacon, and Brian Hedberg, who is no longer with the company. Mr. Laird testified that his company was a small entity, and that "every position . . . hired is a major hire for us" and that every decision to hire an employee includes a discussion with the board of directors.

40. According to Mr. Laird he did not hire Claimant. Moreover, Mr. Laird testified that Mr. Bacon never has had the authority to hire a new employee. However, on cross examination, Mr. Laird admitted that Mr. Bacon had authority to take whatever measures were necessary to make sure that the Garcia Gas Plant ran smoothly. This included getting those people necessary to do the job at hand.

41. Mr. Laird stated his company now has five employees, all of whom are salaried and registered on the company's payroll system. Mr. Laird testified that his company currently works with two pumpers. He testified that he does not consider the other pumpers working for NRG employees and, in his thirty years working in the oil and gas industry, has never considered pumpers to be, nor has he ever known pumpers to be, employees of the company owning and operating the well.

42. He testified that pumpers are not on the NRG's payroll and that instead, the company pays them when they receive the invoices the pumpers send in. Mr. Laird further testified that the company categorizes the money paid to salaried employees and the money paid to pumpers differently: employee salaries are pay roll expenses and pumper funds are lease operating expenses.

43. Mr. Laird stated NRG provides health benefits and a 401k package to its employees, but did not provide these to Claimant.

44. Mr. Laird testified that the company had not given Claimant any compensation other than the checks sent to pay the invoices Claimant mailed to the company. Mr. Laird also testified that the company requires new employees to fill out W-2 forms as well as an I-9 form, but that the company did not ask Claimant to fill out those forms.

45. As found, the fact that Claimant did not proceed through the established hiring process to become a payroll employee of NRG is not persuasive that Claimant was not an actual employee of NRG. As presented here, the persuasive evidence demonstrates that Claimant was under the control and direction of Dwayne Bacon as Operations Manager for NRG. Mr. Bacon oversaw the work of Claimant. He exercised control and directed Claimant in completion of complicated tasks in the field. The ALJ finds that Mr. Bacon was essentially engaged in ongoing training of Claimant to learn the intricacies of the pumper position. The ALJ finds the fact that Claimant was able to manage the mundane tasks of a pumper does not mean that he was he was engaged in an independent business, trade or occupation.

46. Mr. Laird testified that the company had no expectation that their pumpers would work exclusively for them, because pumpers commonly work for multiple companies at the same time. Claimant himself acknowledged that, if another gas company had approached him to work as a pumper on one of their wells; he knew he could have done so but would not have.

47. The ALJ finds that Claimant was not required to work exclusively for NRG.

48. Mr. Laird confirmed that it was not Mr. Bacon's role to train pumpers, and that NRG as a company does not train pumpers. Nonetheless, Mr. Bacon continued to provide on the job training for Claimant by directing and assisting him in completing complicated tasks. Without the ongoing education imparted to Claimant by Mr. Bacon in the field, Claimant would not have been able to complete many of the duties expected of a pumper. Mr. Laird's testimony that Claimant's close and regular contact with Mr. Bacon should be characterized as coordination and not training is unpersuasive.

49. Mr. Laird testified that Employer could terminate Claimant's services at any time without penalty. In addition, Mr. Laird testified that Claimant could quit working for NRG at any time without penalty.

50. Respondents have failed to carry their burden of establishing that Claimant is engaged in an independent trade, occupation, profession, or business.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the Judge draws the following conclusions of law:

Generally

A. The purpose of the Workers' Compensation Act of Colorado (Act), Sections 8-40-01, C.R.S., *et seq.*, is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. In general, the claimant has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the Claimant nor in favor of the rights of the respondents. Section 8-43-201, C.R.S.

B. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of a witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005).

C. In accordance with Section 8-43-215 C.R.S., this decision contains specific Findings of Fact, Conclusions of Law and an Order. In rendering this decision, the ALJ has made credibility determinations, drawn plausible inferences from the record, and resolved essential conflicts in the evidence. See *Davison v. Industrial Claim Appeals Office*, 84 P.3d 1023 (Colo. 2004). This decision does not address every item contained in the record; instead, incredible or implausible testimony or unpersuasive arguable inferences have been implicitly rejected. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office*, 5. P3.d 385 (Colo. App. 2000).

Compensability

D. The question of whether the claimant proved the requisite causal relationship between the injury and the conditions or circumstances of employment is one of fact for determination by the ALJ. *Cabela v. Industrial Claim Appeals Office, 198 P.3d 1277 (Colo. App. 2008); Blunt v. Nursecore Management Services, W.C. No. 4-725-754 (ICAO February 15, 2008).* As found here, Claimant was at the Garcia plant performing work for the Respondent –Employer when he tripped over a pipe fracturing his right hip necessitating surgery. At the time he was injured, the persuasive evidence reveals that Claimant was being paid by Respondent-Employer for the work he was performing. There was no credible evidence which shows that Claimant injured himself other than as to what he testified. Moreover, the medical evidence within hours of the alleged incident persuasively demonstrates objective evidence consistent with the described mechanism of injury. Consequently, the ALJ concludes that Claimant has proven by a

preponderance of the evidence that he was injured while performing work for Respondent-Employer. The injury is compensable.

Independent Contractor Status

E. Only employees of an employer are entitled to compensation for work-related injuries. C.R.S. §8-41-301(1)(a), (stating that an injury is compensable if, "at the time of the injury, both employer and employee are subject to the provisions of said articles…"). Individuals who are "free from control and direction in the performance of [a] service" for an employer are not employees. C.R.S. §8-40-202(2)(a). Such individuals are referred to as "independent contractors." *See* C.R.S. §8-40-202.

F. The party asserting that a claimant is an "independent contractor" bears the burden of proving independence by a preponderance of the evidence. The putative employer may establish that the Claimant is an independent contractor because he was free from direction and control and engaged in an independent business or trade by proving the presence of some or all of nine criteria set forth in §8-40-202(2)(b)(II), C.R.S, 2014; *Nelson v. Industrial Claim Appeals Office,* 981 P.2d 210 (Colo. App.1998).

G. Pursuant to §8-40-202(2)(b)(II) "to prove independence it must be shown that the person for whom services are preformed does not:"

- Require the individual to work exclusively for the person for whom services are preformed; except that the individual may choose to work exclusively for such person for a finite period of time specified in the document;

- Establish a quality standard for the individual; except that the person may provide plans and specifications regarding the work but cannot oversee the actual work or instruct the individual as to how the work will be preformed;

- Pay a salary or at an hourly rate instead of at a fixed or contract rate;

- Terminate the work of the service provider during the contract period unless such service provider violates the terms of the contract or fails to produce a result that meets the specifications of the contract;

- Provide more than minimal training for the individual;

- Provide tools or benefits to the individual; except that materials and equipment may be supplied;

- Dictate the time of performance; except that a completion schedule and a range of negotiated and mutually agreeable work hours may be established;

- Pay the service provider personally instead of making checks payable to the trade or business name of such service provider; and

- Combine the business operations of the person for whom service is provided in any way with the business operations of the service provider instead of maintaining all such operations separately and distinctly.

H. While the ALJ must consider the factors listed in the statute, the fact that the party asserting independence does not prove one of the factors is not conclusive evidence that the claimant was an employee; put another way, the party asserting independence does not have to meet every factor listed above to prove an individual was an independent contractor. *See* C.R.S. §8-40-202(b); *Nelson v. Industrial Claim Appeals Office, supra.*

I. Section 8-40-202(b)(I) and (II) create a "balancing test" requiring the party asserting "independence" to overcome the presumption of an employment contained in section 8-40-202(2)(a) and establish instead independent contractor status. *Nelson v. Industrial Claim Appeals Office, supra*. Once Claimant establishes that he performed services for Respondent-Employer for a wage, the burden shifts to the Respondent to prove the Claimant was not an employee by showing that Claimant was free from control and customarily engaged in an independent trade.

J. Generally an employee is a person who is subject to their employers control over the means and methods of their work, as well as the results. *Carpet Exchange of Denver, Inc. v. Industrial Claim Appeals Office*, 859 P.2d 278 (Colo. App. 1993). It is the power to control, and not the fact of control being exercised, which is the primary factor in distinguishing an employee from a contractor. *Industrial Commission of Colorado v. Moynihan*, 94 Colo. 438, 32 P.2d 802 (1934). As found here, Dwayne Bacon oversaw Claimant's work. While Claimant was competent to handle the commonplace duties of a pumper, Mr. Bacon, and thus NRG controlled the means, methods and results of Claimant's work on more complicated tasks which occasionally arose in the field. Thus, the Judge concludes that Claimant was in fact not free from control and direction in the performance of his service for NRG.

K. Moreover, the Judge concludes that consideration of all of the factors regarding "independence" as set forth in §8-40-202(2)(b)(II) tips the scale in favor of Claimant being an employee as opposed to an "independent contractor."

L. In this claim, Claimant never entered into a contract with Respondent-employer to provide certain services for a fixed rate. Claimant was paid by the hour. Claimant submitted his hours to respondent- Employer which then paid him by check made out to him personally. Claimant, received a "raise" from $15.00 to $20.00/hour when E.O.G was acquired by Employee. Claimant does not have a business where he provides services to other oil companies. In fact prior to performing services for EOG and NRG, Claimant knew nothing about working in the oil and gas industry. Rather, he was a brand inspector for the State of Colorado. Claimant was provided training by Duane

Bacon at time he was hired which this ALJ finds continued after EOG was acquired by NRG. Respondent- Employer provided some of the tools for Claimant to use when performing his job. What tools and equipment Claimant provided was done merely out of convenience as Claimant resided close to the field and had ready access to his tools. Had Claimant been unwilling to use his tools, Employer would have been required to supply all of them. Respondent set up an account at a local auto parts store for Claimant to purchase materials to do his job. The account was under Respondent-Employer's name. The bills were sent to Respondent- Employer and in turn paid by them. Respondent-Employer provided Claimant with a hard hat, hearing protection, and eye protection. Respondent-Employer also provided Claimant a cell phone to use while at the Garcia Gas Plant. Finally, Claimant felt he could quit his job at any time without penalty and Respondent- Employer felt it could terminate claimant's services at anytime without penalty.

M. It is recognized that, claimant was issued a 1099 for one year and never had taxes taken out of his check, that Claimant was never restricted from working for another oil or gas company and that he was allowed to determine the hours he worked. However, considering all of the Factors set forth in Section 8-40-202 (2)(b)(II) the ALJ concludes that Claimant is an employee of Respondent-Employer.

Medical Benefits

Respondents are liable for medical treatment reasonably necessary to cure or relieve the employee from the effects of the injury. Section 8-42-101(1)(a), C.R.S.; *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988). However, the respondents are only liable for authorized treatment or emergency medical treatment, which may be obtained without prior authorization. See § 8-42-101(1), C.R.S.; *Pickett v. Colorado State Hospital*, 32 Colo. App. 282, 513 P.2d 228 (1973); *Sims v. Industrial Claim Appeals Office*, 797 P.2d 777 (Colo. App. 1990). The ALJ concludes Claimant's treatment from Trinidad Ambulance Service, Mt. San Rafael Hospital, St. Mary Corwin Hospital, and Charles A. Hanson, M.D. to constitute a bona fide emergency for which treatment could be obtained without prior authorization. The ALJ also concludes that the treatment was otherwise reasonable and necessary to cure and relieve Claimant from the effects of his compensable work injury. As the claim is compensable, Respondents are liable for the medical treatment provided by Trinidad Ambulance Service, Mt. San Rafael Hospital, St. Mary Corwin Hospital, and Charles A. Hanson, M.D.

ORDER

It is therefore ordered that:

1. Claimant suffered a compensable injury arising out of and in the course of his employment on October 29, 2013.

2. Claimant is an employee of NRG, the Respondent-Employer in this case.

3. Claimant is entitled to medical benefits as provided by Trinidad Ambulance Service, Mt. San Rafael Hospital, St. Mary Corwin Hospital, and Charles A. Hanson, M.D.

4. Pursuant to the parties stipulation, Respondents shall pay temporary total disability ("TTD") benefits for the period between October 30, 2013 and February 12, 2014.

5. The insurer shall pay interest to claimant at the rate of 8% per annum on all amounts of compensation not paid when due.

6. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

Colorado Springs, CO 80906

OFFICE OF ADMINISTRATIVE COURTS
STATE OF COLORADO
WORKERS' COMPENSATION NO. WC 4-943-575-02

ISSUES

Whether Claimant has shown by a preponderance of the evidence that she suffered a re-injury of a previously injured body parts while in the course and scope of her employment with Employer.

FINDINGS OF FACT

Based upon the evidence presented at hearing, the Judge enters the following findings of fact:

1. Claimant has been an employee of Respondent, Employer since 2006.

2. In November 2006, Claimant filed a workers' compensation claim alleging injuries to her hands, arms and neck, and received treatment for those conditions.

3. Ultimately, in August 2007, Claimant was placed at maximum medical improvement, and a subsequent Final Admission was filed without challenge.

4. Claimant's symptoms continued on and off from the 2006, 2007 injury over the course of several years while she continued to be employed at Employer. Claimant has worn wrist splints daily since August, 2007.

5. In 2013, Claimant's job with Employer significantly changed in that she went from being responsible for two lines of jeans in the Employer Men's Department, to being responsible for replenishing and displaying the entire Men's Department. Before 2013, Claimant was responsible for approximately 5,000 pieces of clothing and in 2013 she bacame responsible for approximately 200,000 pieces of clothing. When her job changed, she began experiencing symptoms daily, with new feelings of her finger bones being broken and more intense elbow, shoulder, and neck pain.

6. At around the time Claimant's job duties expanded, Employer changed the display furniture in their Men's Department, replacing lighter tables with much heavier tables.

7. Claimant's responsibilities were increased in that she went from being responsible for "replenishment" of two lines of jeans to being responsible for the entire Men's Department in a "core standard" status.

8. Core standard means not only the handling of merchandise, but stocking tables, moving tables and furniture, and stocking shelves and four-way racks. Claimant cashiers approximately once a day and spends several minutes per day helping customers locate specific merchandise.

9. As of 2013 Claimant was responsible for moving heavy tables on an almost monthly basis as Employer ordered displays of merchandise to be updated.

Although two men and sales associates could help Claimant move the tables, they were often unavailable. Claimant often moved the tables by herself or with one associate.

10. Claimant demonstrated how she turns her hands palm-up and places them under the table's edge to lift the table.

11. Lifting the heavy tables causes increased symptoms in Claimant's hands, wrists, arms, elbows, and shoulders.

12. Prior to her 2013 job change, Claimant had slower times of the day and slower seasons when she could rest and her symptoms would dissipate. But after her job change, she no longer has slow times of day or seasons and she is unable to rest increasing her symptoms.

13. Due to the increase in Claimant's hours on the job, the physical nature of her duties, and the expansion of the duties for which she is solely responsible, she suffered a substantial and permanent aggravation to her upper extremities and neck.

14. Claimant also works at another clothing retailer once or twice a week for a five hour shift. Her job duties there involve greeting customers and loss prevention. These duties do not cause pain in her upper extremities.

15. Respondents called Dr. Craig Davis as an expert in orthopedic surgery. On April 11, 2014, Dr. Davis performed a Respondents' IME on Claimant after reviewing her medical records. In his report, he diagnosed Claimant with carpel tunnel syndrome, lateral epicondylitis, and myofacial pain of the upper extremities, all of which he attributed to her work for Employer with causal origins in 2006 and 2007.

16. The ALJ finds Dr. Davis' hearing testimony supports the finding of substantial and permanent aggravation. For example, Dr. Davis testified:

- A patient with carpel tunnel syndrome can worsen to the point that they will have symptoms even when they are at rest.
- Claimant's experience of symptoms when at rest is "an indication that this condition is worsening."
- He was not aware of changes in Claimant's job duties in 2013, and the details of what her job entailed, "and a lot of activities I wasn't aware of that aggravated the condition.
- "Well, the activities I think - - recent activities here [referring to lifting the heavy tables]. . . I think are responsible for a worsening of the condition she already had."
- Claimant was not at maximum medical improvement.
- Dr. Davis was asked: "if [Claimant] tells you that this furniture moving that she would do on a regular and routine basis has just put her over the max, wouldn't you assume that that then was a new finding, a new injury, a new condition she was not facing before?" He responded: "I would say it's a new activity that I was not aware of that has had a significant aggravating affect on her symptoms."

- He was unaware at the time he wrote his report that Claimant's job involved moving heavy furniture.
- He opined that Claimant's symptoms "worsened considerably in 2013" because of her new job duties.

CONCLUSIONS OF LAW

Based upon the foregoing findings of fact, the Judge draws the following conclusions of law:

The purpose of the Workers' Compensation Act of Colorado (Act), sections 8-40-101, *et seq.*, C.R.S., is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1) C.R.S. The claimant shoulders the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201 C.R.S. A preponderance of the evidence is that which leads the trier-of-fact after considering all of the evidence, and to find that a fact is more probably true than not. *Page v. Clark,* 197 Colo. 306,592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the Claimant nor in favor of the rights of Respondents, and a workers' compensation claim shall be decided on its merits. Section 8-43-201 (2008) C.R.S.

The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved; the ALJ has not addressed every piece of evidence or every inference that might lead to conflicting conclusions, and has rejected evidence contrary to the above findings as unpersuasive. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P.3d 385 (Colo. App. 2000).

Claimant has proven by a preponderance of the evidence that she substantially aggravated her existing physical issues involving her neck area and her upper extremities.

Claimant has proved by a preponderance of the evidence that these aggravations of her underlying physical issues arose out of and in the course of her employment. Section 8-41-301(1) C.R.S.

ORDER

It is therefore ordered that:

1. Claimant suffered a compensable work related occupational disease while in the course and scope of her employment with Employer. Claimant is entitled to reasonable, necessary and causally connected medical treatment as provided by the authorized treating physician in this matter.

2. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's Order, you may file a Petition to Review the Order with the Denver Office of Administrative Courts, Office of Administrative Courts, 1525 Sherman Street, 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the Order as indicated on the certificate of mailing or service; otherwise, the Judge's Order will be final. You may file the Petition to Review by mail as long as the certificate of mailing is attached to your Petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301 (2), C.R.S. (as amended, SB09-070). For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a Petition to Review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

DATED: June 24, 2015

/s/ Kimberly Turnbow
Kimberly Turnbow
Administrative Law Judge
Office of Administrative Courts
1525 Sherman Street, 4th Floor
Denver, CO 80203

ISSUES

The issue addressed by this decision involves Claimant's entitlement to medical benefits. The questions to be answered are:

I. Whether Claimant's need for a right shoulder hemiarthroplasty surgery should be authorized as reasonable, necessary and related to Claimant's admitted industrial injury.

II. Whether Dr. Griffis request for a left shoulder MRI is reasonable, necessary and related to Claimant's admitted industrial injury.

FINDINGS OF FACT

Based upon the evidence presented at hearing as well as the evidence generated at the post hearing deposition of Dr. Klajnbart, the ALJ enters the following Findings of Fact.

Admitted 03/11/14 Work Injury

1. On March 11, 2014, Claimant, a 10-year veteran employee of Respondent-Employer was doing asphalt road maintenance work through his employer's contract for the City of Colorado Springs. He sustained admitted injuries to his right and left shoulder during the execution of those duties. Over the ten-year period of employment and on the aforementioned injury date, Claimant's work for Respondent-Employer required him to, *inter alia,* obtain asphalt mix; deliver it to the site of repair; "cut out" the edges of existing pot holes in the asphalt using a jackhammer and other heavy tools; use demolition saws which necessitated Claimant holding the saw blades against the street edges; shovel hundreds of pounds of asphalt mix into the prepared holes by using large heavy shovels weighing up to 60-80 pounds; move the asphalt mix five feet or more from the dump site location to the pot hole repair site once loaded onto the shovel; pound the newly placed asphalt into place and clear the area of the dump site before moving onto the next repair site. Based upon the description of Claimant's job duties, the ALJ finds the job physically demanding.

2. On the date in question, Claimant estimated nearly 800 pounds of mix had been placed on the ground at a busy intersection in Colorado Springs. After re-directing the traffic, the repair had to be completed quickly due to the traffic congestion. While executing the street repair process, Claimant felt a painful popping sensation in his right shoulder while performing the required heavy work activities. Claimant timely

reported the injury to his employer and the claim was finally admitted by Respondent-Insurer approximately one month later.

3. Respondent filed a General Admission of Liability (GAL) on April 22, 2014 and temporary disability benefits have been admitted from April 4, 2014 and ongoing.

4. Claimant received authorized medical care which included an MRI and right shoulder surgery performed by John Redfern, M.D. on May 12, 2014. The MRI of the right shoulder performed on April 11, 2014 was felt to demonstrate findings including a large tear of the posterior labrum, a SLAP tear, medial subluxation of the long biceps tendon and tendinosis of the rotator cuff involving the supraspinatus, infraspinatus and subscapularis tendons.

5. Dr. Redfern performed a pre-authorized right shoulder arthroscopic biceps tenotomy, right shoulder chondroplasty, limited synovectomy and right shoulder subacromial decompression during the May 12, 2014 surgical procedure.

6. Claimant testified and the records support that following surgery Claimant had no relief and continued with pain, inflammation and instability of the right shoulder following surgery. Consequently, corticosteroid injections were also performed by Dr. Redfern.

7. Additional surgical procedures to improve Claimant's right shoulder condition have been considered. On August 12, 2014 Dr. Redfern noted that Claimant's young age and work as a heavy laborer made a total shoulder arthroplasty contraindicated, but some benefit to improve his post-injury symptoms might be obtained through a hemiarthroplasty.

8. By November 25, 2014, Dr. Redfern noted that as Claimant's range of motion improved with physical therapy, there existed a greater instability in the shoulder joint characterized by catching and popping with movement and with some dropping of the shoulder to the point where Claimant was having difficulty performing simple tasks such as pouring a cup of coffee. Dr. Redfern's opined that "[i]f the patient wishes to return to heavy lifting and heavy duty work, I do not recommend he have a total shoulder arthroplasty and only a hemiarthroplasty. If the patient is going to return to light duty work and not heavy lifting, total shoulder arthroplasty will give him more predictable results in regards to pain relief and shoulder function."

9. On August 6, 2014, William S. Griffis, D.O. recommended an MRI of the left shoulder to rule out a rotator cuff tear versus a labral tear which he also found to be work related.

10. The record demonstrates Respondents were in possession of the original recommendation for shoulder surgery and requested a medical review prior to authorization of the surgery from Dr. Allison Fall.

11. Dr. Allison Fall's report purports the Rule 16 review was performed on August 10, 2014. However, her report cites Dr. Redfern's August 12, 2014 note, which makes this date of report impossible. During her cross-examination, Dr. Fall admitted that the notation at page two of the report "VF#1012-016" (Resp. Ex. E, p. 12) actually demonstrates she created the voice file of her dictation on October 12, 2014 which coincides with the received date stamp of October 13, 2014 by Respondents' counsel, (Resp. Ex. E, p. 11) and which would also coincide with the date stamp purporting to have Dr. Fall's report being sent to Claimant's counsel, the insurance company, and the employer on October 16, 2014. (Resp. Ex. E, p. 11).

12. Respondents' Application for Hearing on the issue of challenging the requested hemiarthroplasty was filed on October 29, 2014.

13. Dr. Fall opines that the request for authorization for a right shoulder hemiarthroplasty is "not medically reasonable and necessary as related" to Claimant's admitted work-related injury. Dr. Fall bases her opinion on Claimant's right shoulder MRI which documents chronic, preexisting, significant degenerative changes including osteophytes and preexisting articular cartilage damage. According to Dr. Fall, the hemiarthroplasty is needed to address the underlying preexisting degenerative changes and not for the increased symptomatology Claimant experienced on March 11, 2014." Moreover, Dr. Fall challenged the opinion of Dr. Redfern "that shoulder arthroplasty may give some pain relief, but he would likely continue to have pain and limitations, as an indication that the procedure is not medically reasonable and necessary treatment for the work-related injury." According to Dr. Fall since there "is no guarantee [Claimant] would have any functional benefit or any significant pain benefit as a result of the hemiarthroplasty, the surgery is not reasonable and necessary treatment.

14. Dr. Hall testified that Claimant's first surgery was "not sufficient to solve the problem" and did not resolve the source of pain caused by the March 11, 2014 admitted work injury. According to Dr. Hall, the second surgery (hemiarthroplasty) was likely improve the pain and loss of function Claimant suffered not only on March 11, 2014, but also as a result of the first surgical procedure which failed to substantially improve his pain complaints.

15. Dr. Klajnbart, who performed an independent medical examination at the request of Respondent testified that in his opinion the first surgical intervention performed on Claimant was reasonable and necessary to cure or relieve Claimant of the effects of the admitted injury (Depo Tr. p. 19:23-20:6), and that it was not only the opinion of the Claimant that the first surgery was not successful, but it was also the opinion of Dr. Klajnbart that this surgery was not successful (Depo Tr. p. 20:20-24). It was also Dr. Klajnbart's opinion that part of the regression of Claimant's condition post-surgery was from the "intervention itself" (Depo Tr. p. 21:7-12). Dr. Klajnbart also suggests the possible surgical option of resurfacing of the humeral head as opposed to the hemiarthroplasty and whether the decision is ultimately made by the treating surgeon to do the hemi, total or resurfacing procedure, there would likely be an increase in Mr. Christian's function based on that surgery (Depo Tr. 23:1-6) and that by

increasing that function the Claimant would then be allowed to return to an ability to work as compared to his current status (Depo Tr. p. 23:7-10).

16. The ALJ finds, based on the evidence presented as a whole, that Claimant, more probably than not, suffers from pre-existing degenerative change in the right shoulder. Nonetheless the ALJ finds that Claimant's work duties on March 11, 2014 not only resulted in Claimant's acute injuries but also aggravated that underlying condition for which Claimant now needs treatment.

17. The ALJ finds the opinions of Dr. Fall unpersuasive and instead credits the testimony of Dr. Hall and Dr. Klajnbart to find that Claimant has proven by a preponderance of the evidence that his need for a right shoulder hemiarthroplasty is reasonable necessary and related to his March 11, 2014 work injury and that said surgery is likely to cure and relieve Claimant of the effects of the aggravation of his underlying pre-existing condition.

CONCLUSIONS OF LAW

Having entered the foregoing Findings of Fact, the ALJ draws the following Conclusions of Law:

Generally

A. The purpose of the Workers' Compensation Act of Colorado (Act), Sections 8-40-101, C.R.S. (2007), *et seq.*, is to assure the quick and efficient delivery of disability and medical benefits to injured workers at a reasonable cost to employers, without the necessity of litigation. Section 8-40-102(1), C.R.S. In general, the Claimant has the burden of proving entitlement to benefits by a preponderance of the evidence. Section 8-43-201, C.R.S. A preponderance of the evidence is that which leads the trier-of-fact, after considering all of the evidence, to find that a fact is more probably true than not. *Page v. Clark*, 197 Colo. 306, 592 P.2d 792 (1979). The facts in a workers' compensation case must be interpreted neutrally, neither in favor of the rights of the Claimant nor in favor of the rights of the respondents. Section 8-43-201, C.R.S.

B. A workers' compensation case is decided on its merits. Section 8-43-201, C.R.S. The ALJ's factual findings concern only evidence and inferences found to be dispositive of the issues involved. The ALJ need not address every piece of evidence or every inference that might lead to conflicting conclusions. *Magnetic Engineering, Inc. v. Industrial Claim Appeals Office,* 5 P. 3d 385 (Colo. App. 2000).

C. When determining credibility, the fact finder should consider, among other things, the consistency or inconsistency of a witness's testimony and actions; the reasonableness or unreasonableness (probability or improbability) of the testimony and actions; the motives of the witness; whether the testimony has been contradicted; and bias, prejudice, or interest. *See Prudential Insurance Co. v. Cline*, 98 Colo. 275, 57 P.2d 1205 (1936); CJI, Civil 3:16 (2005).

D. An employer must take an employee as it finds him and is responsible for any increased disability resulting from the employee's preexisting weakened condition. *Cowin & Co. v. Medina*, 860 P.2d 535, 538 (Colo. App. 1992). Thus, when an industrial injury aggravates, accelerates, or combines with a preexisting disease or infirmity to produce the need for treatment, the treatment is a compensable consequence of the industrial injury. *Duncan v. Indus. Claim Appeals Office*, 107 P.3d 999, 1001 (Colo. App. 2004).

E. The mere occurrence of a compensable injury does not require an ALJ to find that all subsequent medical treatment and physical disability were caused by the industrial injury. To the contrary, the range of compensable consequences of an industrial injury is limited to those which flow proximately and naturally from the injury. *Standard Metals Corp. v. Ball,* 172 Colo. 510, 474 P.2d 622 (1970); § 8-41-301(1)(c), C.R.S. 2013. Here, the persuasive evidence establishes that the recommended right shoulder arthroplasty, which may include resurfacing, hemi or total replacement based on the treating surgeons conclusions at the time of surgery, is reasonable and necessary, and more probably than not related to his March 11, 2014 work injury.

F. Section 8-42-101(1)(a), supra, provides:

> Every employer … shall furnish … such medical, hospital, and surgical supplies, crutches, and apparatus as may reasonably be needed at the time of the injury … and thereafter during the disability to cure and relieve the employee from the effects of the injury.

As Claimant has proven, by a preponderance of the evidence that the recommended right shoulder arthroplasty is reasonable, necessary and related to his work injury and likely to cure and relieve its ongoing effects, Respondents are liable for said medical benefits under the Act.

G. Based upon the evidence presented, the ALJ also concludes that claimant has established that that Dr. Griffis request for an MRI of the left shoulder is also reasonable, necessary and related to the March 11, 2014 work injury. The requested MRI is likely to cure and relieve Claimant of the effects of his admitted work injuries. Consequently, the ALJ concludes that Claimant has proven, by a preponderance of the evidence, that insurer is liable for the MRI requested by Dr. Griffis.

H. Section 8-40-201(14), C.R.S. defines "occupational disease" as:

> [A] disease which results directly from the employment or the conditions under which work was performed, which can be seen to have followed as a natural incident of the work and as a result of the exposure occasioned by the nature of the employment, and which can be fairly traced to the employment as a proximate cause and which does not come from a hazard to which the worker would have been equally exposed outside of the employment.

This section imposes additional proof requirements beyond that required for an accidental injury. An occupational disease is an injury that results directly from the employment or conditions under which work was performed, and can be seen to have followed as a natural incident of the work. Section 8-40-201(14), C.R.S.; *Climax Molybdenum Co. v. Walter*, 812 P.2d 1168 (Colo. 1991); *Campbell v. IBM Corporation*, 867 P.2d 77 (Colo. App. 1993). In contrast, an accidental injury is traceable to a particular time, place and cause. *Colorado Fuel & Iron Corp. v. Industrial Commission*, 154 Colo. 240, 392 P.2d 174 (1964); *Delta Drywall v. Industrial Claim Appeals Office*, 868 P.2d 1155 (Colo. App. 1993).

I. Under the statutory definition of an occupational disease, the hazardous conditions of employment need not be the sole cause of the disease. A claimant is entitled to recovery if he or she demonstrates that the hazards of employment cause, intensify, or aggravate, to some reasonable degree, the disability. *Anderson v. Brinkhoff*, 859 P.2d 819 (Colo. 1993). Once the claimant makes such a showing, the burden of establishing the existence of a nonindustrial cause and the extent of its contribution to the occupational disease shifts to the employer. *Cowin & Co. v. Medina*, 860 P.2d 535 (Colo. App. 1992). Here, Claimant experienced an accidental injury traceable to a particular time, place and cause as admitted for the March 11, 2014 event, but the surgery performed to cure or relieve Claimant of the effects of said injury served to significantly combine with and worsen the occupational disease created in the shoulder joint as a result of 10 years of heavy labor involved with the performance of the street repairs required in the course and scope of his employment. Respondents offered no nonindustrial cause or extent of its contribution to the underlying disease process to Claimant's bilateral shoulders.

J. Claimant has proven by a preponderance of the evidence that he suffered an admitted injury on March 11, 2014 which necessitated the surgery by Dr. Redfern on May 12, 2014, which combined with an occupational disease to his bilateral shoulders resulting directly from the employment or conditions under which work was performed and following as a natural incident of the work and the surgery performed thereafter. Claimant's job required physical exertion at a heavy and vibratory level beyond what was experienced in Claimant's nonindustrial activities. He likely developed end-stage degenerative joint disease as a result. However, the evidence sufficiently connects the incidents of March 11, 2014 and the care provided thereafter to the need for the additional surgery now being requested by Dr. Redfern. Accordingly, Claimant has proven by a preponderance of the evidence that the admitted March 11, 2014 work injury and care related thereto aggravated claimant's condition so that his pain symptoms from his end-stage degenerative joint disease worsened and caused the need for the anticipated hemi or total arthroplasty. The treatment contemplated by Dr. Redfern and Dr. Griffis is therefore related to Claimant's admitted March 11, 2014 work injury. Respondents are therefore liable for said medical treatment as being reasonably necessary to cure or relieve the employee from the effects of the injury. Section 8-42-101, C.R.S.; *Grover v. Industrial Commission*, 759 P.2d 705 (Colo. 1988).

K. Based upon the evidence presented, the ALJ concludes that Claimant has established that Respondents are liable for the medical benefits related to the right and left based on causation grounds.

ORDER

It is therefore ordered that:

1. Claimant's aggravation of her pre-existing degenerative right shoulder condition is a compensable consequence of his March 11, 2014 industrial injury.

2. Respondent shall pay, pursuant to the workers compensation fee schedule for all medical expenses to cure and relieve claimant from the effects of his right shoulder condition, including, but not limited to the arthroplasty procedure requested by Dr. Redfern.

3. Respondents shall pay, pursuant to fee schedule for the recommended left shoulder MRI.

4. All matters not determined herein are reserved for future determination.

If you are dissatisfied with the Judge's order, you may file a Petition to Review the order with the Denver Office of Administrative Courts, 1525 Sherman St., 4th Floor, Denver, CO 80203. You must file your Petition to Review within twenty (20) days after mailing or service of the order, as indicated on certificate of mailing or service; otherwise, the Judge's order will be final. You may file the Petition to Review by mail, as long as the certificate of mailing attached to your petition shows: (1) That you mailed it within twenty (20) days after mailing or service of the order of the Judge; and (2) That you mailed it to the above address for the Denver Office of Administrative Courts. For statutory reference, see section 8-43-301(2), C.R.S. For further information regarding procedures to follow when filing a Petition to Review, see Rule 26, OACRP. You may access a petition to review form at: http://www.colorado.gov/dpa/oac/forms-WC.htm.

ISSUE

Has the claimant proven by a preponderance of the evidence that the need for a right knee total knee arthroplasty is causally related to her January 6, 2014 industrial injury?

FINDINGS OF FACT

1. The claimant sustained an industrial aggravation of a pre-existing condition to her right knee on January 6, 2014 while performing cashiering services for the respondent-employer. The claimant's injuries occurred when she was working in the photo lab as a cashier, turned toward the cash register, caught her foot on a mat, and twisted her knee.

2. The claimant treated her injuries at the designated provider, Concentra Medical Center, and was referred to orthopedic surgeon, Wiley Jinkins, M.D. The claimant reported to Dr. Jinkins that prior to the incident on January 6, 2014 that her right knee was "asymptomatic." Dr. Jinkins understood that the claimant's right knee was essentially asymptomatic prior to the incident on January 6, 2014 and did not require medical treatment.

3. The claimant underwent an MRI of her right knee on February 25, 2014 which revealed a lateral meniscal tear, small medial meniscal tear, and arthrosis of the femorotibial and patellofemoral compartments.

4. The respondents' expert, Dr. Wallace Larson, testified as an expert in the field of orthopedic surgery. Dr. Larson evaluated the claimant and reviewed her prior medical records and authored reports dated March 26 and May 5, 2015. Dr. Larson observed that the initial MRI performed on February 25, 2014 showed severe degenerative changes of the knee.

5. Dr. Jinkins performed surgery on the claimant's right knee on May 22, 2014. The surgery confirmed pre-existing degenerative findings in two compartments of the claimant's knee, the lateral and patellofemoral compartments. Dr. Larson opined that the first surgery documented severe degenerative changes in claimant's right knee.

6. The claimant continued to experience pain in her right knee post surgery. The claimant underwent another MRI of her right knee on September 11, 2014. The second MRI confirmed degenerative findings that were essentially the same as the MRI findings seen on the February 25, 2014 MRI.

7. Dr. Jinkins conducted a second right knee surgery on October 9, 2014. Dr. Jinkins noticed degeneration in the same compartments as he noted during the first surgery.

8. Dr. Jinkins opined that the degenerative findings as seen in the knee during the second surgery had progressed since the first surgery. Dr. Jinkins was not surprised by the progression of the arthritis between the two surgeries because the level of progression was entirely consistent with the claimant's symptoms and history of arthritic knees.

9. The claimant's right knee pain complaints continued after the second surgery. Dr. Jinkins recommended that the claimant proceed with a right knee arthroplasty.

10. Dr. Jinkins testified via deposition regarding his recommendation for the total knee arthroplasty. Dr. Jinkins agreed that the claimant would have necessitated the total knee arthroplasty at some point even if the January 6, 2014 work injuries had never occurred. Dr. Jinkins opined that the need for the total knee arthroplasty was accelerated as a result of the industrial event on January 6, 2014.

11. The claimant's medical history is found to be significant for pre-existing right knee complaints. The claimant's medical records confirm that she has experienced pain complaints in her bilateral knees dating back to at least 1996. On December 3, 1996, the claimant consulted with Dr. Jinkins for complaints of joint pain in her bilateral knees. Dr. Jinkins was concerned about rheumatoid arthritis and referred the claimant to a specialist.

12. The claimant sustained widespread pain complaints and injuries as a result of a motor vehicle accident that occurred in 1999. In 1999 the claimant developed fibromyalgia, which is a chronic pain condition that results in widespread pain in multiple joints. The claimant agreed that her chronic fibromyalgia had not been cured or abated and that she was continuing to experience this chronic joint pain at the time of her January 6, 2014 work injuries.

13. On March 5, 2004 the claimant complained to her primary care provider at Colorado Springs Health Partners that she was experiencing right knee pain. Right knee arthritis was documented via x-ray.

14. On May 18, 2005, the claimant reported bilateral knee pain to her treating doctors, which she described as making it painful to go up and down stairs. The claimant indicated that she was hearing a lot of noise in her knees when going up and down stairs. The claimant's medical providers noted that she was "almost incapacitated" with pain. The claimant indicated that she was thinking about taking off work the following Fall because of the pain going up and down stairs. She was additionally, contemplating moving into a different house.

15. X-rays of the claimant's right knee taken on May 18, 2005 revealed degenerative changes consistent with chondromalacia.

16. On an intake form from June 2005, the claimant noted areas of pain complaints, which included her right knee. On June 16, 2005, the claimant complained of bilateral knee pain with continued difficulty going up and down stairs and difficulty with prolonged standing. The claimant noted no relief with Flexeril, Darvocet and other conservative modalities. The claimant's doctor, Lawrence Zyskowski, M.D., opined the claimant had evidence of chondromalacia in her bilateral knees, which had been caused by early menopause and a hysterectomy.

17. At an evaluation on April 11, 2006, the claimant continued to complain of bilateral knee pain with popping and buckling. The claimant's treating provider noted that her smoking history had been one and a half packs per day for the past 40 years.

18. The claimant's left knee pain worsened and on July 13, 2006, she underwent an MRI of her left knee which revealed three compartment degenerative changes. The claimant was subsequently diagnosed with osteoarthritis of her bilateral knees on July 20, 2006 by Steven Waskow, M.D.

19. The claimant initially testified at hearing that her right knee did not prevent her from performing any activities of daily living prior to January 6, 2014. This is inconsistent with the claimant's medical records which document prior limitations with standing and going up and down stairs. The claimant agreed on cross examination that prior to January 6, 2014 her pre-existing right knee degenerative arthritis caused her to experience pain with some activities of daily living including bending, squatting, kneeling, and stooping.

20. The claimant has been on anti-inflammatory and pain medications for many years for treatment of chronic pain caused by fibromyalgia, injuries sustained in seven prior motor vehicle accidents, and widespread degenerative osteoarthritis. The claimant agreed that she was taking pain medications and anti-inflammatory medication for pre-existing arthritis at the time she sustained her work injuries in this claim on January 6, 2014.

21. The claimant agreed that prior to sustaining her industrial injury on January 6, 2014 she was experiencing pain complaints in her right knee. The claimant attributed these pain complaints to general wear and tear and getting older. The claimant understood that prior to sustaining her injuries on January 6, 2014 that she suffered from degenerative arthritis and that this was a chronic condition that caused her to suffer from incurable pain. The claimant agreed that her pain complaints in her right knee caused pain when she squatted and bent down at work. The claimant acknowledged that she frequently reported to work in pain prior to January 6, 2014.

22. Dr. Jinkins had not reviewed the claimant's pre-existing medical records predating her date of accident in this claim. Dr. Jinkins testified that the claimant had described to him that she was essentially asymptomatic in her right knee prior to the date of accident and that her right knee pain had not required any medical treatment prior to the date accident. There is no indication that Dr. Jinkins was aware of the claimant's documented pre-existing history of pain complaints in her right knee and medical treatment she received for pain complaints in her right knee.

23. Although this prior right knee medical treatment is documented years before the January 6, 2014 event, the diagnostics, medical evaluations and the claimant's own testimony confirm that the claimant was suffering from chronic pain and incurable arthritis in her right knee at the time she sustained her injuries in this claim. The claimant was medically managing these pain complaints at the time she suffered her injuries in this claim with pain medications and anti-inflammatory medication.

24. As found, Dr. Jinkins' testimony and opinion is not supported by the credible weight of the evidence because Dr. Jinkins did not have a full and accurate understanding of the claimant's medical history. Dr. Jinkins conceded that the claimant would have necessitated a total arthroplasty in her right knee at some point in the future, even if the January 6, 2014 work event had never occurred. Dr. Larson's opinion that there is no standard rate of degeneration that is uniform across the general population is credited. Dr. Larson testified that it is scientifically implausible and purely speculative to reach the conclusion that the claimant's right knee degenerative arthritis

accelerated faster than it otherwise would have if the minor twisting event on January 6, 2014 had never occurred.

25. The claimant's argument that her right knee had only minor degenerative changes at the time of the January 6, 2014 injury is not credible in light of claimant's medical records from 2004 to 2006, which document a clear history of right knee arthritis pain and the diagnosis of osteoarthritis, which then progressed over the next ten years. This opinion is further not supported by Dr. Jinkins' own concession that claimant would have needed a right total knee arthroplasty at some point even if the January 6, 2014 event had never occurred.

26. Dr. Larson testified the need for a total knee arthroplasty is an optional choice for any patient. Dr. Larson opined that claimant would have been a candidate for a total knee arthroplasty even if the January 6, 2014 work injury had never occurred.

27. Dr. Larson's opinion that the need for the claimant's right knee arthroplasty is not causally related to the January 6, 2014 industrial incident is credible and more persuasive than medical evidence to the contrary.

28. The ALJ finds that the claimant has failed to establish that it is more likely than not that her need for total right knee arthroplasty is related to her industrial injury of January 6, 2014.

CONCLUSIONS OF LAW

1. The claimant has the burden of proof, by a preponderance of the evidence, of establishing an entitlement to benefits. §§ 8-43-201 and 8-43-210, C.R.S. *See City of Boulder v. Streeb,* 706 P. 2d 786 (Colo. 1985); *Faulkner v. Indus. Claim Appeals* Office, 12 P. 3d 844 (Colo. App. 2000); *Lutz v. Indus. Claim Appeals* Office, 24 P.3d 29 (Colo. App. 2000). *Kieckhafer v. Indus. Claim Appeals Office,* 284 P.3d 202, 205 (Colo. App. 2012). A "preponderance of the evidence" is that quantum of evidence that makes a fact, or facts, more reasonably probable, or improbable, than not. *Page v. Clark,* 197 Colo. 306, 592 P. 2d 792 (1979). *People v. M.A.,* 104 P. 3d 273 (Colo. App. 2004); *Hoster v. Weld County Bi-Products, Inc.,* W.C. No. 4-483-341 [Indus. Claim Appeals Office (ICAO), March 20, 2002]. *Also see Ortiz v. Principi,* 274 F.3d 1361 (D.C. Cir. 2001). "Preponderance" means "the existence of a contested fact is more probable than its nonexistence." *Indus. Claim Appeals Office v. Jones,* 688 P.2d 1116 (Colo. 1984).

2. The claimant is not entitled to medical care that is not causally related to her work-related injury or condition. As noted in *Bekkouche v. Riviera Electric*, W.C. No. 4-514-998 (May 10, 2007), "A showing that the compensable injury caused the need for treatment is a threshold prerequisite to the further showing that treatment is reasonable and necessary." Where the relatedness, reasonableness or necessity of medical treatment is disputed, the claimant has the burden to prove that the disputed treatment is causally related to the injury, and reasonably necessary to cure or relieve the effects of the injury. *Ciesiolka v. Allright Colorado, Inc.,* W.C. No. 4-117-758 (ICAO April 7, 2003).

3. Although a preexisting condition does not disqualify a claimant from receiving workers' compensation benefits, the claimant must prove a causal relationship between the injury and the medical treatment the claimant is seeking. *Snyder v. Indus. Claim Appeals Office*, 942 P.2d 1337, 1339 (Colo. App. 1997). Treatments for a condition not caused by employment are not compensable. *Owens v. Indus. Claim Appeals Office*, 49 P.3d 1187, 1189 (Colo. App. 2002). And where an industrial injury merely causes the discovery of the underlying disease to happen sooner, but does not accelerate the need for the surgery for the underlying disease, treatment for the preexisting condition is not compensable. *Robinson v. Youth Track*, 4-649-298 (ICAO May 15, 2007).

4. The ALJ concludes, as found above, that the claimant has failed to establish by a preponderance that the need for the total knee arthroplasty is causally related to her January 6, 2014 industrial aggravation of her pre-existing arthritic condition.

[The Order continues on the following page.]

ORDER

It is therefore ordered that:

1. The claimant's request for a total right knee arthroplasty is denied and dismissed.
